

 ICOM

SERVICE MANUAL

VHF TRANSCEIVER

IC-H8

INTRODUCTION

This service manual describes the latest service information for the **IC-H8 VHF TRANSCEIVER** at the time of going to press.

VERSION NUMBER	VERSION	FREQUENCY COVERAGE
# 01	U.S.A.	150~162 MHz
# 02	U.S.A.	162~174 MHz
# 03	General	150~162 MHz
# 04	General	162~174 MHz

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following 4 points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1120001590	IC	M5236ML-73A	IC-H8 LOGIC UNIT	5 pieces
8810000740	Screw	OH A M2X15ZK	IC-H8 Rear panel	10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTE

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from a power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 30 dB~40 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

EX-704 PROGRAMMING MANUAL (A-5069S-1EX).

SECTION 1 SPECIFICATIONS

■ GENERAL

• Frequency range	: 150~174 MHz
• Type of emission	: 16K0F3E
• Number of channels	: Up to 6 channels
• Frequency stability	: $\pm 0.0005\%$
• Antenna impedance	: $50\ \Omega$ unbalanced
• Power supply requirement	: Icom battery packs CM-79 or CM-80 (Negative ground)
• Usable temperature range	: $-30^{\circ}\text{C} \sim +60^{\circ}\text{C}$ ($-22^{\circ}\text{F} \sim +140^{\circ}\text{F}$)
• Dimensions (with CM-80)	: 58 mm(W) X 149 mm(H) X 29 mm(D) 2.3" (W) X 5.9" (H) X 1.1" (D)
• Weight (with CM-80)	: 440 g (15.5 oz)

■ TRANSMITTER

• RF output power	: 1.5 W
• Modulation system	: Variable reactance frequency modulation
• Current drain (approx.)	: 0.9 A
• Maximum frequency separation	: 12 MHz
• Microphone impedance	: $1.2\ K\Omega$
• Maximum deviation	: $\pm 5\ \text{kHz}$
• Spurious emissions	: $-60\ \text{dB}$
• Noise and hum rejection	: 40 dB
• Audio response	: +1 dB~-3 dB of +6dB/octave from 300 Hz~3000 Hz
• Limiting of modulator	: 70 %~100 %

