CIRCUIT DESCRIPTION

4-1 MAIN UNIT

MAIN UNIT has RF circuits, 1st and 2nd IF circuits, FM and AM demodulator circuits. The RX signals from the antenna are filtered, amplified and converted into the 1st and 2nd IF signals in sequence, then FM/AM-demodulated.

ATTENUATOR CIRCUIT

RF signals from the antenna are passed through the limiter (D1) and ATT SW (D2), then applied to the band SWs which select the appropriate bandpass/low-pass filter according to the RX frequency.

When the attenuator is inactivated, Q2 is OFF and the RX signals are passed through D2. When the attenuator is activated, Q2 is ON and the RX signals are passed through the attenuator for 20 dB attenuation. The switching of Q2 and D2 is carried out by Q3 with the control signal "ATT."

RF AMP/FILTER CIRCUITS (BC/HF BAND)

The 0.15–76 MHz RX signals are passed through the diode SW (D4) and LPF for unwanted signal removal and diode SW (D28), then applied to the RF AMP (Q12, D33, 34).

When the "external antenna" is selected for AM broadcast RX, the 0.5–3 MHz RX signals are passed through the diode SW (D5) and the BPF (D53, etc.), then applied to the RF AMP (Q12, D33, 34) via the diode SW (D29).

When the "internal bar antenna" is selected, the 0.5–1.6 MHz RX signal is passed through the diode SW (D27) and applied to the RF AMP (Q12, D33, 34) via the diode SW (D29).

The amplified RX signals from the RF AMP (Q12, D33, 34) are applied to the wide band RF AMP (IC1) via the diode SW (D37).

RF AMP/ FILTER CIRCUITS (VHF BAND)

The 76–350 MHz RX signals are passed through the diode SW (D7) and HPF/LPF (D57, etc.) for unwanted signal removal, and applied to the RF AMP (Q7, D14, 15).

The amplified RX signals are passed through the tuned BPF (D31, 35, 58, etc.) for unwanted signal removal, and applied to the wide band RF AMP (IC1) via the diode SW (D38).

When the RX frequency is 160 MHz and higher, the center frequency of BPF is shifted to higher by D51 and D52.

RF AMP/FILTER CIRCUITS (UHF BAND)

The 350–470 MHz RX signals are passed through the diode SW (D8) and HPF/LPF for unwanted signal removal, and applied to the RF AMP (Q41, 42, D18, 19).

The amplified RX signals are passed through the tuned BPF (D32, 36, etc.) for unwanted signal removal, and applied to the wide band RF AMP (IC1) via the diode SW (D40).

RF AMP/FILTER CIRCUITS (800 MHz BAND)

The 470–833 MHz RX signals are passed through the diode SW (D9) and tuned BPF (D12, 13, etc.) for unwanted signal removal, and applied to the RF AMP (Q5, D20, 21).

The amplified RX signals are passed through the tuned BPF (D25, 26, etc.) for unwanted signal removal, and applied to the wide band RF AMP (IC1) via the diode SW (D41).

RF AMP/FILTER CIRCUITS (1 GHz BAND)

The 833–1300 MHz RX signals are passed through the diode SW (D10) and HPF/LPF for unwanted signal removal, and applied to the RF AMP (Q6, D22, 23).

The amplified RX signals are applied to the wide band RF AMP (IC1) via the diode SW (D42).

REGULATOR SWs

The power supply for each RF circuit (3V) is switched by Q11, 17, 18 and 19.

1st MIXER and 2nd MIXER

The RX signals from each RF circuit are amplified by the wideband RF AMP (IC1) and passed through the attenuator, then applied to the 1st mixer (IC5). The RX signals are mixed with the 1st LO signals from the 1st VCO UNIT to be converted into the 429.1 MHz 1st IF signal.

The 429.1 MHz 1st IF signal is filtered by the 1st IF filter (FI1) to remove unwanted signals, then applied to the 2nd mixer (IC8).

The 2nd IF signal is mixed with 2nd LO signals from the 2nd VCO UNIT to be converted into the 2nd IF signal; 19.65 MHz for AM/FM mode, 20.75 MHz for WFM mode.

