

SERVICE MANUAL

WIDEBAND RECEIVER

IC-R7100

INTRODUCTION

This service manual describes the latest service information for the **IC-R7100** WIDEBAND RECEIVER at the time of publication.

5 versions of the **IC-R7100** have been designed. This service manual covers each version.

VERSION NO.	VERSION	SYMBOL
#02	U.S.A.	USA
#03	Europe	EUR
#04	Australia	AUS
#05	Germany	FRG
#06	France	FRA

To upgrade quality, all electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1110001360 IC μ PC1242H IC-R7100 MAIN UNIT 5 pieces
8810005510 Screw FH M3 \times 6 ZK BS IC-R7100 Top cover 10 pieces

Addresses are provided on the inside back cover for your convenience.

DANGER

Use **ONLY** the specified AC voltage described on the AC power socket. Other voltages will cause receiver damage or personal injury.

DO NOT touch the REG UNIT after the receiver is connected to an AC outlet. An insulated tool must be used at all times.

DO NOT expose the receiver to rain, snow or any liquids.

DO NOT apply an RF signal of more than 100 mW (20 dBm) to the antenna connector. This could damage the receiver's front-end.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the receiver.
2. **DO NOT** open the receiver until the receiver is disconnected from a power source.
3. **USE** an external AC power supply to a receiver power source during testing.
4. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
5. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
6. **DO NOT** keep power ON for a long time when the receiver is defective.
7. **READ** the instructions of test equipment thoroughly before connecting equipment to the receiver.

SECTION 1 SPECIFICATIONS

• Frequency coverage :

VERSION	FREQUENCY COVERAGE
U.S.A. Europe Australia	25.0000~1999.9999 MHz*
France	25.0000~ 87.5000 MHz 108.0000~1999.9999 MHz*
Germany	28.0000~ 29.7000 MHz 144.0000~ 146.0000 MHz 430.0000~ 440.0000 MHz 1240.0000~1300.0000 MHz

*Specifications guaranteed for 25~1000 and 1240~1300 MHz.

- Mode : SSB (USB, LSB), AM (Normal, Narrow), WFM, FM (Normal, Narrow)
- Number of memory channels : Memory channels 900
Scan edge channels 20
- Tuning step increments : 0.1, 1, 5, 10, 12.5, 20, 25, 100 kHz, 1 MHz
- Antenna impedance : 50 Ω (Nominal)
- Power supply requirement : 117 V AC or 13.8 V DC ± 15 % (U.S.A. version)
240V AC or 13.8 V DC ± 15 % (Europe, Australia and France versions)
220 V AC (Germany version)

- Type of antenna connector : Type-N
- Current drain (at 13.8 V DC) : Squelched 1.5 A
Max. audio output 1.9 A
- Usable temperature range : +10 °C~+60 °C (+14 °F~140 °F)
- Frequency stability (in FM mode) : 25~250 MHz Less than ±1.5 kHz
250~1000 MHz Less than ±5 ppm
1240~1300 MHz Less than ±10 ppm
(0 °C~+50 °C; +32 °F~+122 °F)
- Dimensions : 241 (W) × 94 (H) × 239 (D) mm; 9.5 (W) × 3.7 (H) × 9.4 (D) in
(Projections not included)

- Weight : 6.0 kg (13.2 lb)
- Receive system : SSB, AM, FM Triple-conversion superheterodyne system
WFM Double-conversion superheterodyne system

• Intermediate frequencies :

IF	25~512 MHz	512~1025 MHz
1st	778.700 MHz	266.700 MHz
2nd	10.700 MHz	10.700 MHz
3rd*	455 kHz	455 kHz

*Except WFM (Crystal-converter system is adopted above 1025 MHz.)

- Sensitivity (typical) : SSB Less than 0.2 μV for 10 dB S/N
AM Less than 1.6 μV for 10 dB S/N
WFM Less than 1.0 μV for 12 dB SINAD
FM Less than 0.35 μV for 12 dB SINAD
- Squelch sensitivity (threshold) : AM, FM Less than 0.35 μV
SSB, WFM Less than 4.5 μV
WFM (1240~1300 MHz) Less than 6.0 μV
- Selectivity : SSB More than 2.4 kHz/−6 dB
AM, FM (Narrow) More than 6.0 kHz/−6 dB
FM, AM (Wide) More than 15 kHz/−6 dB
WFM More than 150 kHz/−6 dB
- Spurious response rejection : More than 50 dB
- Audio output power : More than 2.0 W* with an 8 Ω load
*More than 1.0 W in FM narrow mode
- Audio output impedance : 4~8 Ω

All stated specifications are subject to change without notice or obligation.

SECTION 3 CIRCUIT DESCRIPTION

3-1 RECEIVER CIRCUITS

3-1-1 RF CONVERTER CIRCUIT (CONV, DOUBLER AND HPF UNITS)

The RF converter circuit converts the 1025~1999.9999 MHz RF signals to 25~1024.9999 MHz RF signals.

(1) 25.0000~1024.9999 MHz

RF signals from an antenna connector (J7) pass through the 1 GHz converter switching relay (RL1, RL2) and bypass the RF converter circuit. The signals are applied to the RF UNIT through J2.

(2) 1025.0000~1999.9999 MHz

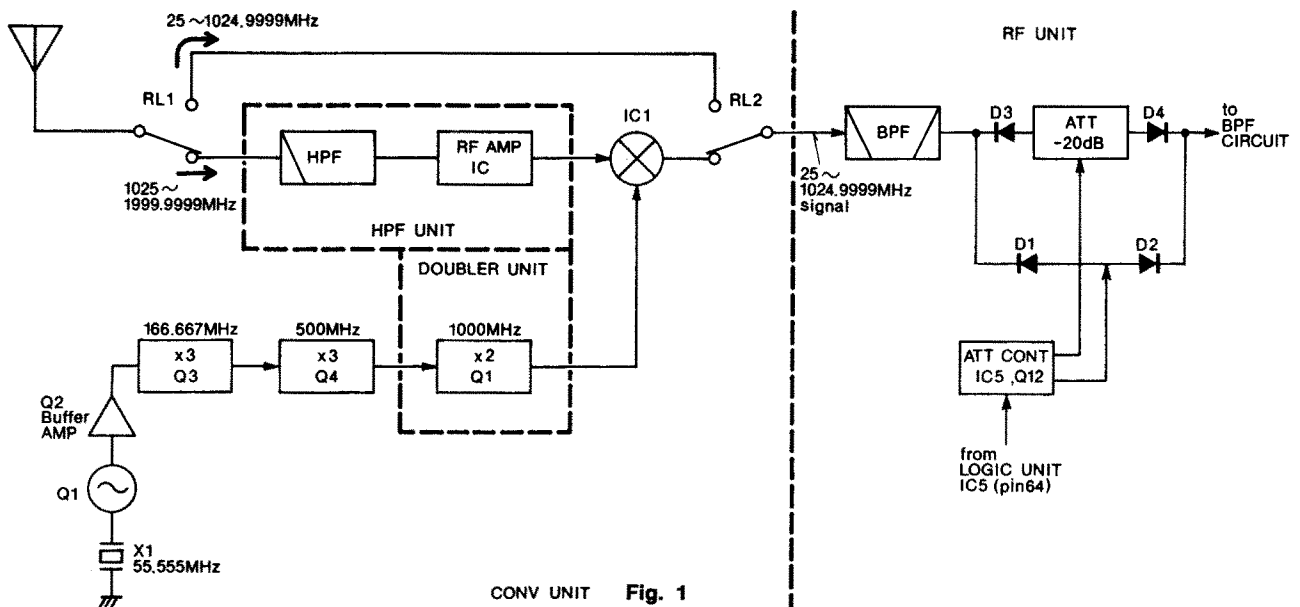

RF signals from the antenna connector (J7) are applied to a high-pass filter (strip line, L3, C1~C6) on the HPF UNIT through the 1 GHz converter switching relay (RL1, RL2).

The high-pass filter attenuates the image signals below 1200 MHz and prevents 1 GHz (7 dBm) LO signals from entering the antenna connector.

The filtered signals pass through a wide range RF amplifier (IC1) to provide 20 dB gain over a wide-band frequency range and are then applied to a mixer circuit (IC1) on the CONV UNIT. IC1 employs a DBM (Double Balanced Mixer). The signals are mixed with the 1 GHz LO signal coming from the DOUBLER UNIT.

A 55.555 MHz reference signal is produced by an oscillator circuit (X1, Q1) and is then multiplied by three at L2 and L3. The resulting 166.666 MHz signal is amplified at Q3 and is then multiplied by three at Q4. The resulting 500 MHz (0 dBm) signal is doubled to produce a 1 GHz (7 dBm) LO signal on the DOUBLER UNIT.

• RF CONVERTER AND ATTENUATOR CIRCUITS

CONV UNIT Fig. 1

The amplified signal is applied to IC1 on the CONV UNIT and is then mixed with RF signals coming from IC1 on the HPF UNIT. The resulting 25~1024.9999 MHz signals are applied to the RF UNIT through J2.

3-1-2 ATTENUATOR CIRCUIT (RF UNIT)

The attenuator circuit attenuates the signal strength to 20 dB to protect the RF amplifier from distortion when excessively strong signals are received.

The 25~1024.9999 MHz signals are applied to a band-pass filter (strip line, L3, C1~C6) to suppress out-of-band signals. The filtered signals either enter or bypass an attenuator circuit.

IC5 switches the power source of the attenuator circuit ON or OFF by using an "ATT" signal from the LOGIC UNIT. Q21 and D52 provide the converted and stable voltage to IC5.

When the [ATT] switch is pushed, the CPU (IC5, pin 64) on the LOGIC UNIT outputs a "HIGH" signal. The "HIGH" signal is applied to IC5 (pin 11) and activates the attenuator circuit (R2~R8).

The filtered signals are applied to the attenuator circuit (R2~R8) through a switching diode (D3). C8 compensates for attenuation when high frequencies are received. The resulting signals are applied to the RF circuit through a switching diode (D4).

