SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 DUPLEXER CIRCUIT (UHF RF UNIT)

The transceiver has a duplexer (low-pass and high-pass filter) on the first stage from the antenna connector to separate the signals into VHF and UHF signals. The low-pass filter (L16, L17, C52) for VHF signals and the high-pass filter (C40–C44, L11, L12) for UHF signals. The separated signals are applied to each RF circuit.

4-1-2 VHF ANTENNA SWITCHING CIRCUIT (VHF RF UNIT)

The antenna switching circuit functions as a low-pass filter while receiving. However, its impedance becomes very high while transmitting by grounding cathode of D16 (except for at E-low power). Thus, transmit signals are blocked from entering the receiver circuits. The antenna switching circuit employs a 1/4λ type diode switching system. The passed signals are then applied to the RF amplifier circuit.

4-1-3 VHF RF CIRCUIT (VHF RFA BOARD)

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

The signals from the antenna switching circuit pass through a band-pass filter (L1, D2), and are applied to the RF amplifier (Q1, Q2). The RF amplifier consists of a cascade circuit. The amplified signals are passed through the next stage band-pass filter (L2, L3, D4, D5) to suppress unwanted signals. The filtered signals are then applied to the 1st mixer circuit (VHF RF unit, Q5).

D2, D3 and D5 employ varactor diodes that track the band-pass filters and are controlled by the PLL lock voltage. These diodes tune the center frequency of an RF passband for wide bandwidth receiving and good image response rejection.

4-1-4 VHF 1ST MIXER AND 1ST IF CIRCUITS (VHF RF UNIT)

The 1st mixer circuit converts the received signal to a fixed frequency of the 1st IF signal with a PLL output frequency. By changing the PLL frequency, only the desired frequency will be passed through a pair of crystal filters at the next stage of the 1st mixer.

The signals from the VHF RFA board are mixed with the 1st LO signal from the VCO circuit (VHF VCO board) to produce a 43.10 MHz 1st IF signal.

After passing through the matching circuit (L1), the 1st IF signal is applied to a pair of crystal filters (FI2) to suppress out-of-band signals. The 1st IF signal is amplified at the IF amplifier (Q4) and applied to the 2nd mixer circuit (IC1).

4-1-5 U/U FUNCTION AMPLIFIER

For the U/U function, the VHF RF unit includes a UHF amplifier and a mixer circuit.

UHF RF signals from the UHF RF unit (via J2, U/U ANT terminal) are amplified at Q9 and Q8, and mixed with the PLL output at Q7. A doubled signal from the VHF VCO board is used as PLL output for UHF signal conversion. The mixed signal (43.10 MHz IF signal) is applied to an IF filter (FI2).

4-1-6 VHF 2ND IF AND DEMODULATOR CIRCUITS (VHF RF UNIT)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double superheterodyne system (which converts receive signals twice) improves the image rejection ratio and obtains stable receiver gain.

The 1st IF signal from the FI2 is applied to the 2nd mixer section of IC1 (pin 20), and is mixed with the 2nd LO signal to be converted to a 455 kHz 2nd IF signal.

IC2 contains the 2nd mixer, 2nd local oscillator, limiter amplifier and quadrature detector circuits. The 2nd local oscillator section and X2 generate 42.645 MHz for the 2nd LO signal.

The 2nd IF signal (455 kHz) from the 2nd mixer (IC1, pin 4) passes through the ceramic filter (FI1) where unwanted signals are suppressed. It is then amplified at the limiter amplifier section (IC1, pin 6) and applied to the quadrature detector section (IC1, pin 9 and ceramic discriminator X1) to demodulate the 2nd IF signal into AF signals.

AF signals output from IC1 (pin 11) are applied to the AF amplifier (Q16, Q17: LOGIC unit), DTMF decoder and optional tone squelch circuits (TSQL unit). The S-meter output "L SD" signal from IC1 (pin 12) is applied to the CPU from IC1 (pin 12). See Figure 1.

