

Ice Lake-N Intel[®] Converged Security and Management Engine Firmware 13.0

Slim Firmware Bring Up Guide

July 2019

Revision 1.0

Intel Confidential

By using this document, in addition to any agreements you have with Intel, you accept the terms set forth below. You may not use or facilitate the use of this document in connection with any infringement or other legal analysis concerning Intel products described herein. You agree to grant Intel a non-exclusive, royalty-free license to any patent claim thereafter drafted which includes subject matter disclosed herein.

INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH Intel® PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS PROVIDED IN INTEL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, INTEL ASSUMES NO LIABILITY WHATSOEVER, AND INTEL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF INTEL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

A "Mission Critical Application" is any application in which failure of the Intel Product could result, directly or indirectly, in personal injury or death. SHOULD YOU PURCHASE OR USE INTEL'S PRODUCTS FOR ANY SUCH MISSION CRITICAL APPLICATION, YOU SHALL INDEMNIFY AND HOLD INTEL AND ITS SUBSIDIARIES, SUBCONTRACTORS AND AFFILIATES, AND THE DIRECTORS, OFFICERS, AND EMPLOYEES OF EACH, HARMLESS AGAINST ALL CLAIMS COSTS, DAMAGES, AND EXPENSES AND REASONABLE ATTORNEYS' FEES ARISING OUT OF, DIRECTLY OR INDIRECTLY, ANY CLAIM OF PRODUCT LIABILITY, PERSONAL INJURY, OR DEATH ARISING IN ANY WAY OUT OF SUCH MISSION CRITICAL APPLICATION, WHETHER OR NOT INTEL OR ITS SUBCONTRACTOR WAS NEGLIGENT IN THE DESIGN, MANUFACTURE, OR WARNING OF THE INTEL PRODUCT OR ANY OF ITS PARTS.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined". Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice.

The Ice Lake Platform and Ice Lake PCH products may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Intel® AMT should be used by a knowledgeable IT administrator and requires enabled systems, software, activation, and connection to a corporate network. Intel AMT functionality on mobile systems may be limited in some situations. Your results will depend on your specific implementation. Learn more by visiting [Intel® Active Management Technology](#).

Intel® Small Business Technology (Intel® SBT) requires an Intel® Small Business Technology enabled system and proper configuration. Availability of features will depend upon the setup and configuration by your PC manufacturer. Consult your system manufacturer.

Intel® vPro™ Technology requires setup and activation by a knowledgeable IT administrator. Availability of features and results will depend upon the setup and configuration of your hardware, software and IT environment. Learn more at: <http://www.intel.com/technology/vpro>.

Any software source code reprinted in this document is furnished under a software license and may only be used or copied in accordance with the terms of that license.

64-bit computing on Intel architecture requires a computer system with a processor, chipset, BIOS, operating system, device drivers and applications enabled for Intel® 64 architecture. Processors will not operate (including 32-bit operation) without an Intel® 64 architecture-enabled BIOS. Performance will vary depending on your hardware and software configurations. Consult with your system vendor for more information.

Intel processor numbers are not a measure of performance. Processor numbers differentiate features within each processor family, not across different processor families. See http://www.intel.com/products/processor_number for details. I2C is a two-wire communications bus/protocol developed by Philips. SMBus is a subset of the I2C bus/protocol and was developed by Intel. Implementations of the I2C bus/protocol may require licenses from various entities, including Philips Electronics N.V. and North American Philips Corporation.

Microsoft*, Windows* and the Windows* logo are trademarks or registered trademarks of Microsoft Corporation in the United States and/or other countries.

Intel, Celeron, Pentium, Intel Xeon, Intel Core, Intel vPro™, and the Intel logo are trademarks of Intel Corporation in the United States and/or other countries. *Other names and brands may be claimed as the property of others.

KVM Remote Control (Keyboard, Video, Mouse) is only available with Intel® Core™ i5 vPro™ and Core™ i7 vPro™ processors with integrated graphics and Intel® Active Management technology activated. Discrete graphics are not supported.

§ §

1 Introduction

This document covers the Intel® Converged Security and Management Engine Firmware (Intel® CSME) 13.0 - Consumer Firmware bring up procedure. Intel® CSME is tied to essential platform functionality — this dependency cannot be avoided for engineering reasons.

