## INTRODUCTION

This service manual describes the latest service information for the **IC-A14** and **IC-A14S** VHF AIR BAND TRANSCEIVER at the time of publication.

MODEL	VERSION	KEY TYPE
IC-A14	[USA]	Full key
	[USA-01]	
	[EXP]	
	[EXP-01]	
IC-A14S	[USA]	Simple key
	[USA-01]	
	[EXP]	
	[EXP-01]	

### UNIT ABBREVIATIONS:

C=CHASSIS PARTS  
M=MAIN UNIT  
P=PA UNIT  
DC=DC UNIT  
A=ANT UNIT

To upgrade quality, any electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

## CAUTION

**NEVER** connect the transceiver to an AC outlet or to a DC power supply that uses more than specified. This will ruin the transceiver.

**DO NOT** expose the transceiver to rain, snow or any liquids.

**DO NOT** reverse the polarities of the power supply when connecting the transceiver.

**DO NOT** apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front-end.

## ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit Icom parts numbers
2. Component name
3. Equipment model name and unit name
4. Quantity required

### <ORDER EXAMPLE>

1110003491	S.IC	TA31136FNG	IC-A14	MAIN UNIT	5 pieces
8820001210	Screw	2438 screw	IC-A14	Top cover	10 pieces

Addresses are provided on the inside back cover for your convenience.

## REPAIR NOTES

1. Make sure the problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a Standard Signal Generator or a Sweep Generator.
7. **ALWAYS** connect a 50 dB to 60 dB attenuator between the transceiver and a Deviation Meter or Spectrum Analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting a test equipment to the transceiver.

## SPECIFICATIONS

### ■ General

- Frequency coverage :
  - IC-A14 TX 118.000 to 136.975 MHz
  - IC-A14 TX RX 108.000 to 136.975 MHz
  - IC-A14S WX (Rx only) 161.650 to 163.275 MHz
  - IC-A14S TX/RX 118.000 to 136.975 MHz
- Mode : 6K00A3E  
16K0G3E (IC-A14/Rx only)
- Channel spacing : 25 kHz
- Number of memory channels:
  - IC-A14 200 (20 CH × 10 BANKS)
  - IC-A14S 100
- Power supply requirement : Specified Icom's battery packs  
7.4 V DC standard
- Usable temperature range : -10°C to +60°C (+14°F to +140°F)
- Current drain (at 7.4 V DC):
  - Tx 1.5 A
  - Rx at stand by 50 mA typical
  - at AF max. 500 mA
- Antenna connector : BNC 50 Ω (nominal)
- Dimensions : 53(W) × 120(H) × 36.9(D) mm  
(projections not included) 23/32(W) × 423/32(H) × 19/16(D) inch
- Weight : Approx. 180 g (6.35 oz) (Without the battery pack and antenna.)

### ■ Transmitter

- Output power : 5.0 W (PEP) typical  
1.5 W (CW)
- Modulation : Low level modulation
- Modulation limiting : 70 to 100%
- Frequency stability : ±5 ppm
- Audio harmonic distortion : Less than 10% (at 60% mod.)
- Hum and noise ratio : More than 35 dB
- Spurious emissions : More than 46 dB (except operating frequency ±62.5 kHz range)
- External MIC connector : 3-conductor 2.5(d) mm (1/10")/150 Ω

### ■ Receiver

- Receive system : Double conversion superheterodyne
- Intermediate frequencies : 1st 46.35 MHz, 2nd 450 kHz
- Sensitivity :
  - COM band (6 dB S/N) -6 dBμ typical
  - NAVI band (6 dB S/N) -3 dBμ typical (IC-A14 only)
  - WX channels (12 dB SINAD) -13 dBμ typical (IC-A14 only)
- Squelch sensitivity : AM Less than 0 dBμ  
(threshold) FM Less than -5 dBμ  
(IC-A14 only)
- Selectivity : 6 dB (More than 7.5 kHz)  
60 dB (Less than 25 kHz)
- Spurious response rejection: AM More than 60 dB  
FM More than 30 dB  
(IC-A14 only)
- Audio output power : More than 700 mW (internal SP)  
(at 10% distortion with an 8 Ω load, 30% mod.) More than 500 mW (external SP)
- Hum and noise : More than 35 dB at 30% mod.
- External SP connector : 3-conductor 3.5 (d) mm (1/8")/8 Ω

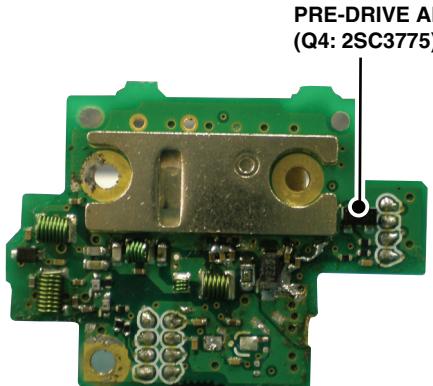

All stated specifications are subject to change without notice or obligation.