When the CPU (IC5, pin 64) on the LOGIC UNIT outputs a "LOW" signal, Q12 and R106 act as an inverter. The inverter supplies a "THROUGH" signal to IC5 (pin 10); then, the filtered signals pass through a switching diode (D1) and are applied to the RF circuit through another switching diode (D2).

3-1-3 RF CIRCUIT (RF UNIT)

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

The RF amplifiers (Q1~Q4) employ gallium arsenic FET's (3SK121). The combination of the RF amplifiers and tuned bandpass filters expand the dynamic range and enhance the sensitivity for the high frequency. Each tuned amplifier has approximately 10 dB gain.

IC4 functions as a comparator and is controlled by the BPF4 signal line. Pin 1 of IC4 outputs positive voltage in a frequency range of 512~1024.9999 MHz, while pin 7 of IC4 outputs positive voltage in a frequency range of 25.0000~511.9999 MHz.

IC5 switches the power source of BPF1~BPF4 ON or OFF by using "B1~B4" and "BH" signals from the LOGIC UNIT. Q21 and D52 provide the converted and stable voltage to IC5.

The 25~1024.9999 MHz signals are applied to four separate filters through switching diodes (D5, D12, D19, D11, D18, D25) depending on the range of frequency coverage. The relay circuit (RL1, RL2) is used instead of switching diodes for the frequencies above 512 MHz. This device prevents a diode from causing distortion when receiving very strong signals.

(1) BPF1 (25.0000~89.9999 MHz)

The 25.0000~89.9999 MHz signals pass through a parallel resonant circuit (D6, L11, C15) to suppress half of the receive frequency interference signals and are then applied to an RF amplifier (Q1) via a tuned bandpass filter (D7, D8, L12~L14). The amplified signals are applied to a 2nd RF amplifier (Q7) through a tuned bandpass filter (D9, D10, L16~L18).

D6~D10 employ varactor diodes which are controlled by the PLL lock voltage. The voltage is current-amplified at the DC amplifier circuit (IC3a, IC1a) and is then applied to the varactor diodes. These varactor diodes tune the center frequency of an RF passband for wide bandwidth receiving and good image response rejection.

D50 protects the varactor diodes from being charged over their maximum voltage.

(2) BPF2 (90.0000~249.9999 MHz)

The 90.0000~249.9999 MHz signals pass through a parallel resonant circuit (D13, L22, C25) to suppress half of the receive frequency interference signals and are then applied to a series resonant circuit (D14, L70, C61) to suppress strong signals in a frequency range of 80~110 MHz, such as FM and TV broadcasting stations. The signals are applied to an RF amplifier (Q2) via a tuned bandpass filter (D15, L23~L25, C119). The amplified signals are applied to a 2nd RF amplifier (Q7) through another tuned bandpass filter (D17, L27~L29, C120).

D13~D15 and D17 employ varactor diodes which are controlled by the PLL lock voltage. The voltage is current-amplified at the DC amplifier circuit (IC3a, IC1b) and is then applied to the varactor diodes. These varactor diodes tune the center frequency of an RF passband for wide bandwidth receiving and good image response rejection.

D51 protects varactor diodes from being negatively charged.

• RF CIRCUIT

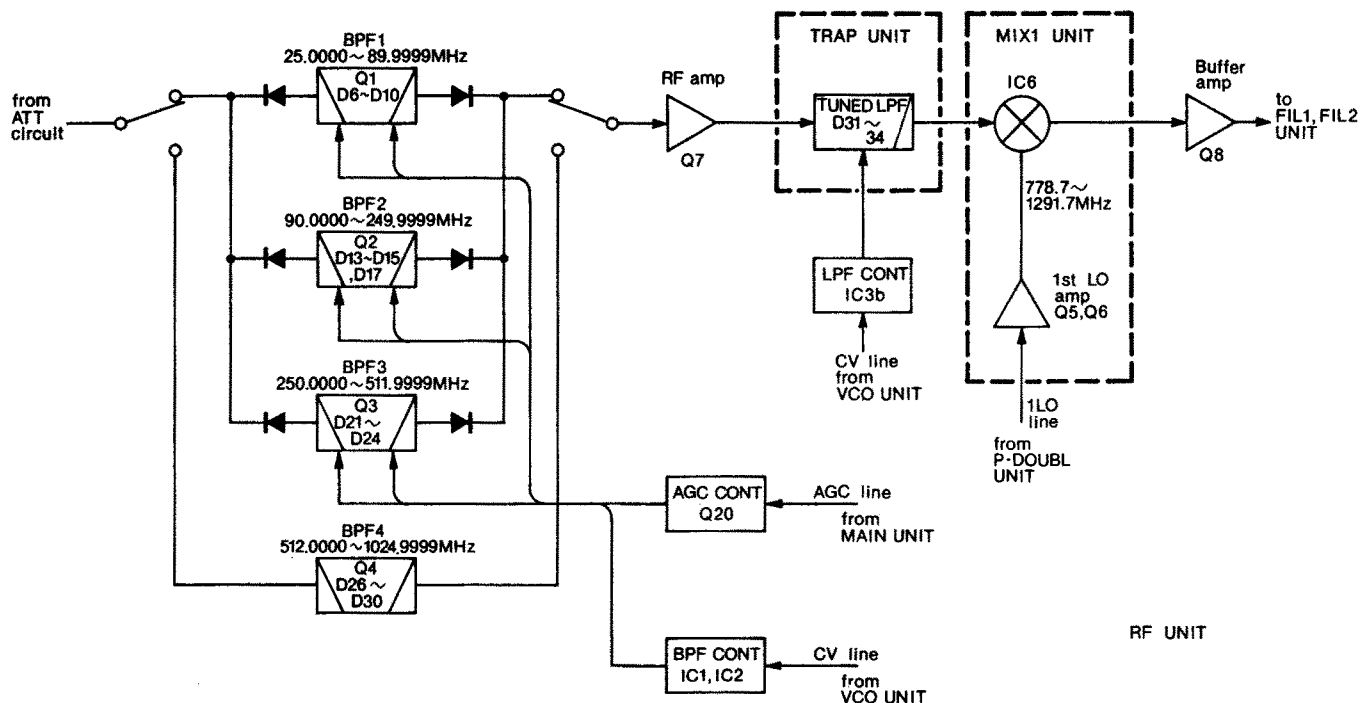

Fig. 2
3 - 2

(3) BPF3 (250.0000~511.9999 MHz)

The 250.0000~511.9999 MHz signals pass through a high-pass filter (L32, L69, C34, C35, C51, C133) to suppress the interference signals in low frequencies. The filter cuts out the 240 MHz frequencies. The filtered signals are applied to an RF amplifier (Q3) via a tuned bandpass filter (D21, D22, L33, L34). The amplified signals are applied to a 2nd RF amplifier (Q7) through another tuned bandpass filter (D23, D24, L36, L37).

D21~D24 employ varactor diodes which are controlled by the PLL lock voltage. The voltage is current-amplified at the DC amplifier circuit (IC3a, IC2a) and is then applied to the varactor diodes. These varactor diodes tune the center frequency of an RF passband for wide bandwidth receiving and good image response rejection.

(4) BPF4 (512.0000~1024.9999 MHz)

RF relays are used instead of a diode switching system for signals above 512 MHz. To drive these relays, Q14 and Q15 are used as current amplifiers.

The 512.0000~1024.9999 MHz signals pass through a parallel resonant circuit (D26, L39, C45) to suppress half of the receive frequency interference signals and are then applied to an RF circuit (Q4) via a tuned bandpass filter. The amplified signals are applied to a 2nd RF amplifier (Q7) through a tuned bandpass filter. The tuned bandpass filters consist of a strip line and D27~D30 and ensure stable operation at high frequencies.

D27~D30 employ varactor diodes which are controlled by the PLL lock voltage. The voltage is current-amplified at the DC amplifier circuit (IC3a, IC2b) and is then applied to the varactor diodes. These varactor diodes tune the center frequency of an RF passband for wide bandwidth receiving and good image response rejection.

(5) 2nd RF AMPLIFIER

The 2nd RF amplifier (Q7) employs a wide frequency band amplifier with approximately 10 dB gain.

The 25.0000~1024.9999 MHz signals from four separate filters are applied to the 2nd RF amplifier (Q7). The 2nd RF amplifier has a feedback circuit (L42, C67, R47) to obtain stable gain in the wide frequency range. The amplified signals are then applied to a tuned notch circuit.

3-1-4 TUNED NOTCH CIRCUIT (TRAP UNIT)

The tuned notch circuit prevents the 1st LO signal from entering the antenna connector.

This circuit consists of a strip line and D31~D34. The notch frequency is adjusted to match the 1st LO frequency by a control voltage coming from IC3b (pin 1).

D31~D34 employ varactor diodes which are controlled by the PLL lock voltage.

The voltage is current-amplified at the DC amplifier circuit (IC3a, IC3b) and is then applied to the varactor diodes. These varactor diodes tune the center frequency of an RF passband for wide bandwidth receiving and good image response rejection.

The signals from the tuned notch circuit are applied to a low-pass filter (strip line, C78, C82, C85, C89, C137) to suppress high harmonic components of the 1st LO signal. The filtered signals are applied to a 1st mixer circuit.

3-1-5 TUNED CONTROL CIRCUIT (RF UNIT)

The tuned control circuit converts the PLL lock voltage to tuned voltage for the BPF1~BPF4 on the RF UNIT and the tuned notch circuit on the TRAP UNIT.

Fig. 3 shows the relation between the PLL lock voltage and each tuned voltage, in the BPF1~BPF4 on the RF UNIT and tuned notch circuit on the TRAP UNIT.