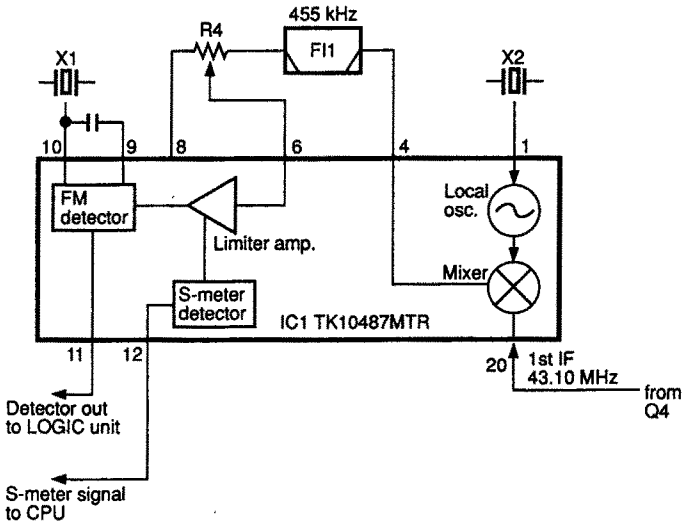

Fig. 1 VHF 2ND IF AMPLIFER

4-1-7 VHF AF AMPLIFIER CIRCUIT (LOGIC UNIT)

The AF amplifier circuit, including an AF mute switch, amplifies the demodulated signal to drive a speaker. For the separate speaker function, 4 multiplexers and a stereo power amplifier are used.

AF signals are applied to Q16 and Q17. Q16 is an active filter that functions as a high-pass filter to suppress subaudible tone signals for tone squelch operation. Q17 is also an active filter that functions as a low-pass filter to suppress higher noise signals.

The filtered signals pass through the AF mute switch (Q18) and [VOL] control (R1) on the V-L board and are then applied to the multiplexers (IC8 and IC22). When the VHF audio is selected to the internal speaker by the separate speaker function, AF signals are applied to the one of the separate inputs of the stereo AF power amplifier (AF board IC1, pin 6); when the external speaker is selected, AF signals are applied to IC1, pin 7. See Figure 2.

4-1-8 VHF NOISE SQUELCH (LOGIC UNIT)

A noise squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signal, the squelch circuit switches the AF mute switches.

Some of the noise components in the AF signal from IC1 (pin 11: VHF RF unit) are applied to the noise amplifier (IC7). The [L SQL] control, R1 on the V-L board, adjusts the IC7 input level.

The noise amplifier (IC7) amplifies noise components of frequencies of 20 kHz and above. Output signals are rectified by D12 for conversion to DC voltage.

The rectified voltage triggers the squelch switch (Q15). The squelch switch sets the "LBUSY" line "HIGH/LOW" to apply the signal to the CPU (IC1, pin 41). Then the CPU outputs the L-MUTE and BUSY LED signals.

The L-MUTE signal, decoded at the output expander (IC3), activates the AF mute circuit (Q18) to cut the VHF AF signals. The BUSY LED signal is applied to the LED drive (Q4).

The voltage regulator (Q1, Q2: AF board) supplies power to the AF power amplifier. The AF ON signal from the data expander (IC2: LOGIC unit) controls Q2 (AF board) to reduce the current drain while the squelch is closed.

4-1-9 UHF RF CIRCUIT (UHF RF UNIT UHF RFA BOARD)

Antenna-in signals are divided between VHF RF signals and UHF RF signals at the duplexer (L11, L12, C40–C44, L16, L17, C52).

The UHF RF signals are passed through the band-pass filter (L8–L12, C35–C44) and antenna switching circuit (L5, L6, D5, D6, D15, C30, C31). The UHF RF signals are then amplified at the RF amplifiers (Q2, Q1). Helical band-pass filters (L2, L1) are used at the last stage of these amplifiers.

4-1-10 UHF 1ST MIXER AND 1ST IF CIRCUIT (UHF RF UNIT)

The signals from the UHF RFA board are mixed at Q2 with a 1st LO signal coming from the UHF VCO circuit (UHF VCO board: Q2, D1) to produce a 35.8 MHz 1st IF signal.

