SERVICE MANUAL

VHF TRANSCEIVER

IC-V220

INTRODUCTION

This service manual describes the latest information for the following transceivers at the time of publication.

MODEL	VERSION NO.	FREQUENCY COVERAGE
IC-V220	#01	150.000 ~ 174.000 MHz

To upgrade quality, all electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1110002550 IC TA7252AP IC-V220 MAIN UNIT 5 pieces
8810006230 Screw FH M2.6 x 4 ZK BS IC-V220 Top cover 10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB ~ 50 dB attenuator between the transceiver and a deviation meter or spectrum analyser when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

SECTION 1 SPECIFICATIONS

■ GENERAL

• Frequency coverage	: 150.000 ~ 174.000 MHz
• Mode	: FM (16K0F3E)
• Channel spacing	: 30 kHz
• Memory channels	: Up to 18
• Antenna impedance	: 50 Ω (nominal)
• Power supply requirement	: 13.8 V DC ± 15 % (negative ground)
• Current drain	: Receive 450 mA (squelched) 1.1 A (max. audio output) Transmit 6.0 A (high) 3.2 A (low)
• Usable temperature range	: -30°C ~ +60°C (-22°F ~ +140°F)
• Frequency stability	: ±0.0005 % (-30°C ~ +60°C)
• Dimensions	: 140 (W) x 40 (H) x 160 (D) mm; 5.5 (W) x 1.6 (H) x 6.3 (D) in (Projections not included)
• Weight	: 1.0 kg (2.2 lb)

