SERVICE MANUAL

800MHz TRUNKED TRANSCEIVER

IC-U810T

INTRODUCTION

This service manual describes the latest information for the **IC-U810T** 800 MHz TRUNKED TRANCEIVER at the time of publication.

To upgrade quality, all electrical and mechanical parts and internal circuits are subject to change without notice or obligation.

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1180000190	IC	NJM7805A	IC-U810T	MAIN UNIT	5 pieces
8810006530	Screw	FH M2.6×6ZKBS	IC-U810T	Top cover	10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB~50 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

SECTION 1 SPECIFICATIONS

■ GENERAL

• Frequency coverage	: 806~821 MHz (transmit) 851~866 MHz (receiver, transmit in talk-around)
• Transmit shift frequency	: -45 MHz (trunked operation) 0 MHz (talk-around operation)
• Mode	: FM (16K0F3E, 15K0F1D)
• Antenna impedance	: 50 Ω nominal
• Usable temperature range	: -30 °C ~ +60 °C (-22 °F ~ +140 °F)
• Frequency stability	: Less than ±0.00025 %
• Power supply requirement	: 13.8 V DC ±15 % (negative ground)
• Current drain (at 13.8 V DC)	: Transmit 7 A Receive squelched 500 mA Max. audio output 1.5 A
• Dimensions	: 151 (W) × 53 (H) × 189 (D) mm 5.9 (W) × 2.1 (H) × 7.4 (D) in (Projections not included)
• Weight	: 1.8 kg (4.0 lb)

■ TRANSMITTER

• Output power	: 15 W (trunked operation) 10 W (talk-around operation)
• Modulation system	: Variable reactance frequency modulation
• Spurious emissions	: Less than -60 dB
• Audio frequency response	: +1 dB, -3 dB of +6 dB/octave with 300 Hz to 3000 Hz input
• Noise and hum	: 40 dB (Trunked operation) without data signal 35 dB (Talked-around operation)
• Microphone impedance	: 600 Ω