The 1st IF signal passes through the pair of crystal filters (FI2) and is then amplified at Q1 and applied to the FM IF IC (IC1, pin 16).

4-1-11 UHF 2ND IF AND DEMODULATOR CIRCUITS (UHF RF UNIT)

A 2nd mixer, 2nd IF, 2nd local oscillator, limiter amplifier, quadrature detector circuit and S-meter detector circuit are incorporated in the IC1. The 2nd local oscillator section and X2 generate a 35.345 MHz for the 2nd LO signal.

A 35.345 MHz signal is mixed with the 1st IF signal to produce the 2nd IF signal (455 kHz) at IC1. The 2nd IF signal from pin 3 is applied to pin 5 through the ceramic filter (FI1) and is amplified at the limiter amplifier section in IC1. It is then applied to the quadrature detector section (IC1, pins 5, 8 and ceramic discriminator X1) to demodulate the 2nd IF signal into an AF signal.

The signal is output from IC1 (pin 9) as a "HDET" signal and then applied to the AF circuit (LOGIC unit).

The S-meter output "H SD" signal is applied to the CPU (IC1 pin 3) on the LOGIC unit from IC1 (pin 13) on the UHF RF unit.

4-1-12 UHF AF CIRCUIT (LOGIC UNIT)

The AF "HDET" signals from IC1 (pin 9) on the UHF RF unit are applied to the active filter (Q12, Q14) on the LOGIC unit. The filtered signals pass through the AF mute switch (Q13) and [H VOL] control (R2) on the V-L board and are then applied to the AF power amplifier (IC1) on the AF board via the multiplexers (IC11, IC21).

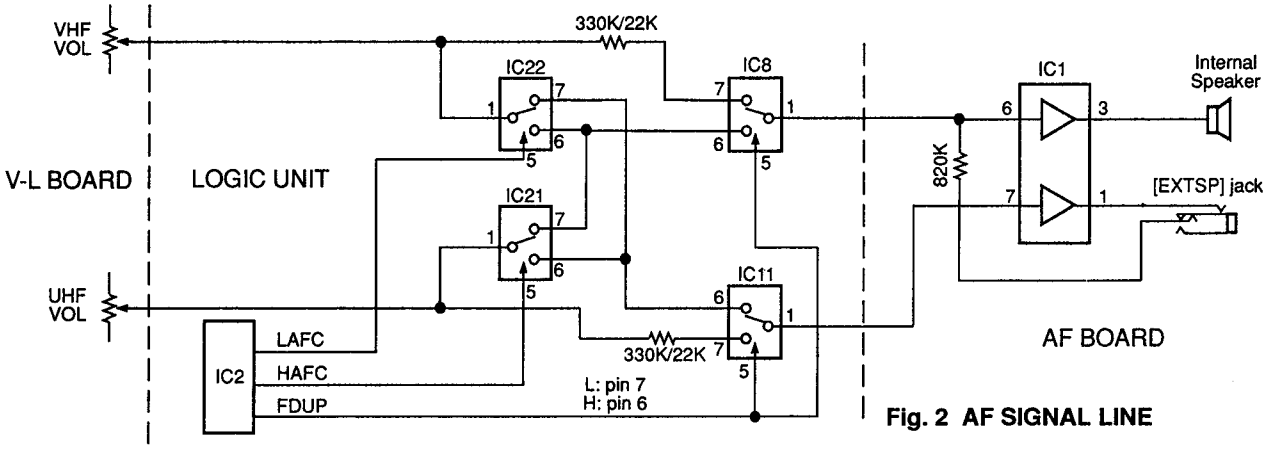

Fig. 2 AF SIGNAL LINE

4-1-13 UHF SQUELCH CIRCUIT (LOGIC UNIT)

Some of the noise components in the AF signal from IC1 (pin 9) on the UHF RF unit are applied to the noise amplifier (IC10). The [H SQL] control, R2 on the V-L board, adjusts the IC10 input level. IC10 amplifies noise components and D6 rectifies them for conversion to DC voltage.