The bring up procedure primarily involves building a Serial Peripheral Interface (SPI) Flash image that will contain:

- **[required]** Descriptor region — Contains sizing information for all other SPI Flash image regions, SPI settings (including Vendor Specific Configuration - or VSCC - tables, SPI device parameters), and region access permissions.
- **[required]** BIOS region — Contains firmware for the processor (or host) and/or Embedded Controller (EC).
- **[required]** Intel® ME FW region — Contains firmware for the Intel® Converged Security and Management Engine.
- **[optional]** GbE region — Contains firmware for Intel LAN solution.

For more details on SPI Flash layout, see the document **Ice Lake-H / LP SPI Programming Guide** SPI Programming Guide and [Appendix A](#). Once the SPI Flash image is built, it will be programmed to the target based platform and the platform will be booted. This document also covers any tests and checks required to ensure that this boot process is successful and that Intel® ME Consumer FW is operating as expected.

1.2 Intel® CSME FW Features

This firmware release includes the following applications:

- Platform Clocks – Tune clock silicon to the parameters of a specific board, configure clocks at run time, and power management clocks. **Benefit:** Allows extensive customization and soft control of “Third generation” clock solution and makes clocks available before CPU powers up.
- Silicon Workaround Capability – Intel® CSME FW will have limited capabilities to perform targeted workarounds for silicon issues. **Benefit:** Allows Intel® CSME FW to address some issues that otherwise would require a new silicon stepping.

1.3 Prerequisites

Before this document is read and utilized, it is essential that the reader first review the Consumer FW Release Notes (included with this Intel® CSME Consumer FW kit).

This document is constructed so that the reader can complete the bring up steps as given for the Intel Customer Reference Board (CRB). However, in the case that bring up is being performed on a different Intel® x based platform, this document will highlight any changes that must be imposed onto the bring up steps accordingly.

This document makes only the following limited assumptions regarding hardware:

- The platform is Ice Lake N based
- The platform is equipped with one or more SPI Flash devices with a total capacity sufficient for storing all relevant firmware images.

1.4 Acronyms and Definitions

1.4.1 General

Acronym or Term	Definition
BIOS	Basic Input Output System
DIMM	Dual In-line Memory Module
DMI	Direct Media Interface
EC	Embedded Controller
FPF	Field Programmable Fuses
FW	Firmware
GbE	Gigabit Ethernet
HECI	Host Embedded Controller Interface (aka Intel® MEI)
Intel® ICCS	Intel® Integrated Clock Controller Service
Intel® CSME	Intel® Converged Security and Management Engine (Intel® CSME)
Intel® MEI	Intel® Management Engine Interface (Intel® MEI) (renamed from HECI)
Intel® PTT	Intel® Platform Trusted Technology (Intel® PPT)
Intel® MSS	Intel® Management and Security Status Application
KVM	Keyboard, Video, Mouse
LAN	Local Area Network
MCP	Multi-Chip Package (Central Processing Unit / Platform Controller Hub)
NVM	Non-Volatile Memory
OOB	Out-of-Band
OS	Operating System
PAVP	Protected Audio and Video Path
PCI	Peripheral Component Interconnect
PCIe*	Peripheral Component Interconnect Express
PHY	Physical Layer (Networking)
RTC	Real Time Clock
SMBus	System Management Bus
SPI Flash	Serial Peripheral Interface Flash
TPM	Trusted Platform Module
VSCC	Vendor Specific Configuration

1.4.2 Intel® Converged Security and Management Engine

Acronym or Term	Definition
3PDS	3rd Party Data Storage
Agent	Software that runs on a client PC with OS running
End User	The person who uses the computer (either Desktop or Mobile). In corporate, the user usually does not have administrator privileges.
Host or Host CPU	The processor that is running the operating system. This is different than the management processor running the Intel® Converged Security and Management Engine Firmware.
Host Service/Application	An application that is running on the host CPU
INF	An information file (.inf) used by Microsoft* operating systems that supports the Plug & Play feature. When installing a driver, this file provides the OS the necessary information about driver filenames, driver components, and supported hardware.
Intel® Management Engine Interface (Intel® MEI)	Interface between the Management Engine and the Host system
Intel® MEI driver	Intel® ME host driver that runs on the host and interfaces between ISV Agents and the Intel® ME HW.
IT User	Information Technology User. Typically very technical and uses a management console to ensure functionality of multiple PCs on a network.
LMS	Local Management Service: A SW application which runs on the host machine and provide a secured communication between the ISV agent and the Intel® Management Engine Firmware.
Intel® ME	Intel® Management Engine: The embedded processor residing in the chipset MCP
MECI	ME-VE Communication Interface
NVM	Non-Volatile Memory: A type of memory that will retain its contents even if power is removed. In the Intel® AMT current implementation, this is achieved using a FLASH memory device.
OOB Interface	Out Of Band interface: This is WSMAN interface over secure or non-secure TCP protocol.
OS not Functional	The Host OS is considered non-functional in Sx power state and any one of the following cases when system is in S0 power state: <ul style="list-style-type: none"> • OS is hung • After PCI reset • OS watch dog expires • OS is not present
System States	Operating System power states such as S0. See detailed definitions in System States and Power Management section.