■ RECEIVER

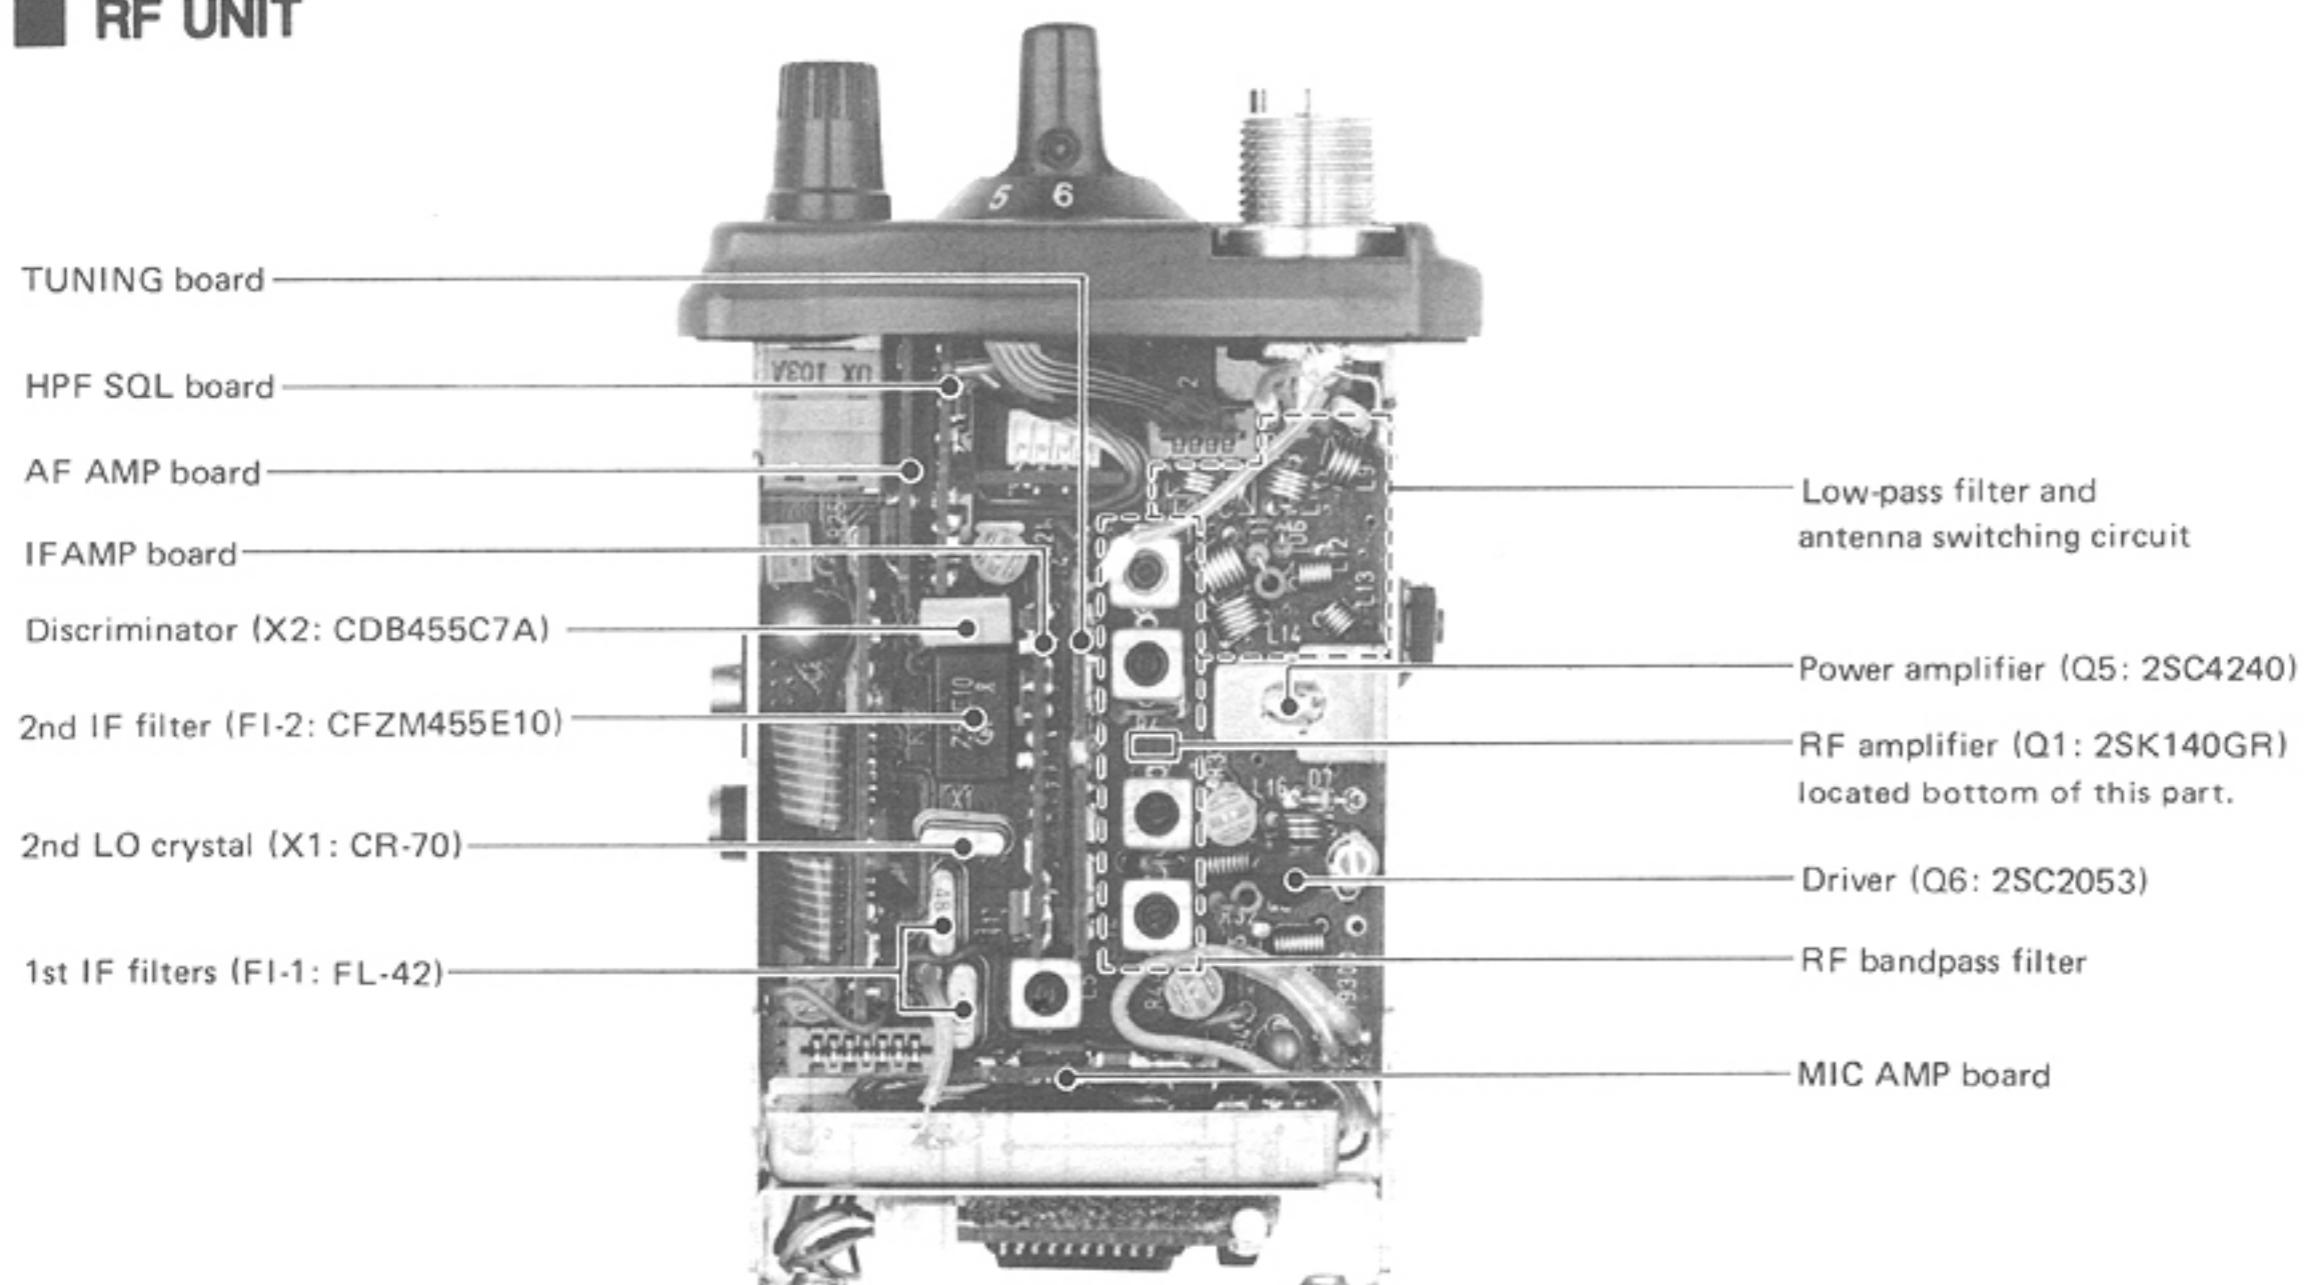

• Receive system	: Double-conversion superheterodyne
• Sensitivity	: $0.28\ \mu\text{V}$ for 12 dB SINAD
• Squelch threshold sensitivity	: $0.28\ \mu\text{V}$
• Intermediate frequencies	: 1st 21.8 MHz 2nd 455 kHz
• Maximum frequency separation	: 12 MHz
• Current drain (approx.)	: Audio max. 250 mA Standby 70 mA
• Audio output power	: 300 mW
• Audio output impedance	: $8\ \Omega$
• Adjacent selectivity	: 65 dB
• Spurious frequency rejection	: 60 dB
• Image rejection	: 60 dB
• Intermodulation	: 60 dB
• Noise and hum	: 40 dB
• Audio response	: +1 dB~-3 dB of $-6\ \text{dB/octave}$ from 300 Hz~3000 Hz

All specifications are per EIA RS316B (transmitter) and RS204C (receiver) procedures.