• PLL LOCK VOLTAGE AND TUNED VOLTAGE

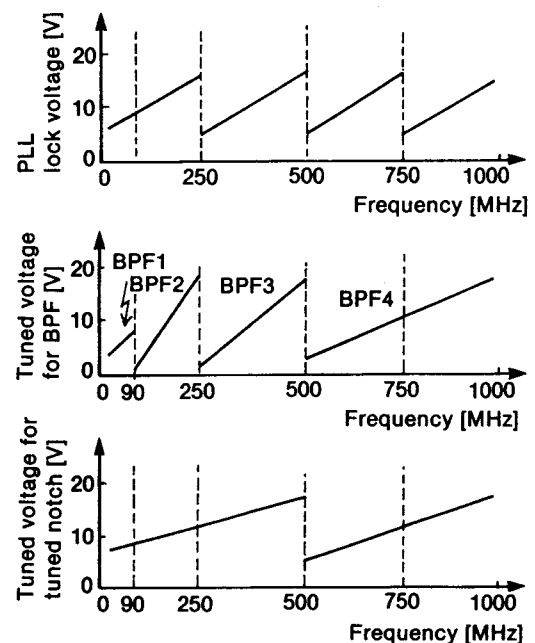

Fig. 3

The PLL lock voltage (CV) passes through the DC amplifier (IC3a) to convert the impedance and is then applied to the operational amplifiers (IC1a, IC1b, IC2a, IC2b, IC3b).

Pin 1 of IC1a supplies a tuned voltage to BPF1. R68 and R66 control the gain and offset voltage of IC1a respectively.

Pin 7 of IC1b supplies a tuned voltage to BPF2. D53 and R157 adjust the gain voltage of IC1b to fit the characteristics of BPF2.

Pin 1 of IC2a supplies a tuned voltage to BPF3.

Pin 7 of IC2b supplies a tuned voltage to BPF4. Q9 and Q10, switch the gain and offset voltage of IC2b ON or OFF and convert the variations of 2 PLL lock voltages into a continuous tuned voltage.

Pin 1 of IC3b supplies a tuned voltage to the tuned notch circuit on the TRAP UNIT.

Q11 switches the offset voltage of IC3b ON or OFF and converts the variations of 2 PLL lock voltages into a continuous tuned voltage.

3-1-6 1st MIXER CIRCUIT (MIX1 UNIT)

The 1st mixer circuit converts the received signal to a fixed frequency of the 1st IF signal with a PLL output frequency. By changing the PLL frequency, only the desired frequency will pass through the FIL1 UNIT or FIL2 UNIT at the next stage of the 1st mixer.

A 778.7~1291.7 MHz (0 dBm) 1st LO signal is applied to a bandpass filter (strip line, L78, C134, C59, C77, C53~C55) on the MIX1 UNIT to suppress unwanted signals through P1 from the PLL UNIT. The filtered signal is amplified at the 1st LO amplifiers (Q5, Q6). The 1st LO amplifiers (Q5, Q6) employ wide frequency band amplifiers with approximately 10 dB gain and amplify the 1st LO signal to approximately 10 dBm.

The 25.0000~1024.9999 MHz signals are mixed at IC6 with the 1st LO signal to produce a 266.7 or 778.7 MHz 1st IF signal. IC6 employs a DBM (Double Balanced Mixer).

Table 1 shows the relation between receive frequency and 1st LO frequency.

RECEIVE FREQUENCY [MHz]	1st LO FREQUENCY [MHz]
25~ 89.9999	803.7~ 868.6999
90~ 249.9999	868.7~1028.6999
250~ 511.9999	1028.7~1290.6999
512~1024.9999	778.7~1291.6999

Table 1

3-1-7 1st IF CIRCUIT (RF, FIL1 AND FIL2 UNITS)

The 1st IF signal (226.7 or 778.7 MHz) is applied to a 1st IF amplifier (Q8) providing approximately 10 dB gain over a wideband frequency range. The 1st IF amplifier employs a feedback circuit (L43, C72, R56) to obtain stable gain in the wide frequency range. The 2nd IF signal is applied to two separate filters depending on the receive frequency.

Table 2 shows the relation between receive frequency and 1st IF frequency.

RECEIVE FREQUENCY [MHz]	1st IF FREQUENCY [MHz]
25~ 89.9999	778.7 (F11)
90~ 249.9999	778.7 (F11)
250~ 511.9999	778.7 (F11)
512~1024.9999	266.7 (F12)

Table 2

Fig. 4 shows the characteristics of the 1st IF filter.

• 1ST IF FILTER CHARACTERISTICS

Fig. 4

(1) FIL1 CIRCUIT (25~511.9999 MHz)

The 778.7 MHz 1st IF signal is applied to an inductive bandpass filter (F11) to suppress out-of-band signals. F11 sets the center frequency at 778.7 MHz and covers a 5 MHz bandwidth. The filtered signal is applied to a notch filter (L51, C79) to suppress the image interference signal (757.3 MHz).

(2) FIL2 CIRCUIT (512~1024.9999 MHz)

The 266.7 MHz 1st IF signal is applied to a helical filter (L46, L47) to suppress out-of-band signals through a series resonant circuit (L73, C86). The helical filter sets the center frequency at 266.7 MHz and covers a 5 MHz bandwidth. The filtered signal passes through a notch filter (L67, L68, C88) to suppress the image interference signal (245.3 MHz) and is then applied to series resonant circuits (L74, C90). The series resonant circuits attenuate out-of-band signals.

The 266.7 or 778.7 MHz 1st IF signal is applied to a low-pass filter (strip line, C139~C141) to suppress the high harmonic components on the RF UNIT.

3-1-8 2nd MIXER CIRCUIT (MIX2 UNIT)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal.

A 256 or 768 MHz (0 dBm) 2nd LO signal is applied to a 1 GHz cutoff low-pass filter (strip line, C104, C105, C146) on the MIX2 UNIT to suppress the high harmonic components through P3 from the PLL UNIT.

The filtered signal is amplified at the 2nd LO amplifiers (Q16, Q17). The 2nd LO amplifiers (Q16, Q17) employ wide frequency band amplifiers with approximately 10 dB gain and amplify the 2nd LO signal to approximately 10 dBm. The amplified signal is applied to an attenuator circuit (R116, R118).

The 266.7 or 778.7 MHz 1st IF signal is mixed at IC7 with the 2nd LO signal to produce a 10.7 MHz 2nd IF signal. The 10.7 MHz 2nd IF signal is output from IC7 (pin 1) and is then applied to the RF UNIT. IC7 employs a DBM (Double Balanced Mixer).

Table 3 shows the relation between receive frequency and 2nd LO frequency.

RECEIVE FREQUENCY [MHz]	2nd LO FREQUENCY [MHz]
25~ 89.9999	768
90~ 249.9999	768
250~ 511.9999	768
512~1024.9999	256

Table 3

• IF CIRCUIT

3-1-9 AGC BUFFER AMPLIFIER CIRCUIT (RF UNIT)

The AGC voltage shifts from approximately 4 V to 0 V. The AGC buffer amplifier (Q20) shifts approximately 1.5 V to the minus voltage that the RF amplifiers (Q1~Q4) require.

3-1-10 2nd IF CIRCUIT (RF AND MAIN UNITS)

The 10.7 MHz 2nd IF signal is applied to a low-pass filter which cuts off the frequencies around 400 MHz. The filter consists of a strip line and C142~C144 and prevents the high harmonic components from entering the 2nd mixer (IC7) on the MIX2 UNIT.

The filtered signal passes through a 2nd IF amplifier (Q18) with approximately 20 dB gain and is then applied to the MAIN UNIT through J4.

A portion of the 2nd IF signal output from IC7 passes through a buffer-amplifier (Q19) and is then applied to a 20 MHz cutoff low-pass filter (L60, C114~C116). The filtered signal is applied to the [IF OUT] jack on the rear panel.

In WFM mode, the 10.7 MHz 2nd IF signal passes through the IF amplifiers (L1, Q55) and is then applied to a high-quality ceramic filter (FI1) covering the 230 kHz (3 dB) bandwidth. The filtered signal is amplified at Q14 and is then re-amplified at IC11. Q14 and IC11 provide approximately 40 dB gain in WFM mode. The amplified signal passes through another high-quality ceramic filter (FI2) covering the 230 kHz (3 dB) bandwidth and is then applied to the WFM demodulator circuit.

In other modes, the 10.7 MHz 2nd IF signal is applied to a pair of crystal filters (FI3) covering a ± 7.5 kHz (3 dB) bandwidth in order to obtain wide selection capability and to pass only desired signals. The filtered signal is applied to Q21.

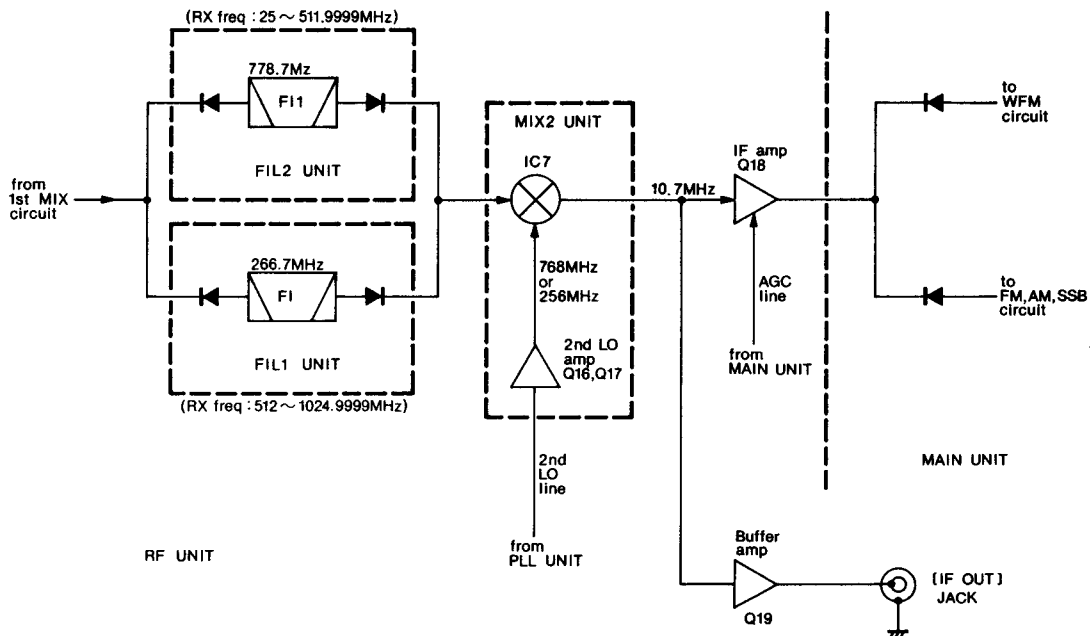

Fig. 5

3-1-11 NOISE BLANKER CIRCUIT (MAIN UNIT)

The noise blanker circuit effectively reduces interference from pulse-type noise such as car ignition systems and functions in only SSB and AM modes.

