

SERVICE MANUAL

DUAL BAND FM TRANSCEIVER

IC-T7A

IC-T7E

INTRODUCTION

This service manual describes the latest service information for the **IC-T7A/E DUAL BAND FM TRANSCEIVER** at the time of publication.

5 versions of the **IC-T7A/E** have been designed. This service manual covers each version.

MODEL	VERSION NUMBER	VERSION	SYMBOL
IC-T7A	#05	U.S.A.	USA
	#07	Australia	AUS
	#09	SE Asia	SEA
IC-T7E	#02	Europe	EUR
	#04	Italy	ITA

To upgrade quality, any electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1110002700 S.IC NJM2904M-T1 IC-T7A 1F UNIT 5 pieces
8810008750 Screw PH BT M2 x 15 ZK IC-T7A Rear pane 10 pieces
Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB to 50 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

• LOGIC AND 2F UNITS

• 1F UNIT

SECTION 3 DISASSEMBLY INSTALLATIONS

■ Disassembling panels

- Unscrew 4 screws ① from the rear panel and 2 screws ② from the rear plate to separate front and rear panels.
- Unscrew 4 screws ③ from the rear plate to remove it.

■ Removing 2F unit

- Unscrew 1 screw ④ from the 2F unit.
- Unsolder the point ⑤, then remove the 2F unit with the contact base.
(Disconnect J1 on reverse side of the 2F unit to remove.)

■ Removing LOGIC unit

- Unscrew 4 screws ⑥ from the LOGIC unit.
- Unsolder jumper wires from the speaker as shown below.

■ Removing 1F unit

- Pull the 2 knobs off, and then unscrew the nut.
- Unscrew 3 screws ⑦, and 2 screws ⑧ from the 1F unit.
- Unsolder the points ⑨, then remove the 1F unit.

SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 DUPLEXER CIRCUIT (1F UNIT)

The transceiver has a duplexer (low-pass and high-pass filters) on the first stage from the antenna connector to separate the signals into VHF and UHF signals. The low-pass filter (L10–L12, C16–C22) for VHF signals and high-pass filter (L1–L3, C1–C5) for UHF signals. The separated signals are applied to each RF circuit.

4-1-2 VHF ANTENNA SWITCHING CIRCUIT (1F UNIT)

The antenna switching circuit functions as a low-pass filter while receiving. However, its impedance becomes very high while transmitting by applying a current to D51 and D52. Thus, transmit signals are blocked from entering the receiver circuits. The antenna switching circuit employs a $1/4 \lambda$ type diode switching system. The passed signals are then applied to the RF amplifier circuit on the 2F unit.

4-1-3 VHF RF CIRCUIT (2F UNIT)

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

The signals from the antenna switching circuit are applied to the bandpass filter (D52, L53), and are then applied to the RF amplifiers (Q51, Q52). The amplifier consists of a cascade circuit. The amplified signals are passed through the next stage bandpass filter (D53, D54, L54, L55) to suppress unwanted signals. The filtered signals are then applied to the mixer circuit (Q401).

D53 and D54 track the bandpass filters and are controlled by the PLL lock voltage. These diodes tune the center frequency to obtain good image response rejection.

4-1-4 UHF RF CIRCUIT (2F UNIT)

The signals from the antenna switching circuit (1F unit D551, D552) are amplified at the the RF amplifier (Q201) and are then passed through the bandpass filter (FI201). The filtered signals are applied to another RF amplifier (Q202) and are then applied to the 1st mixer circuit (Q401).

Common circuits with VHF band are used later stage from the 1st mixer.

4-1-5 1ST MIXER AND 1ST IF CIRCUITS (2F UNIT)

The mixer circuit converts the received signal to a fixed frequency of the 1st IF signal with a 1st LO (VCO output) frequency. By changing the PLL frequency, only the desired frequency will be passed through a crystal filter at the next stage of the mixer.

The receive signals from the VHF or UHF RF circuit are mixed with the 1st LO signal (VCO output signal) at the 1st mixer (Q401) to produce a 45.15 MHz 1st IF signal.

The 1st IF signal is applied to a crystal filter (FI401) to suppress out-of-band signals. The filtered 1st IF signal is amplified at the IF amplifier (Q101) and is then applied to the 2nd mixer circuit (IC101).