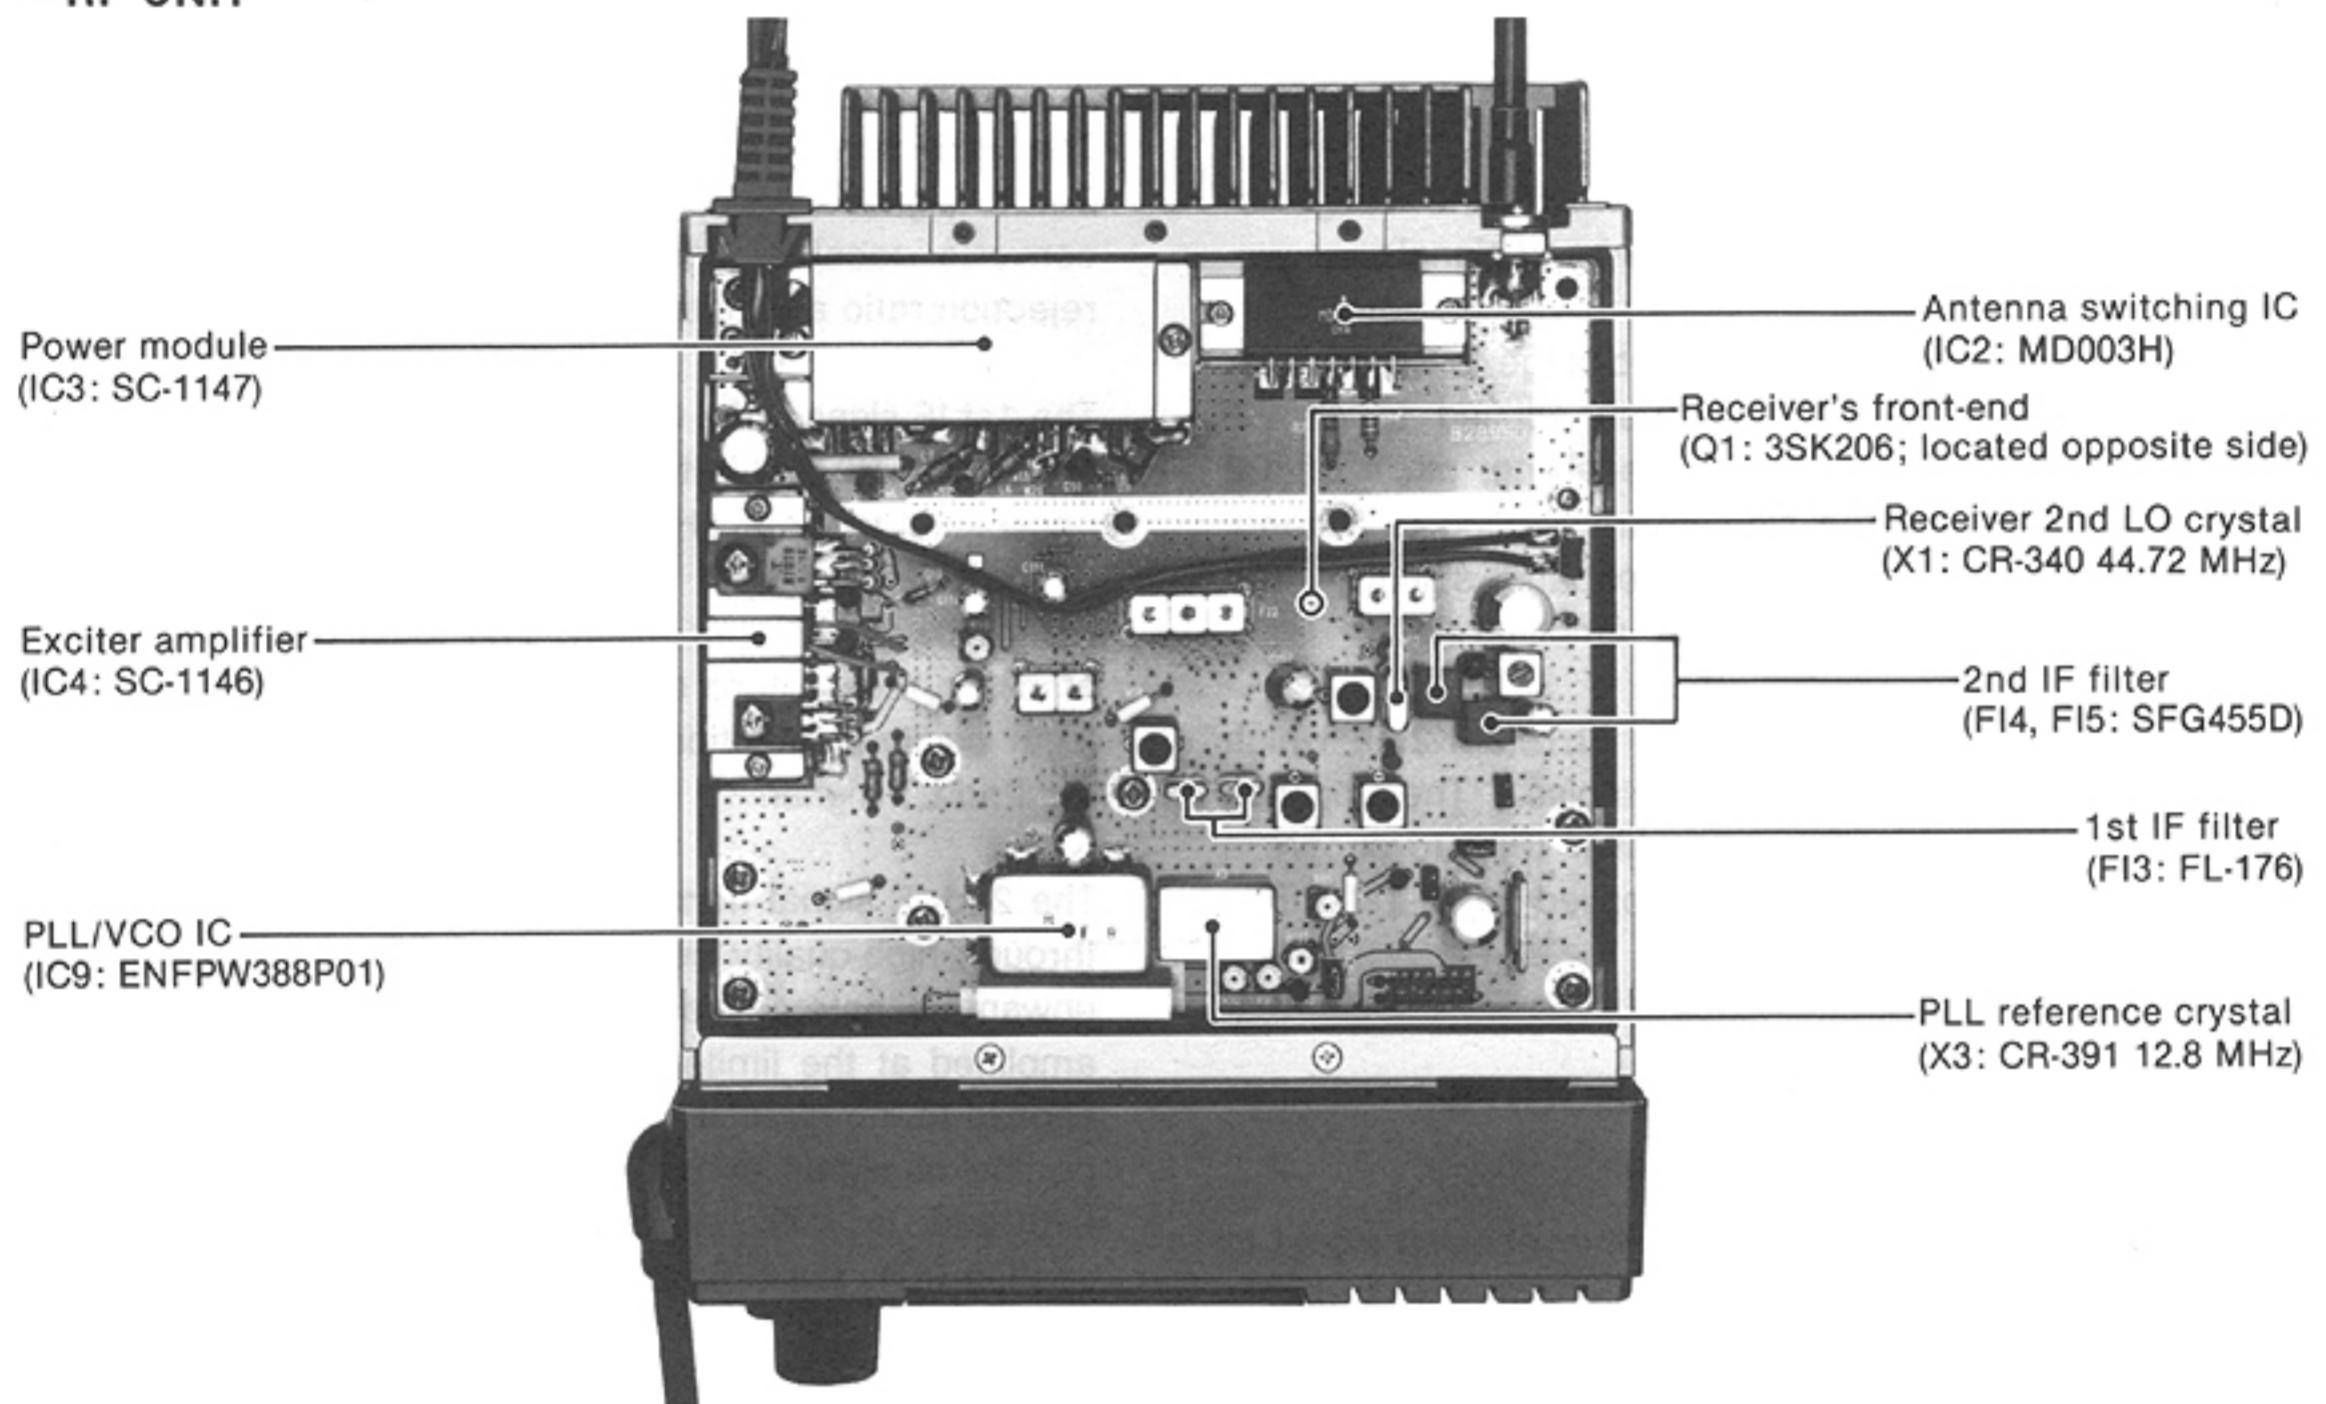

■ RECEIVER

• Sensitivity	: 0.35 μV for 12 dB SINAD
• Intermediate frequency	: 1st 45.175 MHz 2nd 455 kHz
• Squelch sensitivity (Threshold level)	: 0.35 μV
• Adjacent channel selectivity	: -65 dB
• Intermodulation rejection	: -65 dB
• Spurious response rejection	: -70 dB
• Blocking and desensitization	: 90 dBμ e.m.f.
• Noise and hum	: 40 dB without data signal
• Audio frequency response	: +1 dB, -3 dB of +6 dB/octave with 300 Hz to 3000 Hz deviation
• Audio output power	: More than 4.5 W
• Audio output impedance	: 4 Ω