1.4.3 System States and Power Management

Acronym or Term	Definition
G3	A system state of Mechanical Off where all power is disconnected from the system. G3 power state does not necessarily indicate that RTC power is removed.
CM0	Intel® Management Engine firmware power state where all hardware power planes are activated. The host power state is S0.
CM3	Intel® Management Engine power state where the host is in Sx. The processor DRAM Controller is turned off and DRAM power stays in off/self refresh mode. There is no UMA usage in CM3 state. Less than 1MB of SRAM used for code and data. Code is executed off of flash takes ~1mS.
CM0-PG	Core Well Powered; Intel® CSME Well Powered; (Intel® ME core not consuming power) DRAM available.
CM3-PG	An Intel® CSME Firmware power state where no power is applied to the Management Engine subsystem. (Intel® ME firmware is shut down).
OS Hibernate	System state where the OS state is saved on the hard drive.
S0	A system state where power is applied to all HW devices and the system is running normally.
S1, S2, S3	A system state where the host CPU is halted but power remains available to the memory system (memory is in self-refresh mode).
S4	A system state where the host CPU and memory are not active.
S5	A system state where all power to the host system is off, however the power cord (and/or battery in mobile designs) is still connected.
Shut Down	Equivalent to the S5 state.
Snooze Mode	Intel® Management Engine activities are mostly suspended to save power. The Intel® Converged Security and Management Engine monitors HW activities and can restore its activities depending on the HW event.
Standby	System state where the OS state is saved in memory and resumed from the memory when mouse/keyboard is clicked.
Sx	All S states which are different than S0.

1.5 Reference Documents

Document	Doc Number/ Location*
<i>Ice Lake Intel® Converged Security and Management Engine (Intel® CSME) and Embedded Controller Interaction Product Specification Revision 0.5</i>	549024 / CDI
<i>Intel® Management Engine BIOS Writers Guide</i>	TBD / *
<i>Intel® Converged Security and Management Engine (Intel® CSME) 13 SKU Firmware Consumer Compliance Guide for Ice Lake PCH-H/LP Chipset Family - Ice Lake Platform Compliancy and Testing Guide - Revision 1.1</i>	TBD / CDI

Note: * Unless specified otherwise, a document can be ordered by providing its reference number to your Intel Field Applications Engineer.

1.6 Format and Notation

The formats and notations used within this document model are those typically used by BIOS vendors. This section describes the formatting and the notations that will be followed in this document.

Table 1-1. Number Format Notation

Number Format	Notation	Example
Decimal (default)	d	14d. Note that any number without an explicit suffix can be assumed to be decimal.
Binary	b	1110b
Hex	h	0Eh
Hex	0x	0x0E

Table 1-2. Data Format Notation

Data Type	Notation	Size
Bit	b	Smallest unit, 0 or 1
Byte	B	8 bits
Word	W	16 bits or 2 bytes
Double-word	DW	32 bits or 4 bytes
Quad-word	QW	8 bytes or 4 words
Kilobyte	KB	1024 bytes
Megabit	Mb	1,048,576 bits or 128 KB
Megabyte	MB	1,048,576 bytes or 1024 KB
Gigabit	Gb	1,073,741,824 bits
Gigabyte	GB	1024 MB

1.7 Kit Contents

The Intel® ME Consumer FW kit can be downloaded from VIP (<https://platformsw.intel.com/>). The contents of this kit are detailed below (Note that only key files are listed).

1.8 External Hardware Requirements for Bring Up

Acquire the following hardware tools before moving on to the next step.