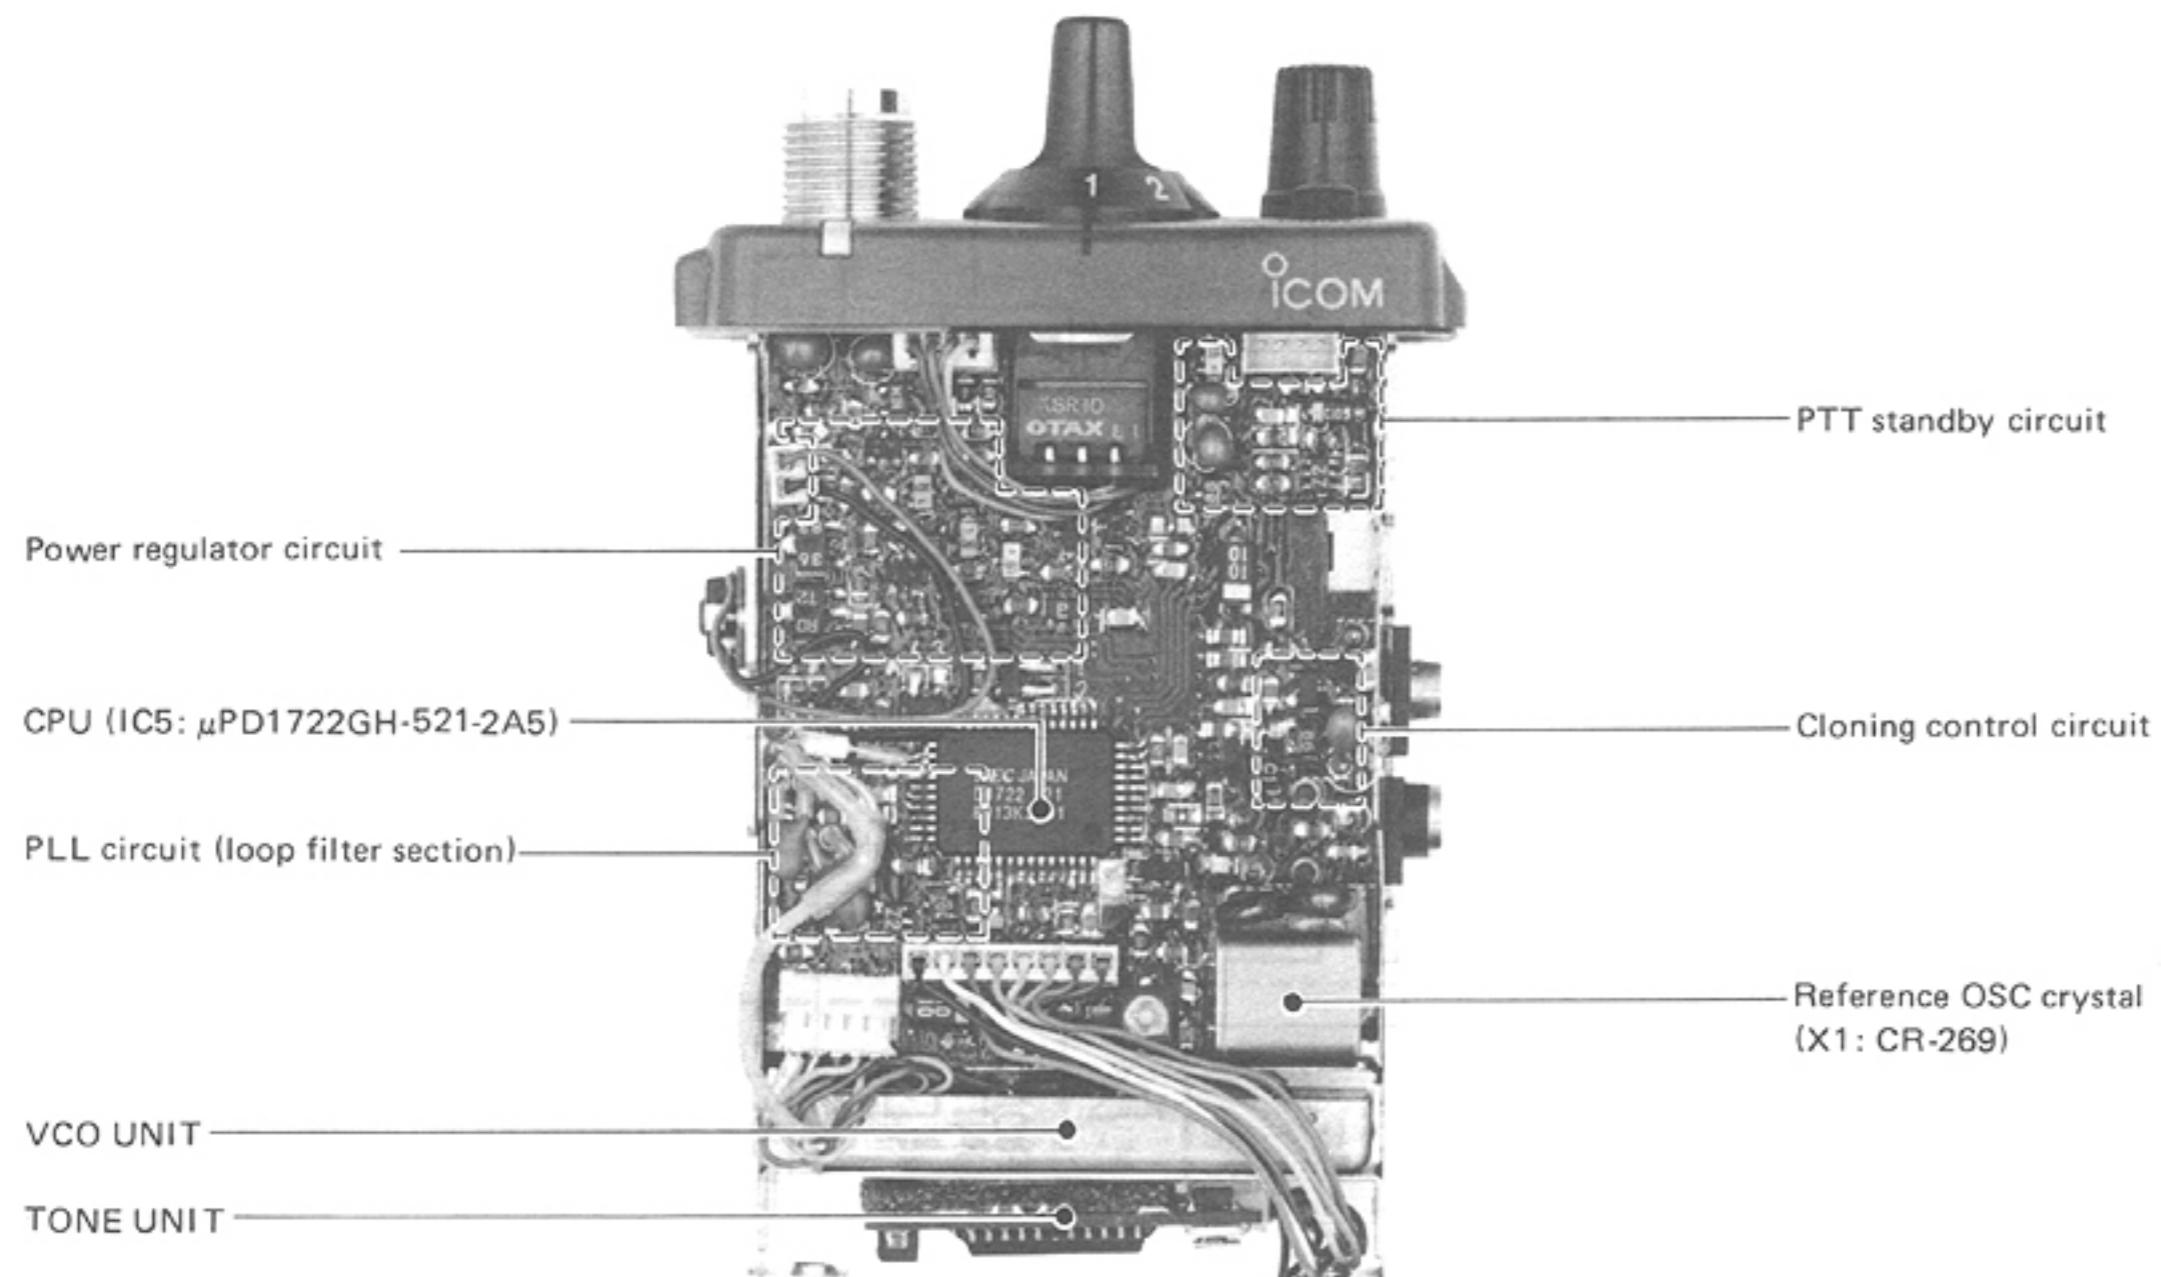

All stated specifications are subject to change without notice or obligation.