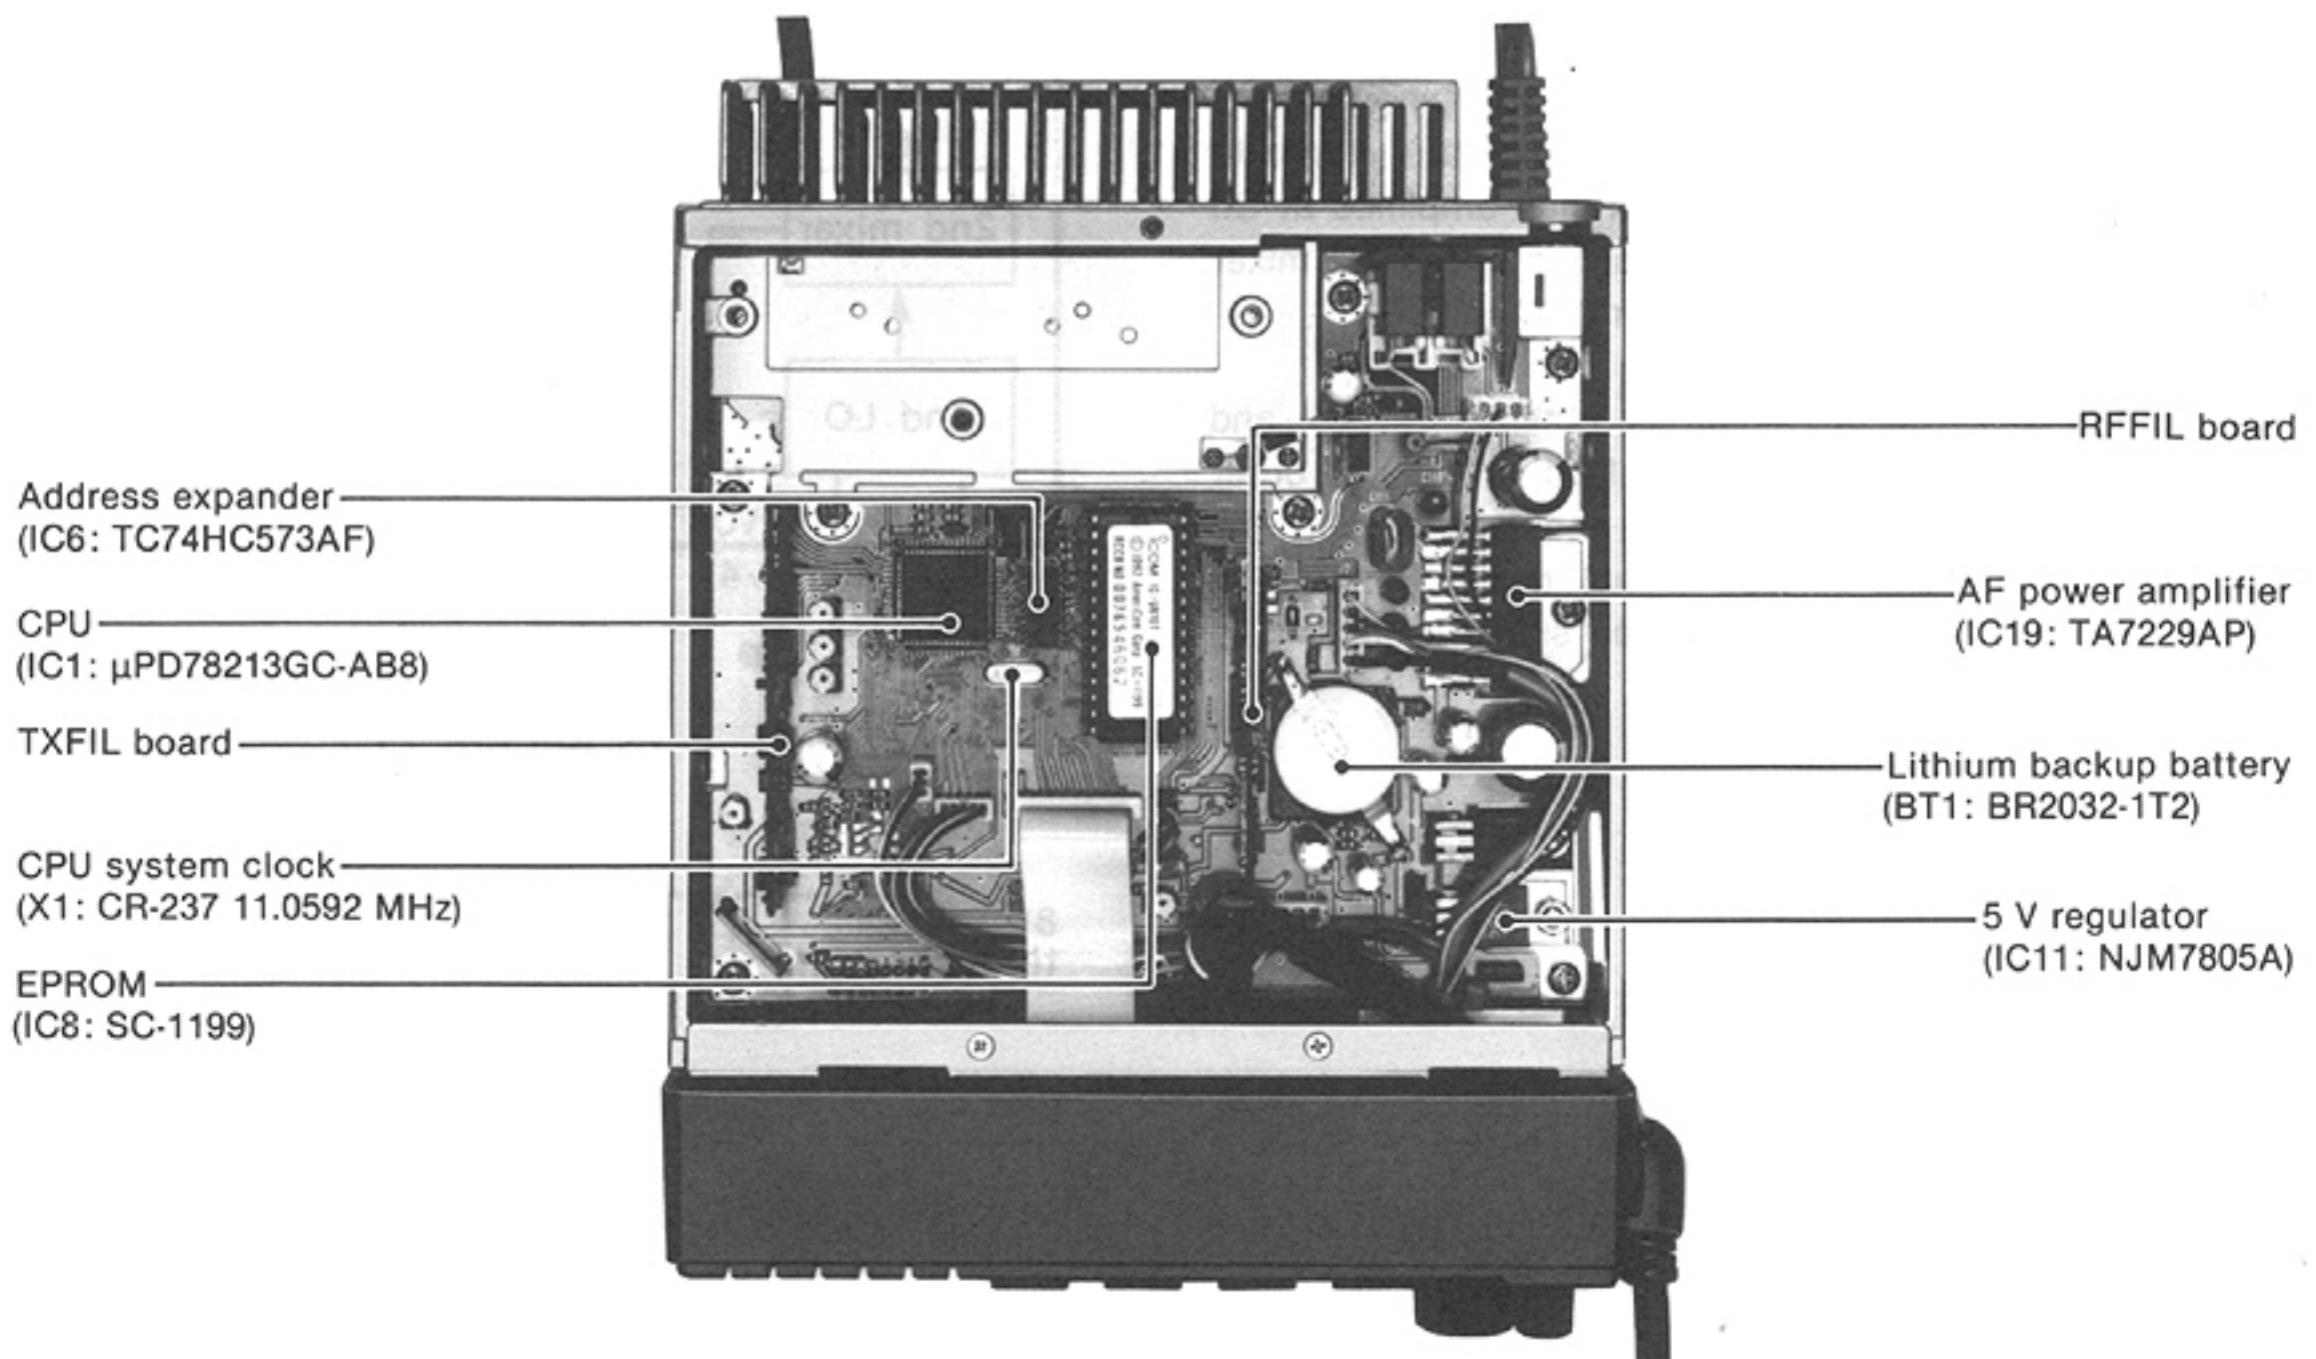

All stated specifications are approximate and subject to change without notice or obligation.

SECTION 2 INSIDE VIEWS

• RF UNIT

• MAIN UNIT

SECTION 3 CIRCUIT DESCRIPTION

3-1 RECEIVER CIRCUITS

3-1-1 RF CIRCUIT (RF UNIT)

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

Received signals pass through a two-stage low-pass filter (strip line, C79~C85) and are then applied to an RF switching IC (IC2, pin 3). While receiving, pin 4 of IC2 becomes "LOW" and the signals are applied to a band-pass filter (F11) to suppress out-of-band signals. The filtered signals are applied to an RF amplifier (Q1).

The RF amplifier (Q1) employs an FET (3SK206) which expands the dynamic range with low noise. The amplified signals pass through a bandpass filter (F12) to suppress unwanted signals and are then applied to a 1st mixer circuit.