## SECTION 3 DISASSEMBLY INSTRUCTION

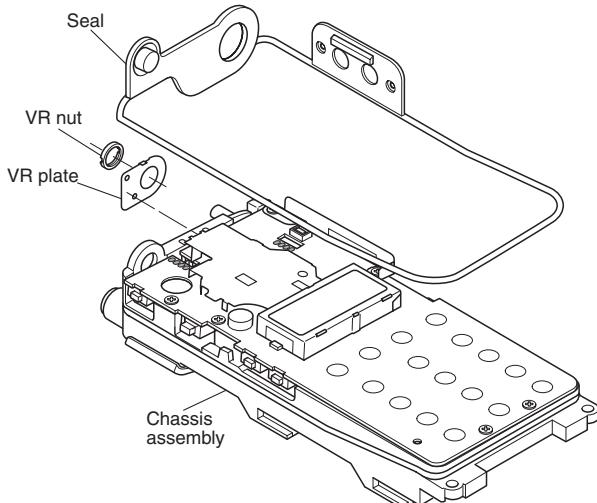

### 1. Removing the front panel

- ① Remove the VR knob and antenna nut.
- ② Unscrew 2 screws from the bottom.
- ③ Unscrew 2 screws from the side, and remove the jack panel.
- ④ Take off the CHASSIS assembly in direction of the arrow until the speaker cable appears.
- ⑤ Disconnect the speaker connector from the CHASSIS assembly, and separate the front panel and CHASSIS assembly completely.

### 2. Removing the MAIN UNIT

- ① Remove the seal, VR nut and VR plate from the CHASSIS assembly.

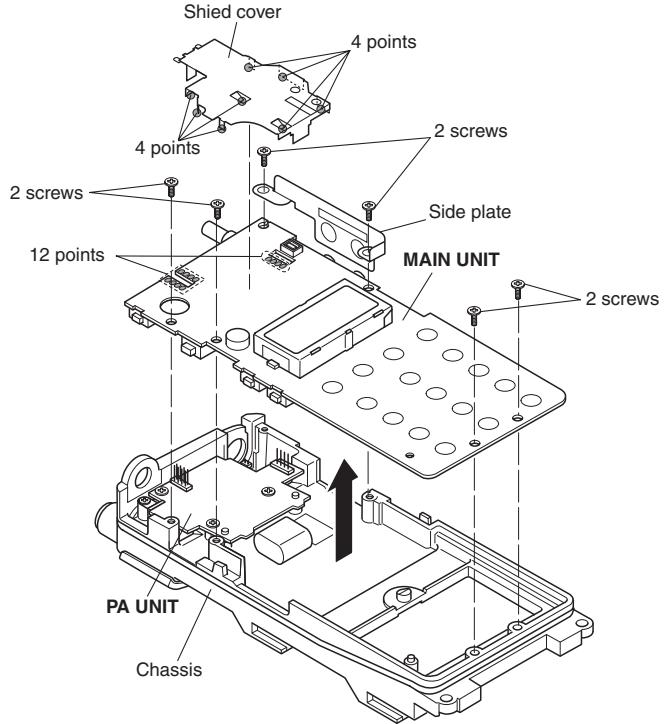

(Continued to right above)

- ② Unsolder total of 8 points from the shield cover then remove it.

③ Unscrew 2 screws from the side plate then remove it.

④ Unscrew total of 4 screws from the MAIN UNIT.

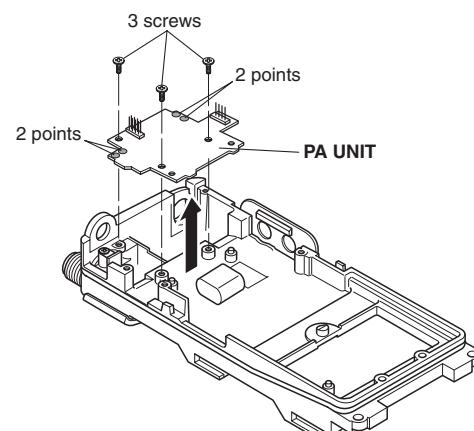

⑤ Unsolder total of 12 points which connecting PA UNIT, then remove the MAIN UNIT from the CHASSIS.