In AM/FM mode operation, the 2nd IF signal is filtered by the 2nd IF filter (FI2) to remove unwanted signals, then applied to the 2nd IF AMP (Q31).

In WFM mode operation, the 2nd IF signal is by-passed the 2nd IF filter (FI2).

The path of 1st IF signal is switched by diode SWs (D44, 49).

• WFM MODE

The 3rd IF signal is by-passed FI3, and applied to the FM demodulator circuit. The path of 3rd IF signal is switched by diode SWs (D47, 48) controlled by Q37.

In WFM mode operation, the 3rd IF signal (1.55 MHz) is FM-demodulated by the LC resonator for WFM demodulation. The switching of mode (WFM) is controlled by Q38, 40.

• AM MODE

The 3rd IF signal is amplified by Q26 and AM-demodulated by Q25.

• Ripple Filter

The ripple filter is composed by Q4, C32 and R21, and removes ripples contained in the voltage line for regulated voltage for the VCO.

4-4 LOGIC UNIT

The LOGIC UNIT has CPU, D/A converter (DAC), AF circuits and power supply circuits. The CPU and DAC control the whole operation of the receiver (RX frequency setting, BPF tuning etc.), and the AF circuits filter, amplify and tone-control the demodulated AF signals. The power supply circuits supply the voltage for each circuits.

CPU

IC17 is a 16 bits CPU that integrated ROM, RAM, the intrude controller, real time pulse unit, serial interface and A/D converter on the chip, and the CPU and external EEPROM (IC14 and IC15) compose the main control system of receiver.

RESET CIRCUIT

RESET CIRCUIT power-detects of ON/OFF with IC6, and resets the CPU when the receiver is turned ON/OFF.

CLOCK CIRCUIT

The clock frequency (around 12.288 MHz) of the CPU is oscillated by X1, C19 and 22. The clock frequency is able to be shifted to prevent spurious interference.

DAC

IC16 is a 3-ch 8-bit D/A converter. The DAC controls the LO frequencies, gain of RF AMP, tuning voltage, etc. according to the serial data from the CPU.

DC UPCONVERTER

The clock signal from the CPU is upconverted to 12 V DC by the full-wave rectification circuit (IC11, D24 to 27). The upconverted voltage is passed through the ripple filter (Q24, C158, 195) then applied to the VP terminal of PLL IC as the charge pump voltage.

POWER SUPPLY CIRCUITS

IC3 is a 3.2 V 3-terminal regulator and supplies voltage to CPU, EEPROM and RESET IC. While the receiver's power is ON, +3 V DC is provided by Q2.

IC4 is also 3.2 V 3-terminal regulator and supplies 3 V (as R3V) in power save mode.

BAR ANTENNA TUNING CIRCUIT

The internal bar antenna for AM broadcast band RX is tuned to the frequency to receive by varying the capacitance of D19 using the voltage from DC-DC upconverter via Q21 and D37.

DECODE CIRCUIT

The demodulated AF signals "DET" from each detector circuit are passed through the tone filter (1/2 of IC12) and applied to the CPU for tone signal interpretation.

Another 1/2 of IC12 composes the LPF for VSC function, and cut the AF line when unwanted continuous audible signals is out there.

The demodulated AF signals from detector circuit are also applied to the CPU for other tone signals interpretation (WX/ MSK) via some LPFs.

AF CIRCUITS

Other than WFM mode operation, and when the AF filter is activated, the demodulated AF signals are passed through the AF filter (Q20) and applied to Q18.

In WFM mode operation, and when the AF filter is inactivated, the demodulated AF signals are passed through Q23 and applied to Q18.

The amplified AF signals from Q18 are applied to the tone controller (IC19). The tone controller adjusts the frequency characteristic of the AF signals. The output signals of tone controller are then applied to the electric VR IC (IC10) and level-adjusted.

AF AMP

The level-adjusted AF signals are power-amplified by the speaker AMP (IC9), then applied to the external/internal speaker.