■ TRANSMITTER

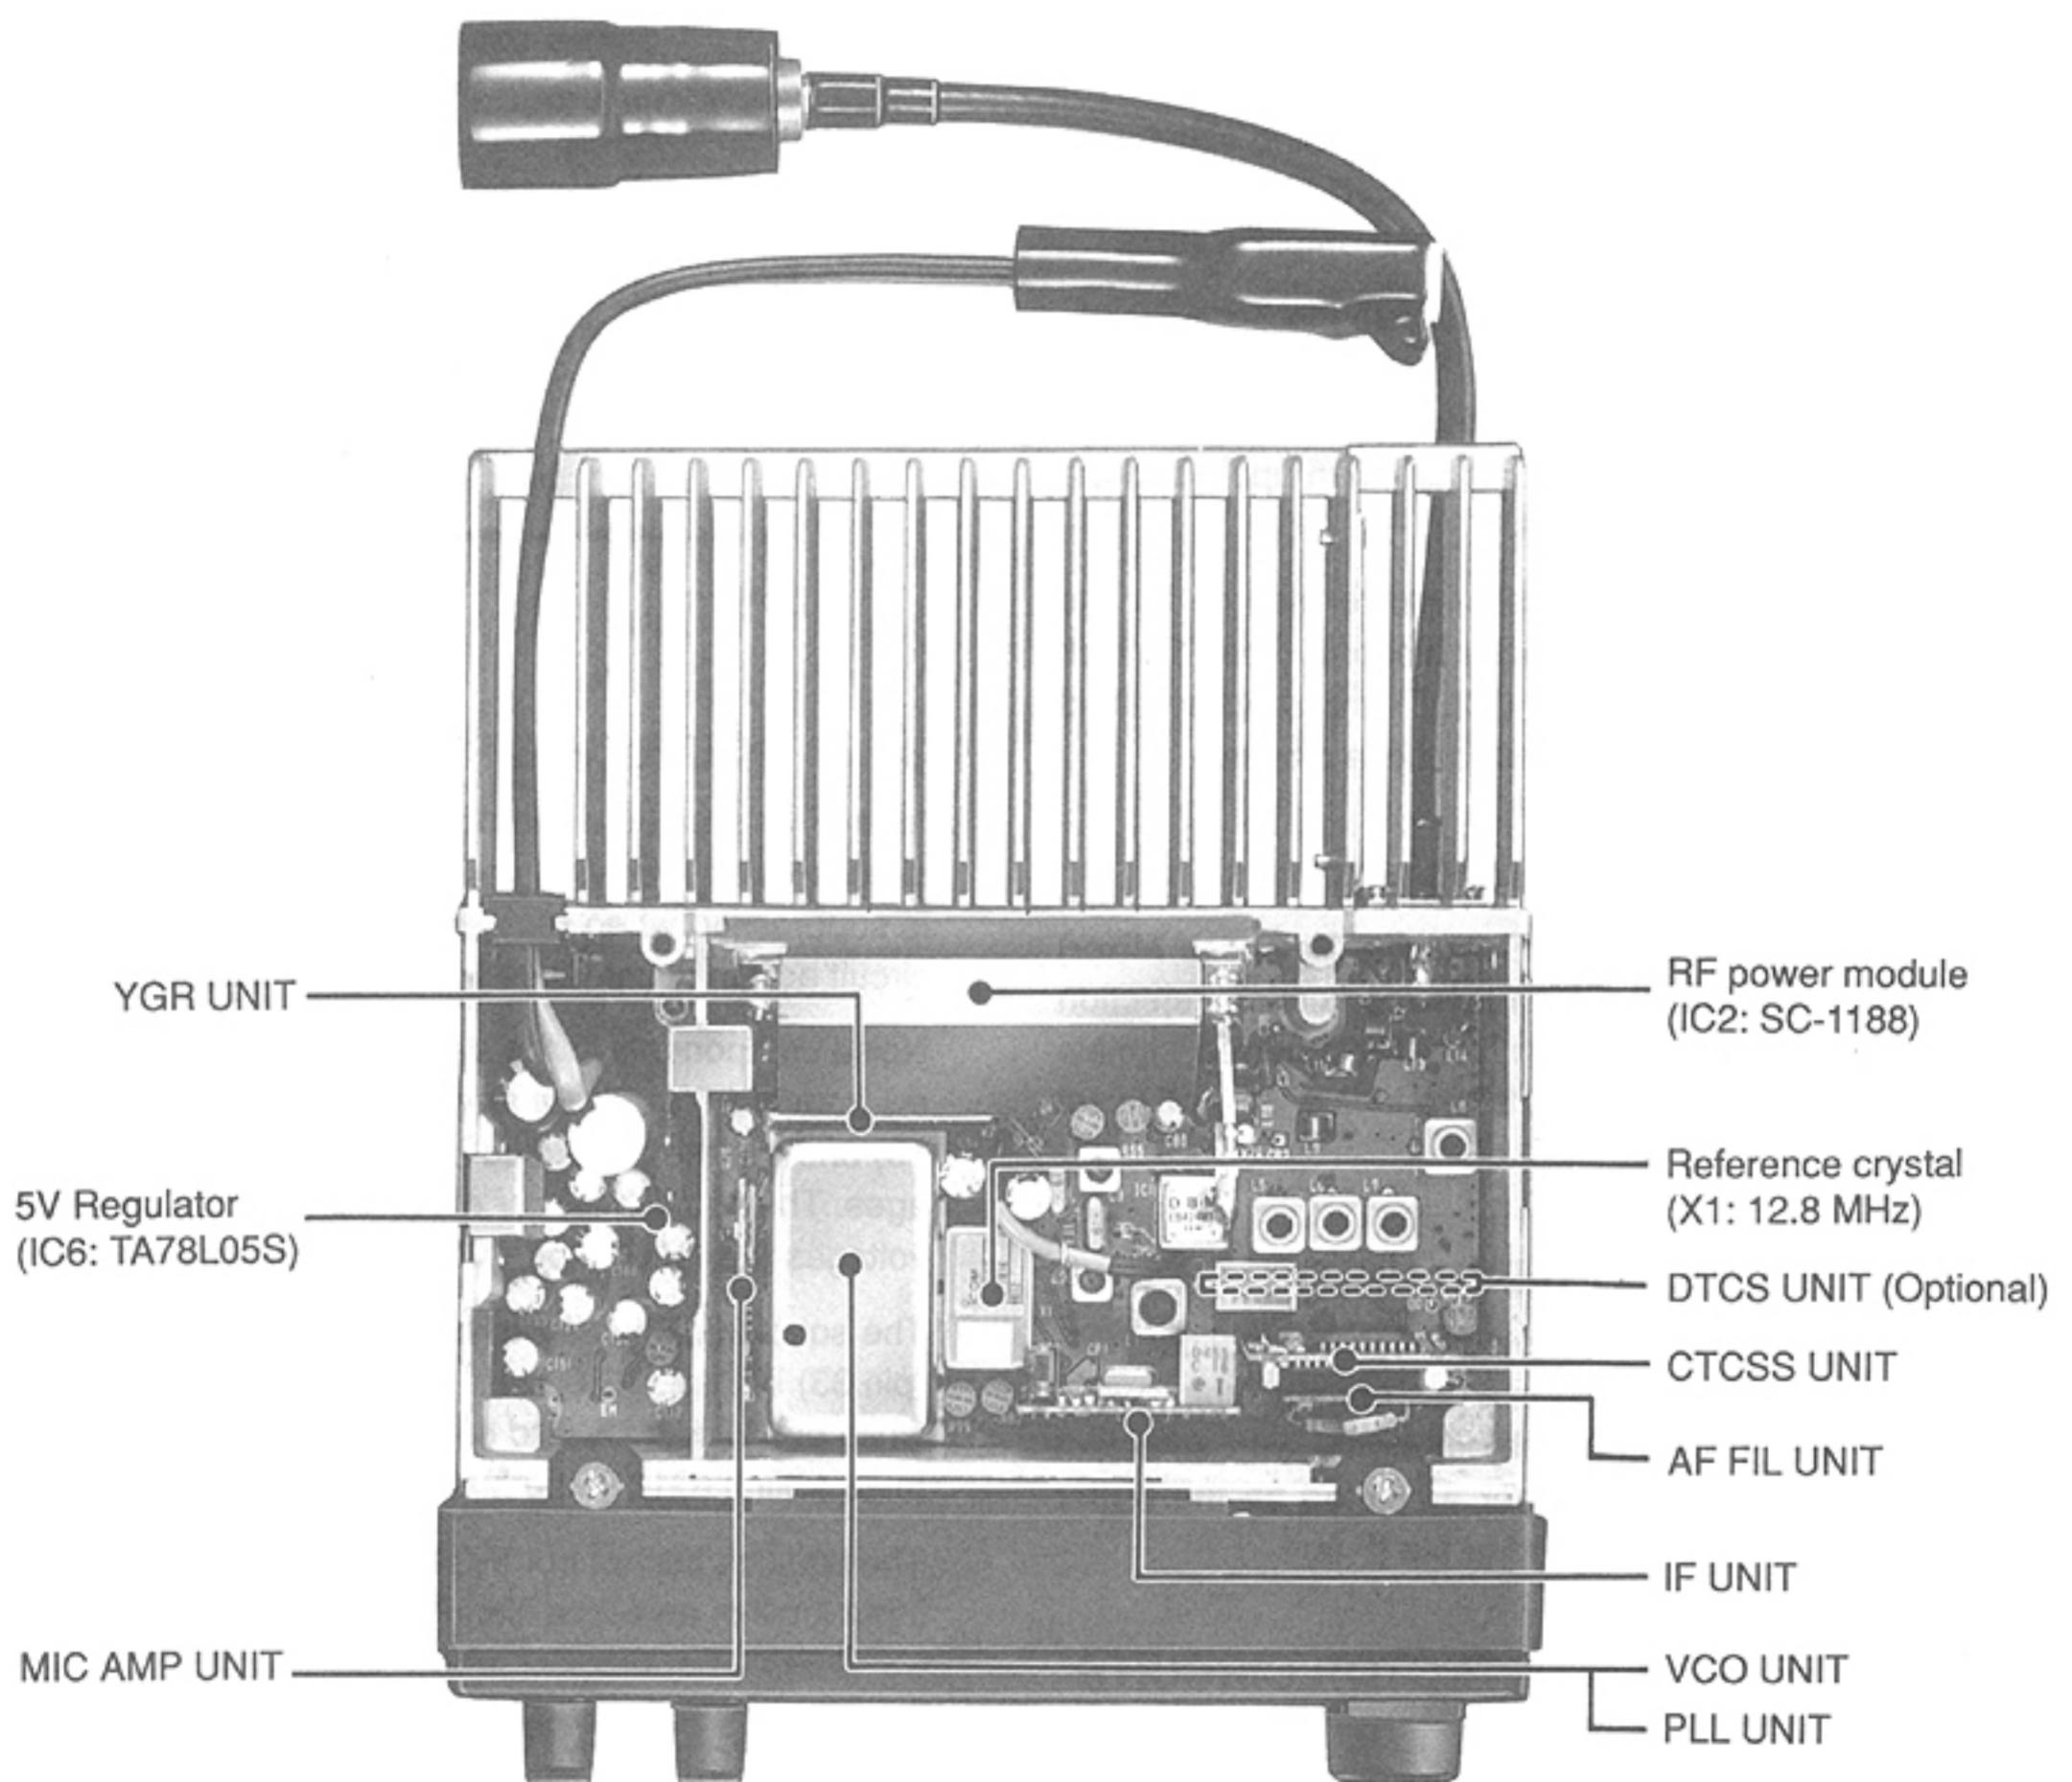

• Output power	: 25 W (high), 5 W (low)
• Modulation system	: Variable reactance frequency modulation
• Max. frequency deviation	: ±5.0 kHz
• Spurious emissions	: -70 dB
• Harmonic emissions	: -70 dB
• Noise and hum ratio	: -50 dB
• Audio harmonic distortion	: 10%
• Audio frequency response	: +1 dB ~ -3 dB of +6 dB/octave with 300 Hz to 3000 Hz input
• Microphone impedance	: 600 Ω

■ RECEIVER

• Receive system	: Double-conversion superheterodyne
• Intermediate frequencies	: 1st 21.8 MHz 2nd 455 kHz
• Sensitivity	: 0.2 μV for 12 dB SINAD
• Squelch sensitivity	: 0.2 μV (threshold level)
• Adjacent channel selectivity	: -75 dB (-80 dB typical)
• Spurious response rejection	: -90 dB
• Intermodulation rejection	: -70 dB (-75 dB typical)
• Audio frequency response	: +1 dB ~ -3 dB of -6 dB/octave with 300 Hz to 3000 Hz deviation
• Audio output power	: 4 W with a 4 Ω load
• Audio output impedance	: 4 Ω

All stated specifications are subject to change without notice or obligation.

SECTION 2 INSIDE VIEWS

SECTION 3 CIRCUIT DESCRIPTION

3-1 RECEIVER CIRCUITS

3-1-1 ANTENNA SWITCHING CIRCUIT (MAIN UNIT)

The antenna switching circuit functions as a low-pass filter while receiving and as a resonator circuit while transmitting. It switches the flow of the transmitting or receiving signal.

Received signals enter the MAIN unit from the antenna connector and pass through the low-pass filter (C42 ~ C45, L11, L12). They are then applied to the antenna switching circuit (D6, D8, D9, L9, L10).

3-1-2 RF CIRCUIT (MAIN UNIT)

The signals pass through the antenna switching circuit and are applied to the bandpass filter circuit (D5, L8, C31) where the object signals are led to the RF amplifier (Q3).

The signals amplified by Q3 are applied to the 3-stage variable bandpass filter (D2 ~ D4, L5 ~ L7, C14, C16, C17, C20, C21, C24) to eliminate the out-of-band signals and improve the selectivity. The signals are then applied to the 1st mixer (IC1).