### 3. Removing the PA UNIT

- ① Unscrew 3 screws from the PA UNIT.

② Unsolder total of 4 points then remove the PA UNIT from the CHASSIS.

## SECTION 4

## CIRCUIT DESCRIPTION

### 4-1 RECEIVER CIRCUITS

#### RF CIRCUITS

RF circuits consist of RF filters, antenna switch (ANT SW), RF amplifier (RF AMP), etc., and extracts and amplifies the signals of frequency which desired to receive.

The received signals (RX signals) from the antenna are entered to the ANT UNIT and passed through the LPF. The filtered RX signals are entered to the PA UNIT, and passed through the LPF and ANT SW (an LPF in RX), then entered to the MAIN UNIT.

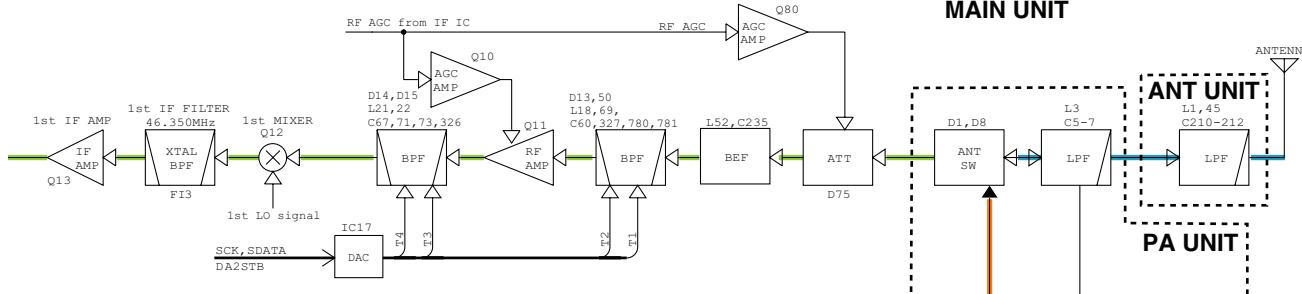

The RX signals from the PA UNIT are passed through the attenuator (ATT), BEF and 2-staged tuned BPF, then applied to the RF AMP (Q11). The amplified RX signals are passed through another 2-staged tuned BPF, and applied to the 1st mixer (Q12).

The ANT SW toggles RX line and TX line. While receiving, the TX line and the antenna is disconnected to prevent RX signals entering. The RX line is disconnected from the GND simultaneously, and an LPF which guides received signals to the RX circuits is composed.

While transmitting, serial-connected PIN diodes are ON, thus the TX line is connected to the antenna, and the RX line is connected to the GND simultaneously to prevent transmit signal entering.

The ATT functions as a part of the AGC circuit. The AGC voltage which is applied to the PIN diodes of the ATT controls RX signal level to enter the RX circuits, to keep the demodulated AF signal level stable.

#### • RF AND 1ST IF CIRCUITS

#### 2ND IF AND DEMODULATOR CIRCUITS

The 2nd IF circuit consists of 2nd mixer, 2nd IF filter, 2nd IF amplifier. And it converts the 1st IF signal into the 2nd IF signal, then filters and amplifies 2nd IF signal only. And the demodulator circuit converts the 2nd IF signal to AF signals. IC1 is an IF IC which contains the whole of the 2nd IF and demodulator circuits for the both of AM and FM demodulation.

The amplified 1st IF signal from the 1st IF AMP is applied to the IF IC, and converted into the 2nd IF signal, by being mixed with the 45.9 MHz 2nd LO signal at internal 2nd mixer.

The 2nd LO signal is generated by PLL IC (IC29) and X5, and tripled by Q84 before being applied to the 2nd mixer.

#### • AM signals

The converted 2nd IF signal is filtered by external 2nd IF filter (FI2), and amplified by the internal 2nd IF AMP. The amplified 2nd IF signal is AM-demodulated by internal AM detector, then output from pin 14.

The demodulated AF signals are applied to the RX AF circuits via the ANL (Automatic Noise Limiter) circuit which reduces pulse-type noises, if the ANL function is activated.

The tuned-BPF is adjusted so that it responds to receiving frequency and rejects all others, by the variable capacitor whose capacitance is varied by applied tuning voltages; "T1 – T4."