Windows* OS System	Flash Burner	DOS Bootable USB Key
		
<p>Equipment:</p> <ul style="list-style-type: none"> Laptop or desktop that supports win32 applications <p>Purpose:</p> <ul style="list-style-type: none"> Will run firmware image assembly and build process software. 	<p>Equipment:</p> <ul style="list-style-type: none"> (Optional) For platforms that don't boot, a Flash Chip Programmer will be required For platforms that can boot to DOS or Windows*, a Intel® FPT is provided in this kit <p>Purpose:</p> <ul style="list-style-type: none"> Will burn firmware images onto the target system Flash device(s). 	<p>Equipment:</p> <ul style="list-style-type: none"> A DOS Bootable USB Key (Size > 512 MB) <p>Purpose:</p> <ul style="list-style-type: none"> Acting as a bootable device and will be used to run Intel® FPT (fpt.exe) directly on the system that is undergoing Bring Up process. Or will be used to transfer a firmware image onto a Flash burner.

§ §

2 Image Creation: Intel® Flash Image Tool

Intel® Flash Image Tool (Intel® FIT) can be used to generate either a full SPI Flash binary image with Descriptor, GbE, BIOS, and Intel® ME Regions. Additionally, it can be used to create a simple image containing only the Intel® ME Region only for use with custom SPI Flash binary image assembly solutions. Use the steps shown in following sections.

After this image has been created, it will need to be burned onto the target platform's SPI Flash device(s). [Section 3, "Programming SPI Flash Devices and Checking Firmware Status"](#) later in this document provides steps to do this.

Note: The Flash Image Tool may be updated throughout the release cycles. As a general rule, please ensure you use the tools, images and other content from the same kit and refrain from using different version tools.

2.1 Start Intel® FIT

1. Invoke Intel® Flash Image Tool. Using Explorer*, navigate to **[root]\Tools\System Tools\Flash Image Tool**. Verify that the directory contents are correct (see [Section 1.7](#)). Double-click **FIT.exe**.
2. **NOTE:** In the tables below, where default settings are listed for ICL LP/H, if the value is the same one value will be listed. If there is a different default value when the program loads with either platform, both values will be listed to show the difference.

2.2 Step-by-Step Guide to Build SPI Flash Image with Intel® FIT Interface

Table 2-1. - Initial Screen Layout (Sheet 1 of 9)

#	Label	Contents
1	New	This button labeled 'New' on rollover allows opening of a new session with default values
2	Open	This button labeled 'Open' on rollover allows opening of an xml or bin file
3	Save	This button labeled 'Save' on rollover allows saving of xml file
4	Clear Console	This button labeled 'Clear Console' clears the console area (see page 23)
5	Build Settings	This button labeled 'Build Settings' brings up the build settings popup Window see (Table 2-2)
6	Build Image	This button labeled 'Build Image' on rollover allows build of the image
7	Build Image For FWUpdate	This button labeled 'Build Image For FWUpdate' allows the user to build separate firmware update binaries.

Table 2-1. - Initial Screen Layout (Sheet 2 of 9)

#	Label	Contents
<p>The screenshot shows the Intel Flash Image Tool interface. At the top, there are two dropdown menus: 'Intel(R) IceLake LP Series Chipset' (highlighted with a red box and number 8) and 'ICP-LP Premium U' (highlighted with a red box and number 9). Below these, the 'Flash Layout' section is expanded to show a list of platform options: 'Intel(R) IceLake LP Series Chipset', 'Intel(R) IceLake H Series Chipset', 'Intel(R) IceLake N Series Chipset', and 'Intel(R) IcePoint N with IceLake H Series Chipset'. The 'ICP-N Premium Y' and 'ICP-N Premium U' options are also visible. Below the platform list, there are sections for 'BIOS Region' and 'Ifwi: Intel(R) Me and Pmc Region', each containing a table of parameters and values. At the bottom, there is a log area showing the date and time (10/09/2018 11:31:53), the command line, and the log file path.</p>		
8	Drop Down Selector	This drop down allows selection of platform
9	Drop Down Selector	This drop down allows selection of SKU within platform selected

	Hotfix Version - This displays Hot-Fix revision number of the currently loaded Intel® CSME binary.		
	Build Version - This displays Build version number of the currently loaded Intel® CSME binary.		
	Chipset Initialization Version - This displays the current Chipset Initialization version contained in the currently loaded Intel® CSME binary.		