The rectified voltage triggers the squelch switch (Q10). The squelch switch controls the "HBUSY" signal to inform the CPU (IC1, pin 24).

4-2 TRANSMITTER CIRCUITS

4-2-1 MICROPHONE AMPLIFIER CIRCUIT (LOGIC UNIT)

The microphone amplifier circuit amplifies audio signals with +6 dB/octave pre-emphasis from the microphone to a level needed for the modulation circuit. The microphone amplifier circuit is used for both the VHF and UHF bands.

The AF signals from the built-in condenser microphone, or from the [MIC] jack, pass thorough the microphone selector (IC19, pins 6, 1) and are then applied to the microphone amplifier (IC17a, pin 3).

The output signals from IC17a (pin 1) pass through the AF selector (IC18 pins 6, 1) and are then applied to the splatter filter (IC17b, pin 5) where signal components greater than 3 kHz are attenuated. The output signals from IC17b (pin 7) are then separately applied to the VHF VCO circuit (VHF VCO board) as an "L MOD" signal and to the UHF VCO circuit (UHF VCO board) as an "H MOD" signal.

4-2-2 VHF MODULATION CIRCUIT (VHF VCO BOARD)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signals.

The "L MOD" signal changes the reactance of a diode (D2) to modulate the oscillated signal at the VHF VCO circuit (Q1, Q2, D1). The VCO output is buffer-amplified at Q3 and Q16 on the VHF RF unit and is then applied to the transmit/receive switching circuit (D4, D5) on the VHF RF unit.

4-2-3 VHF DRIVE AMPLIFIER CIRCUIT (VHF RF UNIT)

The drive amplifier circuit amplifies the VCO oscillating signal to the needed level at the power amplifier.

The signal from the transmit/receive switching circuit (D5) is amplified at the drive amplifiers (Q17, Q18) to obtain approx. 15 mW.

When low power (E LOW) is selected, the output of the drive amplifier (Q18) bypasses the RF power amplifier through D7. The signal is passed through the low-pass filter (C38-C39, L6, L7) and is then applied to the antenna connector. At this point, half of the antenna switching circuit (D1) is turned OFF to prevent the output power from entering the receiver circuit.

4-2-4 VHF POWER AMPLIFIER CIRCUIT (VHF RF UNIT)

IC4 is a power module which provides more than 5 W of output power with a 13.5 V DC power source.

An RF signal from the drive amplifier (Q18) is applied to IC4. The amplified signal is then applied to the antenna connector via the transmit/receive switching circuit (D12) and band-pass filter.

4-2-5 VHF APC CIRCUIT (VHF RF UNIT AND VHF APC BOARD)

The APC circuit protects the power module (IC4) from a mismatched output load and selects HIGH, LOW1, LOW2 or LOW3 output power.

When the antenna impedance is matched at 50 Ω, the voltage detected at the APC detector circuit (L16, D9, D10, D11) is at its minimum. The detected voltage is applied to an APC amplifier Q4 (R6 side) on the VHF APC board.

When the antenna impedance is mismatched, the base voltage of Q4 (R6 side on the VHF APC board) is higher than the other base voltage of Q4 (R4 side: reference voltage), resulting in a decrease in the collector current of Q4. This current controls the diode attenuator (VHF RF unit, D6) using Q5 until the base voltage of Q4 (R6 side) reaches the same level as that of Q4 (R4 side).

Low output power is obtained by changing the reference voltage via the VAP line. The voltage of the VAP line is controlled by two ports of the data expander (VHF RF unit, IC2). A thermistor (R3) controls APC reference voltage to reduce the output power when the temperature is increased. See Figure 3.