A portion of the 2nd IF signal output (drain of Q21) is applied to the noise amplifier (IC14) and is then detected at the noise detector circuit (D46, D47). The detected voltage is applied to a noise blanker switch (Q27).

The threshold level of the noise blanker switch (Q27) is set at approximately 0.3 V higher than that of Q26 to avoid malfunctions when the operating frequency or mode is changed. When the detected voltage exceeds the threshold level, Q28 outputs a blanking signal to activate the noise blanker gate circuit (D30~D32).

A portion of the detected voltage is applied to a noise blanker AGC circuit (Q26). The threshold level of the noise blanker AGC circuit (Q26) is set at 0.6 V. The noise components are fed back to the noise amplifier (IC14) through a DC amplifier (Q25). The time constant of the noise blanker AGC circuit is determined by R206, R209 and C129. This AGC circuit does not detect pulse-type noise.

Q46 turns the noise blanker circuit ON or OFF. While pulse-type signals are received, Q46 turns Q28 ON. Therefore, the noise blanker gate circuit (D30~D32) is reverse-biased to cut OFF the 2nd IF signal.

3-1-12 3rd MIXER AND 3rd IF CIRCUITS (MAIN UNIT)

The 3rd mixer circuit converts the 2nd IF signal to a 3rd IF signal with the 3rd LO signal.

The signal output from the noise blanker gate circuit (D30~D32) enters the 3rd mixer circuit (IC13). IC13 is a DBM (Double Balanced Mixer).

A 10.245 MHz 3rd LO signal is oscillated by (Q29, X2) and is then applied to the 3rd mixer circuit to produce a 455 kHz 3rd IF signal. C132 provides frequency control.

The 455 kHz 3rd IF signal output from IC13 (pin 3) passes through an impedance converter (L7, C97) and is then applied to three separate, high-quality ceramic filters (FI4~FI6) depending on the mode.

(1) SSB MODE

The 455 kHz 3rd IF signal is applied to FI4 covering 2.8 kHz of bandwidth in SSB mode.

(2) AM/FMN MODES

The 455 kHz 3rd IF signal is applied to FI5 covering 6.0 kHz of bandwidth in AM or FMN mode.

(3) FM/AMW MODES

The 455 kHz 3rd IF signal is applied to FI6 covering 15.0 kHz of bandwidth in FM or AMW mode.

The filtered signal is applied to the 3rd IF amplifier circuit (Q22, Q23) and is then applied to the demodulator circuits.

3-1-13 WFM DEMODULATOR CIRCUIT (MAIN UNIT)

The 10.7 MHz 2nd IF signal output from FI2 is applied to pin 1 of IC12 to demodulate the 2nd IF signal into an AF signal.

IC12 contains a limiter amplifier, a filter, an FM detector and a signal meter circuit.

Input signal from IC12 (pin 1) passes the limiter amplifier and the filter sections of IC12. The filtered signal is demodulated into an AF signal by using the FM detector section of IC12 and the other components (X1, L2, R128, C72, C73, D26).

A varactor diode (D26) adjusts the distortion of the center frequency in a ceramic discriminator (X1) by changing its voltage.

The AF signal is output from IC12 (pin 8) and is then applied to the buffer amplifier (Q18) for AF signal switching and AF signal level adjustment in other modes.

• WFM DEMODULATOR CIRCUIT

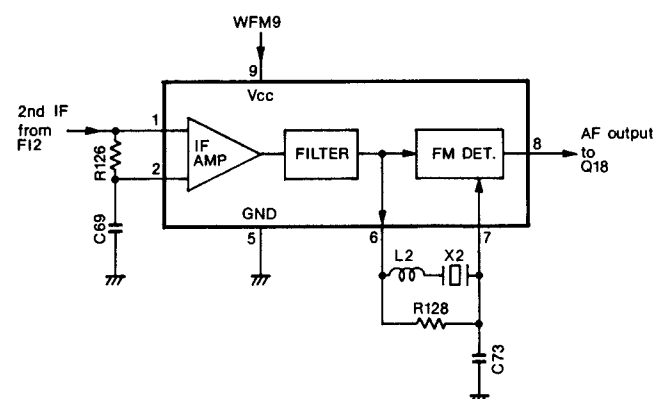

Fig. 6

3-1-14 WFM AGC CIRCUIT (MAIN UNIT)

The AGC (Automatic Gain Control) circuit reduces signal fading and keeps the audio output level constant.

The strength of the 2nd IF signal is detected at the signal meter circuit section of IC12. The detected voltage is output from pin 3 of IC12 depending on the signal strength of the input voltage (IC12, pin 1).

Q15 is a DC buffer amplifier. When the input voltage of IC12 (pin 1) becomes strong, the base voltage of Q16 increases. Therefore, Q15 turns Q16 ON to cut off the AGC voltage.

Q19 and Q20 are DC buffer amplifiers providing gain control to pin 1 of IC11. Q56 provides gain control to Q55 and Q14 by changing its voltage.

3-1-15 BFO AND SSB DEMODULATOR CIRCUITS (MAIN UNIT)

The BFO (Beat Frequency Oscillator) circuit consists of Q41 and Q42. The oscillator provides a beat frequency signal to the SSB demodulator circuit (D39~D42) for demodulating the 3rd IF signal into an AF signal. The BFO frequency is adjusted at L4 in SSB mode.

In LSB mode, the CPU (IC5, pin 74) on the LOGIC UNIT outputs a "HIGH" signal. The "HIGH" signal turns Q40 ON. Therefore, the capacitance of C180 and C181 is added to L14, C182 and C183 to increase the BFO oscillation by 3 kHz.

The AF signal output from the SSB demodulator circuit (D39~D41) is applied to a buffer amplifier (Q24) for AF signal switching and AF signal level adjustment in other modes.

3-1-16 FM DEMODULATOR CIRCUIT (MAIN UNIT)

The 3rd IF signal output from Q23 is buffer-amplified at Q30 and is then applied to a limiter amplifier (IC15) to eliminate the AM signal components.

The signal output from IC15 is applied to a ceramic discriminator (X3) to be demodulated into an AF signal. The AF signal is applied to an active filter circuit (Q31, Q32) to suppress the signals below 300 Hz.

3-1-17 AM DEMODULATOR CIRCUIT (MAIN UNIT)

The 3rd IF signal output from Q23 is buffer-amplified at Q30 and is then applied to an AM demodulator circuit (C168, D57) to be demodulated into an AF signal.

The AF signal is applied to a buffer amplifier (Q39) for AF signal switching and AF signal level adjustment in other modes.

3-1-18 AM/SSB/FMN AGC CIRCUIT (MAIN UNIT)

A portion of the 3rd IF signal output from Q30 is applied to an AGC detector circuit. The AGC voltage is detected at D56 and is then applied to a DC amplifier (Q38).

In AM or SSB mode, the "AM9" or "SSB9" line becomes "HIGH." The "HIGH" signal turns Q34 and Q35 ON. Therefore, R246 shortens the time constant. C161 and R247 are connected in parallel with the AGC time constant line to obtain an appropriate time constant.

In FM mode, the "FM9" line becomes "LOW." The "LOW" signal turns Q35 OFF. Therefore, C162 and R246 are connected in parallel with the AGC time constant line to obtain a rapid AGC release time.

R248 and R249 offset the AGC voltage to approximately 4 V when receiving no signal.

When the scan is in operation, the CPU (IC5, pin 91) on the LOGIC UNIT outputs a "HIGH" signal for 35 msec. on the "IFBK" signal line. The "HIGH" signal turns Q36 and Q37 ON to reset the AGC circuit.

• DEMODULATOR AND AGC CIRCUITS

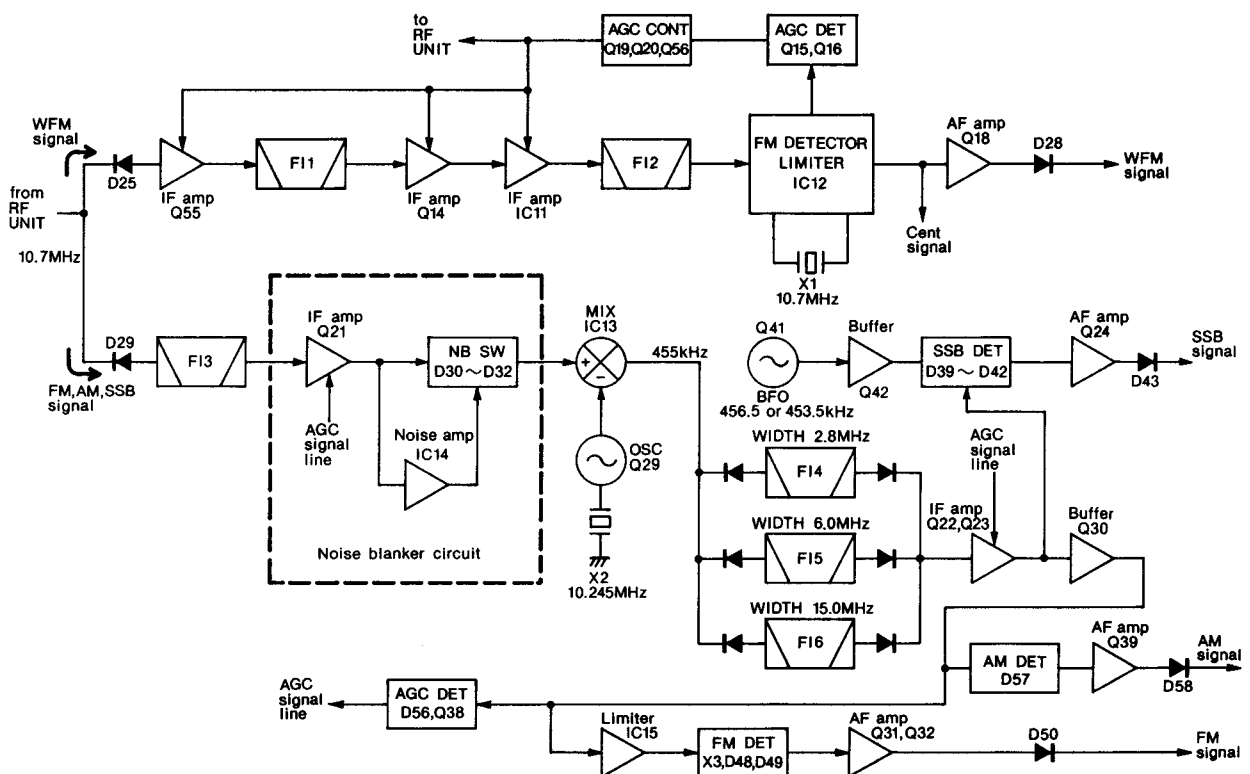

Fig. 7

3-1-19 AF AMPLIFIER CIRCUIT (MAIN AND LOGIC UNITS)