Table 2-3. - Flash Layout (Sheet 3 of 5)

	<p>Chipset Initialization Binary - This loads the Chipset Initialization binary that will be merged into the output image generated by the Intel® FIT. If specified, this will override the version contained in the Intel® ME binary.</p> <p>Note: When BIOS passes new Chipset Initialization settings to Intel® CSME, a Global Reset is initiated (only required on the first boot, subsequent boots will not incur a global reset). This allows for the new settings to be stored in the Intel® CSME Region and programmed into the PCH. This global reset can be avoided by loading the proper chipset initialization binary in to the Intel® CSME Region when building the image that aligns with the values in BIOS. The Chipset Initialization Binary will be included in BIOS RC package. If BIOS contains an older version of Chipset Initialization settings Intel® CSME will be updated at boot with the older settings regardless of any newer settings being present in firmware. In order to avoid this problem and the additional Global Reset customers should ensure that both BIOS and Intel® CSME are updated with same Chipset Initialization binary.</p>	ICL-YN ICL-UN	Chipset.bin (Optional) Chipset.bin (Optional)

SPI Out of Order operation Enabled	Yes	When this setting is enabled priority operat
SPI Resume Hold-off Delay	8us	Specifies the time after the completion of a
SPI Max write / erase Resume to Suspend intervals	No Ceiling	This setting specifies the maximum value f
SPI Suspend / Resume Enabled	Yes	When this setting is enabled writes and era
Software Re-Binding Enabled	No	When enabled this settings will allow for S

#	Parameter	Platform	Settings
1	Flash Components		
	Number of Components Values: 0, 1, 2 - This setting configures the total number of flash components for the platform. Note: Choosing a selection of '0' part will cause the Intel® FIT tool to build an output image containing only the Intel® ME region.	ICL-YN ICL-UN	1 1
	Flash component 1 Size Values: 512KB, 1MB, 2MB, 4MB, 8MB, 16MB, 32MB, 64MB - This setting determines the size of Flash component 1 for the platform image.	ICL-YN ICL-UN	16MB 16MB
	Flash component 2 Size Values: 512KB, 1MB, 2MB, 4MB, 8MB, 16MB, 32MB, 64MB - This setting determines the size of Flash component 2 for the platform image. Note: This setting is only applicable when the Number of Flash Components option is set to '2'.	ICL-YN ICL-UN	Greyed Out Greyed Out
	SPI Global Protected Range - This sets the default value of the Global Protected Range register in the SPI Flash Controller.	ICL-YN ICL-UN	0x0 0x0
	SPI Idle to Deep Power Down Timeout - This sets SPI Idle to Deep Power Down Timeout Default Specifies the time in microseconds that the Flash Controller waits after all activity is idle before commanding the flash devices to Deep Power down, time = 2^N microseconds.	ICL-YN ICL-UN	0x5 0x5
	SPI Out of Order operation Enabled - When this setting is enabled priority operations may be issued while waiting for write / erase operations to complete on the flash device. When this setting is disabled all write / erase type operations in order.	ICL-YN ICL-UN	Yes Yes
	SPI Resume Hold-off Delay - This specifies the time after the completion of a pri_op before the flash controller sends the resume instruction. If a new pri_op is eligible to be issued prior to the end of this delay time then the pri_op is issued and the timer is reinitialized to tRHD. 3-bit field encodes count with range 0-7. tRHD = count * 2us.	ICL-YN ICL-UN	8us 8us

Table 2-4. - Flash Settings (Sheet 2 of 9)

	SPI Max write / erase Resume to Suspend intervals - This setting specifies the maximum value for the write and erase Resume to Suspend intervals.	ICL-YN ICL-UN	No Ceiling No Ceiling
	SPI Suspend / Resume Enabled - When this setting is enabled writes and erases may be suspended to allow a read to be issued on the flash device. When this setting is disabled no transaction will be allowed to the busy flash device.	ICL-YN ICL-UN	Yes Yes
	Software Re-Binding Enabled - When this setting is enabled it allow for the re-binding of the SPI part to a new PCH during manufacturing and re-manufacturing prior to platform EOM. <i>Note:</i> Re-binding to a replacement PCH can only be done a maximum of 5 times before the SPI part needs to be re-flashed.	ICL-YN ICL-UN	No No
Click on Flash Layout in the left tabs menu> BIOS Region is expanded by default:

#	Parameter	Platform	Settings
6	Flash Configuration		

Table 2-4. - Flash Settings (Sheet 7 of 9)