SECTION 2 INSIDE VIEWS

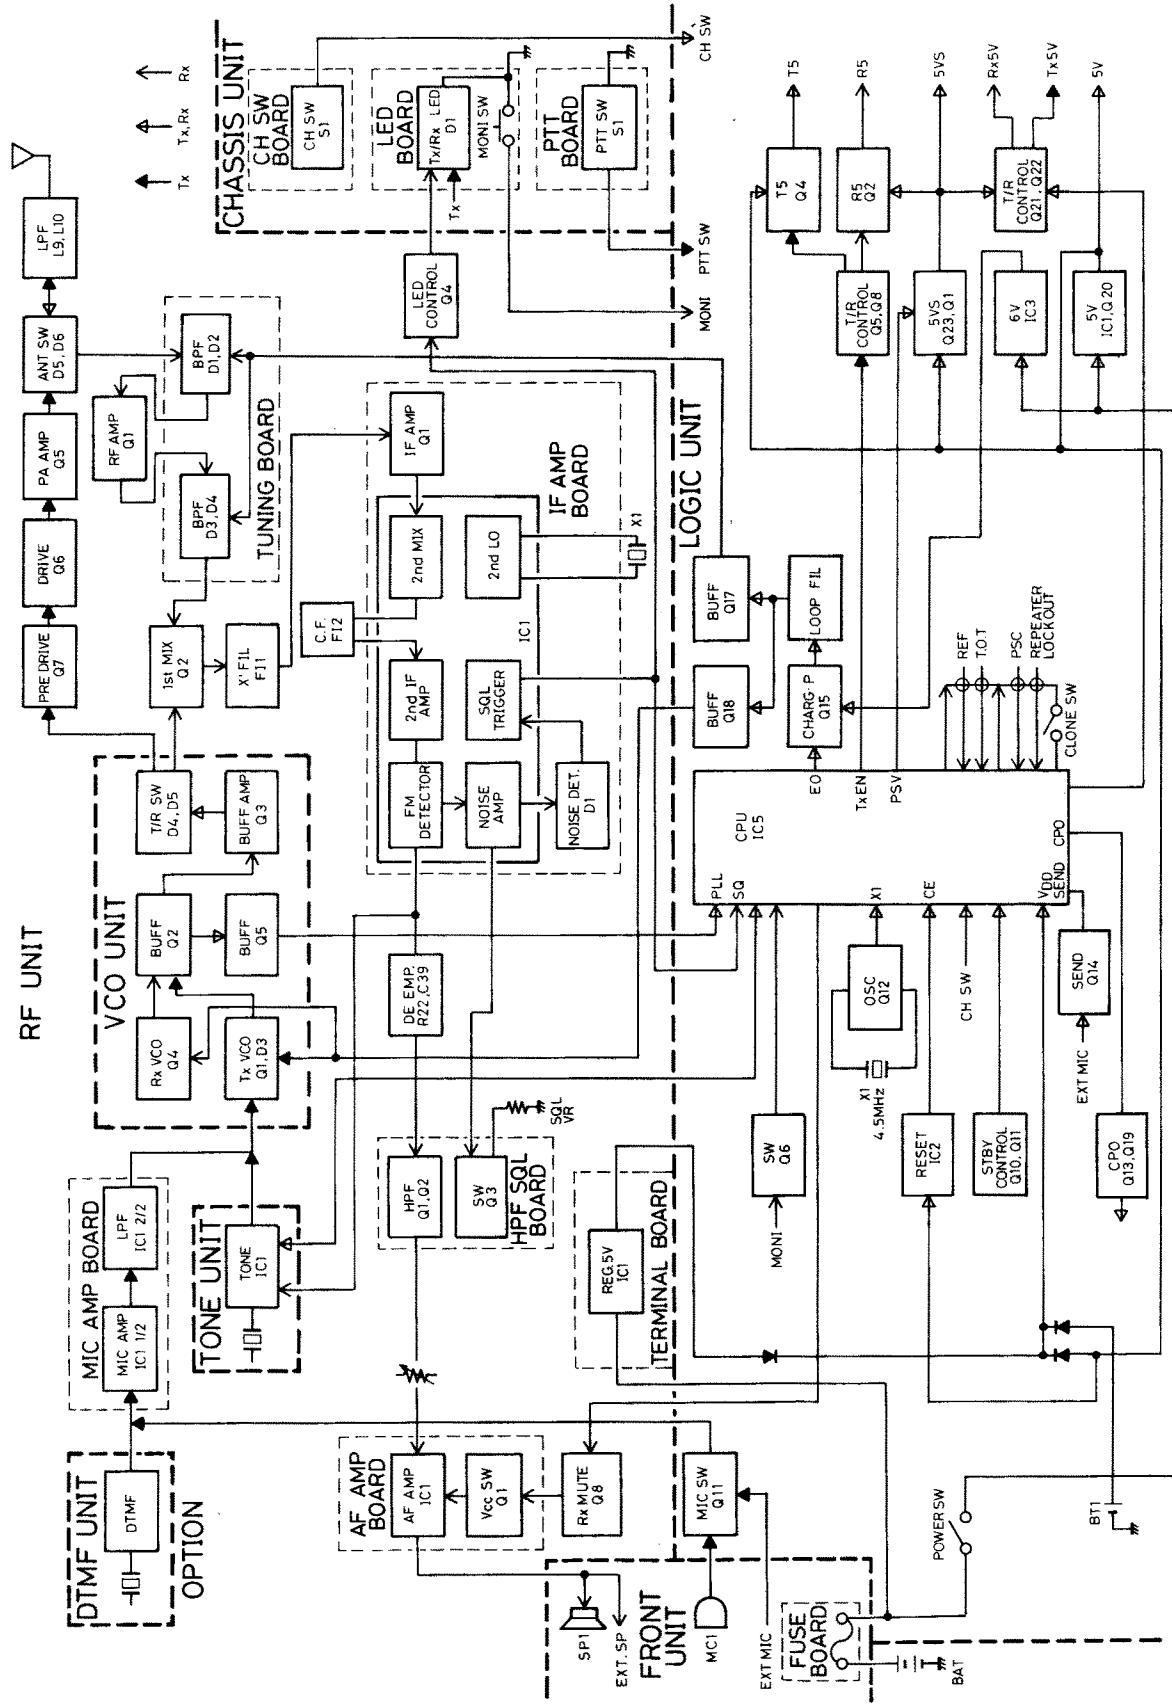

■ RF UNIT

■ LOGIC UNIT

SECTION 3 BLOCK DIAGRAM

SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 ANTENNA SWITCHING CIRCUIT (MAIN UNIT AND APC BOARD)

An antenna switching circuit functions as a low-pass filter while receiving and as a resonator circuit while transmitting.

Received signals enter the antenna connector and pass through a two-stage Chebyschev low-pass filter (L9, L10, C53~C57). The signals are applied to the antenna switching circuit (D5, D6, D7, L8, C50~C52), and then to the RF circuit. This antenna switching circuit employs a $\lambda/4$ -type diode switching system.

4-1-2 RF CIRCUIT (RF UNIT)

The RF circuit amplifies signals within the range of frequency coverage, and filters out out-of-band signals.

Signals from the antenna switching circuit are passed through a two-stage bandpass filter (L1, L2, D1, D2), amplified at Q1 and then applied to another bandpass filter (L3, L4, D3, D4), to suppress out-of-band signals.

D1~D4 are varactor diodes that track the bandpass filters and are controlled by the lock voltage of the PLL circuit. These diodes turn the center frequency of the bandpass filters.

4-1-3 1ST MIXER CIRCUIT (RF UNIT)

A 1st mixer circuit converts the received signal to a fixed frequency of 1st IF signals using a PLL output frequency. By changing a PLL frequency, only the desired frequency can be passed through a crystal filter located at the next stage of the 1st mixer.

Signals from the RF circuit are mixed with the 1st LO signal from the VCO circuit (PLL output) to produce a 21.8 MHz 1st IF signal.

4-1-4 1ST IF CIRCUIT (RF UNIT)

The 1st IF circuit amplifies a signal which is converted in a 1st mixer circuit.

After passing through the matching transformers (L5), the 1st IF signal is applied to the crystal filter (F11) to suppress out-of-band signals. The filtered signal is amplified at Q1 in the IF AMP board, and is then applied to the 2nd IF circuit.

4-1-5 2ND IF AND DEMODULATOR CIRCUITS (IF AMP BOARD)

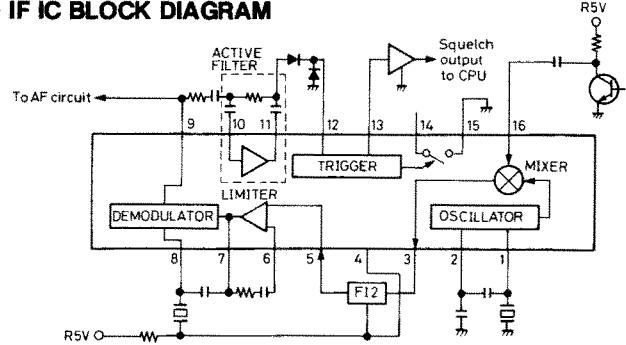

The 2nd mixer circuit converts a 1st IF signal to a 2nd IF signal. A double superheterodyne system (2 times conversion of a receive signal) improves the image rejection ratio and obtains stable receiver gain.