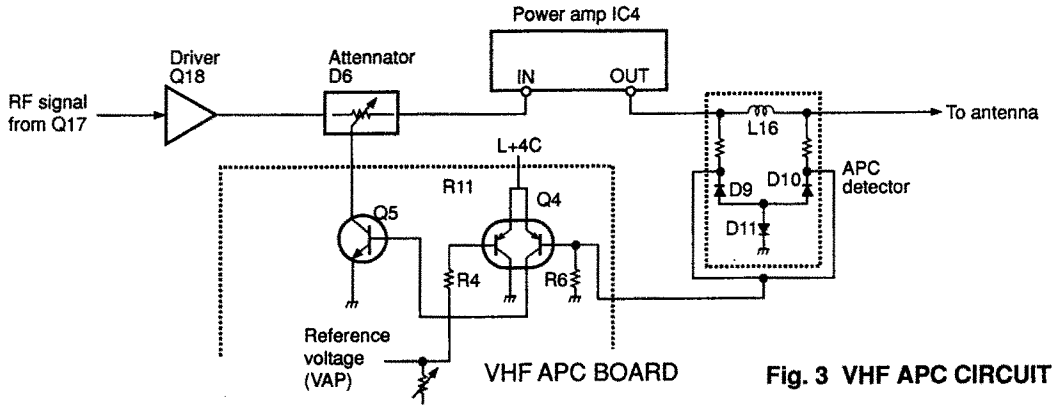

Fig. 3 VHF APC CIRCUIT

4-2-6 VHF ANTENNA SWITCHING CIRCUIT (VHF RF UNIT)

The antenna switching circuit applies receive signals to the receiver circuit and transmit signals to the antenna connector.

When transmitting, D12 and D16 are turned ON. The RF output signal is applied to the antenna connector via D12 and the low-pass filter (L8, L9, C42, C44, C46, C101, C102). At this time, D16 is also turned ON to activate the low-pass filter (L6, L7, C38–C40) as a resonator circuit.

4-2-7 UHF MODULATION CIRCUIT (UHF VCO BOARD AND UHF RF UNIT)

The audio signals from the microphone amplifier circuit (described in Section 4-2-1) are applied to D3 on the UHF VCO board.

The audio signals change the reactance of a varactor diode (D3) to modulate the oscillated signal at the UHF VCO circuit (Q1, Q2). The oscillated signal is amplified at the buffer amplifier (Q3, UHF RF unit Q13) and is then applied to the drive amplifier circuit (Q15, Q16) through the LO switch circuit (D11).

4-2-8 UHF POWER AMPLIFIER CIRCUIT (UHF RF UNIT)

IC5 is a power module which provides a stable 5 W (DC 13.5 V) of output power.

The drive amplifier (Q15, Q16) and power amplifier (IC5) amplify the VCO oscillating signal to an output level. The output signal passes through the APC detector circuit (D12–D14) and band-pass filter, and is applied to the antenna connector.

4-2-9 UHF APC CIRCUIT (UHF APC BOARD)

The APC circuit detects the output signal from the power module on the UHF RF unit. Q4 compares the voltages detected by the APC detector and the reference voltages. When a voltage detected by APC exceeds a reference voltage, Q4 increases D12 attenuation using Q5 to reduce the RF output power.

4-3 PLL CIRCUITS

4-3-1 GENERAL (VHF AND UHF RF UNITS)

A PLL circuit provides stable oscillation of the transmit frequency and the receive local frequency. The PLL circuit compares the phase of the divided VCO frequency to the reference frequency. The PLL output frequency is controlled by a crystal oscillator and the divided ratio of a programmable divider.

The PLL circuit, using a one chip PLL IC (VHF: IC3, UHF: IC4), directly generates the transmit frequency and receive 1st LO frequency with a VCO. The PLL IC sets the divided ratio based on serial data from the CPU on the LOGIC unit and compares the phases of a VCO signal and the reference oscillator frequency. The PLL IC detects the out-of-step phase and output from pins 15 and 16. The reference frequency (12.8 MHz) is oscillated at X3 on the UHF RF unit.

4-3-2 VHF PROGRAMMABLE DIVIDER AND PHASE DETECTOR CIRCUITS (VHF RF UNIT)

The VCO generated signal enters the PLL IC (IC3, pin 8) and is divided at the programmable divider section and is then applied to the phase detector section.