Dual I/O Read Enabled Values: Yes/No - This setting allows the customer to enable support for Dual I/O Read capabilities for flash components. See Ice Lake LP SPI Programming guide for further details.	ICL-YN ICL-UN	Yes Yes
Dual Output Read Enabled Values: Yes/No - This setting allows the customer to enable support for Dual Output Read capabilities for flash components. See Ice Lake LP SPI Programming guide for further details.	ICL-YN ICL-UN	Yes Yes
Fast Read Clock Frequency Values: 17MHz, 30MHz, 48MHz - This setting allows the customer to configure the flash component clock frequency setting for Fast Read. See Ice Lake LP SPI Programming guide for further details.	ICL-YN ICL-UN	48MHz 48MHz
Fast Read Supported Values: Yes/No - This setting allows the customer to enable support for Fast Read capabilities for flash components. See Ice Lake LP SPI Programming guide for further details. Note: If fast read supported is set to "No" any changes made to Dual I/O, Quad I/O, Dual Output, or Quad Output will not be affected if set to yes. Fast read supported should also be set to enable frequencies greater than 20MHz.	ICL-YN ICL-UN	Yes Yes
Invalid Instruction 0 - This setting allows the customer to configure invalid instruction to protect against Chip Erase. See Ice Lake LP SPI Programming guide for further details. Note: This setting should be set to '0' if there are not Invalid instructions.	ICL-YN ICL-UN	0x00000021 0x00000021
Invalid Instruction 1 - This setting allows the customer to configure invalid instruction to protect against Chip Erase. See Ice Lake LP SPI Programming guide for further details. Note: This setting should be set to '0' if there are not Invalid instructions.	ICL-YN ICL-UN	0x00000042 0x00000042
Invalid Instruction 2 - This setting allows the customer to configure invalid instruction to protect against Chip Erase. See Ice Lake LP SPI Programming guide for further details. Note: This setting should be set to '0' if there are not Invalid instructions.	ICL-YN ICL-UN	0x00000060 0x00000060
Invalid Instruction 3 - This setting allows the customer to configure invalid instruction to protect against Chip Erase. See Ice Lake LP SPI Programming guide for further details. Note: This setting should be set to '0' if there are not Invalid instructions.	ICL-YN ICL-UN	0x000000AD 0x000000AD
Invalid Instruction 4 - This setting allows the customer to configure invalid instruction to protect against Chip Erase. See Ice Lake LP SPI Programming guide for further details. Note: This setting should be set to '0' if there are not Invalid instructions.	ICL-YN ICL-UN	0x000000B7 0x000000B7
Invalid Instruction 5 - This setting allows the customer to configure invalid instruction to protect against Chip Erase. See Ice Lake LP SPI Programming guide for further details. Note: This setting should be set to '0' if there are not Invalid instructions.	ICL-YN ICL-UN	0x000000B9 0x000000B9
Invalid Instruction 6 - This setting allows the customer to configure invalid instruction to protect against Chip Erase. See Ice Lake LP SPI Programming guide for further details. Note: This setting should be set to '0' if there are not Invalid instructions.	ICL-YN ICL-UN	0x000000C4 0x000000C4
Invalid Instruction 7 - This setting allows the customer to configure invalid instruction to protect against Chip Erase. See Ice Lake LP SPI Programming guide for further details. Note: This setting should be set to '0' if there are not Invalid instructions.	ICL-YN ICL-UN	0x000000C7 0x000000C7
Quad I/O Read Enabled Values: Yes/No - This setting allows the customer to enable support for Quad I/O Read capabilities for flash components. See Ice Lake LP SPI Programming guide for further details.	ICL-YN ICL-UN	Yes Yes
Quad Output Read Enabled Values: Yes/No - This setting allows the customer to enable support for Quad Output Read capabilities for flash components. See Ice Lake LP SPI Programming guide for further details.	ICL-YN ICL-UN	Yes Yes
Read ID and Read Status clock frequency Values: 17MHz, 30MHz, 48MHz - This setting allows the customer to configure the flash component clock frequency setting for Read ID and Read Status. See Ice Lake LP SPI Programming guide for further details.	ICL-YN ICL-UN	48MHz 48MHz

Table 2-4. - Flash Settings (Sheet 8 of 9)

	Write and Erase clock frequency Values: 17MHz, 30MHz, 48MHz - This setting allows the customer to configure the flash component clock frequency setting for Write and Erase. See Ice Lake / Ice Lake LP SPI Programming guide for further details.	ICL-YN ICL-UN	48MHz 48MHz