The amplified 1st IF signal enters to IC1 pin 16. IC1 contains a mixer, local oscillator, quadrature detector, op-amp, and a trigger circuit.

The entered signal is to be converted to a 2nd IF signal at the mixer section to obtain the 455 kHz 2nd IF frequency. The 2nd IF signal exits IC1 from pin 3 and passes through the ceramic filter (F12) where unwanted heterodyned signals are removed.

The signal re-enters IC1 pin 5 and is then amplified at the op-amp section that functions as a limiter amplifier. The amplified signal is detected at the quadrature detector section (pins 7, 8 and an external ceramic resonator X2) and is output from pin 9 as AF signals.

• IF IC BLOCK DIAGRAM

4-1-6 AF CIRCUIT (HPF SQL BOARD AND AF AMP BOARD)

An AF circuit de-emphasizes a demodulated signal with -6dB/oct and power amplifies the signal to drive a speaker. The AF circuit includes a mute circuit to mute the signal with a noise squelch and a tone squelch.

The demodulated signal output from IC1 pin 9 in the IF AMP board is de-emphasized at R22 and C39 and is applied to active filters (high-pass filter), Q1 and Q2 in the HPF SQL board. The signal passes through the volume control (R25) and is applied to the AF AMP board to obtain 300 mW of speaker driving power.

Q8 in the RF unit and Q1 in the AF AMP board function as an AF mute switch when the noise squelch or tone squelch is closed.

4-1-7 SQUELCH CIRCUIT (HPF SQL BOARD AND IF AMP BOARD)

A squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signal, the squelch circuit switches the AF power amplifier.

IC1 pin 9 in the IF AMP board outputs demodulated signals to the AF circuit. A portion of the demodulated signals re-enters IC1 pin 10 via R10, C12 and C13. IC1 pins 10 and 11 function as an active filter with CR connection (C5, C6 and R5).

Noise components above 20 kHz are amplified at the active filter and are then applied to a noise detector, D1. The detected signal (DC voltage) becomes a trigger in the trigger circuit section in IC1. The triggered signal is inverted at Q2. Q2 outputs "LOW" when the squelch opens.

4-1-8 TONE SQUELCH CIRCUIT (TONE UNIT)

A tone squelch circuit is decoded whether the CTCSS tone is superimposed on the AF signal or not. Also the circuit encodes the tone while transmitting for the subaudible tone encoder.

A portion of AF signal output from the IF AMP board is applied to the TONE unit via the "Rx AF" line and enters tone encoder/decoder IC1. IC1 detects the signal superimposing a tone.

When the same tone as the programmed one is received, IC1 pin 23 outputs "HIG" to inform the decoding signal to the CPU (IC5 in the LOGIC unit). The CPU controls the AF mute switch using the "MUTE" signal.

4-2 TRANSMITTER CIRCUITS

4-2-1 MICROPHONE AMPLIFIER (MIC AMP BOARD)

The microphone amplifier circuit amplifies audio signals with 6 dB/oct pre-emphasis from the microphone to a level needed at the modulation circuit.

AF signals from the microphone enter the MIC AMP board via the LOGIC and RF units. IC1 on the MIC AMP board is a dual operational amplifier that functions as a low signal amplifier and limiter amplifier. IC1 also pre-emphasizes the signals using a C5 and R3 connection. Output signals from IC1 pin 1 pass through the splatter filter (R6, R9, R10 and C8~10) to filter out the audio components above 3 kHz. The signals amplified at IC1 pins 5~7 exit the MIC AMP board.

The output signals are level-adjusted at R45 on the MAIN unit and are then applied to the VCO unit to make a frequency modulation.

4-2-2 MODULATION CIRCUIT (VCO UNIT)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signal.

The entered signals at the VCO unit change the reactance of a diode, D3 to modulate the oscillated signal at VCO, Q1. The oscillated signal buffer-amplified at Q2 and Q3 exits from the VCO unit via the LO switching diode (D5).

4-2-3 DRIVE AND POWER AMPLIFIER CIRCUITS (RF UNIT)

The drive and power amplifier circuits amplify the VCO oscillating signal to an output power level.

The output signal from the VCO unit is applied to the transmitter amplifier circuits in the RF unit. The transmitter amplifier circuits consist of a predriver Q7, driver Q6 and power amplifier Q5. The signal is amplified at this state up to 4 W maximum and is then applied to the antenna connector via the low-pass filters.

4-2-4 ANTENNA SWITCHING CIRCUIT (RF UNIT)

The antenna switching circuit applies the received signal to the receiver circuits and the transmitter signal to the antenna connector.

The circuit employs a $\lambda/4$ -type diode switching system consisting of 2 diodes and a low-pass filter. T5V switches the low-pass filter to a resonance or matching circuit using diodes.

When T5V are applied to D6 and D5, the diodes turn ON and L8 is seemingly grounded to an RF signal. The low-pass filter (L8, L7, C50 and C51) becomes a resonance circuit and has high impedance. The output signal from the power amplifier (Q5), therefore, is never applied to the receiver circuits.

4-3 PLL CIRCUITS

4-3-1 GENERAL DESCRIPTION

PLL circuits stably oscillate the transmit frequency and receive the local frequency comparing phase of the divided VCO frequency and reference frequency. The PLL output frequency is therefore controlled by the divided ratio (N-data) of the programmable divider.

4-3-2 VCO CIRCUITS (VCO UNIT)

The VCO circuits oscillate the PLL output frequency controlling varactor diodes.

The VCO unit has 2 VCO circuits, transmitter VCO (Q4) and receiver VCO (Q1). An oscillating circuit is selected with Rx 5V and Tx 5V. An oscillating frequency is controlled with varactor diodes, D1/D2 (when Q1 activates) or D6/D7 (when Q4 activates).

An oscillated signal passes through the switching diode (D4). The signal is buffer-amplified at Q2 and is then applied to the receiver or transmitter circuit via Q3 and fed back to the PLL circuit in the LOGIC unit via Q5.

4-3-3 PHASE DETECTOR CIRCUITS (LOGIC UNIT)

The phase detector circuit detects the off phase components of the VCO frequency using the stable reference frequency.

The CPU IC5 contains logic and PLL sections. The oscillated signal comes from the VCO unit, enters IC5 from pin 5 and is divided at a prescaler part and divided again at a programmed divider part. The divided signal is applied to a phase detector part to compare with the reference frequency. The detected signal exits from IC5 pins 1 and 3.