3-1-2 1ST MIXER AND IF CIRCUITS (RF UNIT)

The 1st mixer circuit (Q2) converts the received signal to a fixed frequency of the 1st IF signal with a PLL output frequency. By changing the PLL frequency, only the desired frequency will be passed through a pair of crystal filters at the next stage of the 1st mixer.

The signals from the RF circuit are mixed at Q2 with a 1st LO signal coming from the PLL/VCO IC (IC9) to produce a 1st IF signal.

The 1st LO signal from the PLL/VCO IC (IC9, pin 6) passes through the attenuator (R78~R80) and the transmit/receive switching circuit (D5) and is then amplified at Q6 and Q5. The amplified signal is applied to the 1st mixer circuit (Q2) through a bandpass filter (F16).

The 45.175 MHz 1st IF signal is obtained at L1 and is then applied to a pair of crystal filters (F13) in order to obtain wide selection capability and to pass only the desired signals. The filtered signal passes through a 1st IF amplifier (Q3). The amplified signal is applied to a 2nd IF circuit.

3-1-3 2ND IF AND DEMODULATOR CIRCUITS (RF UNIT)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double superheterodyne system (which converts receive signals twice) improves the image rejection ratio and obtains stable receiver gain.

The 1st IF signal from Q3 is applied to a 2nd mixer section of IC1 (pin 16) and is then mixed with a 2nd LO signal for conversion to a 455 kHz 2nd IF signal.

IC1 contains the 2nd mixer, 2nd local oscillator, limiter amplifier, quadrature detector and audio amplifier. The local oscillator section and X1 generate 44.72 MHz for the 2nd LO signal.

The 2nd IF signal from the 2nd mixer (IC1, pin 3) passes through high-quality ceramic filters (F14, F15) to suppress unwanted heterodyned frequency signals. It is then amplified at the limiter amplifier section (IC1, pin 5) and applied to the quadrature detector section (IC1, pin 7). A portion of signal output from IC1 (pin 7) is detected at L10 and is then applied to the quadrature detector section (IC1, pin 8) to demodulate the 2nd IF signal into AF signals.

• 2ND IF AND DEMODULATOR CIRCUITS

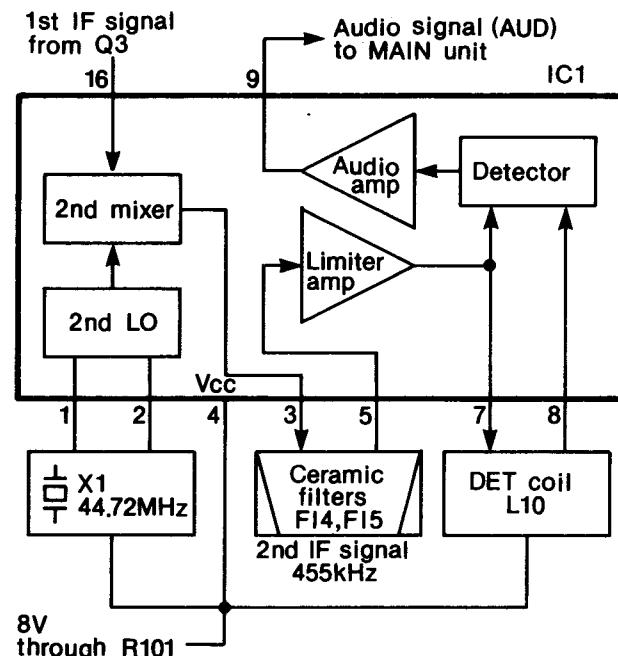

Fig. 1

The AF signals are output from IC1 (pin 9) and are then applied to the AF amplifier circuit on the MAIN unit and the low-speed/high-speed data switching circuit on the RXFIL board.

3-1-4 AF AMPLIFIER CIRCUIT (MAIN UNIT)

The AF amplifier circuit, which includes an AF mute circuit, amplifies the demodulated signals to drive a speaker.

The AF signals (AUD) from the RF unit pass through a notch filter (IC17a) and are then applied to a high-pass filter (IC17b) to suppress low-speed data components. The filtered signals are amplified at the pre-drive amplifier (Q16) and are then passed through the AF mute switch (IC18).

The AF mute circuit (Q17, Q18, IC18, IC28) controls a speaker using a "P07" signal from the CPU (IC1, pin 61) and an "NMI" signal from IC27. The "P07" signal from the CPU (IC1, pin 61) becomes "HIGH" when either low-speed or high-speed data matches the programmed message in the CPU (IC1). The "NMI" signal from IC27 becomes "HIGH" when a squelch opens. Therefore, an AND gate IC (IC28) becomes "HIGH" to turn IC18 ON.

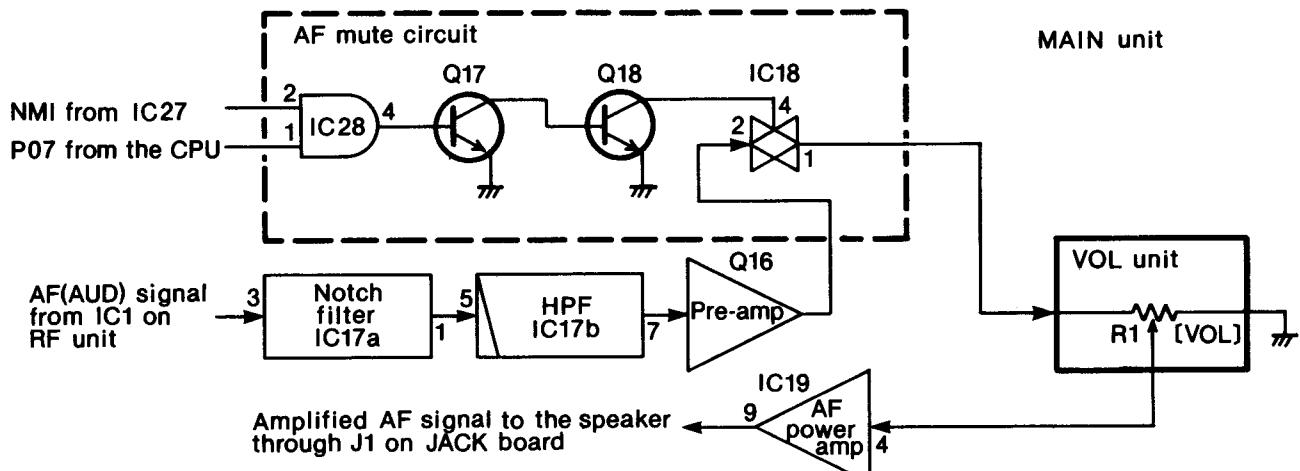

The signals are then applied to the AF power amplifier (IC19) through the [VOL/PWR] control (R1) on the VOL unit. The AF amplifier (IC19) amplifies the AF signals to drive the speaker.

A user tone signal, such as beep signal, comes from the TXFIL board and is added to the audio line before the volume control.

3-1-5 SQUELCH CIRCUIT (MAIN UNIT)

By detecting noise components in the AF signals, the squelch circuit cuts out AF signals when no RF signal is received.

• AF AMPLIFIER CIRCUIT

Some noise components in the AF signals (AUD) from the RF unit are applied to an active filter (IC13b). This amplifies the noise components of frequencies 20 kHz and above. The noise signal, output from IC13b (pin 7), passes through the squelch level setting volume control (R43) and is then amplified at IC14a. IC13a produces a bias voltage from 8 V line and supplies the voltage to IC13b and IC14a.

The amplified signal is converted to DC voltage at a noise rectifier (D7, D8, C73, C74, R46) and is then applied to a comparator (IC14b).

The output signal from IC14b (pin 7) triggers the squelch switch (Q13). A squelch signal from the collector of Q13 is applied to the CPU (pin 28) and an inverter IC (IC27). The inverted signal at IC27 is applied to the CPU (pin 28) and to an AND gate IC (IC28).

When pins 28 and 49 of the CPU (IC1) receive the squelch signal, pin 61 of the CPU (IC1) supplies a speaker mute signal to the AF mute circuit (Q17, Q18, IC18, IC28) according to the received signals.