The PLL lock voltage is used as a power source for the control voltage of D2 ~ D5 (varactor diodes). The PLL lock voltage output from the PLL unit ("CLV") is current-amplified by Q6 and Q7, and is then applied to these diodes.

3-1-3 MIXER CIRCUIT (MAIN UNIT)

The IC-V220 employs a DBM IC (Double Balanced Mixer) as a 1st mixer to obtain a high intermodulation rejection ratio. The mixer circuit (IC1) mixes the received signals and 1st LO signal from the PLL to produce a 21.8 MHz 1st IF signal.

3-1-4 1ST IF CIRCUIT (MAIN UNIT)

The 1st IF signal is amplified by the 1st IF amplifier (Q2) and is then applied to FI1. FI1 is a pair of monolithic crystal filters which only pick up an object signal with sufficient selectivity. This signal is further amplified by the buffer amplifier (Q1) and is then applied to the IF unit.

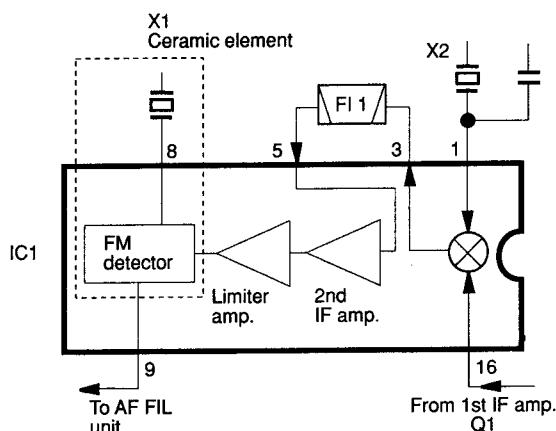

3-1-5 2ND IF AND FM DETECTOR CIRCUITS (IF UNIT)

IC1 contains the 2nd LO circuit, 2nd mixer circuit, limiter amplifier circuit, squelch trigger circuit and quadrature detector circuit.

The 1st IF signal from Q1 is applied to the 2nd mixer section of IC1 (pin 16), and is mixed with a 2nd LO signal generated by X2 to produce a 455 kHz 2nd IF signal.

The 2nd IF signal is output from IC1 (pin 3) and is passed through the ceramic filter (FI1), where unwanted signals are suppressed, and is then applied to the 2nd IF and limiter amplifiers in IC1 (pin 5). The signal is detected by AF signals from the FM detector section in IC1.

The FM detector circuits employ a quadrature detection method (linear phase detection), which uses a ceramic element for phase delay to obtain a non-adjusting circuit. The detected signal exits IC1 (pin 9).

3-1-6 SQUELCH CIRCUIT (IF UNIT)

In an FM receiver, audio noise is produced in its IF and AF circuits when receiving no RF signals. However, the noise is suppressed when receiving a signal. The noise squelch circuit acts in accordance with this phenomenon.