The AF signal output from the demodulator circuits is amplified at Q49. The amplified signal passes through a squelch switch (Q1) and is then applied to IC8 (pin 2). Pin 8 of IC8 is connected with the "AFUD" signal line from the LOGIC UNIT. The audio output level is varied by the [AF GAIN] control (R1) on the VR UNIT and is then applied to IC21 (pin 7) on the LOGIC UNIT through the "AFG" signal line. The signal is applied to IC8 (pin 8) on the MAIN UNIT. The AF signal is output from IC8 (pin 3) and is then power-amplified at an AF power amplifier (IC9) to drive a speaker.

The AF amplifier (Q11) amplifies the "VOIC" signal from the optional UT-36 VOICE SYNTHESIZER UNIT on the SPEECH UNIT.

3-1-20 NOISE SQUELCH CIRCUIT (MAIN UNIT)

The noise squelch functions in AM or FMN mode. Some noise components in the AF signal from the ceramic discriminator (X3) are applied to an active filter (IC17).

The active filter (IC17) amplifies noise components of frequencies 20 kHz and above, and outputs the resulting signals from pin 1. Output signals are rectified at the doubler circuit (D59, D60) and are then converted to DC voltage. The rectified noise voltage passes through a differential circuit (C179, R266) and is then applied to a DC amplifier (IC3a, pin 3).

When the scan is in operation, the CPU (IC5, pin 91) on the LOGIC UNIT outputs a "HIGH" signal for 35 msec. on the "IFBK" signal line. The "HIGH" signal turns Q36 and Q37 ON to deactivate the squelch circuit. The pulse-type signal is applied to C179 through D55 for rapid charging.

• S-METER SQUELCH CIRCUIT

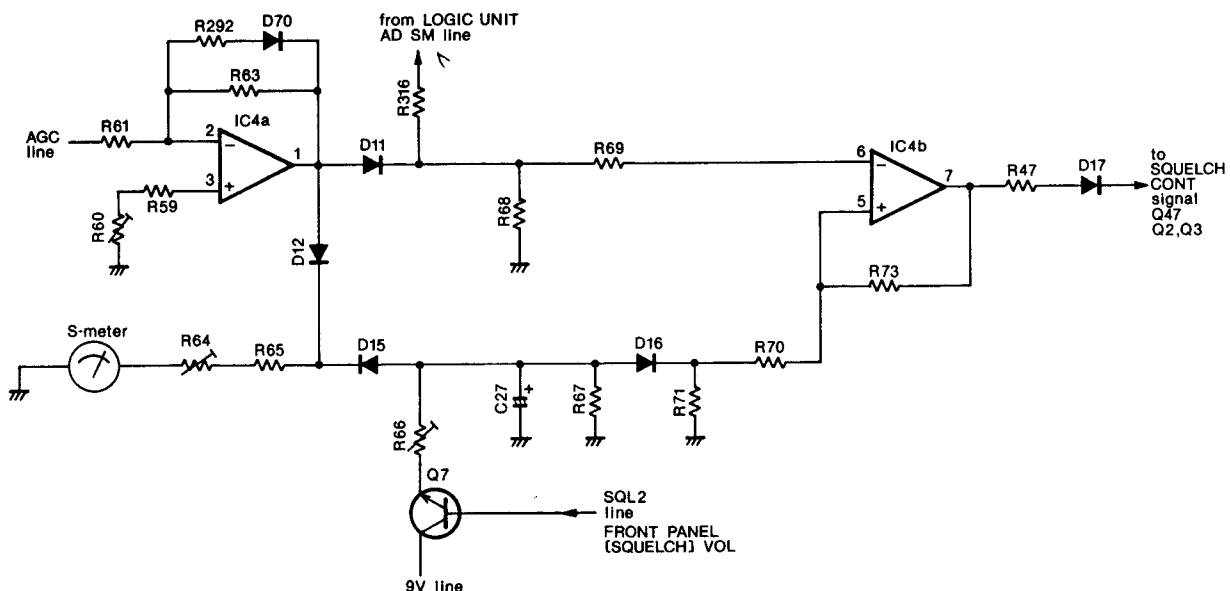

Fig. 8
3 - 8

The amplified signal passes through a voltage limiter circuit (D8, D9, R49) and is then applied to a comparator (IC3b, pin 5). The noise squelch reference voltage is applied to pin 6 of IC3b and is varied by the [SQUELCH] control on the VR UNIT. R51 adjusts the input level of IC3b (pin 6).

The noise squelch is output from IC3b (pin 7) and is then applied to the base of Q47 through D10. Q51 short-circuits the output from IC3b (pin 7) in SSB mode.

3-1-21 S-METER SQUELCH AND S-METER CIRCUITS (MAIN UNIT)

The S-meter squelch functions in any mode. The AGC voltage is inverted and amplified at IC4a. The signal output from IC4a (pin 1) passes through D11 and is then applied to a comparator (IC4b, pin 6). The "ADSM" voltage line from D11 is applied to IC15 (pin 5).

The S-meter squelch reference voltage passes through a DC amplifier (Q7) and is then applied to the comparator (IC4b, pin 5) through D16 and is varied by the [SQUELCH] control on the VR UNIT. R66 adjusts the input level of IC4b (pin 5). This reference voltage is added to the S-meter voltage and is then applied to the [S.METER] on the FRONT PANEL through D15 to indicate the S-meter squelch threshold level.

The S-meter squelch is output from IC4b (pin 7) and is then applied to the base of Q47 through D17.

3-1-22 SQUELCH SWITCH CIRCUIT (MAIN UNIT)

Q47 switches Q2 ON or OFF depending on the output level from the comparators (IC3b, IC4b). Q3 controls the gate voltage of Q1 by using the collector voltage of Q2. Q1 cuts out the AF signal when the squelch is closed. Q2 outputs a "BUSY" signal to the LOGIC UNIT and lights up the [BUSY] indicator on the FRONT PANEL when the squelch is open.

3-1-23 VSC CIRCUIT (MAIN UNIT)

The VSC (Voice Scanning Control) detects the AF signal during scanning and skips undesired signals such as unmodulated signals, beat signals and noise component signals.

The AF signal output from the squelch switch (Q1) passes through an active filter circuit (IC1a, R8~R13, C6~C10) which attenuates the components of frequencies 1 kHz and above. The filtered signal is amplified sufficiently at IC1b and is then detected at D2. The detected voltage is charged at C15 and is then applied to a comparator (IC2b). Pin 7 of IC2b outputs a "HIGH" signal only when receiving AF signals.

C15 and R22 set the charge time. The release time is set at R23.

Q4, Q5 and Q52 control a relay circuit (RL1) for the [REC REMOTE] jack on the REAR PANEL. RL1 is turned ON by the "MO" signal from the LOGIC UNIT when receiving AF signals. VSC operation is given priority even when the squelch is open. When the VSC function is activated, RL1 is turned OFF by the "MO" signal from the LOGIC UNIT.

3-1-24 CENTER DETECTOR AND CENTER METER CIRCUITS (MAIN UNIT)

The center detector circuit adjusts the center frequencies of the IF signals in the WFM and FM demodulator circuits.

R224 adjusts the mismatch of the center frequencies by using the offset voltage from R224, R225 and R229.

The center signal passes through a DC amplifier (Q17 or Q43). The amplified signal is inverted and amplified at IC2a.

The resulting signal is output from IC2a (pin 1) and is then applied to IC15 (pin 4).

The center signal is applied to a window comparator (IC5a, IC5b).

R78 adjusts the offset voltage to 0 V output from IC5 when the receive frequency is matched with the center frequency. When the receive frequency is not matched with the center frequency, the cathodes of D18 and D19 become "HIGH." The scanning control circuit prevents malfunction caused by adjacent channels and spurious emissions.

3-1-25 SCANNING CONTROL CIRCUIT (MAIN UNIT)

Output signals from the squelch and center detector circuits are applied to the base of Q9. Q9 turns OFF only when both of them are "LOW." In other words, Q9 turns OFF when the squelch is open in the center frequency. The collector of Q9 provides the "STOP" signal to the LOGIC UNIT. The "STOP" signal becomes "HIGH" when the scanning function stops. When the scan is in operation, the CPU (IC5, pin 91) on the LOGIC UNIT outputs a "HIGH" signal for 35 msec. on the "IFBK" signal line. The "HIGH" signal is applied to D66 and turns Q9 ON to deactivate the scanning circuit. Q8 and D20 turn OFF the output from the center detector circuit in SSB mode.

3-1-26 IF FILTER SWITCHING CIRCUIT (MAIN UNIT)

The mode signals from the LOGIC UNIT select the IF filters in the separate modes by using the diode matrix (D51, D52, D67, D68), the mode voltage switching circuit (Q33, Q48, Q53, Q54) and a voltage buffer (IC8). The voltage buffer (IC8) converts the mode signals to the needed levels to drive each mode.