The RF AMP amplifies RX signals to a level suited to the 1st mixer.

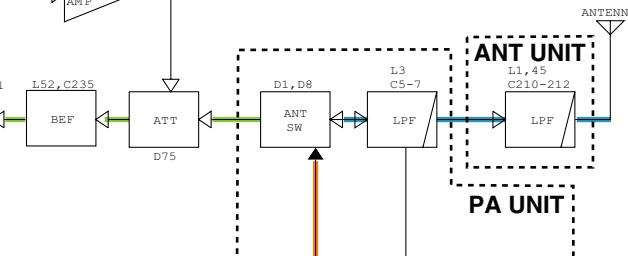

#### 1ST IF CIRCUITS

The 1st IF circuits consist of 1st mixer, 1st IF filter and 1st IF amplifier. And it converts the RX signals into the 1st IF signal, then filters to remove unwanted signals and amplifies.

The filtered RX signals are applied to the 1st mixer to be converted into the 46.35 MHz 1st IF signal, by being mixed with the 1st Local Oscillator (LO) signals from the RX VCO via buffers (Q60 and Q28), LO SW (D17) and ATT (R63, 335, 336).

The converted 1st IF signal is passed through the 1st IF filter (FI3) to be removed unwanted signals, and amplified by the 1st IF AMP (Q13). The amplified 1st IF signal is then applied to the 2nd IF circuit.

#### MAIN UNIT

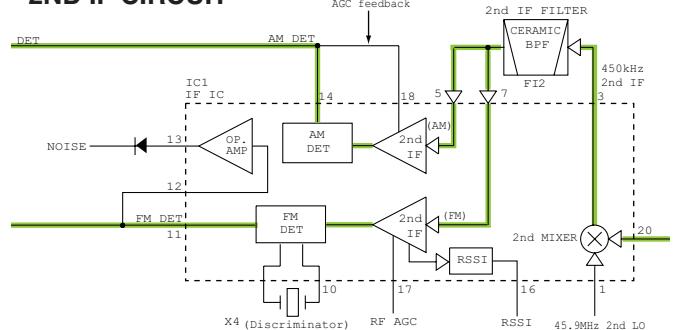

#### • FM (Weather Alert) signals

The converted 2nd IF signal is filtered by external 2nd IF filter (FI2), and amplified by internal 2nd IF AMP. The amplified 2nd IF signal is FM-demodulated by quadrature detector, then output from pin 11.

The demodulated AF signals are applied to the RX AF circuits.

#### • 2ND IF CIRCUIT

## AGC (Automatic Gain Control) CIRCUITS (For receiving AM signals)

The AGC circuit effectively reduces the RX signal level if the signal is strong, and raises it when it is weaker. The AGC circuit detects the overall strength of RX signals and automatically adjusts the gain of RF and IF AMPs, and attenuation level of the ATT to maintain an approximately constant average level of the received signals (=the AF output level).

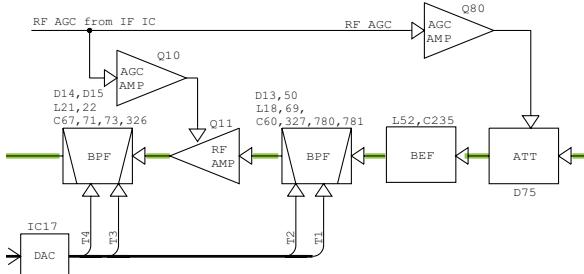

### • 2nd IF AMP gain control

The DC component in the AM-demodulated signals whose signal level is in proportion to the RX signal (RF signal) level, is feedback to the 2nd IF AMP in the IF IC. The DC voltage controls the gain of 2nd IF AMP to keep the 2nd IF signal level constant.

### • RF AMP and 1st IF AMP gain control

The AGC voltage "RF AGC" which is in proportion to the RX signal (RF signal) level is generated by the internal 2nd IF AMP (similar as RSSI voltage). The AGC voltage "RF AGC" is output pin 17 and applied to the AGC line drivers (Q10 and Q80) via AGC SW (Q85). Q10 controls the gain of RF AMP (Q11), and Q80 controls the attenuation level of ATT (D75-77) for stable 2nd IF signal level.