1	Intel® AMT - Intel® AMT Configuration		
	Intel® AMT Supported Values: Yes/No - This setting allows customers to disable Intel® AMT on the platform and force the platform into Standard Manageability mode. Note: If this setting has been set to disabled Intel® AMT cannot be re-enabled once the descriptor has been locked. This setting applies to Desktop and Workstation only.	ICL-YN ICL-UN	No No No
	Intel® ME Network Services Supported Values: Yes/No - This setting allows customers to enable / disable Intel® ME Network Services on the platform. Note: This setting and TLS needs to be enabled for proper operation of Intel® Authenticate (Corporate Only). In addition if this setting is disabled Intel® AMT will also be disabled.	ICL-YN ICL-UN	No No No
	Intel® Manageability Application Supported Values: Yes/No - This setting allows customers to force Intel® AMT enabled platforms to operate in Standard Manageability mode. Note: This setting only applies to Desktop and Workstation platforms.	ICL-YN ICL-UN	No No No
	Manageability Application initial power-up state Values: Enabled/Disabled This setting allows customers to determine the power up state for Intel® AMT or Standard Manageability. Note: If this setting is disabled Intel® AMT or Standard Manageability can still be re-enabled through the Intel® MEBx interface.	ICL-YN ICL-UN	Disabled Disabled Disabled
	Intel® AMT Idle Timeout Values: 0xFFFF - This setting configures the idle timeout value before Intel® AMT enters into an off state.	ICL-YN ICL-UN	0xFFFF 0xFFFF
	Intel® AMT Watchdog Automatic Reset Enabled Values: Yes/No - This setting allows customers to enable the Intel® ME firmware to trigger an automatic platform reset if either the MEI or Agent Presence are in a hung state. Note: This feature only allows one reset at a time when the watchdog expires. After this feature has triggered a reset, it must be re-armed for reuse via management console.	ICL-YN ICL-UN	No No No

Table 2-8. - Integrated Clock Controller (Sheet 1 of 7)

Click on Integrated Clock Controller in the left tabs menu> Integrated Clock Controller Policies are expanded by default:

▼ **Integrated Clock Controller Policies** 1

Parameter	Value	Help Text
Register Lock Policy	0:Default	Policy applied to ICC Registers at EOP.
Boot Profile	Profile 0	Profile applied during each boot.
Failsafe Boot Profile	Profile 0	Boot profile used when system instability is detected.

#	Parameter	Platform	Settings
1	Integrated Clock Controller - Integrated Clock Controller Policies		
	Register Lock Policy <i>Note:</i> Leave settings at Intel® FIT default values	ICL-YN ICL-UN	0: Default 0: Default
	Boot Profile This parameter allows user to select default profile to be used by the final generated SPI Flash binary image for the target platform at boot time. Selection is limited to the profiles defined under "Integrated Clock Controller Profiles" up to maximum 16 profiles. Profiles can be added by clicking on "Add profile" button under "Integrated Clock Controller Profiles". The 'Record #' refers to profile created under the "Integrated Clock Controller Profiles". Default boot profile for system is Profile 0. Double click on value column of this parameter to choose from available options.	ICL-YN ICL-UN	Profile 0 Profile 0
	Failsafe Profile This parameter specifies the profile index of the fail-safe profile. On boot failure detection or CMOS clear the Intel® ME Firmware will revert to this profile if "Integrated Clock Controller Integrated Clock Controller Policies - Profile Changeable" is set to True. If profile Changeable parameter is set to False, User can not select Failsafe Boot Profile and profile 0 will be selected as a fail safe boot profile by default. The 'Record #' refers to profile created under the "Integrated Clock Controller Profiles". Default Failsafe boot profile for system is Profile 0. Double click on value column of this parameter to choose from available options.	ICL-YN ICL-UN	Profile 0 Profile 0

SRC1 CLKREQ# Mapping	GPP_B6	Assign the CLKREQ# signal assoc
SRC2 CLKREQ# Mapping	GPP_B7	Assign the CLKREQ# signal assoc
SRC3 CLKREQ# Mapping	GPP_B8	Assign the CLKREQ# signal assoc
SRC4 CLKREQ# Mapping	GPP_B9	Assign the CLKREQ# signal assoc
SRC5 CLKREQ# Mapping	GPP_B10	Assign the CLKREQ# signal assoc
24Mhz Crystal Shutdown Wait Interval	8us	Enable Dynamic power managem