• CENTER DETECTOR CIRCUIT

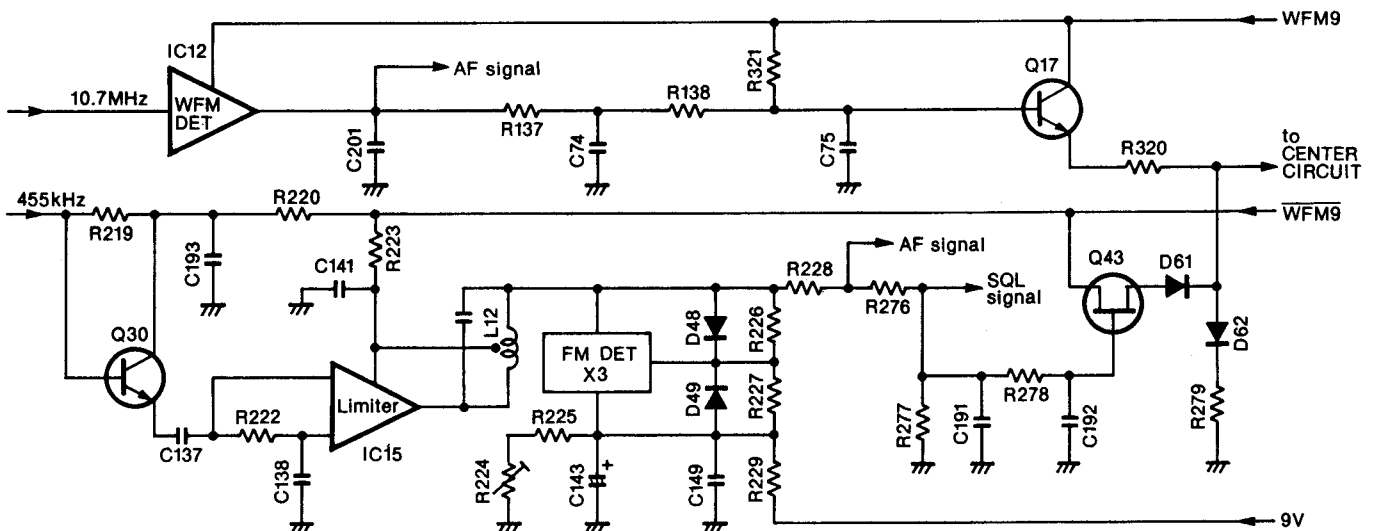

Fig. 9

3-1-27 TIMER CONTROL CIRCUIT (MAIN UNIT)

Q13 controls a relay circuit (RL2) for the timer function. The CPU (IC5, pin 34) on the LOGIC UNIT outputs a "HIGH" signal when the [TIMER] switch is pushed OUT. The "HIGH" signal is applied to Q13 through the "POC" line and turns RL2" ON.

3-1-28 REGULATOR CIRCUIT (MAIN UNIT)

IC10 is a voltage regulator providing a stable 9 V to the MAIN and RF UNITS.

3-2 PLL CIRCUITS

3-2-1 GENERAL

The PLL circuit oscillates a 1st LO frequency (778.7000 ~1291.6999 MHz) for the 1st mixer circuit on the MIX1 UNIT and a 2nd LO frequency (256 or 768 MHz) for the 2nd mixer circuit on the MIX2 UNIT. The IC-R7100 uses a heterodyne down converter PLL system. The heterodyne down converter PLL system employs a mixer circuit in the PLL loop circuit to cut off the high frequency components by mixing the frequencies when the VCO frequency exceeds the maximum frequency that the PLL IC can divide.

• PLL CIRCUIT

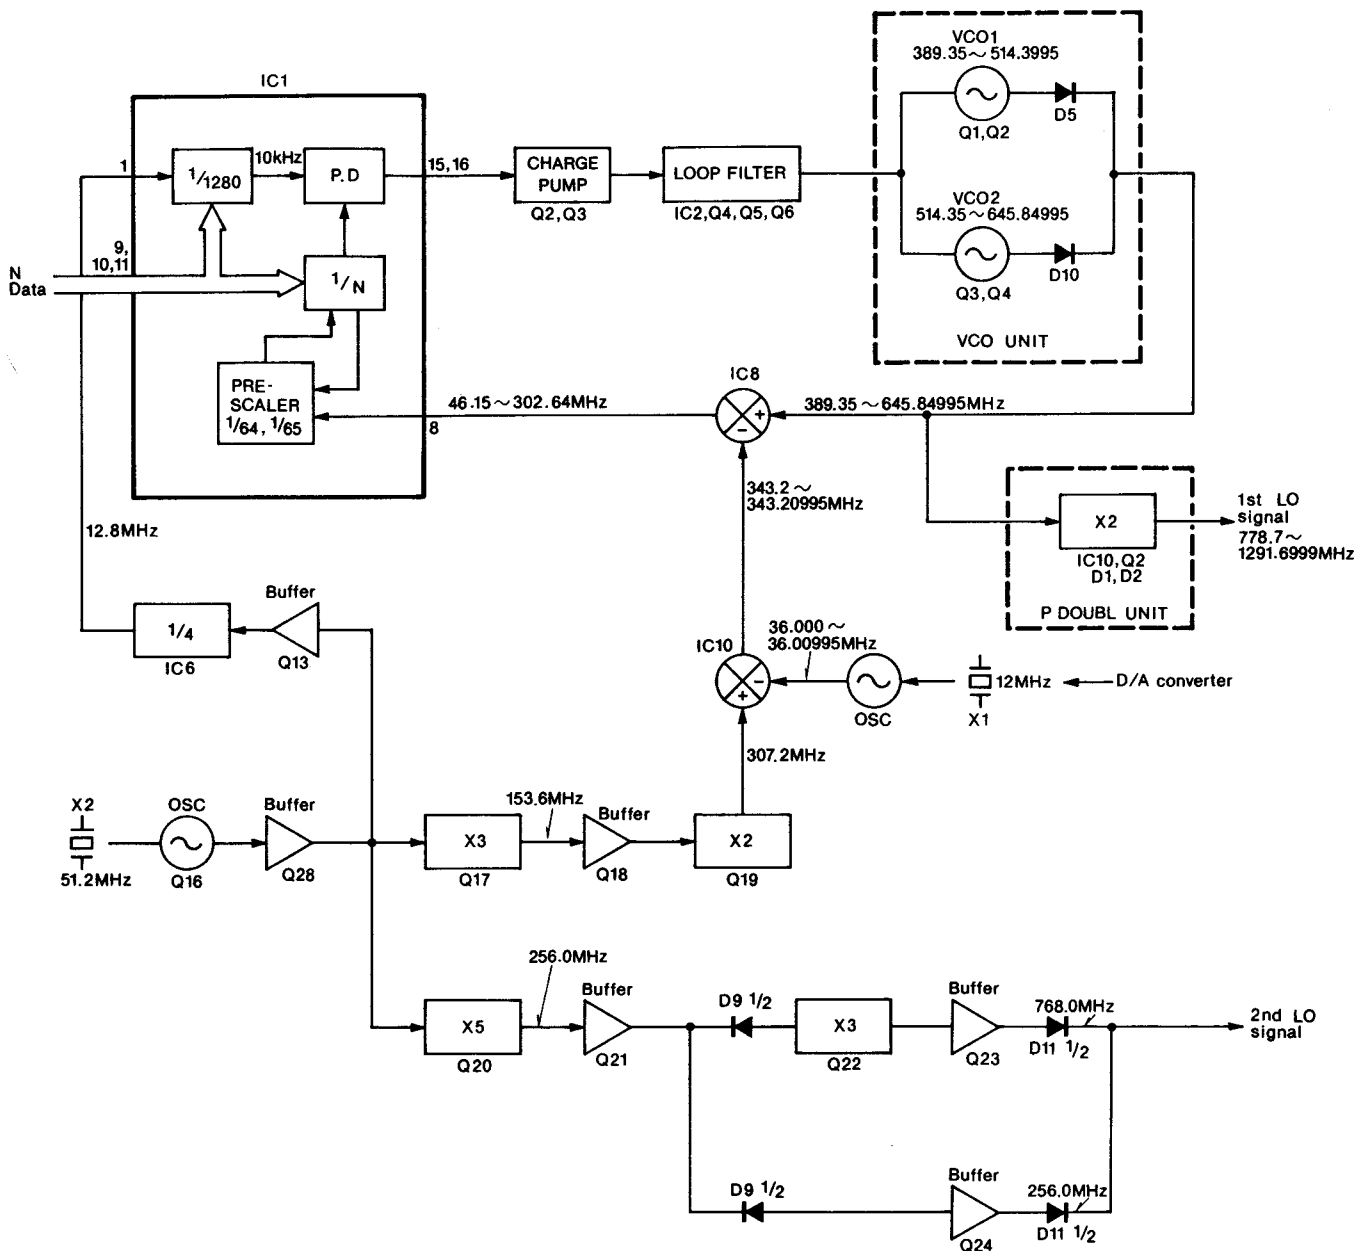

Fig. 10

3-2-2 REFERENCE OSCILLATOR CIRCUIT (PLL UNIT)

The IC-R7100 employs two reference oscillator circuits.

The 51.2 MHz reference oscillator circuit consists of Q16 and X2. The 51.2 MHz reference frequency is applied to a buffer amplifier (Q28). The amplified signal enters a buffer amplifier (Q13) or a tripler (Q17) or a 2nd LO circuit.

The reference frequency from the buffer-amplifier (Q13) is then divided by 4 at IC6 and applied to the PLL IC (IC1, pin 1).

The 51.2 MHz reference frequency from the tripler (Q17) is applied to a filter circuit (L25~L27) to eliminate spurious signals and is then buffer-amplified at Q18. The amplified signal passes through the doubler (Q19) and is applied to a helical bandpass filter (L31, L32) to eliminate spurious signals. The filtered signal is mixed with a reference frequency from X1 and Q14.

The 12.0 MHz reference oscillator circuit consists of X1 and Q4. The 12.0 MHz reference frequency is generated at X1 and is then multiplied by 3 at Q14. The resulting signal is applied to IC10 to be mixed with a reference frequency from X2 and Q16.