### • RF AMP AND 1ST IF AMP GAIN CONTROL

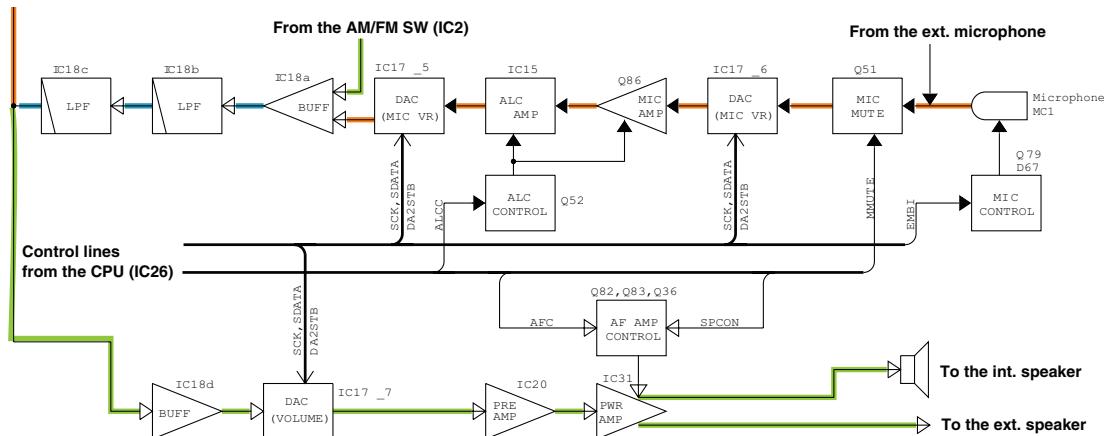

## RX AF CIRCUITS

The RX AF circuits consist of AF filters, AF amplifiers, etc., and amplify, filter the demodulated AF signals.

The demodulated AF signals from the IF IC are passed through the AM/FM SW (IC2), and applied to the buffer (IC18a). The AF buffer-amplified AF signals are passed through the 5-pole LPF (IC18b/c) to filter audio band signals only, then buffer-amplified by another AF buffer (IC18d). The buffer-amplified AF signals are level-adjusted (audio output level) by DAC (IC17\_7), then applied to the AF power AMP (IC31) via AF Pre-AMP (IC20). The AF signals are power-amplified to obtain AF output level, then applied to the internal speaker or external speaker via [SP] jack (J5).

### • AF CIRCUITS (for RX and TX)

## SQUELCH CIRCUITS

The squelch circuit cuts off the AF output signals when no RF signals are received.

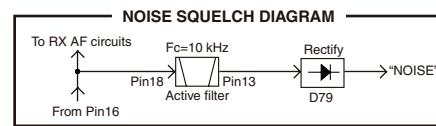

### • For receiving AM signals (RSSI SQUELCH)

The "RSSI" signal which is in proportion to the RX signal level is applied to the CPU (IC26, pin 30). The CPU interprets that RX signals are present or absent according to the voltage of "RSSI" signal level.

### • For receiving FM (WX) signals (NOISE SQUELCH)

A portion of FM demodulated AF signals is filtered by active BPF (IC1; pins 12, 13, R790, 792, 793, C736, 737, 744) which filters and amplifies only noise components (around 10 kHz signals) in the demodulated signals. The amplified noise components are detected into pulse-type signal by D79, then applied to the CPU (IC26) via the noise AMP (IC28). The CPU interprets that RX signals are present or absent by counting the pulse of noise signal.

If the CPU interprets that the RX signals are absent, the CPU sends the "DETMUTE" signal to the AM/FM mute SW (IC2). Then the AM/FM SW cuts off the AF line to close the squelch.

## ANL (Automatic Noise Limiter) CIRCUIT

The ANL circuit is a limiter which reduces pulse-type noises by cutting off the AF line temporarily. When the ANL function is activated (ANL SW (Q21) is ON), demodulated AF signals are applied to the cathode of D82 (switching diode) only. If a pulse-type noise is included in the demodulated AF signals, the cathode voltage of D82 becomes higher than that of anode, and D82 turns OFF to cut-off the AF line. Thus, if the RX signals contains pulse-type noise, the demodulated AF signals are not applied to the AM/FM SW (IC2).