Noise components in the detected signal (20 kHz and higher) from IC1 (pin 9) are amplified at the active filter IC1 (pin 10) and are then detected by D2 and converted to DC voltages. The squelch trigger circuit IC1 (pin 12) converts these voltages to a "HIGH" or "LOW" squelch switch signal.

The squelch control switch signal is applied to the CPU IC2 (pin 33) in the LOGIC unit. The CPU pin 54 outputs "HIGH" while pin 33 is "LOW" to cut the audio signals using the AF mute switch (Q12 in the MAIN unit).

The squelch control pot (R34 in the LOGIC unit) adjusts the input level of an active filter IC1 (pin 10).

3-1-7 AF CIRCUIT (AF FIL UNIT)

The AF signals output from IC1 (pin 9) in the IF unit are amplified and filtered in the AF FIL unit.

Output from the AF FIL unit ("FILOUT") passes through the AF mute switch (Q12) and the [VOL] control (in the LOGIC unit) and is amplified by the AF power amplifier (IC7) to drive a speaker.

3-1-8 AF MUTE CIRCUIT (MAIN UNIT)

The AF mute switch (Q12) cuts the AF signal when its gate is "HIGH." This condition appears while noise squelch, CTCSS or DTCS is activated or while transmitting.

A portion of the AF detector signals from the AF FIL unit ("DETO" port) are applied to the CTCSS unit and an optional DTCS unit. "HIGH" or "LOW" detector signals from the CTCSS or DTCS unit are applied to the CPU IC2 (pin 35) to control the CPU MUTE1 port (pin 54).

3-2 TRANSMITTER CIRCUITS

3-2-1 MICROPHONE AMPLIFIER CIRCUIT (MIC AMP UNIT)

The microphone amplifier circuit amplifies audio signals with +6 dB/octave pre-emphasis from the microphone to a level needed at the modulation circuit.

The signals from the microphone pass through the mic mute circuit (Q1) and through the pre-emphasis circuit (C7, R8) that is given the frequency characteristics of +6 dB/oct.

The signals are amplified by IC1a and are then passed through the active high-pass filter (IC1b). IC1b eliminates frequencies lower than 300 Hz. The signals are amplified at the limiter amplifier (IC1c) to be limited in frequency deviation and are then applied to the splatter filter (IC1d), where the signals higher than 3 kHz are eliminated. The signals are amplified by IC4b in the MAIN unit and are then applied to the modulation circuit.

3-2-2 MODULATION CIRCUIT (VCO UNIT)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signals.

Audio signals from IC4b ("MOUT") in the MAIN unit are applied to the VCO unit. The signals change the capacitance between the gate and source of the VCO oscillator (Q1) to modulate the oscillated signal using the microphone audio signals. The oscillated signal is buffer-amplified at Q2 and Q3 and is then applied to the MAIN unit.

3-2-3 DRIVER AMPLIFIER CIRCUIT (YGR UNIT)

The driver amplifier circuit amplifies the VCO oscillating signal to a level needed at the power amplifier.

The VCO output signal passes through the low-pass filter (C51, C58, L15) in the MAIN unit and is applied to the YGR unit. The signal is amplified by the predrive (Q1) and drive (Q2) amplifiers in the YGR unit to obtain an approximate +26 dBm (400 mW) signal level. The signal is applied to the RF power amplifier (IC2 in the MAIN unit).

3-2-4 POWER AMPLIFIER CIRCUIT (MAIN UNIT)

The power amplifier circuit amplifies the driver signal to an output power level.

Though IC2 is a power module which has amplify capabilities of up to about 30 W, the APC circuit sets the power to 25 W or 5 W.

The output from IC2 (pin 4) passes through D9, C39 and the low-pass filter (L11 ~ L12, C42 ~ C45) to reduce the higher harmonic wave of the transmission frequency. The transmit/receive switching circuit (D6, D8, D9) is turned ON by T8 to prevent the transmit output power from going into the receiver circuit. While receiving, D6, D8 and D9 turn OFF for the antenna switching circuit to act as a low-pass filter.

3-2-5 APC CIRCUIT (MAIN UNIT)

The APC circuit stabilises RF output power even when the supplied voltage changes.

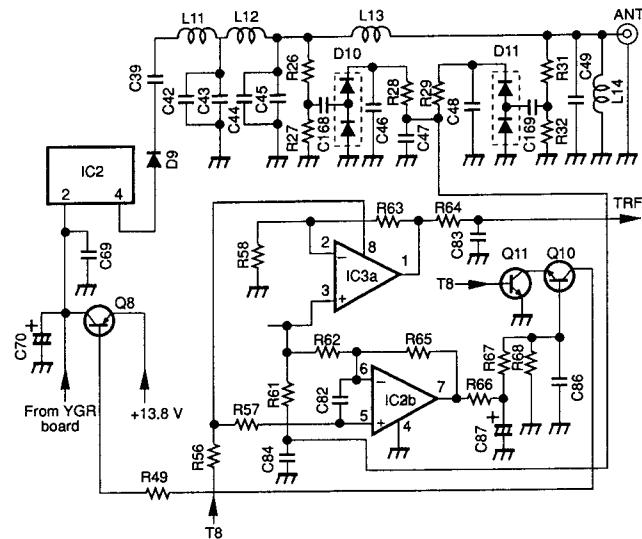

The RF output power from IC2 is detected by the mismatching detection circuit (D10, D11, L13) and its detected voltage is minimum while the output is matched with $50\ \Omega$.

However, when the output is mismatched, the detected voltage rises. This voltage is applied to IC3a (pin 3) and IC3b (pin 5).

IC3b is as an APC amplifier which acts as a differential amplifier. IC3b's \oplus input (pin 5) receives a reference voltage which determines the output power and the \ominus input (pin 6) receives the APC detected voltage. IC3b compares both inputs and controls current amplifiers (Q10, Q8).

When antenna impedance is mismatched, the APC detected voltage increases and becomes higher than the reference voltage. At this time IC3b decreases the corrector current of Q10 and Q8 to decrease the output power.