4-1-6 2ND IF AND DEMODULATOR CIRCUITS (2F UNIT)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double superheterodyne system (which converts receive signals twice) improves the image rejection ratio and obtains stable receiver gain.

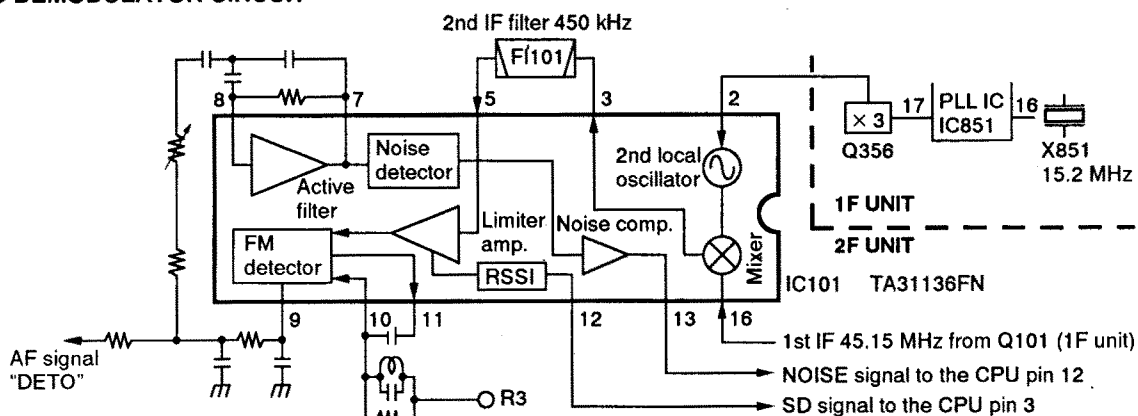

The FM IF IC (IC101) contains the 2nd mixer, 2nd local oscillator, limiter amplifier, S-meter detector and quadrature detector circuits.

The 1st IF signal (45.15 MHz) from the IF amplifier (Q101) is applied to the 2nd mixer section of IC101 (pin 16), and is mixed with the 2nd LO signal (45.6 MHz) for conversion to a 450 kHz 2nd IF signal at the 2nd mixer section.

The 2nd IF signal (450 kHz) from the 2nd mixer section (IC101 pin 3) passes through the ceramic filter (FI101) where unwanted signals are suppressed. It is then amplified at the limiter amplifier section (IC101 pin 5) and applied to the quadrature detector section to demodulate the 2nd IF signal into AF signals.

AF signals output from IC101 (pin 9) are applied to the AF drive amplifier (Q12) on the LOGIC unit. The S-meter output "SD" signal from IC101 (pin 12) is applied to the CPU (LOGIC unit pin 3).

2nd IF AND DEMODULATOR CIRCUIT

4-1-7 AF AMPLIFIER CIRCUIT (LOGIC UNIT)

The AF amplifier circuit, including an AF mute switch, amplifies the demodulated signals to drive a speaker.

The demodulated AF signals ("DETO" signals) from the FM IF IC (IC 101) on the 2F unit are applied to the drive amplifier (Q12) through the bandpass filter (C44, C45). The bandpass filter suppresses subaudible tones and higher noise signal components.

The amplified signals from Q12 pass through the AF mute switch (Q10) and are then applied to the AF volume control on the 1F unit via the "AF" signal line.

4-1-8 AF POWER AMPLIFIER CIRCUIT (2F UNIT)

The AF signals from the AF volume control ("AFV" signals) are amplified at the AF power amplifier IC (IC151). The amplified AF signals are applied to the loud speaker via the external speaker jack (1F unit J902).

4-1-9 NOISE SQUELCH UNIT (2F UNIT)

A noise squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signals, the squelch circuit switches the AF mute switch.

Some of the noise components in the AF signals from the FM IF IC (IC101 pin 9) are applied to the active filter section (IC101 pins 7, 8). The variable register (R504) adjusts the active filter input level.

The active filter section amplifies noise components with frequencies of 20 kHz and above. The filtered signals are rectified at the noise detector section and converted into "NOISE" (pulse type) signals at the noise comparator section. The "NOISE" signal is applied to the CPU (LOGIC unit IC1 pin 12).