3-1-6 LOW-SPEED/HIGH-SPEED DATA SWITCHING CIRCUIT (RXFIL BOARD)

The RXFIL board separates the high-speed data and LTR low-speed data from the audio components; and sharpens the waveform for data acknowledgement on the CPU (MAIN unit IC1).

The AF signals (AUD) from the RF unit are buffer-amplified at IC2a and are then applied to a low-pass filter or high-pass filter for the low-speed and high-speed data respectively. The buffer amplifier (IC2a) isolates the MAIN unit and RXFIL board.

Fig. 2

An LTR low-speed data signal, obtained at the low-pass filters (IC3a and IC3d), is applied to the rectifier circuit (IC3b, IC3c, D1~D3), for conversion to DC voltage, and to the multiplexer (IC4, pin 12). The low-pass filter (IC3a and IC3d) is controlled by a band-width control signal (BWC) from the I/O expander (MAIN unit IC9, pin 7) via Q1.

When the LTR low-speed data signal is detected, the rectified voltage passes through the multiplexer (IC4, pins 2, 15) and is then applied to a comparator (IC1b, pin 6) as a reference voltage.

A high-speed data signal, obtained at the low-pass filter (IC2b and IC2c) and the high-pass filter (IC2d), is then applied to the multiplexer (IC4, pin 13).

The "BIAS" voltage is produced on the TXFIL board and is used for the high-pass filter (IC2d).

The multiplexer (IC4) selects the low-speed data or the high-speed data signal using the "H/LS" signal from the CPU (MAIN unit IC1, pin 5).

The data signal is output from pin 14 of IC4 and is then applied to the comparator (IC1b, pin 5). At the same time, the reference voltage is output from pin 15 of IC4 and is then applied to the comparator (IC1b, pin 6). The comparator (IC1b) sharpens the waveform and converts the signals for a logic circuit. The output signal from pin 7 of IC1b is applied to the CPU (IC1, pin 32) as an "RXDT" signal.

• MULTIPLEXER (IC4) ON THE RXFIL BOARD

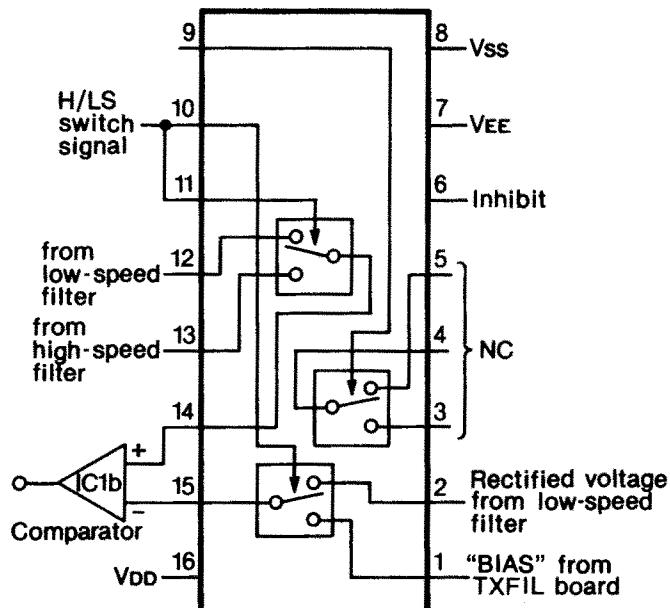

Fig. 3

3-2 TRANSMITTER CIRCUITS

3-2-1 MICROPHONE AMPLIFIER CIRCUIT (TXFIL BOARD)

The microphone amplifier circuit amplifies audio signals from the microphone to a level needed for the modulation circuit.

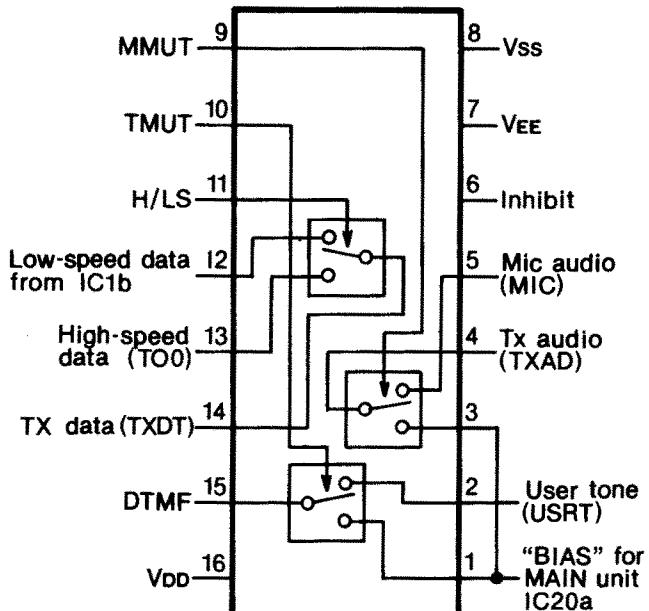

The AF signals from the microphone pass through a notch filter (IC2b), a high-pass filter (IC2a, IC3a) and are then amplified at a limiter amplifier (IC3b). The output signals from IC3b (pin 1) are applied to the analog adder (MAIN unit IC20a) via the multiplexer (IC4, pins 5, 4).

The notch filter suppresses the audio components near the low-speed data frequency to prevent false detection by the other parties' transceiver.

The multiplexer (IC4) outputs 3 signals (Tx audio, DTMF, Tx data) using controlling signals (MMUT, TMUT, H/LS) from the CPU.

IC5 produces a bias voltage for the splatter/limiter amplifier on the MAIN unit and for the reference voltage of the comparator on the RXFIL board.

• MULTIPLEXER (IC4) ON THE TXFIL BOARD

CONTROL SIGNAL			OUTPUT		
MMUT	TMUT	H/LS	TXAD	DTMF	TXDT
L	H	L	Microphone	Bias voltage	Low-speed data
H	L	L	Bias voltage	User tone	Low-speed data
H	H	L	Bias voltage	Bias voltage	Low-speed data
H	H	H	Bias voltage	Bias voltage	High-speed data

Fig. 4

3-2-2 LOW-SPEED, HIGH-SPEED DATA AND USER TONE (TXFIL BOARD)

Ports TO0~TO3 of the CPU (MAIN unit IC1, pins 50~53) output low-speed, high-speed and user tone signals.

When the operating channel is programmed with LTR low-speed data, ports TO0 and TO1 output the low-speed data. The data signals are passed through the low-pass filter (IC1a, IC1b) and are then applied to the analog adder (MAIN unit IC20a) via the multiplexer (IC4, pins 12, 14).

When the operating channel is programmed with high-speed data, port TO0 outputs the high-speed data. The data signal passes through the multiplexer (IC4, pins 13, 14) and is then applied to the analog adder (MAIN unit IC20a).

When the CPU outputs DTMF signals as a user tone, ports TO2 and TO3 are used. The signals pass through the multiplexer (IC4, pins 2, 15) and are then applied to the analog adder (MAIN unit IC20a).

3-2-3 MODULATION CIRCUIT (MAIN AND RF UNITS)

The modulation circuit modulates the VCO oscillating signal or reference oscillator using audio or data signals. The transceiver's modulation circuit adopts a 2 modulation system to obtain low frequency (low-speed data) to high frequency (microphone audio) equality in modulation levels.

The analog adder (IC20a) adds the 3 signals (TXAD, TDMF, TXDT) from the multiplexer (TXFIL board IC4) and outputs an "MOD" signal from pin 1. The "MOD" signal passes through a splatter filter (IC20d and IC20c), which eliminates signal components greater than 3 kHz, and is then buffer-amplified at IC26a.

The amplified signal is applied to the VCO section of the PLL/VCO IC (IC9, pin 5) and an inverter (IC6, pin 6) on the RF unit. The inverted signal at IC6 is applied to the VC-TCXO (X3).

A talk-around control (Q17) attenuates the "MOD" signal to prevent deep modulation on the low transmit frequency by a shift signal (SFT) from the I/O expander IC (MAIN unit IC9, pin 9).

The oscillated signal at the VCO section of IC9, amplified at a buffer amplifier section inside IC9, is then output from pin 6. The signal passes through the attenuator (R78 ~R80), the transmit/receive switching circuit (D5) and is then applied to the drive amplifier circuit.