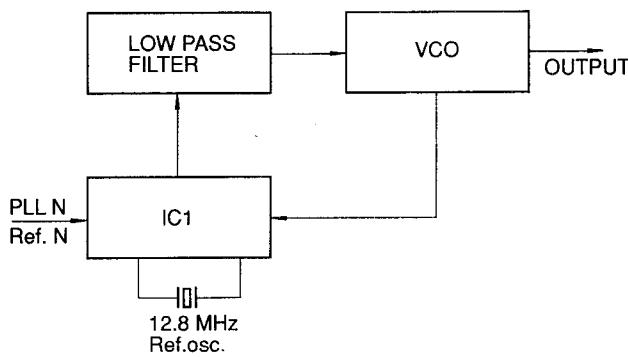

A level of low output power is also set by the reference voltage. High/low power switching is controlled by Q9.

3-3 PLL CIRCUITS

3-3-1 GENERAL DESCRIPTION (PLL UNIT)

A PLL circuit provides stable oscillation of the transmit frequency and the receive local frequency. The PLL circuit compares the phase of the divided VCO frequency to the reference frequency. The PLL output frequency is controlled by a reference oscillator and the divided ratio of a programmable divider.

The one chip PLL IC (IC1 in the PLL unit) contains two programmable dividers, a phase detector and a shift register.

The VCO oscillation output from OUT2 passes through the low-pass filter (L2, C9, C10) to cut the higher harmonic component and to prevent miss-dividing in IC1.

IC1 divides this input with the serial data from the CPU and phase-detects it with the divided reference frequency (12.8 MHz oscillated by X1 and Q15 in the MAIN unit) and then outputs the phase difference as a pulse.

The output signal is converted to a DC voltage by the charge pump (Q1, Q2) and the loop filter (R6, R7, R16, C2, C4, C17, C20) and as well controls the varactor diodes (D1, D2, D3, D4 in the VCO unit).

3-3-2 VCO CIRCUIT (VCO UNIT)

A VCO circuit generates receive and transmit frequencies and produces FM modulation.

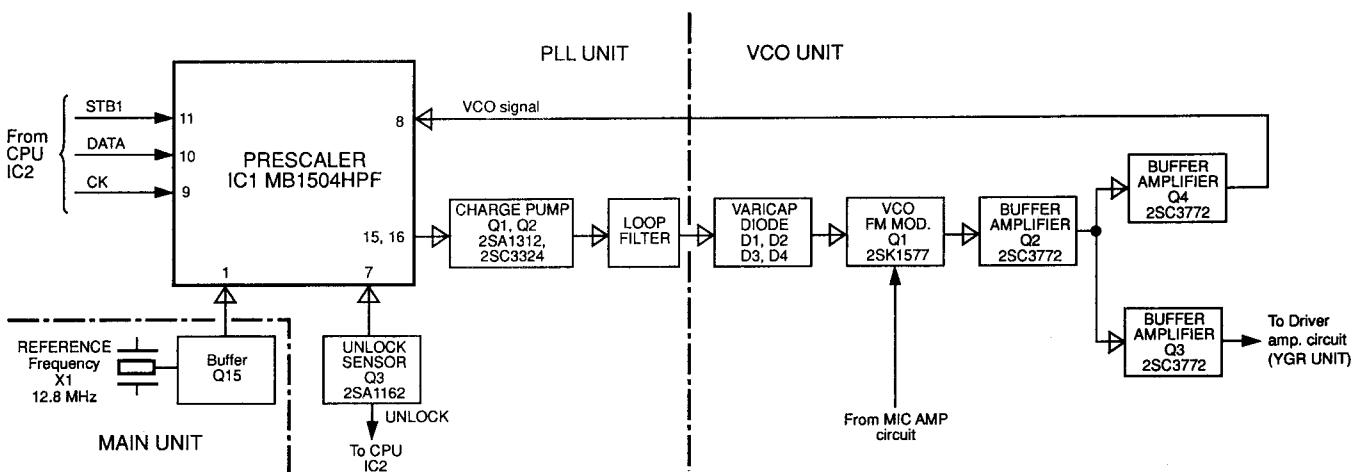

The VCO circuit forms a Colpitts oscillator circuit (Q1). Q1 FET causes oscillation; C14, with a small capacitance, provides coupling; and Q2 provides a buffer effect that is unaffected by VCO oscillation.

The output of Q2 is divided into OUT1 and OUT2 with a pad that has a resistor. OUT1 is sent to the YGR and LO circuits, and OUT2 is led to the PLL circuit.

3-3-3 REFERENCE OSCILLATOR (MAIN UNIT)

The reference oscillator circuit oscillates the PLL reference frequency.

The reference frequency is determined by X1 (12.8 MHz). This signal is supplied to IC1 (PLL unit) through the buffer amplifier (Q15).

3-4 LOGIC CIRCUITS

3-4-1 CPU PORT DESCRIPTION (LOGIC UNIT)

PIN NO.	NAME	DESCRIPTION
1	TXC	Power supply control signal when transmitting. Outputs a "HIGH" signal when transmitting.
2	RXC	Power supply control signal when receiving. Outputs a "HIGH" signal when receiving.
3	OPC	Output port for the optional decoder power supply control signal. Outputs a standby signal "HIGH" when this port receives a "HIGH" from a HANG.
4	STB3	Output port for the DTCS data strobe signal.
5	STB2	Output port for the CTCSS tone data strobe signal.
6	RESET	Input port for RESET of the CPU. When a "LOW" signal is applied here, the CPU is initialised.
29	STBY	When a "LOW" signal is applied here, the CPU changes to back-up mode.
30	DCK	Input port for the clock signal of the channel dial.
31	DUP	Input port for the up signal of the channel dial.
32	DDWN	Input port for the down signal of the channel dial.
33	SQLS	Input port for the squelch open signal; becomes "LOW" when opened.
34	UNLK	Input port for PLL unlock signals. During unlock conditions, this port is "HIGH."
35	DOUT	When the received TONE code is matched to the desired code, this terminal becomes "HIGH."
36	PTT1	Input port for the transmit signal. This port transmits the data when it receives "LOW."
37	CPO	Outputs cloning data.
38	CK	Outputs a synchronised clock signal for PLL, CTCSS, DTCS and LCD data.
39	DATA	Outputs a data signal for PLL, CTCSS, DTCS and LCD data.