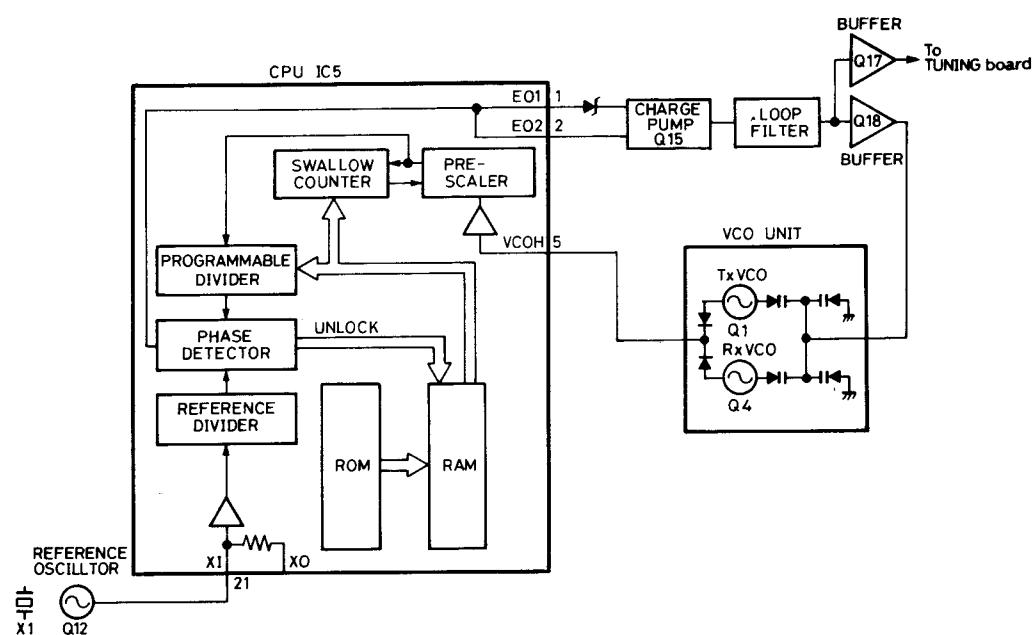

The reference frequency is obtained when the generated signal at an oscillator, Q1 with X1, is divided at a reference divider part inside IC5.

4-3-4 CHARGE PUMP AND LOOP FILTER (LOGIC UNIT)

A loop filter and a charge pump convert the phase-detected signal (pulse signal) to DC voltage to control the VCO oscillating signal. The DC voltage is also used for the receiver tune circuit.

The phase-detected signal output from the CPU is applied to the charge pump (Q15) and the lag-lead-type loop filter (R22, R23, R69, C20, C39) to convert the pulse signal to DC voltages (PLL lock voltage). This voltage determines the clarity characteristics of the PLL output signal.

The lock voltage is buffer-amplified at Q18 and is then applied to the VCO circuit. Another buffer amplifier, Q17, amplifies the lock voltage to use in the receive RF circuit.

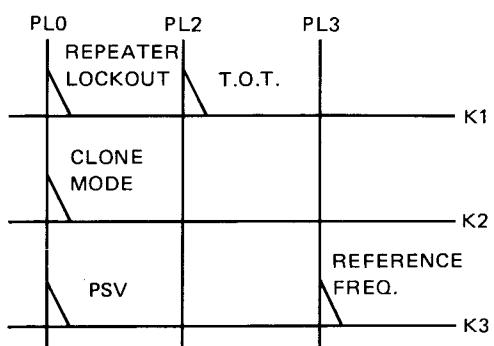

4-4 LOGIC CIRCUITS

4-4-1 CPU PORT ALLOCATIONS

The transceiver has only a few switches yet has many functions contained in a 4-bit CMOS CPU. All functions can be pre-programmed via cloning from another transceiver or a data programmer EX-704.

PIN NUMBER	PORT NAME	I/O	DESCRIPTION	PIN NUMBER	PORT NAME	I/O	DESCRIPTION
P01	E01	OUT	Output PLL phase-detected signal.	P17	PSV	OUT	Outputs the "circuit off" signal when the power saver function is activated.
P02	E02	OUT	The same signals are output at P01 and P02.	P18	MUTE	OUT	Outputs the mute signal (LOW) when: — Squelch closes. — Tone squelch closes. — Transmitting. — PLL is unlocked.
P03	VDD1	IN	Power voltage input port that requires 5 V for operation and 2.5 V for CPU standby.	P19	STB	OUT	Outputs the strobe signal for tone encoder/decoder.
P04	VCOL	IN	Not used.	P20	XO	OUT	Oscillator output port connected at inside parallel with the XI port.
P05	VCOH	IN	PLL prescaler input port that accepts 10~200 MHz (0.3 Vp-p).	P21	XI	IN	Oscillator input port used for PLL reference frequency and the CPU clock.
P06	CE	IN	Chip enable port for the CPU. When the port is "HIGH" the CPU is in normal operation; when "LOW" the CPU is in standby.	P22	GND	---	Ground
P07	VDD2	IN	Power voltage input port. Same as P03.	P23	TxEN	OUT	Outputs "HIGH" when transmitting.
P08	SQ	IN	Squelch input port. When the port is "LOW" the CPU detects that the squelch is open.	P24, P25 P27	PL2, PL3 PL0	OUT	Output a signal to the key matrix when power is ON.
P09 ~11	PC1 ~PC3	IN	Input ports for the channel selector.	P26	BEEP	OUT	Outputs beep signals.
P12	PTT	IN	PTT input port. When the port is "LOW" the CPU detects that the transceiver is transmitting.	P28 ~P31	TEST	OUT	Not used.
P13	DATA	OUT	Outputs serial data for the tone encoder/decoder.	P32 ~P42	NC	---	Not connected.
P14	SEND	IN	The same as the PTT input port. The port becomes "LOW" faster than the PTT input port. This port is also used as the cloning data input port.	P43 ~P45	K1 ~K3	IN	Input ports for the key matrix.
P15	CPO	OUT	Outputs the cloning data when the transceiver is in the clone output mode.	P46	DET	IN	Input port for the tone decoder. Receives "HIGH" when a tone is acknowledged.
P16	CK	OUT	Outputs the clock signal for the tone encoder/decoder.	P48	INT	IN	Interrupt port for CPU operation.

4-4-2 INITIAL MATRIX (LOGIC UNIT)

• REPEATER LOCKOUT

When the matrix is open the repeater lockout function is activated. This function inhibits transmitting on the receive tone programmed channel under the following conditions:

- When the channel is busy with a signal not including a correct tone. At this time, 5 beeps are emitted from the speaker.
- Transmitting is accepted when the channel is not busy, or when the channel is busy with a signal including a correct tone.

• CLONE MODE

While pushing the CLONING switch, power comes on, the transceiver enters the clone mode, then CPU pin 14 (SEND port) functions as the clone data input port.

When the CLONING switch is pushed again, the transceiver becomes a master transceiver of clone transmit. The CPU pin 15 (CPO port) outputs clone data.

• PSV (POWER SAVER) FUNCTION

When the matrix is open, the power saver function activates 30 sec. after the squelch closes or a switch is released. When the function is activated the circuit in the transceiver operates with the following time ratio:

Circuit off : 1000 msec.

Standby : 250 msec.

• T.O.T. (TIME-OUT TIMER) FUNCTION

When the matrix is open, the time-out timer function is activated. The function inhibits continuous transmitting of more than 60 sec.

• REFERENCE FREQUENCY

When the matrix is open, 6.25 kHz is used for the reference frequency.

When the matrix is shortened, 5.0 kHz is used for the reference frequency.

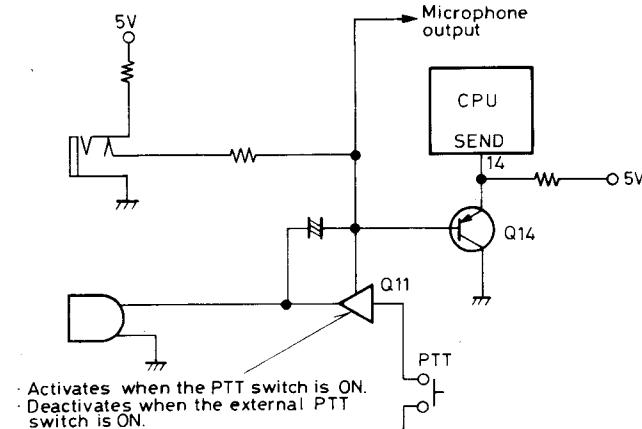

4-5 OTHER CIRCUITS

4-5-1 PTT CONTROL CIRCUIT (LOGIC UNIT)

When the PTT switch is pushed, Q11 is activated, hence voltage is applied to the microphone element. At this time, Q14 also is activated and a "LOW" SEND signal is applied to the CPU. CPU pin 23 outputs "HIGH" when the SEND signal is received and the PLL is not unlocked.