The resulting signal from IC10 is buffer-amplified at IC9 and is then applied to L19 to eliminate the spurious signals and then to IC8 to be mixed with VCO output from the VCO UNIT.

3-2-3 2nd LO CIRCUIT (PLL UNIT)

The 51.2 MHz reference signal is multiplied by 5 at Q20 and is then applied to a filter circuit (L36~L38) to eliminate spurious signals. The filtered signal is then buffer-amplified at Q21 and applied to the two separate amplifier circuits.

(1) 256.0 MHz 2nd LO

The amplified signal from Q21 is re-amplified at Q24 to obtain a 256.0 MHz 2nd LO signal.

(2) 768.0 MHz 2nd LO

The amplified signal from Q21 is multiplied by 3 at Q22 and is then applied to a helical bandpass filter (L42) to eliminate spurious signals. The filtered signal is buffer-amplified at Q23 to obtain a 768.0 MHz 2nd LO signal.

Either a 256.0 MHz or a 768.0 MHz 2nd LO signal is applied to the 2nd mixer circuit (IC7) on the MIX2 UNIT to produce a 10.7 MHz 2nd IF signal.

3-2-4 VCO CIRCUIT (VCO UNIT)

The VCO circuit consists of two VCO's on the VCO UNIT. VCO1 (Q1, Q2, D1~D4) generates the 389.35~514.3995 1st LO frequency, while the VCO2 (Q3, Q4, D6~D9) generates the 514.35~645.84995 MHz 1st LO signal. The varactor diodes (D1~D4, D6~D9) provide frequency control.

The output signal from the VCO circuit either passes through a three-stage low-pass filter (L59~L61, C147~C152) and is then applied to the P DOUBL UNIT or is amplified at IC3 and is then applied to IC8 to be mixed with a reference frequency from IC9.

The resulting signal from IC8 is applied to a low-pass filter circuit (L14, L15) to eliminate spurious signals and is then buffer-amplified at Q15. The amplified signal is applied to the PLL IC (IC1, pin 8).

3-2-5 DOUBLER CIRCUIT (P DOUBLE UNIT)

The VCO oscillation (389.35~645.84995 MHz) is buffer-amplified at IC10 and is then applied to a low-pass filter (strip line, C168~C172). The filtered signal is buffer-amplified at Q2 and then applied to a doubler circuit (D1, D2, L5). The amplified signal passes through a band-pass filter (strip line, C113~C115, C175, C195, C196) and a low-pass filter (strip line, C188~C192) to suppress unwanted signals. The resulting 778.7~1291.7 MHz 1st LO signal is applied to the MIX1 UNIT to produce a 266.7 or 778.7 MHz 1st IF signal.

3-2-6 PROGRAMMABLE DIVIDER AND PHASE DETECTOR CIRCUITS (PLL UNIT)

The programmable divider shifts the dividing ratio with a prescaler depending on the operating frequency and determines the VCO oscillating frequency.

The phase detector circuit detects the off-phase components of the VCO frequency using a stable reference frequency.

IC1 is a one-chip PLL IC that contains a two-modulus prescaler, a swallow counter, a programmable divider and a phase detector. IC1 accepts up to 520 MHz inputs.

The input signal from PLL IC (IC1, pin 8) passes through the two-modulus prescaler and the programmable counter sections of IC1. A 10 kHz reference frequency is applied to IC1 (pin 1) and passes through a programmable reference counter section of IC1. Both of the divided signals are compared at the phase detector section of IC1. The phase-detected signal (pulse signal) is output from IC1 (pins 15 and 16).

3-2-7 CHARGE PUMP AND LOOP FILTER CIRCUITS (VCO AND PLL UNITS)

The phase-detected signal (pulse signal) from IC1 (pins 15 and 16) passes through the charge pump (Q2, Q3) and is then applied to an active loop filter (Q4~Q6). The pulse signal is converted to DC voltage (PLL voltage) to control oscillation from the VCO UNIT. A charge pump (Q2, Q3) is used to expand the range of the PLL lock voltage. The PLL lock voltage changes the reactance of the varactor diodes (D1~D4, D6~D9) in the VCO circuit.

3-3 LOGIC CIRCUITS

The LOGIC circuit consists of a one chip 8-bit CPU (IC5), an I/O expander (IC4) controlling the input level from the key matrix, a 64 k-bit CMOS RAM (IC11) and a CI-V circuit. The 64 k-bit CMOS RAM (IC11) contains 900 memory channels which can be divided into 9 banks and 20 independent, program channels. The CI-V circuit controls frequency, mode, memory channels etc., by connecting the receiver with an optional CT-17 CI-V LEVEL CONVERTER to a personal computer equipped with an RS-232C port.

3-3-1 RESET CIRCUIT (LOGIC UNIT)

The reset circuit resets the CPU (IC5), the LCD drivers (IC8, IC9) and the I/O expander (IC4) when the three-terminal voltage regulator (IC13) detects 5 V and outputs 5 V. The leading edge voltage is applied to a time constant (R24, C22). The "LOW" pulse-type signal is output from the time constant during the delay time. The signal is inverted at Q6 and is then applied to a Schmitt trigger circuit (IC7) to tune the pulse-type signal. The reset signal is applied to the reset ports of the CPU (IC5), the LCD drivers (IC8, IC9) and the I/O expander (IC4). D14 discharges the voltage of C22.

3-3-2 DIMMER CIRCUIT (LOGIC UNIT)

The dimmer circuit consists of Q2, Q3 and D16 and drives backlights (DS4~DS7), ensuring that brightness does not change even with a change of power supply. When the [DIMMER] switch is ON, the CPU (IC5, pin 56) outputs a "LOW" signal to decrease the base voltage of Q3.

• DIMMER CIRCUIT

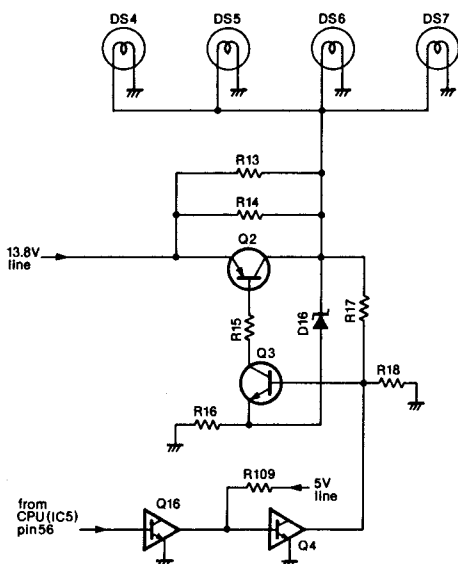

Fig. 11

3-3-3 REGULATOR CIRCUIT (LOGIC UNIT)

IC23 is a 5 V three-terminal regulator. The "LHV" line is converted from the "HV" line and passes through a resistor (R291) on the MAIN UNIT. Then, the voltage line is applied to IC23. The time constant consists of R291 on the MAIN UNIT and C71 on the LOGIC UNIT and protects the 5 V line from any drastic changes.

3-3-4 BAND SELECTION DATA (LOGIC UNIT)

The band control signals are changed depending on the receive frequencies. The CPU (IC5) outputs the following signals for the RF UNIT, PLL UNIT and MAIN UNIT.

RECEIVE FREQUENCY	RF BAND					PLL		CONV
	B1	B2	B3	B4	BH	BS	VS	
25.0000~ 89.9999 MHz	H	L	L	L	L	L	H	L
90.0000~ 249.9999 MHz	L	H	L	L	L	L	H	L
250.0000~ 511.9999 MHz	L	L	H	L	H	L	L	L
512.0000~ 761.9999 MHz	L	L	L	H	L	H	H	L
762.0000~ 1024.9999 MHz	L	L	L	H	H	H	L	L
1025.0000~ 1089.9999 MHz	H	L	L	L	L	L	H	H
1090.0000~ 1249.9999 MHz	L	H	L	L	L	L	H	H
1250.0000~ 1511.9999 MHz	L	L	H	L	H	L	L	H
1512.0000~ 1761.9999 MHz	L	L	L	H	L	H	H	H
1762.0000~ 1999.9999 MHz	L	L	L	H	H	H	L	H

3-3-5 CPU (IC5) PORT ALLOCATIONS (LOGIC UNIT)

PORT NUMBER	PORT NAME	PIN NUMBER	DESCRIPTION
P00~ P04	B1~ B4, BH	14~18	Outputs the band control signals for the RF UNIT. See the table shown in the BAND SELECTION DATA (3-3-4).
P05	CONV	19	Outputs a band control signal for the MAIN UNIT. See the table shown in the BAND SELECTION DATA (3-3-4).
P06, P07	VS, BS	20, 21	Outputs the band control signals for the PLL UNIT. See the table shown in the BAND SELECTION DATA (3-3-4).
P10	DIM	56	Becomes "LOW" when the [DIMMER] switch is ON.
P11	SSTB	57	Outputs a strobe signal for an optional UT-36 VOICE SYNTHESIZER UNIT.
P12	PSTB	58	Outputs a strobe signal for a PLL IC (IC1) on the PLL UNIT.
P13	EXSTB	59	Outputs a strobe signal for a D/A control IC (IC14) on the PLL UNIT.
P14	REML	61	Outputs an indicator signal for the [REMOTE] indicator on the front panel. This port becomes "HIGH" when the CPU enters the remote condition via the CI-V system.

