## SECTION 4

## CIRCUIT DESCRIPTION

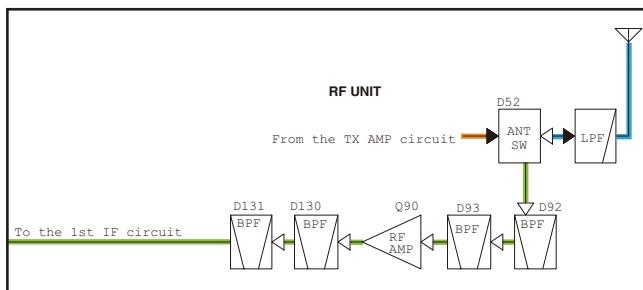

### 4-1 RECEIVE CIRCUITS

#### RF CIRCUIT (RF UNIT)

The RX signal from the antenna is passed through a two-staged LPF (L81, L82, C83–C86 and C89), ANT SW (D90), and two tuned BPFs (D92, D93, L92, L93, C95, C97–C100 and C117), and then applied to the RF AMP (Q90).

The amplified signal is applied to the 1st IF circuit, through two tuned BPFs (D130, D131, L96, L97, C109, C110 and C112–C115).

#### • RF CIRCUITS

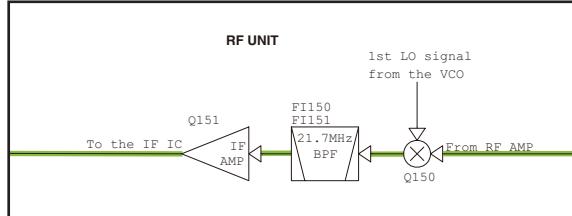

#### 1ST IF CIRCUIT (RF UNIT)

The RX signal from the RF circuits is applied to the 1st IF mixer (Q150), and mixed with the 1st LO signal from the VCO (Q21, Q22, and D20–D22), resulting in a 21.7 MHz 1st IF signal.

The 1st IF signal is filtered by the 1st IF filters (FI150 and FI151), and then applied to the 1st IF AMP (Q151). The amplified signal is applied to the 2nd IF circuits.

#### • 1ST IF CIRCUITS

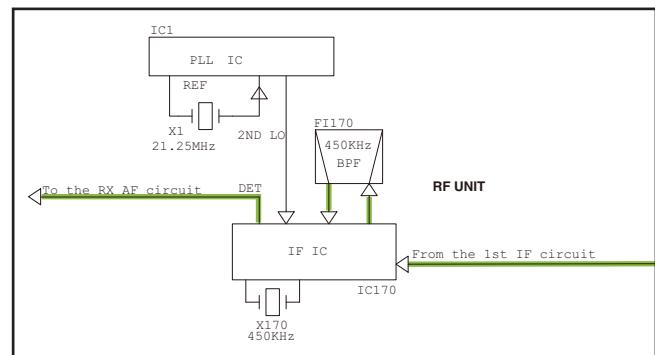

#### 2ND IF CIRCUIT (RF UNIT)

The 1st IF signal from the 1st IF circuits is applied to the IF IC (IC170, pin 16). The IF IC contains the 2nd IF mixer, 2nd IF AMP, detector, and so on, in its package.

The 1st IF signal is mixed with the 21.25 MHz 2nd LO signal from the reference frequency oscillator (TCXO: X1), resulting in a 450 kHz 2nd IF signal. The 2nd IF signal is passed through the 2nd IF filter (FI170) to remove sideband noise. The filtered signal is amplified by the 2nd IF AMP, and demodulated by the quadrature detector with discriminator (X170).

The demodulated AF signal is applied to the RX AF circuits on the MAIN UNIT.

#### • 2ND IF CIRCUITS

#### RX AF CIRCUIT (MAIN UNIT)

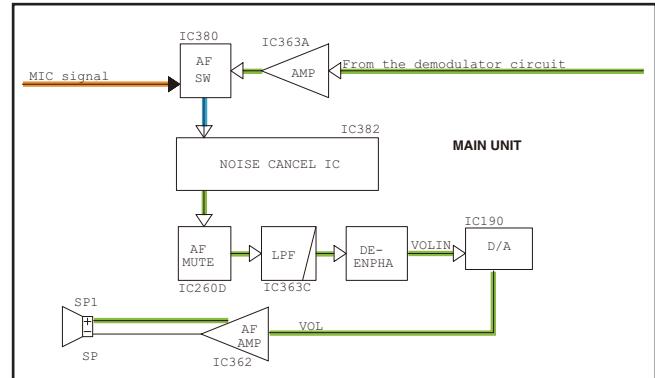

The demodulated AF signal from the IF IC (RF UNIT: IC170) is amplified by the AF AMP (IC363A), and then applied to the noise canceller IC (IC382, pin 36), through the AF SW (IC380, pins 7, 1).