When the connected external microphone is used, a PTT line signal activates Q14 via R40. At this time, Q11 is deactivated, hence the internal microphone is not used.

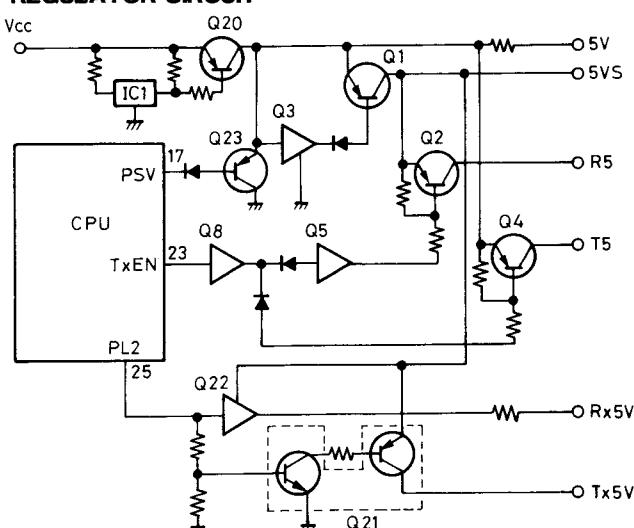

• PTT CONTROL CIRCUIT

4-5-2 VOLTAGE LINES (RF UNIT)

LINE	DESCRIPTION
Vcc	Battery pack voltage that passes through the fuse (F1), and the power switch (R25). Vcc is applied to the transmitter amplifier circuit and audio power amplifier circuit.
5VS	5 V controlled by the power saver function. Q1 produces the voltage from the 5 V line.
5V	Common 5 V produced at Q20 and IC1.
Rx 5V	5 V for receiver VCO. Q22 produces the voltage from 5VS line with the output of the CPU pin 25 (PL2 port).
Tx 5V	5 V for transmitter VCO. Q21 produces the voltage from 5VS line with the output of the CPU pin 25 (PL2 port).
R5	5 V for the receiver circuit. Q2 produces the voltage from 5VS line with the CPU pin 23 (TxEN port).
T5	5 V for the mic amplifier circuit and bias voltage for the transmitter amplifier circuit. Q4 produces the voltage from the 5 V line regardless of the power saver function.
6.0 V	Used for the charge pump and buffer amplifier in the PLL circuit. IC3 produces the voltage from the Vcc line.
CPU 5	Used for the CPU in the LOGIC unit. IC1 in the RF unit produces the voltage from the battery pack voltage. When the battery pack is removed, an internal lithium battery is used as a backup.

[LOGIC UNIT]

REF. NO.	ORDER NO.	DESCRIPTION	
C33	4550000350	Tantalum	DN 1V 010M
C34	4030000710	Ceramic	GRM40 SL 560J 50PT
C35	4030000960	Ceramic	GRM40 CH 390J 50PT
C36	4030001100	Ceramic	GRM40 B 102K 50PT
C37	4030000740	Ceramic	GRM40 SL 101J 50PT
C38	4030000740	Ceramic	GRM40 SL 101J 50PT
C39	4550000400	Tantalum	DN 1C 2R2M
C40	4550000210	Tantalum	DN 1A 6R8M
C41	4030001100	Ceramic	GRM40 B 102K 50PT
C42	4030000740	Ceramic	GRM40 SL 101J 50PT
C43	4030001100	Ceramic	GRM40 B 102K 50PT
C44	4030000740	Ceramic	GRM40 SL 101J 50PT
C45	4030000740	Ceramic	GRM40 SL 101J 50PT
C46	4030000740	Ceramic	GRM40 SL 101J 50PT
C47	4030000740	Ceramic	GRM40 SL 101J 50PT
C48	4030000740	Ceramic	GRM40 SL 101J 50PT
C49	4030000740	Ceramic	GRM40 SL 101J 50PT
C50	4550000460	Tantalum	TESVA 1C 105M1-8L
C51	4030000740	Ceramic	GRM40 SL 101J 50PT
C52	4030000740	Ceramic	GRM40 SL 101J 50PT
C53	4030000570	Ceramic	GRM40 SL 030C 50PT
C54	45500003030	Tantalum	TEMSVA 0J 475M1-8L
C55	4550003110	Tantalum	TEMSVC 1A 226M1-12L
C56	4550000010	Tantalum	DN 1C 4R4M
C57	4030003580	Ceramic	GRM40 CH 270J 50PT
C58	4030001100	Ceramic	GRM40 B 102K 50PT
C59	4030001100	Ceramic	CRM40 B 102K 50PT
C60	4030001100	Ceramic	GRM40 B 102K 50PT
C61	4030001100	Ceramic	GRM40 B 102K 50PT
C62	4030001100	Ceramic	GRM40 B 102K 50PT
C63	4030001150	Ceramic	GRM40 B 102K 50PT
C64	4030001150	Ceramic	GRM40 F 104Z 25PT
C65	4030001150	Ceramic	GRM40 F 104Z 25PT
C66	4030001100	Ceramic	GRM40 B 102K 50PT
S1	2260000580	Switch	SKHLAD035A
BT1	3020000060	Lithium Battery	CR1220-1VF
W9	7030000010	Jumper	MCR10EZHJ JPW (000)
W10	7030000010	Jumper	MCR10EZHJ JPW (000)
W13	7120000380	Jumper	JPW 01 R-01
J1	6450000130	Connector	HSJ1102-01-540
J2	6450000110	Connector	HSJ0836-01-010
J3	6510009370	Connector	B4B-ZR
J4	6510009370	Connector	B4B-ZR
J5	6510008270	Connector	PI28B-05M
EP1	0910020956	P.C. Board	B 1931F FX-677
EP5	0910019722	P.C. Board	B 1903B

[TONE UNIT]