The phase detector compares the input signal and a reference frequency and outputs the out-of-phase signal (pulse-type signal) from pin 15 and 16.

4-3-3 VHF CHARGE PUMP AND LOOP FILTER CIRCUITS (VHF RF UNIT)

The phase detected signal is amplified at the charge pump (Q11, Q12). This signal is converted to DC voltage at the loop filter (R49–R51, C51–C54) and is applied to a varactor diode (D2) in the VHF VCO circuit to control and stabilize the oscillated frequency.

4-3-4 VHF VCO CIRCUIT (VHF VCO BOARD)

A VCO circuit generates receive and transmit frequencies at Q1, Q2, L2 and D2, and produces FM modulation.

The frequency shift signal from the data expander (IC2, pin 13) turns Q14 (VHF RF unit) and D1 (VHF VCO board) ON or OFF to switch the VCO frequency between transmitting and receiving.

4-3-5 REFERENCE OSCILLATOR CIRCUIT (UHF RF UNIT)

A 12.8 MHz reference frequency is generated by the oscillator (Q5, X3: UHF RF unit). The frequency is adjusted by C60. The reference frequency is applied to both the VHF and UHF PLL circuits.

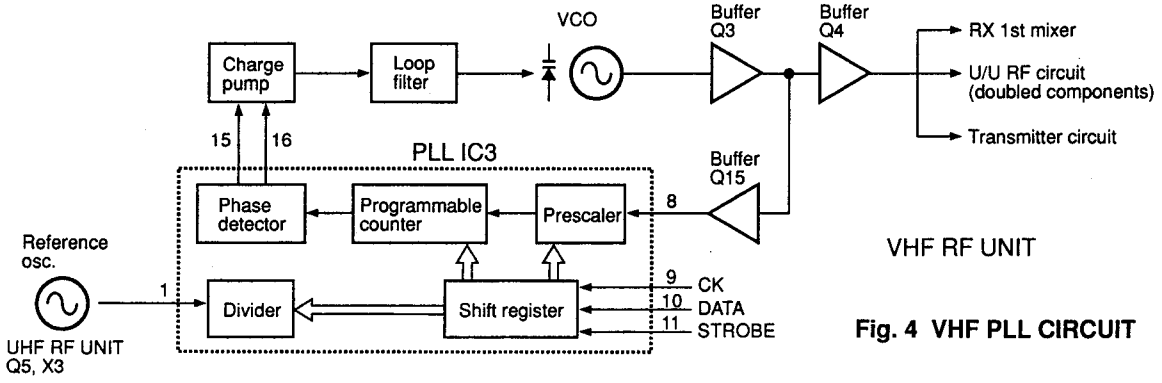

Fig. 4 VHF PLL CIRCUIT

4-3-6 UHF PLL CIRCUITS (UHF RF UNIT)

The VCO oscillated signal is buffer amplified at Q3 on the UHF VCO board, is amplified at Q11, and is then applied to the PLL IC (IC4, pin 8).

This signal is divided at the programmable divider section and is then applied to the phase detector section inside IC4. A reference frequency is also applied to IC4 from Q5, and the phase detector outputs the phase difference between the divided signal and the reference frequency via pin 15 and pin 16.

This out-of-phase signal is amplified at the charge pump (Q9, Q10) and is then converted to DC voltage by the loop filter (R38–R40, C69–C71).

The converted voltage is applied to a varactor diode (D1) of the VCO circuit on the UHF VCO board to control and stabilize the oscillated frequency.

The tone signal reply to the data signal is output from IC1 (pin 16: UHF) or IC2 (pin 16: VHF) and is applied to the microphone amplifier (IC17a) through the modulation switch (IC18). R13 adjusts the deviation level.

The received signal from the HDEF (LDEF) signal line is applied to the active low-pass filter Q6 (Q7) and then to pin 24 of IC1 (IC2). The filtered signal is compared with the programmed tone signal.