3-2-4 DRIVE AMPLIFIER CIRCUIT (RF UNIT)

The drive amplifier circuit amplifies the VCO oscillating signal to a level needed at the power amplifier.

The signal from the transmit/receive switching circuit (D5) is amplified at the pre-drive amplifier (Q13) and is then re-amplified at a drive amplifier (Q12). The amplified signal is amplified at an exciter amplifier (IC4) to obtain 400 mW of RF power.

3-2-5 POWER AMPLIFIER CIRCUIT (RF UNIT)

IC3 is a power module which provides a stable 15 W of output power.

The RF signal from the exciter amplifier (IC4) is applied to the power amplifier (IC3, pin 1). The amplified signal is output from pin 5. The output signal is applied to the antenna connector through the APC circuit, the RF switching IC (IC2) and the low-pass filter circuit.

3-2-6 APC CIRCUIT (RF UNIT)

This circuit stabilizes the transmit power. A differential amplifier is used for the APC circuit and compares the output power level and 8 V of regulated voltage. Thus stable RF output power is obtained even when the supplied voltage is changed.

• APC CIRCUIT

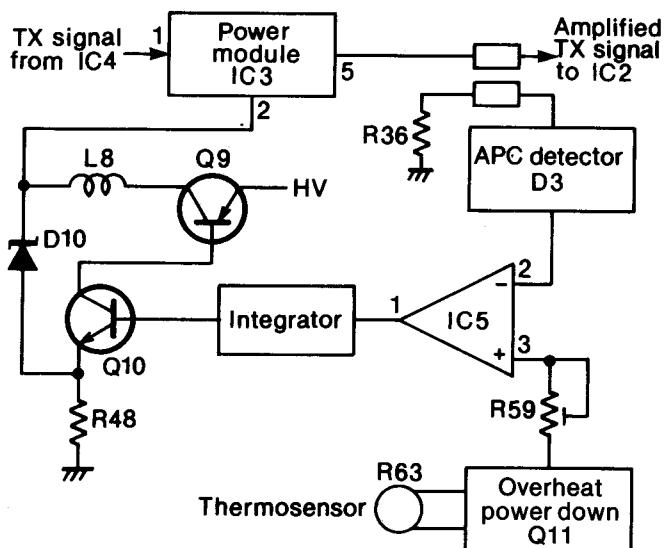

Fig. 5

The output power from the power module (IC3, pin 5) is detected at the APC detector (D3). The detected voltage is applied to a differential amplifier circuit (IC5, pin 2). The APC reference voltage is adjusted at R59 and is then applied to IC5 (pin 3).

When power voltage is decreased, the total gain of the transmitter circuit is reduced and RF power is also reduced. At this time, the APC detected voltage goes down. However the reference voltage of the differential amplifier (IC5) is a constant voltage, so that the output voltage from IC5 increases. The output voltage is integrated by R52 and C114 and is then applied to the current controller (Q7~Q10). The current controller increases the supplied current to obtain the fixed RF power.

A thermistor (R63) detects the temperature around the power module (IC3) and decreases the reference voltage of the differential amplifier (IC5) using Q11 to protect the transceiver from high temperatures during continuous transmitting.

3-3 PLL CIRCUITS

3-3-1 GENERAL

PLL circuits provide steady oscillation of the transmit frequency and the receive 1st LO frequency. The PLL output frequency is controlled by the divided ratio (N-data) of the programmable divider.

• PLL AND VCO CIRCUIT

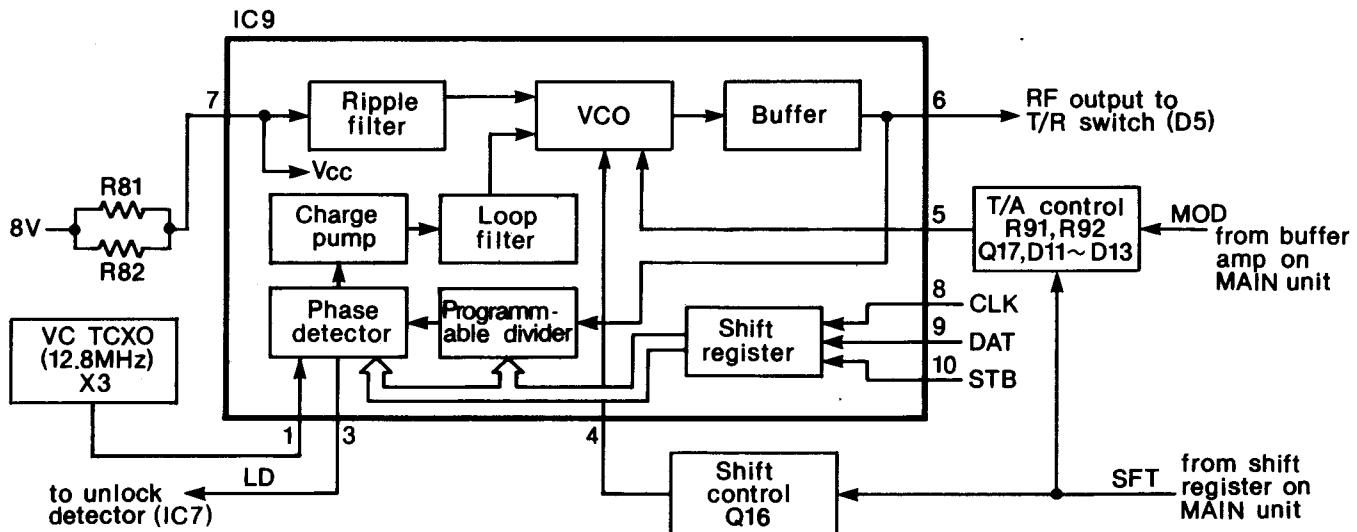

Fig. 6

3-3-2 PLL AND VCO CIRCUITS (RF UNIT)

The PLL/VCO IC (IC9), which contains the VCO circuit, programmable divider, phase detector, loop-filter and ripple filter, directly generates the transmit frequency and the receive 1st LO frequency with the VCO section and outputs them from pin 6. The programmable divider section sets the dividing ratio based on serial data from the CPU (MAIN unit IC1) and compares the phase of the VCO signal with the reference oscillator frequency. A reference frequency is oscillated at X3.

The VCO section of IC9 selects a trunking band or a talk-around band by an "SFT" signal from the I/O expander IC (MAIN unit IC9, pin 4). The "SFT" signal is applied to a switching transistor (Q16) to control pin 4 of IC9. When pin 4 of IC9 becomes "HIGH" or "LOW," the trunking band or the talk-around band is selected respectively.

3-3-3 REFERENCE OSCILLATOR CIRCUIT (RF UNIT)

A reference frequency (12.8 MHz) is produced by X3. The frequency is applied to the PLL/VCO IC (IC9, pin 1). X3 adopts VC-TCXO to ensure stable operation over a wide temperature range.

3-3-4 UNLOCK SENSOR CIRCUIT (RF AND MAIN UNITS)

When the PLL circuit is unlocked, an "LD" signal is output from pin 3 of IC9 and is then inverted at IC7. The inverted signal, smoothed at D6, R84, R85 and C151, passes through an unlock switch (Q15) and is then applied to the CPU (IC1, pin 34) on the MAIN unit.

3-4-3 RESET AND MEMORY BACKUP CIRCUITS (MAIN UNIT)

This circuit resets the CPU (IC1) with a reset IC (IC10). The reset IC (IC10) detects the increase and decrease of the 5 V line to control the RESET port of the CPU (IC1, pin 6) when the [PWR] switch is turned ON and OFF.

When the [PWR] switch is turned ON, the RESET port of the CPU (IC1, pin 6) becomes "HIGH." The CPU (IC1) starts operation.

When the [PWR] switch is turned OFF, the RESET port of the CPU (IC1, pin 6) becomes "LOW" before the 5 V line becomes 0 V. The CPU (IC1) stops operation. At this time, DC voltage is applied to the SRAM (IC7, pin 28) via R182 from the lithium backup battery (BT1) installed in the transceiver to provide backup for the memory contents. BT1 is charged by the current regulator (Q1 and Q2).