The processed AF signal is passed through the AF mute SW (IC260D, pins 11, 10), LPF (IC363C, pins 9, 8) and de-emphasis circuit (R279 and C266), and then applied to the D/A converter (IC190, pin 1) to adjust the level.

The level-adjusted AF signal is amplified by the AF AMP (IC362), and then output to the internal speaker (CHASSIS: SP1).

When an external speaker is connected, the AF signal from the D/A converter (IC190, pin 2) is amplified by the AF AMP (IC362), and then output to the external speaker, through J290.

#### • RX AF CIRCUITS

## 4-2 TRANSMIT CIRCUITS

### TX AF CIRCUIT (MAIN UNIT)

The AF signal from the internal microphone (MC250) is passed through the MIC mute SW (IC260A, pins 1, 2), and then applied to the MIC AMP (IC200B, pin 6).

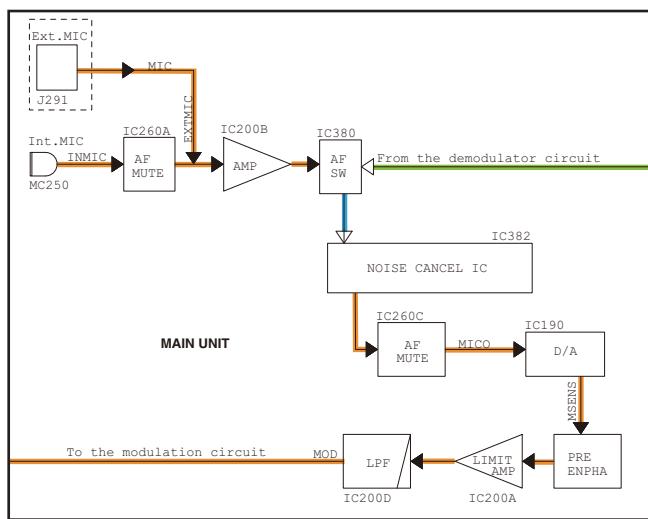

The MIC signal from the external microphone is directly applied to the MIC AMP (IC200B, pin 6), through J290.

The amplified AF signal is passed through the AF SW (IC380, pins 6, 1) and applied to the noise canceller IC (IC382, pin 36).

The processed AF signal is passed through the AF mute SW (IC260C, pins 8, 9), and then applied to the D/A converter (IC190, pin 13) to adjust the level.

The level-adjusted AF signal is passed through the pre-emphasis circuit (R201, C385), and then amplified by the limiter AMP (IC200A) which limits the amplitude of AF signal to prevent over deviation. The amplitude-limited signal is passed through the LPF (IC200D, pins 12, 14), and then applied to the modulation circuits on the RF UNIT.

### • TX AF CIRCUITS

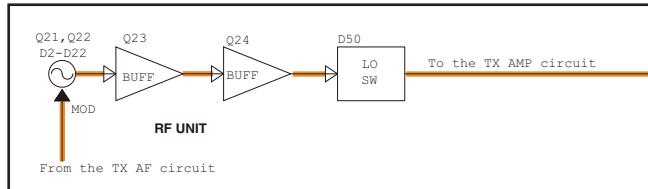

### MODULATION CIRCUIT (RF UNIT)

The AF signal from the TX AF circuits is applied to the VCO (Q21, Q22, and D20–D22). The modulation signal is applied to D20, for Frequency Modulation.

The modulated VCO output signal is passed through the buffers (Q23 and Q24), and then applied to the TX AMP circuits as a TX signal, through the LO SW (D50).

### • MODULATION CIRCUITS

### TX AMP CIRCUIT (MAIN UNIT)

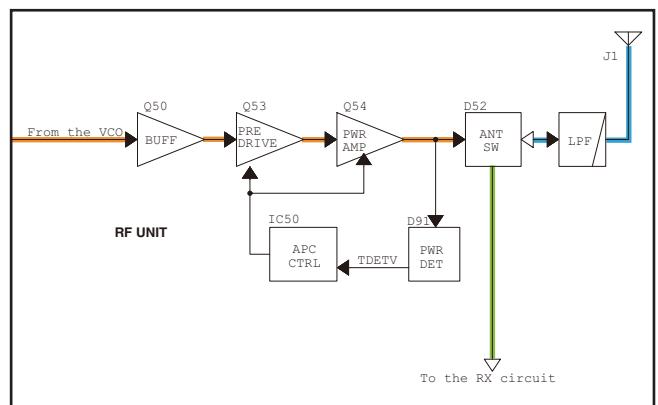

The TX signal is sequentially amplified by the buffer (Q50), YGR (Q53) and power (Q54) AMPS, and then passed through two LPFs (L57, C70, C71 and L80, C81, C82), TX output power detector (D91), ANT SW (D52), and a two stage LPF (L81, L82, C83–C86 and C89), before being sent to the antenna.