PIN NO.	NAME	DESCRIPTION
44	CL	Input port for the clone mode. This port can set the clone mode when a "LOW" signal is applied here.
45	S. P	Input port for the self-program mode. This port changes to self-program mode from the clone mode when a "LOW" signal is applied here.
46	BAND	Input port for changing to VHF or UHF. This port is in VHF mode when it becomes "LOW."
47	DIMMER	Input port for the dimmer control signal. The luminescence changes one by one when it becomes "LOW."
48	HANG	Input port for TSQI and DTCS. When a "HIGH" signal is applied here, the CPU changes to stand-by mode. When a "LOW" signal is applied here, the CPU is opened.
50	LBUSY	Input port for the BUSY signal of the LCD driver.
51	BEEP	Output port for the beep tone signal.
52	TRF	Input port for "TX" INDICATOR. The indicator appears on the LCD when this port is "HIGH."
53	PTT2	Input port for the transmit signal. This port transmits the data when the PTT1 port is "HIGH" and this port is "LOW."
54	MUTE1	Output port for muting an AF amplifier. It becomes "HIGH" when the speaker sound is muted.
55	MMUTE	Output port for muting a mic amplifier.
56	LRST	Outputs a reset signal for the LCD.
57	LC/D	Outputs a "LOW" signal when LCD data is sent out. Outputs a "HIGH" signal when an LCD command is sent out.
58	D1	Output for the dimmer control signal 1.
59	D2	Output for the dimmer control signal 2.
60	STB1	Outputs a strobe signal for a PLL-IC.
63	LCS	The CPU is in standby mode for LCD data when this port outputs a "LOW" signal.
64	LOW	This port becomes low when the [HI/LOW] switch is pushed. Outputs a "HIGH" signal when low power is transmitted.

3-4-3 CONTROL AND BUFFER CIRCUIT (LOGIC UNIT)

CPU POWER SUPPLY

Q10 and Q11 function as a power supply switch for IC2 (CPU). When 5 V is supplied from the MAIN unit, Q10 and Q11 turn ON and supply 5 V to IC2.

During backup, Q10 turns OFF to prevent the battery current (BT1) from flowing to anything other than IC2.

CLONE BUFFER

Q7 and Q8 constitute a PTT buffer circuit and function as a clone input. The input/output are arranged to be in-phase.

Q5 and Q6 constitute a CPO buffer circuit and also function as a clone output that is in-phase for input and output.

Q4 is a HANG buffer circuit. Q4 ~ Q8's function is protection against the outside (MIC, etc.).

BEEP TONE

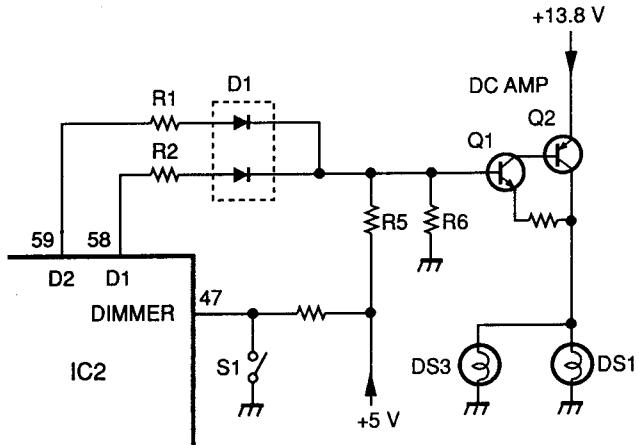

The beep signal from IC2 (pin 51) is applied to the AF power amplifier via the [VOLUME] control. While a beep sounds, the CPU cuts the audio using the "MUTE1" port (pin 54).

3-4-4 DIMMER CIRCUIT (LOGIC UNIT)

Each time S1 is turned ON, IC2's "DIMMER" port (pin 47) becomes "LOW" and the "D1" port (pin 58) and "D2" port (pin 59) are sequentially set "HIGH." The voltage from R1, R2, R5 and R6 is applied to the input (Q1 base) of the DC amplifier (Q1, Q2). The output (Q2 collector) of the DC amplifier supplies the voltage corresponding to the input to DS1 and DS3 to adjust the illumination.

Level 3 is brightest.

Level	0	1	2	3
DM1	L	H	L	H
DM2	L	L	H	H

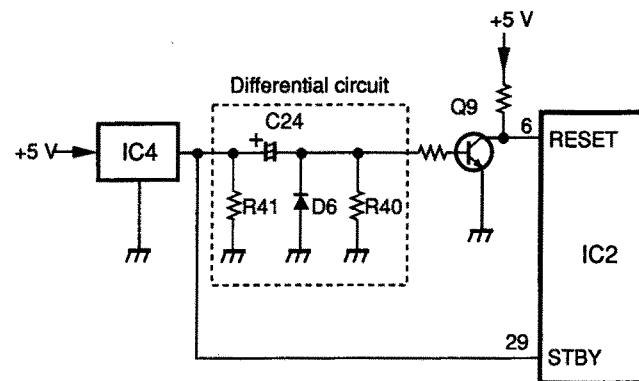

3-4-5 CPU RESET CIRCUIT (LOGIC UNIT)

The resetting IC (IC4) sets the CPU to the operating mode when turning power ON and sets it to the backup mode when turning power OFF.

When turning power ON, voltages in the 5 V line increase. When the voltages exceed the IC4 reference voltage, IC4 outputs "HIGH." The signal switches Q9, for a period determined by the differential (R40, R41, C24, D6), to set the CPU to the operating mode.

When turning power OFF, IC4 applies "LOW" to the "STB5" port of the CPU thus setting the CPU to the backup mode.