3-4 POWER SUPPLY CIRCUITS

3-4-1 VOLTAGE LINES (MAIN UNIT)

LINE	DESCRIPTION
HV	The external DC power from the DC power cable. Directly applied to the RF power module and APC control circuit. The HV voltage is applied to all circuits when the ignition sense line (SEN) is at "HIGH" as described in Section 3-4-2 below.
8V	Common 8 V converted from the HV line at the 8 V regulator circuit (Q8, IC12).
5V	Common 5 V converted from the common 8 V line at the 5 V regulator (IC11).
R8	Receive 8 V controlled by an "A19" signal from the CPU (IC1, pin 2). Pin 2 of IC1 becomes "LOW" while receiving. At this time, Q3 and Q6 are turned OFF. Therefore, Q5 is turned OFF and Q4 outputs the "R8" voltage.
T8	Transmit 8 V controlled by an "A19" signal from the CPU (IC1, pin 2). Pin 2 of IC1 becomes "HIGH" while transmitting. At this time, Q3 and Q6 are turned ON. Therefore, Q4 is turned OFF and Q5 outputs the "T8" voltage.
T5V	Transmit 5 V converted from the T8 line at Q15. Q15 is turned ON while transmitting. This voltage is applied to the TXFIL board.

3-4-2 POWER CONTROL SWITCH CIRCUIT (MAIN UNIT)

When the ignition sense voltage (SEN) from the ignition sense cable is applied to the power control switch (Q11), Q11 turns Q12 ON. Q12 collector (SW2) and Q10 base (SW1) is connected by the [PWR] switch, therefore, Q10 is turned ON while the ignition sense voltage appears.

The power control switch (Q11) also turns Q7 ON to set the "AN4" line to "HIGH." When the CPU receives the signal that the "AN4" line is at "HIGH," the CPU turns Q9 ON via the "P06" line. Thus Q9 sets the SW2 line to "LOW" until the auto-power down function activates, even when the ignition sense voltage disappears.

3-5 LOGIC CIRCUITS

3-5-1 GENERAL

The LOGIC circuit consists of an 8-bit CMOS CPU (IC1), an address expander (IC6), a 256 k-bit EPROM (IC8), a 64 k-bit SRAM (IC7) and an I/O expander (IC9). IC1 oscillates the 11.0592 MHz system clock signal with X1.

3-5-2 PORT ALLOCATIONS (MAIN UNIT)

- **IC1 (CPU)**

PORT NAME	PIN NUMBER	DESCRIPTION
RD	1	Outputs a permission signal for an EPROM (IC8, pin 22). Active: LOW
A19	2	Outputs a send signal while transmitting. Active: HIGH
A18	3	Outputs a microphone muting signal (MMUT) for the TXFIL board. Active: LOW
A17	4	Outputs a tone muting signal (TMUT) for the TXFIL board. Active: LOW
A16	5	Outputs a high-speed/low-speed data switching signal (H/LS) for the RXFIL and TXFIL boards. High-speed: HIGH Low-speed: LOW
RESET	6	Input port for the CPU reset signal. The CPU enters standby mode when this port becomes "LOW."
X2	7	This port is connected to the system clock crystal (X1).
X1	8	Input port for the system clock signal.
Vss	9	Ground

PORT NAME	PIN NUMBER	DESCRIPTION
A15~A8	10~17	Output the address busses for the EPROM (IC8).
AD7~AD2, AD1, ADO	18~23, 25, 26	Input and output ports of time divided address/data buses for the EPROM (IC8).
Vss	24	Ground
ASTB	27	Outputs a strobe signal for the address expander (IC6, A0~A7).
NMI	28	Input port for an interrupt signal from a noise squelch (Q13, IC27). Squelch open: HIGH
INT0	29	Input port for the [PTT] switch. PTT pushed: LOW
INT1	30	Inputs a clockwise signal from the [SELECT] knob. Active: LOW
INT2	31	Inputs a counterclockwise signal from the [SELECT] knob. Active: LOW
INT3	32	Input port for an "RXDT" signal from the RXFIL board.
INT4	33	Input port for the [SET] switch. Switch pushed: LOW
INT5	34	Input port for the PLL unlock signal (LD) from PLL/VCO IC (RF unit IC9, pin 3). PLL locked: HIGH PLL unlocked: LOW
SI	35	Input port for the [CLR] switch. Switch pushed: LOW
RXD	36	Input port for serial data from the accessory jack, pin 7.
TXD	37	Outputs serial data to the accessory jack, pin 6.
SCK	38	Outputs clock signal. Applied to the PLL/VCO as an "SCK" signal and to the RF unit as a "CK" signal.
S0	39	Outputs serial data. Applied to the RF unit as a "DAT" signal and to the FRONT unit as an "SDT" signal.
EA	40	Ground
Vdd	41	Voltage input terminal
AVss	42	Ground
AVref	43	Power source
AN5	44	Input port for the [SYS/GRP] switch. Switch pushed: LOW
AN4	45	Input port for the ignition sense. When ignition voltage disappears: LOW
AN3	46	Input port for the microphone hook. ON hook: LOW OFF hook: HIGH
AN2	47	Input port for the [SCAN] switch. Switch pushed: LOW
AN1	48	Input port for a "BUSY" signal from the LCD driver (FRONT unit IC1, pin 25). Busy: LOW
AN0	49	Input port for a noise squelch signal from Q13. Squelch open: LOW
T00	50	Outputs a portion of the low-speed data or high-speed data.

PORT NAME	PIN NUMBER	DESCRIPTION
T01	51	Outputs a portion of the low-speed data.
T02	52	Outputs a portion of the user/1 kHz tone.
T03	53	Outputs a portion of the user/1 kHz tone.
P00	54	Outputs a control signal storage register for the I/O expander (IC9). Active: HIGH
P01	55	Outputs a control signal for the I/O expander (IC9). Output: LOW High impedance: HIGH
P02	56	Not used
P03	57	Outputs a strobe signal to the PLL/VCO (RF unit IC9, pin 11).
P04	58	Outputs a permission signal (CTS) for data transmission to the accessory jack, pin 4.
P05	59	Outputs a chip select signal to the LCD driver (FRONT unit IC1, pin 24).
P06	60	Outputs a power holding signal until the automatic power down function activates. Power hold: HIGH Power down: LOW
P07	61	Outputs a speaker muting signal when the received data message matches the programmed one in the CPU. Speaker mute: LOW Speaker unmute: HIGH
AN7	62	Input port for a data transmission request signal (RTS) from the accessory jack, pin 5.
AN6	63	Ground
WR	64	Outputs a write strobe signal for the external memory. Data output: HIGH Data input: LOW

• IC9 (I/O expander)

PORT NAME	PIN NUMBER	DESCRIPTION
DIM1, DIM2	1, 2	Output control signals for the dimmer circuit on the FRONT unit.
CAL	3	Outputs a switching signal for the [CALL] light (DS1) on the LED unit. Active: HIGH
BUY	4	Outputs a switching signal for the [BUSY] light (DS2) on the LED unit. Active: HIGH
SFT	5	Outputs the PLL shift signal. During talk-around transmission: HIGH
ALT	6	Outputs the external alert signal. Function activates: HIGH
Qh	7	Outputs a band-width range switching signal (BWC) to the RXFIL and the TXFIL boards. Active: HIGH
C/D	15	Outputs a command/data switching signal for the LCD driver (IC1, pin 26) on the FRONT unit. Command mode: HIGH Data mode: LOW

3-6 OTHER CIRCUITS

3-6-1 DIMMER CIRCUIT (FRONT UNIT)

The dimmer circuit (IC2, IC3, Q2~Q7) drives the backlights (DS2, DS3) and ensures that brightness does not change even with a change in the power supply. This circuit is controlled by the control signals from the I/O expander (MAIN unit IC9, pins 1 and 2).

3-6-2 HORN ALERT CIRCUIT (LED UNIT)

An "ALT" signal from the I/O expander (MAIN unit IC9, pin 6) is applied to a horn alert switch (Q18). Q18 is turned ON when the "ALT" signal is "HIGH." The optional UX-11 HORN-HONK DRIVER UNIT drives a signaling device such as a car horn to alert the operator to specific calls received.