The CPU detects the signal level from the number of the pulses, and outputs an "MM/RM" signal from pin 44. This signal controls the AF mute switch (Q10) to cut the AF signal line.

4-2 TRANSMITTER CIRCUITS

4-2-1 MICROPHONE AMPLIFIER CIRCUIT (LOGIC AND 2F UNIT)

The microphone amplifier circuit amplifies audio signals with +6 dB/octave pre-emphasis from the microphone to a level needed for the modulation circuit.

The AF signals from the built-in condenser microphone (LOGIC unit MC1), or from the [MIC] jack via the "EXT MIC" line are applied to the limiter amplifier (LOGIC unit IC12 pin 3) which has +6 dB/octave pre-emphasis characteristics. The amplified AF signals pass through the splatter filter (IC12 pins 5-7). The filtered signals are applied to frequency deviation pots (2F unit R308 for VHF, R314 for UHF) and are then applied to the modulation circuit on the DUAL VCO board.

Q32 on the LOGIC unit is the PTT control circuit and outputs a "High" signal to the CPU when transmitting.

4-2-2 MODULATION CIRCUIT (DUAL VCO BOARD)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signals.

The "VMOD" signals change the reactance of a diode (D304) to modulate the oscillated signal at the VHF-VCO circuit (Q304, Q305, D303).

The "UMOD" signals are applied to the UHF-VCO circuit via the "USHIFT" line. The applied signals change the reactance of a diode (D302) to modulate the oscillated signal at the UHF-VCO circuit (Q301, Q302, D301).

The VCO output is buffer-amplified at Q306 and then applied to the band switch (D351, D352) via the LO amplifiers (Q852, Q351).

4-2-3 POWER AMPLIFIER CIRCUIT (1F UNIT)

Q402 is a drive and Q403 is a power amplifier. They are designed to use both VHF and UHF commonly. They provide more than 4 W for VHF and 3 W for UHF with a 13.5 V DC power source via one power amplifier system.

APC CIRCUIT

An RF signal from the band switch (D351, D352) is buffer-amplified at Q201 (for VHF) or Q701 (for UHF) and then applied to the drive amplifier (PA board Q402) via the other band switch (D201, D701). The applied RF signal from the band switch is amplified at a drive amplifier (Q402) and then amplified again at the power amplifier (Q403).

The amplified RF signal is passed through the low-pass filter (VHF) or high-pass filter (UHF), and then applied to the antenna connector via the transmit/receive switching circuit (D51, D52, D202 for VHF, D551, D552, D723, D724 for UHF).

4-2-4 APC CIRCUIT (1F AND 2F UNITS)

The APC circuit stabilizes transmit output power and selects HIGH and LOW output power. The APC circuit consists of APC sensor, APC control (1F unit) and APC set (2F unit) circuits.

The APC sensor circuit (1F unit R250) detects a driving current from a drive voltage at the PA board. The detected current is applied to the op-amp IC (1F unit IC250 pin 2) in the APC control circuit, and compared with a "PSET" voltage which is supplied from the APC set circuit (2F unit IC301). The output voltage from pin 1 of IC250 is applied to the APC control circuit (1F unit Q255 base) to control "VGGC" voltage.

The "VGGC" APC control signal is separated for VHF (VGG1) and UHF (VGG2) by resistors. The VGG1 line is for the APC control signal for the drive amplifier and the VGG2 line is for the power amplifier.

Low output power is obtained by changing the "PSET" voltage coming from pin 1 of IC301 on the 2F unit. The "PSET" voltage is controlled by power set pots (R302 for VHF, R304 for UHF) and an "H/L" signal via the CPU (LOGIC unit pin 56). A thermistor (R266) controls APC reference voltage ("PREF" voltage) to reduce the output power when the temperature is increased.

4-2-5 ANTENNA SWITCHING CIRCUIT (1F UNIT)

The antenna switching circuit applies receive signals to the receiver circuit and transmit signals to the antenna connector.

VHF ANTENNA SWITCHING CIRCUIT

When transmitting, D51, D52 and D202 are turned ON. The signal passes through the low-pass filter (L11, L12, C16-C22) and is then applied to the antenna connector. The low-pass filter suppresses high harmonic components.