3-4-6 AUTO MEMORY CHANNEL TABLE

CH NO	RECEIVING FREQUENCY (MHz)	TRANSMITTING OFF-SET FREQUENCY (MHz)	RECEIVING TONE	TRANSMITTING TONE	TRANSMITTING POWER
1	150.100	-0.100	OFF	OFF	High
2	161.900	+0.100	OFF	OFF	High
3	173.900	+0.100	OFF	OFF	High
4	150.100	-0.100	DTCS 023	DTCS 023	Low
5	161.900	+0.100	DTCS 023	DTCS 023	Low

7	150.100	-0.100	CTCSS 67 Hz	CTCSS 67 Hz	High
8	150.100	-0.100	CTCSS 250.3 Hz	CTCSS 250.3 Hz	High
9	161.900	+0.100	CTCSS 88.5 Hz	CTCSS 88.5 Hz	High
10	173.900	+0.100	CTCSS 67 Hz	CTCSS 67 Hz	High
11	173.900	+0.100	CTCSS 250.3 Hz	CTCSS 250.3 Hz	High

3-5 POWER REGULATOR CIRCUIT

When the [POWER] switch on the front panel is turned ON, Q20 and Q30 in the MAIN unit activate and supply 13.8 V to each power source circuit.

IC6 is a 3-terminal regulator which produces +5 V. The current amplifier (Q26, Q27) amplifies this reference voltage to supply each circuit.

IC5 is +9 V regulator and its output is used as the reference voltage for the T8 and R8 voltage lines.

HV	External power from the DC power connector.
13.8 V	13.8 V DC from the [VOL] switch.
5 V	Common 5 V converted from the 13.8 V line at Q27. Common 5 V converted from the 13.8 V line at IC6.
8 V	Common 8 V converted from the 13.8 V line at Q22.
T8	Transmit 8 V converted from the 13.8 V line at Q17.
R8	Receive 8 V converted from the 13.8 V line at Q24.

SECTION 6 ADJUSTMENT PROCEDURES

6-1 PREPARATION BEFORE SERVICING

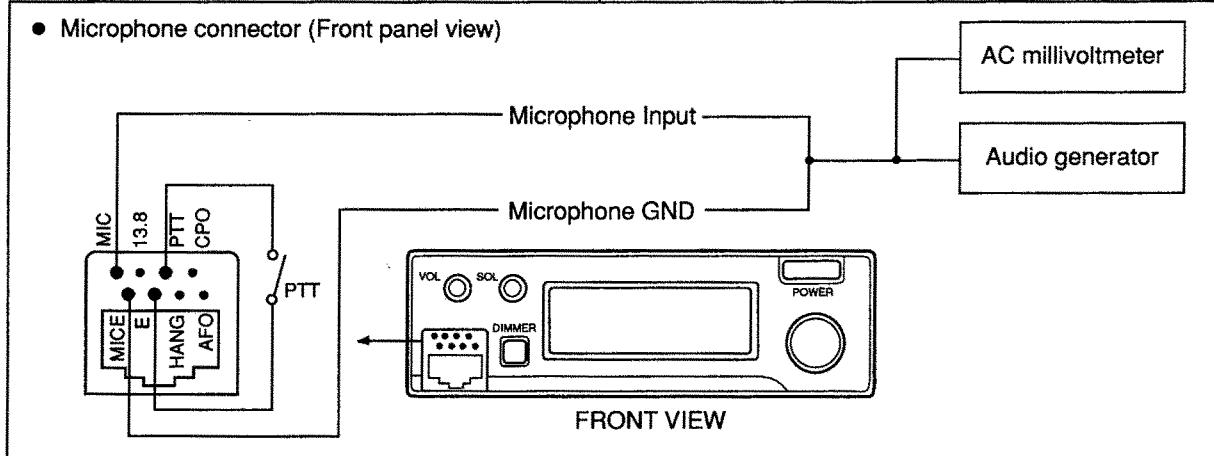

■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 13.8 V DC Current capacity : 10 A or more	Audio generator	Frequency range : 300 ~ 3000 Hz Output level : 1 ~ 200 mV
RF power meter (terminated type)	Measuring range : 1 ~ 50 W Frequency range : 120 ~ 200 MHz Impedance : 50 Ω SWR : Less than 1.2 : 1	Attenuator	Power attenuation : 40 or 50 dB Capacity : 25 W or more
	AC millivoltmeter	Measuring range : 2 ~ 200 mV	
	Oscilloscope	Frequency range : DC ~ 20 MHz Measuring range : 0.01 ~ 10 V	
Frequency counter	Frequency range : 0.1 ~ 200 MHz Frequency accuracy : ± 1 ppm or better Sensitivity : 100 mV or better	DC voltmeter	Input impedance : 50 kΩ/DC or better
	FM deviation meter	Frequency minimum : 200 MHz Measuring range : 0 ~ ±5 kHz	
	External speaker	Impedance : 4 Ω	
Distortion meter	Frequency range : 1 kHz ± 10 Hz Measuring range : 1 ~ 100%		
Standard signal generator (SSG)	Frequency range : 120 ~ 200 MHz Output level : -127 ~ -17 dBm (0.1 μV ~ 32 mV)		

■ CONNECTIONS

- Microphone connector (Front panel view)