### APC CIRCUIT (MAIN UNIT)

The voltage produced at two LPFs (L57, C70, C71 and L80, C81, C82) is rectified by D91, and is used as the TX power sensing voltage.

The voltage is applied to the APC AMP (IC50, pin 3), and the output voltage controls the gain of the pre-driver (Q53) and power (Q54) AMPS, to keep the TX output power constant.

### • TX AMP AND APC CIRCUITS

## 4-3 FREQUENCY SYNTHESIZER (MAIN UNIT)

### • VCO

The VCO (Q21, Q22, and D20–D22) generates both the 1st LO signal and the TX signal. The generated signal is amplified by buffers (Q23 and Q24), and then used as the TX or RX LO signal.

In receive, the LO signal is applied to the 1st IF mixer (Q150), through the LO SW (D51) and BPF (L26 and C122).

In transmit, the LO signal is applied to the TX AMP circuits, through the LO SW (D50).

### • PLL

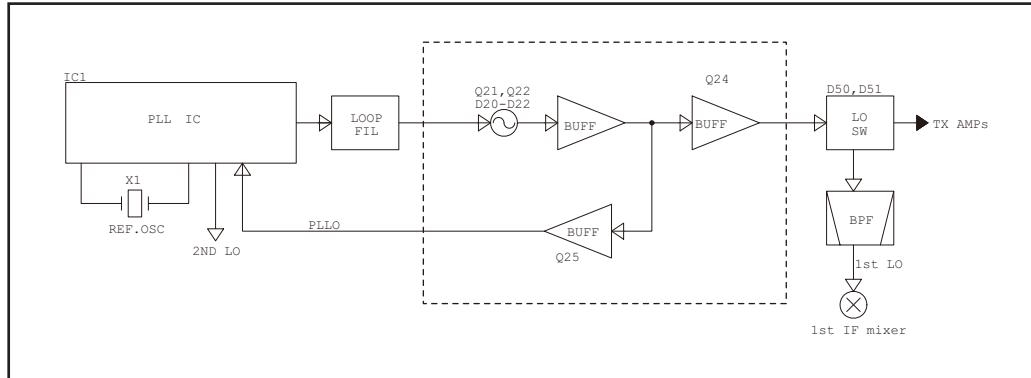

A portion of the VCO output signal is passed through two buffers (Q23 and Q25), and then fed back to the PLL IC (IC1, pin 16), through the LPF (L20, C21 and C22).

The PLL IC (IC1) phase compares the outputs of the reference frequency oscillator (TCXO; X1) and VCO, and the phase difference is output as the charge pump current.

The current is passed through the loop filter (R10, R22, C11, C13, C18 and C24) to be converted into the lock voltage, which controls the oscillating frequency of VCO.

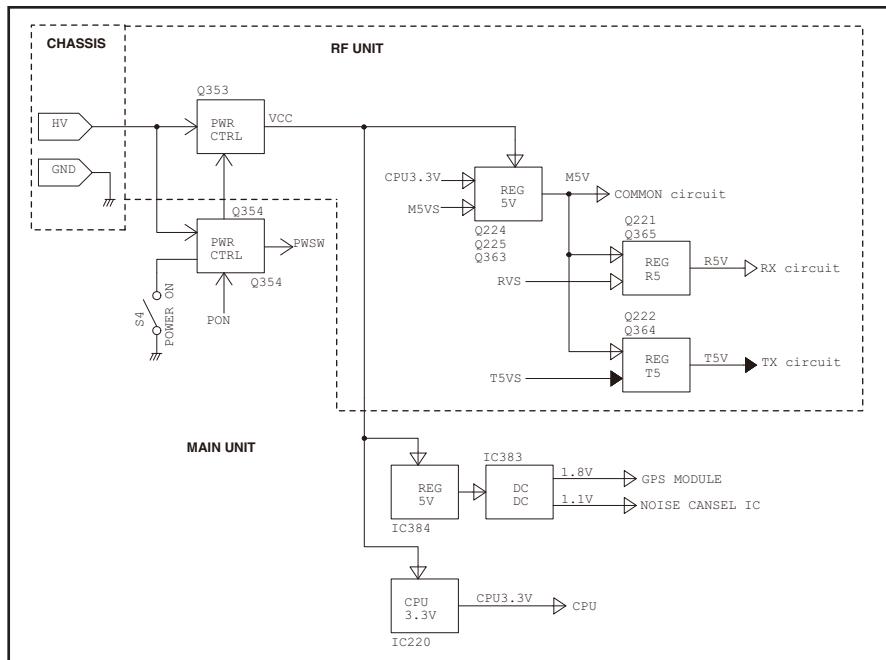

When the oscillation frequency drifts, its phase changes from that of the reference frequency, causing a lock voltage change to compensate for the drift in the VCO oscillating frequency.

Voltage from the power supply is routed throughout the transceiver, through regulators and switches.