SECTION 4 ADJUSTMENT PROCEDURES

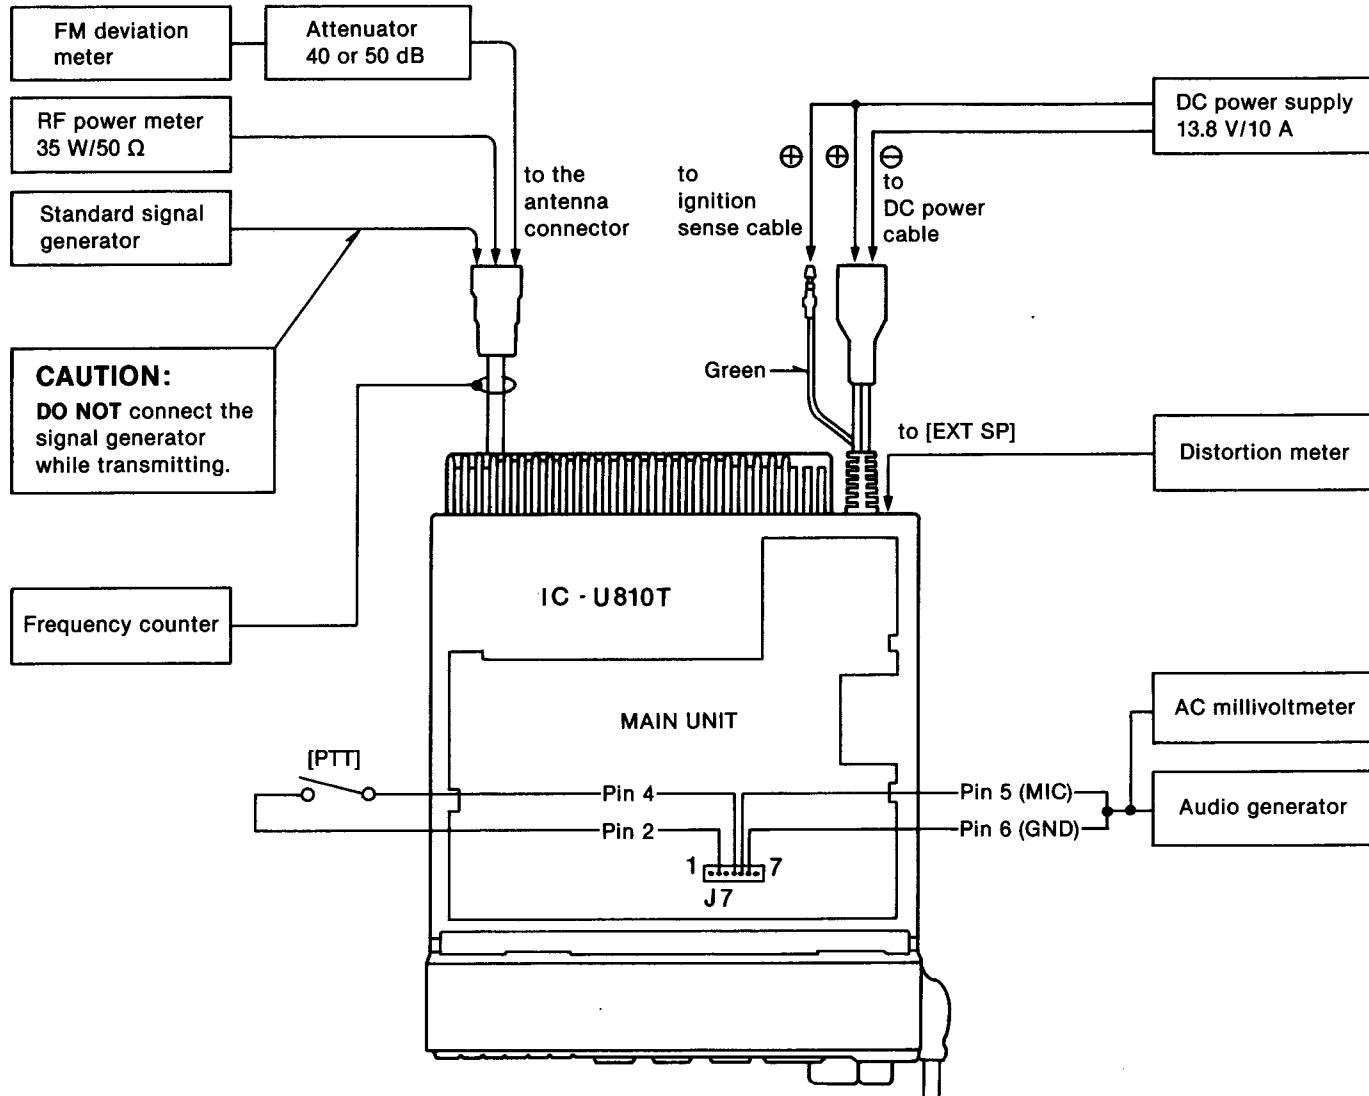

4-1 PREPARATION BEFORE SERVICING

■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 13.8 V DC Current capacity : 10 A or more	Audio generator	Frequency range : 300~3000 Hz Output level : 1~1000 mVrms
RF power meter (terminated type)	Measuring range : 1~35 W Frequency range : 800~900 MHz Impedance : 50 Ω SWR : Less than 1.2:1	Attenuator	Power attenuation : 40 or 50 dB Capacity : 35 W or more
	AC millivoltmeter	Measuring range : 2~2000 mVrms	
	Oscilloscope	Frequency range : DC~20 MHz Measuring range : 0.01~10 V	
Frequency counter	Frequency range : 10~900 MHz Frequency accuracy : ±1 ppm or better Sensitivity : 100 mV or better	DC voltmeter	Input impedance : 50 kΩ/DC or better
	FM deviation meter	Frequency minimum : 900 MHz Measuring range : 0~±5 kHz	
Distortion meter	Frequency range : 1 kHz±10 Hz Measuring range : 1~100 %		
Standard signal generator (SSG)	Frequency range : 100~900 MHz Output level : -127~- -17 dBm (0.1 μV~32 mV)		

CW: Clockwise CCW: Counterclockwise

■ CONNECTION

4-2 TEST MODE

Some frequency and settings which are needed for this "adjustment procedure" are pre-programmed in the transceiver's test mode. This "adjustment procedure" uses the System No. and Group No. for each adjustment, based on the pre-programmed settings.

NOTE: The settings in the test mode are re-programmed by the "Diagnostic frequency" setting. If you changed the test mode contents, re-program the System numbers 01~03 and Group numbers 1~4 as following table.

■ TEST FREQUENCY (EPROM frequency)

System No.	Built-in frequency	System No.	Built-in frequency
01	851.0125 MHz	11	858.4875 MHz
02	858.5125 MHz	12	865.8625 MHz
03	865.9875 MHz	13	851.0875 MHz
04	851.1875 MHz	14	858.5375 MHz
05	858.1875 MHz	15	865.8875 MHz
06	865.5625 MHz	16	851.1125 MHz
07	851.0375 MHz	17	858.5625 MHz
08	858.4625 MHz	18	865.9125 MHz
09	865.8375 MHz	19	851.1375 MHz
10	851.0625 MHz	20	851.1625 MHz

NOTE: Above frequency shows the receive or Talk-around frequency in the test mode. Subtract 45 MHz from this frequency for the Trunking transmit frequency.

■ FREQUENCY INDICATION

The receive frequency can be indicated in the test mode. If you need to check the frequency, push and hold the [SCAN] button.

■ ENTERING THE TEST MODE

- 1) While pushing the [SET] and [SCAN] buttons, turn the [VOL/PWR] switch ON.
 - All characters in the LCD appear and [BUSY]/[CALL] indicators light up.
- 2) Continue pushing the buttons for 3 sec.
 - The transceiver is in the test mode now.
- 3) Release the buttons.
 - Use the [SYS/GRP] button and [SELECT] knob to set the Group/System number.