6-2 PLL ADJUSTMENT

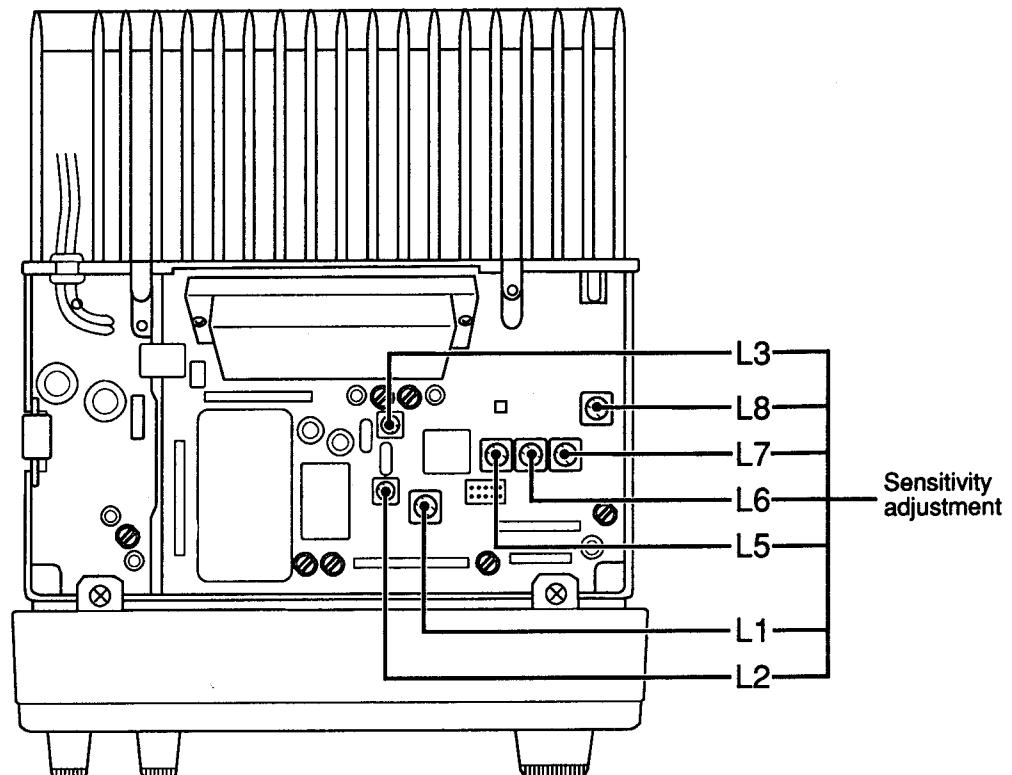

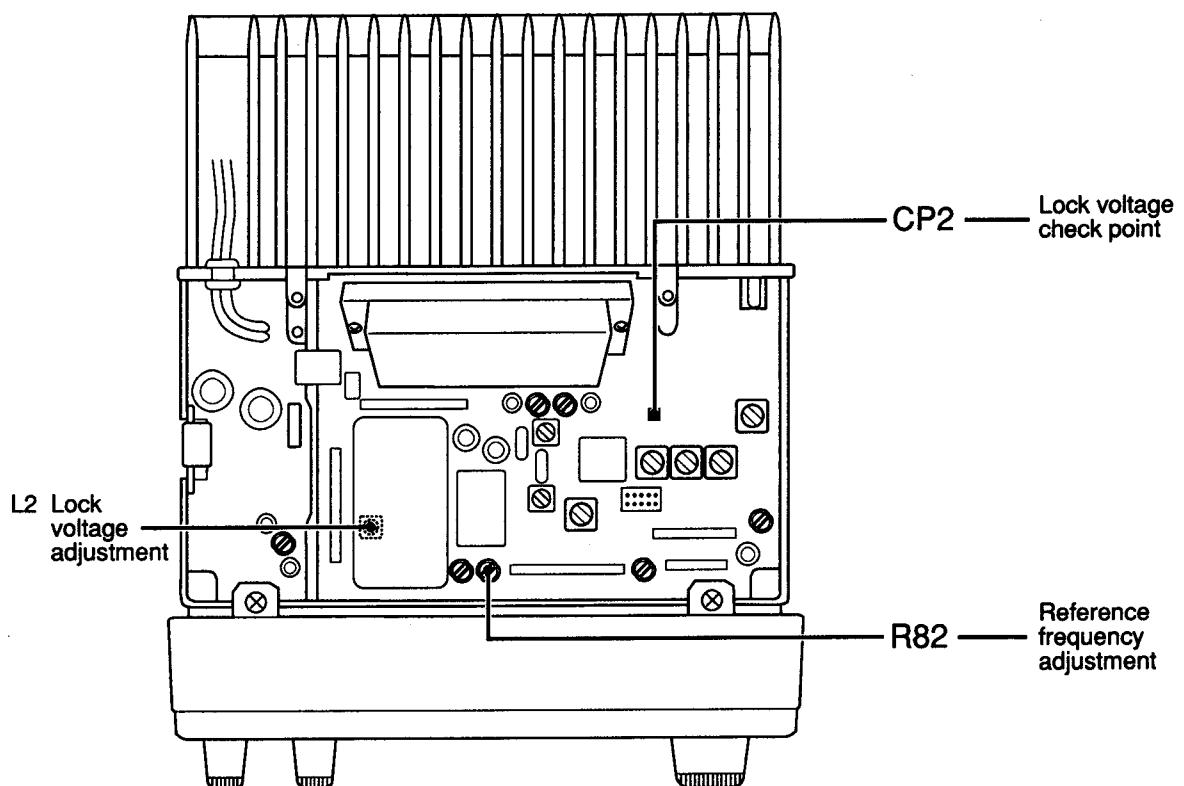

ADJUSTMENT		ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
			UNIT	LOCATION		UNIT	ADJUST
LOCK VOLTAGE	1	• Operating frequency: 150.000 MHz • Receiving	MAIN	Connect the DC voltmeter to CP2.	2.1 V	VCO	L2
REFERENCE FREQUENCY	2	• Select any channel. • Connect the RF power meter or a 50 Ω dummy load to the antenna connector. • Be sure the CTCSS and DTCS are turned OFF and that there is no audio input to the microphone connector. • Transmitting	Rear panel	Loosely couple the frequency counter to the antenna connector.	The same frequency as the programmed one.	MAIN	R82

6-3 RECEIVER ADJUSTMENT

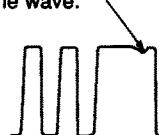

ADJUSTMENT		ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
			UNIT	LOCATION		UNIT	ADJUST
SENSITIVITY	1	NOTE: When the sensitivity is less than 0.2 µV on every channel, the following sensitivity adjustment is not necessary. Skip to Section 6 - 4 TRANSMITTER ADJUSTMENT.					
		• Operating frequency: 150.000 MHz • Connect the SSG to the antenna connector and set as: Level : 0.2 µV* (-121 dBm) Modulation : 1 kHz Deviation : ±3.0 kHz • [SQL] control : Maximum counterclockwise • Receiving	MAIN	Connect the distortion meter to the [EXT SP] jack with a 4 Ω load.	Minimum distortion level	MAIN	Adjust in sequence L8, L7, L6, L5, L3, L2, L1

* This output level of the standard signal generator (SSG) is indicated as SSG's open circuit.