UHF ANTENNA SWITCHING CIRCUIT

When transmitting, D723, D724, D551 and D552 are turned ON. The signal passes through the low-pass (L8, L9, C10-C14) and high-pass (L2, L3, C1-C5) filters and is then applied to the antenna connector. The high-pass filter suppresses low harmonic components.

4-3 PLL CIRCUITS

4-3-1 VHF PLL CIRCUIT (1F UNIT)

The oscillated signal at the VCO circuit (DUAL VCO board Q304, Q305, D303) is amplified at a buffer-amplifier (Q306) and is again amplified at another buffer-amplifier (Q352). The amplified signal is applied to the PLL IC (IC851 pin 2), and then divided by serial data from the CPU and phase-detected with the divided reference frequency. The phase difference is output as pulses.

The output signals from IC851 (pin 8) are converted to DC voltages (lock voltage) by the loop filter (R366, C362) and are then fed back to the VHF VCO circuit to stabilize the VCO frequency.

The DC voltage is also applied to the receiver tuned bandpass filters as a "VTUNE" signal.

PLL CIRCUIT

4-3-2 UHF PLL CIRCUIT (1F UNIT)

The oscillated signal at the VCO circuit (DUAL VCO board Q301, Q302, D301) is amplified at a buffer-amplifier (Q306) and is again amplified at another buffer-amplifier (Q352). The amplified signal is applied to the PLL IC (IC851 pin 19), and then divided by serial data from the CPU. It is the phase-detected with the divided reference frequency and the phase difference is output as pulses.

The output signals from IC851 (pin 13) are converted to DC voltages (lock voltage) by the loop filter (R866, C862) and are then fed back to the UHF VCO circuit to stabilize the VCO frequency.

4-4 POWER SUPPLY CIRCUITS

VOLTAGE LINE

Line	Description
HV	The voltage from the external power supply or attached battery pack.
VCC	The same voltage as the HV line (external power supply or battery pack) which is controlled by the power switch ([POWER] control).
+3CPU	Common 3 V converted from the VCC line by the +3CPU regulator IC (LOGIC unit IC2). The output voltage is supplied to the +3C, R3 and T4 regulator circuits, etc.
+3C	Common 3 V converted from the VCC line by the +3C regulator circuit (LOGIC unit Q4, Q5) using the +3CPU regulator (LOGIC unit IC2).
R3	3 V for receiver circuit converted from the VCC line by the R3 regulator circuit (2F unit Q4, Q5).
T4	4 V for transmitter circuit converted from the VCC line by the T4 regulator circuit (1F unit Q702, Q703). The T4 regulator circuit controlled by the CPU (LOGIC unit IC1 pin 45) via T4 control regulator circuit (1F unit Q704).
T8	8 V for drive amplifier circuit converted from the VCC line by the T8 regulator circuit (1F unit Q100, Q101, D100).

4-5 OTHER CIRCUITS

4-5-1 TONE SQUELCH CIRCUIT (LOGIC UNIT)

A portion of the detected audio signals from the "DETO" line are passed through the low-pass filter (IC13). The filtered signal is then applied to the CPU (IC1 pin 4), and is compared with the programmed tone signal. The CPU (IC1) outputs control signals to the AF mute and AF regulator circuits to open the squelch when a matched tone signal is received.

The programmed subaudible tone signal is output from the CPU (LOGIC unit IC1 pin 9) directly when transmitting with a tone.

4-6 PORT ALLOCATIONS

CPU (LOGIC UNIT)