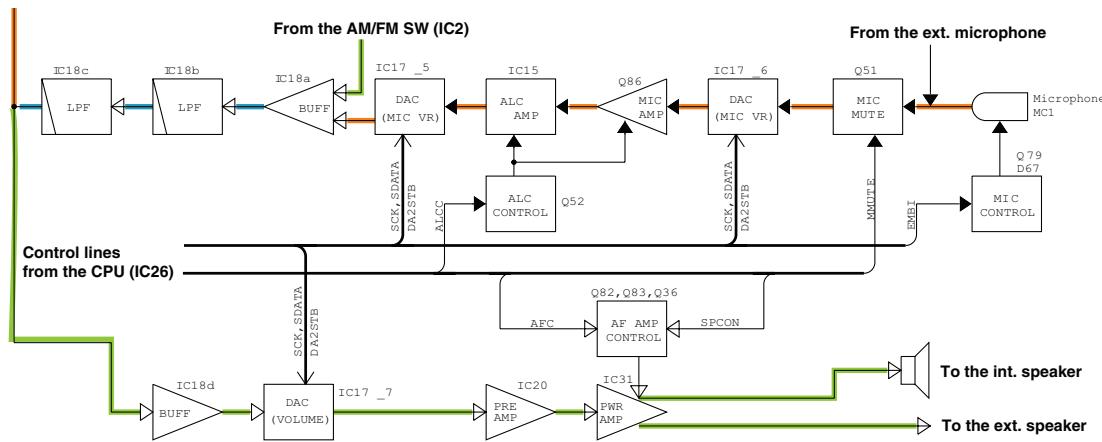

## 4-2 TRANSMITTER CIRCUITS

### TX AF CIRCUITS

The TX AF circuit consists of microphone amplifier (MIC AMP), ALC and AF filters. ALC (Automatic Level Control) is an amplifier which reduces its gain automatically according to the MIC signals level. The ALC provides stable modulation signals by limiting the amplitude of MIC signals to prevent the over deviation.

The audio signals from the connected headset's microphone (MIC signals) are passed through the MIC mute SW (Q51) and the DAC (IC17\_6) which adjusts the MIC signal level. The level-adjusted MIC signals are amplified by the MIC AMP (Q86), then applied to the ALC AMP (IC15).

### • AF CIRCUITS (for RX and TX)

### AM MODULATION CIRCUITS

The AM modulation circuits modulate the carrier with the MIC signals (=modulation signals).

The level-adjusted modulation signals from the MAIN UNIT are applied to the APC AMP. The output voltage of APC AMP controls the gain of drive (Q3) and power (Q2) AMPS swings corresponding to the amplitude of modulation signals, thus the AM modulation is obtained.

### TX AMPLIFIERS

The TX amplifiers consist pre-driver, driver and power amplifiers, and amplify the VCO output to the transmit output level.

The TX VCO (Q59, D45, 46) output is applied to the pre-driver via buffers (Q60 and Q28), LO switch (D6) and ATT, and amplified by the pre-driver (Q4) to the driver (Q3) input level. The amplified TX signal is amplified by driver (Q3) to the power AMP (Q2) input level, then power-amplified by the power AMP (Q2) to the TX output level.

The power-amplified TX signal is passed through the LPF, ANT SW and LPF and entered to the ANT UNIT, then applied to the antenna via the LPF.

The ALC (Automatic Level Control) AMP is an amplifier which controls its gain automatically according to the MIC signals level. The ALC provides stable modulation signals by limiting the amplitude of MIC signals to prevent the over deviation.

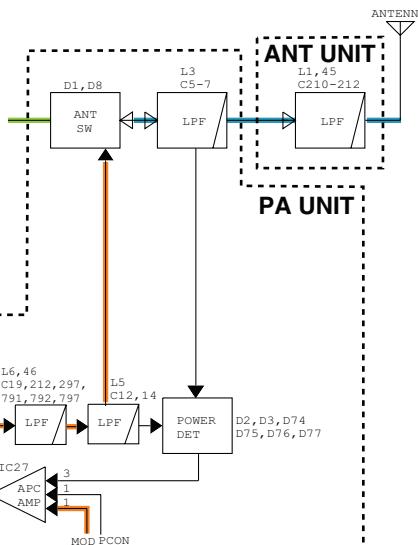

The output signals of ALC are applied to another DAC (IC17\_5) for level (deviation) adjustment. The level-adjusted MIC signals are passed through the buffer (IC18a) and 5-pole LPF (IC18b/c) to filter audio band signals only. The filtered MIC signals are entered to the PA UNIT, and applied to the APC AMP (PA: IC27) as the modulation signals.