PORT NUMBER	PORT NAME	PIN NUMBER	DESCRIPTION
P15	MO	62	Outputs a control signal for the [REC REMOTE] jack. This port becomes "HIGH" when the CPU drives a tape recorder to record receive audio.
P16	NB	63	Becomes "HIGH" when the [NB • AFC] switch is ON.
P17	ATT	64	Becomes "HIGH" when the [ATT] switch is ON.
P20	LBUSY	75	Inputs "BUSY" signals for LCD drivers (IC8, IC9) on the LOGIC UNIT.
P21	STOP	76	When the port becomes "LOW," the CPU is changed to the backup mode.
P22	DCK	77	Input port for the main dial clock pulses.
P23	DUP	79	Input port for the main dial UP signal.
P24	DDN	80	Input port for the main dial DOWN signal.
P24	SQLS	81	Detects a squelch signal. When the signal is "LOW," the squelch opens.
P25	VSC	82	Detects a VCS signal. This port becomes "HIGH" when the VSC circuit detects an audio signal.
P27	AD1	83	Inputs serial data from the A/D converter.
P30	CIVRX	85	Input port for CI-V data.
P31	CIVTX	86	Outputs CI-V data.
P32	CK	87	Outputs serial clock signals.
P33	DATA	88	Outputs serial data.
P34	POC	89	Becomes "HIGH" when the timer function turns the receiver ON.
P35	BEEP	90	Outputs 1 kHz or 500 Hz square waves used for beep tones.
P36	BKIF	91	Outputs a "HIGH" pulse of 35 msec. width during scanning when the [LOCK] switch is ON.
P37	LCDCD	92	Outputs command/data selector signals for the LCD drivers (IC8, IC9) on the LOGIC UNIT.
P40~ P47	AD0~ AD7	49~42	Input and output ports for address bus data.
P50~ P54	A8~ A12	40~36	Output ports for the address bus.
P55	A13	34	Not used.
P56, P57	A14, A15	33, 32	Outputs selector signals for the RAM IC (IC11) on the LOGIC UNIT.
P60	EXCS	30	Outputs selector signals for the I/O expander IC (IC4) on the LOGIC UNIT.
P61	TMCS	29	Outputs selector signals for the real time clock IC (IC12) on the LOGIC UNIT.

PORT NUMBER	PORT NAME	PIN NUMBER	DESCRIPTION
P62, P63	ADC0, ADC1	28, 27	Outputs channel selector signals for the A/D converter IC (IC15) on the LOGIC UNIT.
P64	RD	26	Outputs a strobe signal for memory reading.
P65	WR	25	Outputs a strobe signal for memory writing.
P66, P67	LCS1, LCS2	24, 23	Outputs chip selector signals for the LCD drivers (IC8, IC9) on the LOGIC UNIT.
P70	FIL W	67	Becomes "HIGH" when FM or AMW mode is selected.
P71	ADCS	68	Outputs chip selector signals for the A/D converter IC (IC 15) on the LOGIC UNIT.
P72	SSB	69	Becomes "HIGH" when SSB mode is selected.
P73	AM	71	Becomes "HIGH" when AMW or AM mode is selected.
P74	FM	72	Becomes "HIGH" when FM or FMN mode is selected.
P75	WFM	73	Becomes "HIGH" when WFM mode is selected.
P76	U/L	74	Becomes "LOW" when USB mode is selected. This port becomes "HIGH" in other modes.
PT0	VBUSY	93	Inputs a "BUSY" signal for an optional UT-36 VOICE SYNTHESIZER UNIT. This port becomes "HIGH" while synthesizing.
PT1~ PT7	—	94, 1~6	Not used.

SECTION 6 ADJUSTMENT PROCEDURES

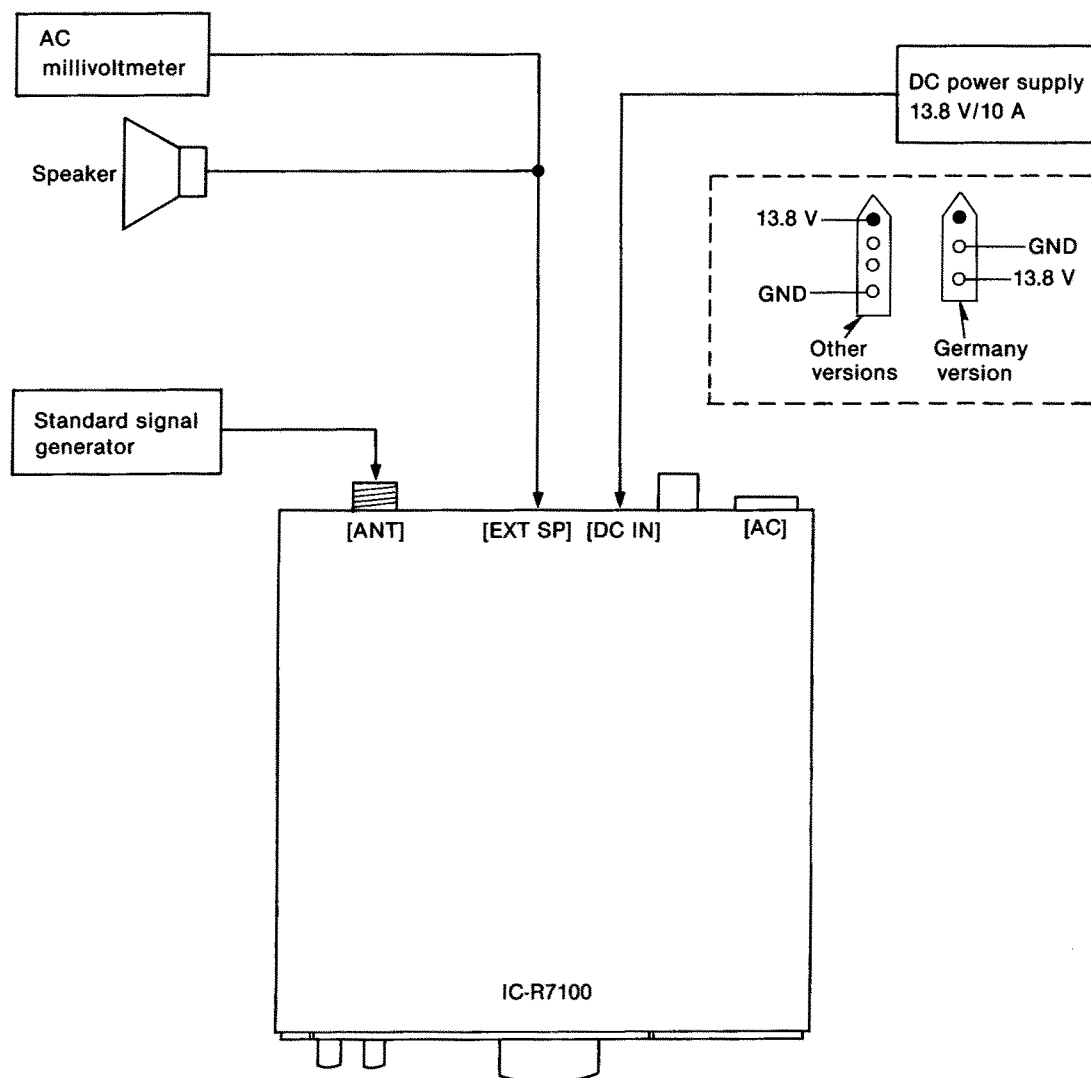

6-1 PREPARATION BEFORE SERVICING

■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 13.8 V DC Current capacity : 10 A or more	Oscilloscope	Frequency range : DC~50 MHz Measuring range : 0.01~10 V
Frequency counter	Frequency range : 0.1 MHz~1 GHz Frequency accuracy : ± 1 ppm or better Sensitivity : 100 mV or better	AC millivoltmeter	Measuring range : 10 mV~10 V
RF voltmeter	Frequency range : 0.1 MHz~50 MHz Measuring range : 0.01~10 V	External speaker	Impedance : 8 Ω
Distortion meter	Frequency range : 1 kHz \pm 10 Hz Measuring range : 1~100 %	Standard signal generator (SSG)	Frequency range : 0.1 MHz~2 GHz Output level : -127~-17 dBm (0.1 μ ~32 mV)
		DC voltmeter	Input impedance : 50 k Ω /DC or better

CW: Clockwise CCW: Counterclockwise CP: Checkpoint

■ CONNECTION

6-2 PLL ADJUSTMENT

ADJUSTMENT	ADJUSTMENT CONDITIONS		MEASUREMENT		VALUE	ADJUSTMENT POINT		
			UNIT	LOCATION		UNIT	ADJUST	
2nd LO OUTPUT LEVEL	1	• Displayed frequency: 512.000 MHz	PLL	Connect a spectrum analyzer or RF voltmeter to J5.	Maximum value (More than -8dBm)	PLL	L36, L37 L38, L39 L47	
	2	• Displayed frequency: 511.9999 MHz					Maximum value (More than -3dBm)	L42, L44
NOTE: Wait a few minutes after power ON to perform each adjustment.								
2nd LO OUTPUT FREQUENCY	1	• Displayed frequency: 511.9999 MHz	PLL	Connect a frequency counter to J5.	768.0000 MHz	PLL	C69	
	2	• Displayed frequency: 512.0000 MHz			256.0000 MHz ± 100 Hz		Verify	
IF	1	• Displayed frequency: 512.0000 MHz	PLL	Connect a spectrum analyzer or RF voltmeter to CP (L29 side).	Maximum value (More than -3dBm)	PLL	L29, L25 L26, L27	
D/A OSC FREQUENCY	1	• Displayed frequency: 512.0000 MHz					Maximum value (More than -18dBm)	L11, L12
1st LO OUTPUT FREQUENCY	1	• Displayed frequency: 145.0000 MHz • Mode : FM					Connect a frequency counter to J4.	923.7000 MHz
	2	• Display frequency : 149.9999 MHz	923.6999 MHz	R41				
NOTE: Repeat steps 1 and 2 (several times).								

6-3 LOCAL OSCILLATOR ADJUSTMENT

ADJUSTMENT	ADJUSTMENT CONDITIONS		MEASUREMENT		VALUE	ADJUSTMENT POINT			
			UNIT	LOCATION		UNIT	ADJUST		
3rd LO OUTPUT FREQUENCY	1	• Displayed frequency: 145.0000 MHz • Mode : USB	MAIN	Connect a frequency counter to R217 (C93 side).	10.2450 MHz	MAIN	C132		
BFO FREQUENCY	1	• Displayed frequency: 145.0000 MHz • Mode : USB					Connect a frequency counter to W29.	456.5 kHz	L14
	2							453.5 kHz	C181