Pin number	Port name	Description
2	REMOTE	Input port for remote control signals from an optional HM-75A microphone via the [EXT MIC] jack.
3	SD	Input port for detected S-meter signals from the IC101 (pin 12) on the 2F unit.
4	CTCIN	Input port for received CTCSS tone signals.
5	PCON	Output port for +3C regulator circuit control signals. "HIGH": Power ON
6	PLST	Outputs PLL strobe signals.
7	PLCK/ECK	Output port for clock signals to PLL and EEPROM ICs.
8	UL/PDA	DATA bus line for PLL. • Outputs PLL DATA when PLL is locked. • When PLL is unlocked, PLL IC releases the port being pulled up, therefore, the CPU receives "HIGH" level signal.
9	CTCSS	Output port for CTCSS tone signals.
10	DTMF	Output port for: • Beep audio signals while receiving. • DTMF signals or 1750 Hz tone signal while transmitting. (according to versions)
12	NOISE	Inputs pulse signals for noise squelch from the IC101 on the 1F unit.
17	LOCK	Input port for the [LOCK] switch. "LOW": [LOCK] switch is ON.
21	DIUD	Inputs up/down signals from the [DIAL] control.
22	DICK	Input port for dial clock signals.
23	POWER	Input port for the [POWER] switch. "LOW": [POWER] switch is pushed.
24	CONT	Outputs LCD contrast control signals.
28-31	KR3-KR0	Input ports for key matrix.
32	PTT	Input port for the PTT control circuit. "HIGH": When transmitting.

Pin number	Port name	Description
33	RESET	Input port for reset circuit (LOGIC unit IC3).
39	CFC	Outputs control signals to the power supply of the CTCSS bandpass filter (LOGIC unit Q45). "LOW" : Activates the BPF.
40	ESIO	DATA bus line for the EEPROM (LOGIC unit IC15) data signals.
41	BLED	Outputs [BUSY] LED control signals. "HIGH" : The LED lights.
42	LIGHT	Outputs LCD backlight control signals. "HIGH" : The backlight lights.
43	MICC	Output port for the microphone amplifier (2F unit IC12). "LOW" : Activates the mic. amp.
44	MM/RM	Outputs a mute signal. [MM] : Microphone mute for DTMF or 1750 Hz tone while transmitting. [RM] : Audio mute for squelch circuit while receiving. "HIGH" : To mute one of above.
46	TXSEL	Outputs transmit frequency band control signals. "HIGH" : UHF band "LOW" : VHF band
47	HVCO	Output port for the UHF band VCO (DUAL-VCO board Q301, Q302) control signals. "HIGH" : Activates the UHF-VCO.
48	LVCO	Output port for the VHF band VCO (DUAL-VCO board Q304, Q305) control signals. "HIGH" : Activates the VHF-VCO.
49	SHIFT	Output port for SHIFT signals to the shift switches (1F unit Q354, Q854). "HIGH" : Transmit on VHF "LOW" : Transmit on UHF
55	AFON	Outputs control signals to the AF regulator circuit (2F unit Q151, Q152). "HIGH" : Activates the AF amplifier.
56	H/L	Output port for the TX output power (High or Low) select signals. "LOW" : High power is selected.

SECTION 5 ADJUSTMENT PROCEDURES

Maximum level	2F	Adjust in sequence L53, L54, L55
UHF SENSITIVITY	1 <ul style="list-style-type: none"> • Displayed frequency: 445.000 MHz (USA version) 435.000 MHz (Other versions) • Connect a SSG to the antenna connector and set as: Level : 1.0 mV* (-47 dBm) Mod. : OFF • Receiving 	2F	Connect a digital multimeter or oscilloscope to the CP1.	1.0 V	2F	L102
SQUELCH LEVEL	1 <ul style="list-style-type: none"> • Displayed frequency: any • Connect an SSG to the antenna connector and set as: Level : 0.11 μV* (-126 dBm) Mod. : 1 kHz (±3.5 kHz Dev.) • Pre-set the R504 to maximum CW. • Receiving 	Speaker		At the point where the AF signal just disappears.	2F	R504
S-METER	1 <ul style="list-style-type: none"> • Displayed frequency: 445.000 MHz (USA version) 435.000 MHz (Other versions) • Connect an SSG to the antenna connector and set as: Level : 0.5 μV* (-113 dBm) Mod. : 1 kHz (±3.5 kHz Dev.) • Connect a terminator to the [EXT SP] jack. • Receiving 	Front panel				Push and hold the [CALL] key.
	2 <ul style="list-style-type: none"> • Set an SSG output level for the S-meter to S3 (4 dots). 	SSG	Output level	0.32 to 0.79 μV (-117 to -109 dBm)		Verify

*This output level of a standard signal generator (SSG) is indicated as the SSG's open circuit.