### APC CIRCUIT (PA UNIT)

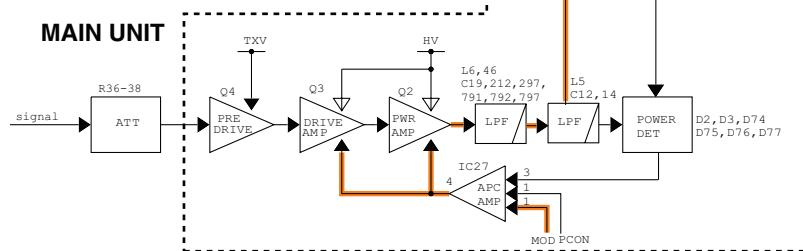

The APC (Automatic Power Control) circuit stabilizes transmit output power to prevent transmit output power level change, which is caused by load mismatching or heat effect, etc.

The power detector rectifies a portion of the TX signal and converts it into DC voltage which is in proportion to the transmit output power level. The detected voltage is applied to the input terminal (pin 3) of APC AMP (IC27; as a comparator). The TX power setting voltage "POW" is applied to another input terminal (pin 1) as the reference voltage.

The comparator compares the detected voltage and reference voltage, and the difference of voltage is output from output terminal. The output voltage controls the bias of the driver and power amplifiers to reduce/increase the gain of these amplifiers for stable TX output power.

### • AM MODULATION, TX AMPLIFIERS AND APC CIRCUITS

## 4-3 FREQUENCY SYNTHESIZER CIRCUITS

### VCO

A VCO is an oscillator whose oscillating frequency is determined by the applied voltage. This transceiver has two VCOs; RX VCO and TX VCO. The RX VCO generates the 1st LO signals for the 1st IF signal produce, and TX VCO generates TX signal.

#### • RX VCO (Q58, D38, 48)

The RX VCO oscillates 1st LO signals for normal RX (174.350 to 183.325 MHz) and for WX channels (208.000–209.625 MHz). The generated 1st LO signals are applied to the 1st mixer (Q12) via the buffer AMPs (Q60 and Q28), LO SW (D17) and the ATT.

#### • TX VCO (Q59, D45, 46)

The TX VCO oscillates 118.000–136.975 MHz transmit signals. The generated TX signal is applied to the pre-driver via buffers (Q60 and Q28), LO SW (D6) and ATT.

A portion of each VCO output is applied to the PLL IC via the buffer (Q29).

### PLL (Phase Locked Loop) CIRCUIT

The PLL circuit provides stable oscillation for both of the TX and 1st LO frequencies (for RX). By comparing feedback VCO output and reference frequency signals, the PLL corrects the difference of these frequencies.

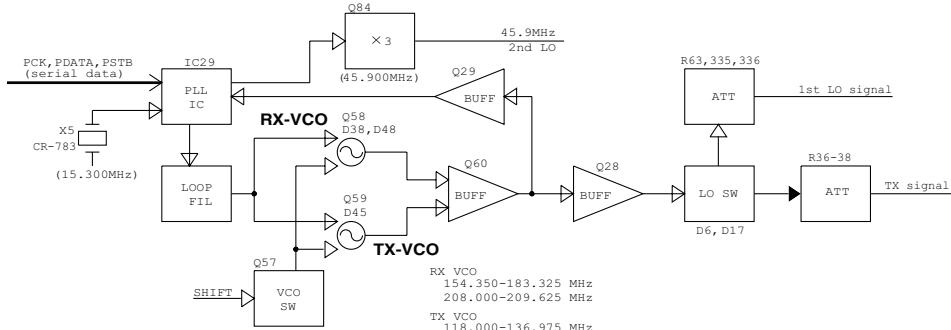

A portion of RX/TX VCO output is applied to the PLL IC via buffer (Q29). The applied VCO output is divided according to the serial data including divide ratio from the CPU, at the prescaler and programmable divider. In the same way, the reference frequency signal from the TCXO is applied to the PLL IC and divided so that these two applied signals are the same frequency.

The divided and frequency-matched signals (VCO output and the reference frequency signals) are applied to the phase comparator and phase-compared. The resulted phase difference is detected as a phase-type signal, and level-adjusted at the charge pump then output. The output pulse type signal is passed through the loop filter to be converted into the DC voltage (=Lock Voltage).

Applying the lock voltage to the variable capacitor which composes a part of the resonator of RX/TX VCO, the capacitance of variable capacitor changes corresponding to the applied lock voltage. This causes the change of resonance frequency that determines the VCO oscillating frequency to keep the VCO frequency constant.

When the oscillation frequency drifts, its phase changes from that of the reference frequency, causing a lock voltage change to compensate for the drift in the VCO oscillating frequency.