CHARGING CONTROL CIRCUIT

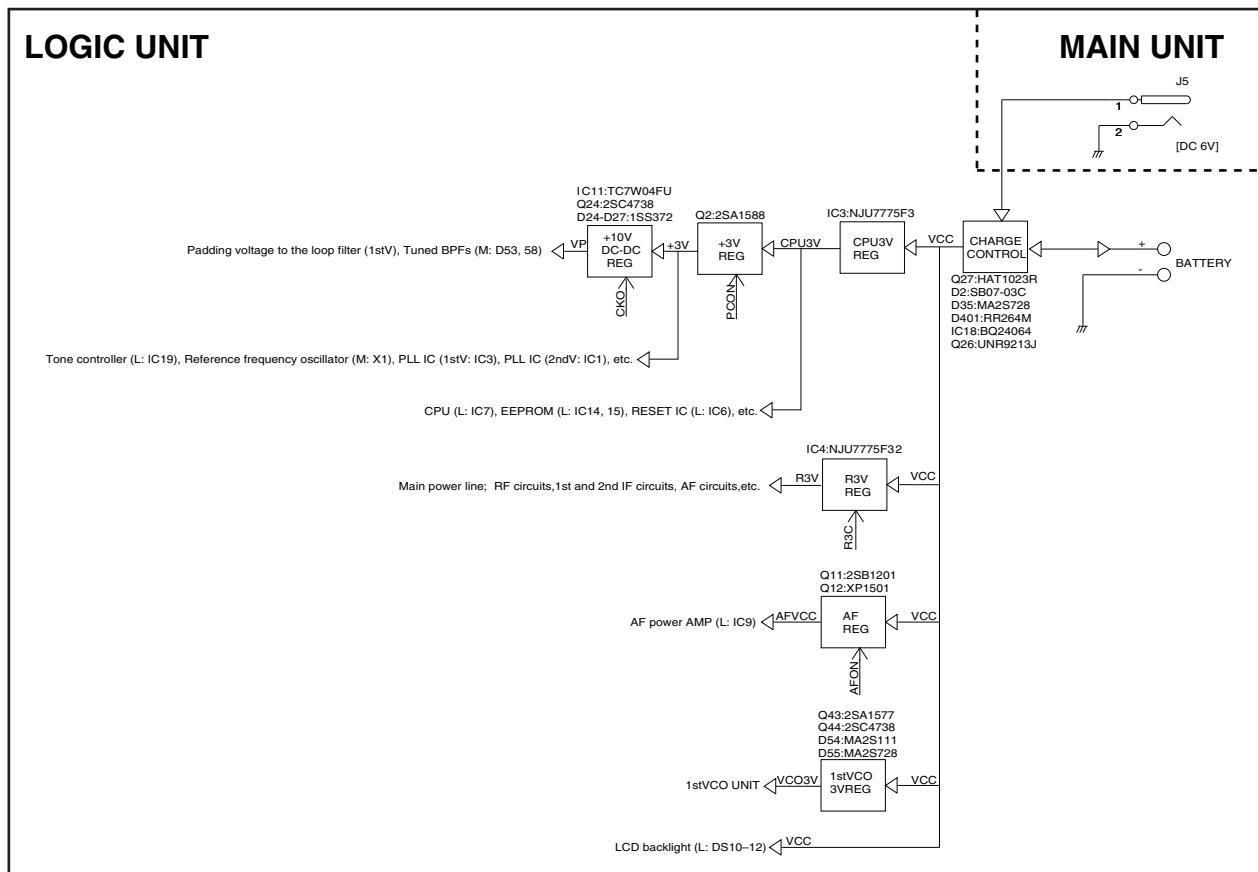

IC18 is a charge control IC that contains battery connect detection, full charge detection, charging current control, temperature detection, etc. The remaining battery capacity and type of battery is detected by the voltage to be applied to pin 2, and the IC interpret whether pre-charge is necessary or not.

The charging period is set by resistors connected to the pins 2 and 6, and the temperature is ministered by the voltage to be applied to pin 8 with external thermostat.

While charging, pin 3 outputs "L" level to the CPU for charging indication on the LCD. Only when an external power supply is connected and chargeable batteries are detected through "BDET" terminal, the IC permits to start charging.

4-5 VOLTAGE DIAGRAM

Voltage from the power supply is routed to the whole of the receiver via the regulators and switches.