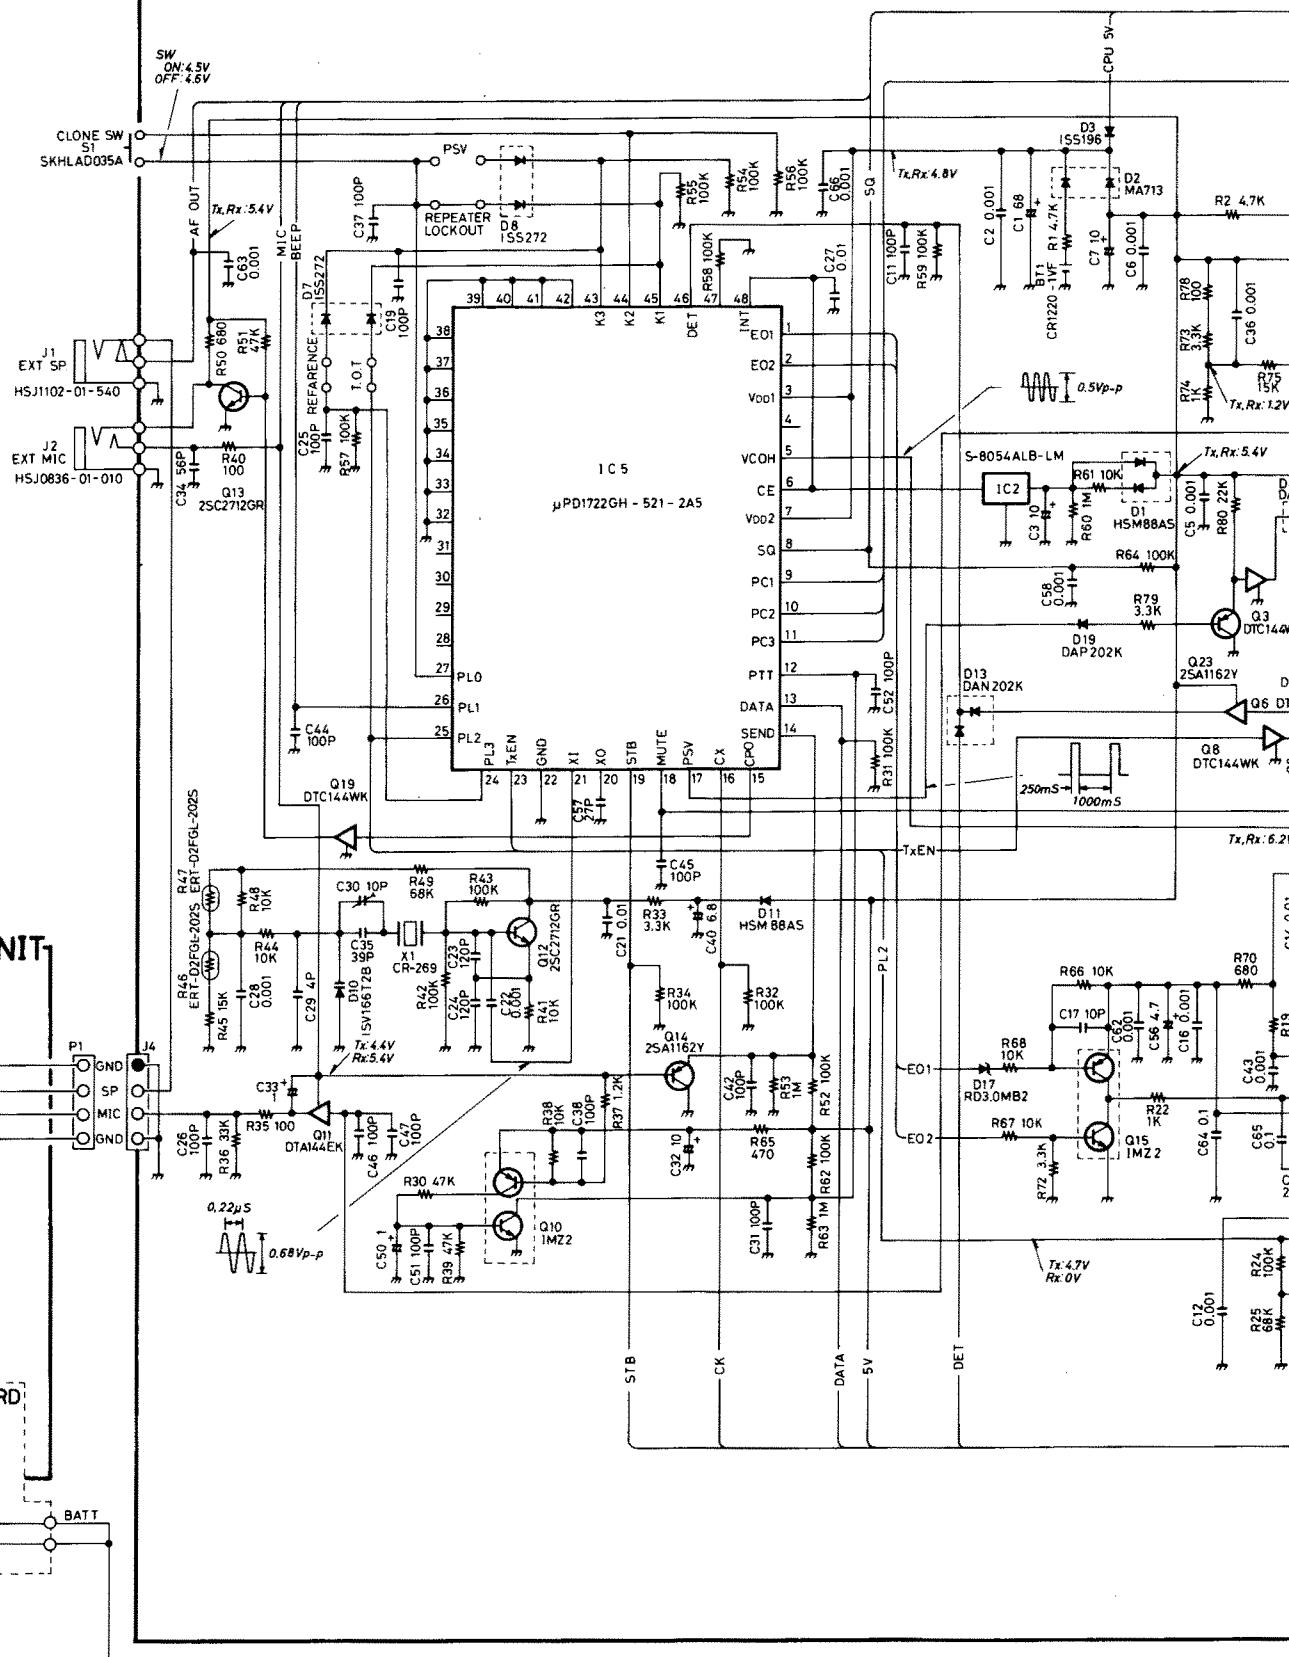

REF. NO.	ORDER NO.	DESCRIPTION	
D1	1750000130	Diode	DA204U T107
D2	1750000050	Diode	1SS193 (TE85R)
X1	6050005090	Crystal	CR-245
R1	7030002280	Resistor	MCR03EZHJ 10KΩ (103)
R2	7030002300	Resistor	MCR03EZHJ 15KΩ (153)
R3	7030002440	Resistor	MCR03EZHJ 150KΩ (154)
R4	7030002200	Resistor	MCR03EZHJ 2.2KΩ (222)
R5	7030002280	Resistor	MCR03EZHJ 10KΩ (103)
R6	7030002280	Resistor	MCR03EZHJ 10KΩ (103)
R7	7030002420	Resistor	MCR03EZHJ 100KΩ (104)
R8	7030002360	Resistor	MCR03EZHJ 47KΩ (473)
R9	7030002320	Resistor	MCR03EZHJ 22KΩ (223)
R10	7310001410	Trimmer	RH04A3AJ4J01A (223)
R11	7030002420	Resistor	MCR03EZHJ 100KΩ (104)
R12	7030002420	Resistor	MCR03EZHJ 100KΩ (104)
R13	7030002550	Resistor	MCR03EZHJ 1MΩ (105)
R14	7030002240	Resistor	MCR03EZHJ 4.7KΩ (472)
R15	7030002590	Resistor	MCR03EZHJ 2.2MΩ (225)
C1	4030001150	Ceramic	GRM40 F 104Z 25PT
C2	4030001150	Ceramic	GRM40 F 104Z 25PT
C3	4030003880	Ceramic	GRM39 SL 180J 50PT
C4	4030003880	Ceramic	GRM39 SL 180J 50PT
C5	4550000700	Tantalum	TESVC OG 336M-12L
C6	4030003890	Ceramic	GRM39 B 471K 50PT
C7	4550000460	Tantalum	TESVA 1C 105M1-8L
C8	4550000460	Tantalum	TESVA 1C 105M1-8L
C9	4030001150	Ceramic	GRM40 F 104Z 25PT
J1	6510007110	Connector	PI28A-10M
EP1	0910024040	P.C. Board	B 2321 FX-677