## • FREQUENCY SYNTHESIZER CIRCUITS

## 4-4 PORT ALLOCATIONS

### • CPU (IC26)

LINE NAME	DESCRIPTION	IN/OUT	STATUS	CONDITION
PTT	Ext. [PTT] input.	IN	High	While transmitting. (=[PTT] is pushed.)
UNLK	PLL unlock signal from the PLL IC (IC29).	IN	Low	While PLL is unlocked.
SCK	Clock signal to the DAC (IC17).	OUT	—	—
SDATA	Serial data to the DAC (IC17).	OUT	—	—
RSSI	RSSI voltage from the IF IC (IC1).	IN	—	—
RFDETV	TX power monitor. (The DC voltage which is in proportional to the TX power.)	IN	—	—
THERMC	Internal temperature moniter. (The DC voltage which is divided by thermistor (R701) and R702.)	IN	—	—
VOL_IN	[VOL] dial position detect. (The DC voltage which is divided by R824.)	IN	—	—
VIN	Remaining battery capacity monitor. (The voltage of "HV" line divided by R194 and R19.)	IN	—	—
DETO	1050 Hz tone (for weather alert) detect.	IN	—	—
DA2STB	Strobe signal to the DAC (IC17).	OUT	Low	—
EDATA	Serial data to the EEPROM (IC25).	I/O	High	—
ECK	Clock signal to the EEPROM (IC25).	OUT	High	—
POW	TX power setting voltage to the APC AMP (PA: IC27).	OUT	—	—
PCON	Control signal to the +3.6V regulator (Q89).	OUT	High	+3.6V regulator is activated. (=+3.6V and +5V lines are ON.)
HOUT	Battery type detect. (The voltage of +5V line which divided by R838 and R839.)	IN	High	Li-ion battery pack is attached.
HSW	Battery type detect circuit control.	OUT	High	Detect circuit is activated.
KR0-KR4	Key matrix.	IN	Low	While the key is pushed.
PSTB	Strobe signal to the PLL IC (IC29).	OUT	High	—
PDATA	Serial data to the PLL IC (IC29).	OUT	High	—
PCK	Clock signal to the PLL IC (IC29).	OUT	High	—
TXC	TXV regulator (Q7, 8) control signal.	OUT	High	TXV regulator is activated.
LIGHTC	Backlight (DS2, 3) driver (Q75, 76) control signal.	OUT	High	Backlight is ON.
LIGHT	[LIGHT] key input.	IN	Low	While the key is pushed.
JACKDET	Ext. speaker connection detect.	IN	High	Ext.speaker is connected.
EXTREGC	EXT-MIC regulator (Q25, 26) control signal.	OUT	High	While an ext. microphone is connected. (While the VOX circuit is activated; "Low.")
KS0-KS3	Strobe signals for key matrix.	OUT	Low	All the time "Low."
INI	Initial matrix return signal.	IN	Low	Any key is pushed.
EMBI	Int. microphone control signal to the MIC controller (Q79).	OUT	High	Int. microphone is enable. (While in VOX mode;"Low.")
INTPTT	[PTT] key input.	IN	Low	While the key is pushed. (=While transmitting)
BEEP	Beep sounds (AF square waves).	OUT	—	—
AGCOFF	AGC SW (Q85) control signal.	OUT	High	AGC function is disable.
NOISE	Noise level for noise squelch. (pulse-type signal)	IN	High	(Upper edge of the pulse)
SPCON	Speaker select signal to the AF power AMP (IC31). (Switching to internal or External speaker)	OUT	Low	Ext. speaker is selected.
VOX	VOX control signal from the IC21. (A portion of MIC signals which is amplified by IC21.)	IN	A/D	TX=Voltage is high RX=Voltage is low
AFC	AF power AMP controller (Q36, 82) control signal.	OUT	High	AF power AMP is activated. (=Squelch is open.)
ALCC	ALC AMP controller (Q52) control signal.	OUT	High	ALC AMP is activated. (=The ALC function is activated.)
R5C	R5S line regulator (Q20, 90) control signal.	OUT	Low	While receiving
ANLC	ANL SW (Q21) control signal.	OUT	High	ANL circuit is activated. (=The ANL function is activated.)
WXC	AF/FM SW (IC2) control signal.	OUT	High	While receiving an WX channel.
SHIFT	VCO SW (Q57) control signal.	OUT	High	While transmitting. (=TX VCO is activated.)
DETMUTE	AF/FM SW (IC2) control signal.	OUT	High	While RX AF is mute.