#	Parameter	Platform	Settings
7	Integrated Clock Controller - Profiles - Profile Power Management Configuration Configuring CLKREQ# and assigning GPIO depends on how CLKOUT_SRCx configuration via FIT is done (Enabled or Disabled) and if CLKREQ is required or not. Please refer to Appendix B.3 (How to configure CLKREQ# parameters) for the detail of CLKREQ configuration for SRC Output clocks. Please configure CLKREQ parameters accordingly.		
	SRC0[5:0] CLKREQ# Mapping Possible configuration: Select one of the GPIOs from the list to map it as a CLKREQ# for specific SRC# Output clock. This parameter controls association of dynamic CLKREQ control with SRC (PCIe) clocks. SRC[15:6] CLKREQ# Mapping - ICL/CFL H/S Only Possible configuration: Select one of the GPIOs from the list to map it as a CLKREQ# for specific SRC# Output put clock. This parameter controls association of dynamic CLKREQ control with SRC (PCIe) clocks.	ICL-YN ICL-UN	GPP_B5 GPP_B5
	SRC1 CLKREQ# Mapping Assign the CLKREQ# signal associated with CLKOUT_SRC1.	ICL-YN ICL-UN	GPP_B6 GPP_B6
	SRC2 CLKREQ# Mapping Assign the CLKREQ# signal associated with CLKOUT_SRC2.	ICL-YN ICL-UN	GPP_B7 GPP_B7
	SRC3 CLKREQ# Mapping Assign the CLKREQ# signal associated with CLKOUT_SRC3.	ICL-YN ICL-UN	GPP_B8 GPP_B8
	SRC4 CLKREQ# Mapping Assign the CLKREQ# signal associated with CLKOUT_SRC4.	ICL-YN ICL-UN	GPP_B9 GPP_B9

Table 2-8. - Integrated Clock Controller (Sheet 7 of 7)

	SRC5 CLKREQ# Mapping Assign the CLKREQ# signal associated with CLKOUT_SRC5.	ICL-YN ICL-UN	GPP_B10 GPP_B10
	24MHz Crystal Shutdown Wait Interval This parameter allows user to Enable Dynamic power management of Crystal. Upon the event that all conditions (other than this wait timer itself) are satisfied for iSCLK crystal shutdown, a timer is started. Once it expires and there are no wake events, iSCLK will shutdown crystal. Note: Recommendation is to leave setting at default value.	ICL-YN ICL-UN	8us 8us

#	Parameter	Platform	Settings
1	Internal PCH Buses - PCH Timer Configuration		
	PCH clock output stable to PROCPWRGD high (tPCH45) Values: 100ms, 50ms, 5ms, 1ms - This setting configures the minimum timing from XCK_PLL locked to CPUPWRGD high. For further details see Ice Lake LP Platform Controller Hub EDS.	ICL-YN ICL-UN	1ms 1ms
	PCIe Power Stable Timer (tPCH33) Values: Enabled/Disabled - This setting configures the enables / disables the t36 timer. When enabled PCH will count 99ms from PWROK assertion before PLTRST# is de-asserted. Note: The recommended setting is "Disabled".	ICL-YN ICL-UN	Disabled Disabled
	PROCPWRGD and SYS_PWROK high to SUS_STAT# de-assertion (tPCH46) Values: 1ms, 2ms, 5ms - This setting configures the minimum timing from CPUPWRGD assertion to SUS_STAT#. For further details see Ice Lake LP Platform Controller Hub EDS.	ICL-YN ICL-UN	1ms 1ms
	APWROK Timing Values: 2ms, 4ms, 8ms, 16ms - This soft strap determines the time between the SLP_A# pin de-asserting and the APWROK timer expiration. For further details see Ice Lake LP Platform Controller Hub EDS.	ICL-YN ICL-UN	2ms 2ms
	APWROK Check Enabled Values: Yes/No - This setting determines if Intel® ME should de-assert SLP_A# and wait for APWROK or not.	ICL-YN ICL-UN	Yes Yes
	Over Clocking Watchdog Self Start Enable Values: OC WDT Disabled, OC WDT 3 Second Timeout, OC WDT 5 Second Timeout, OC WDR 10 Second Timeout, OC WDT 15 Second Timeout, OC WDT 30 Second Timeout, OC WDT 45 Second Timeout, OC WDT 60 Second Timeout - This setting affect whether the Over Clocking Watchdog Timer is enabled to automatically start on Host power cycle	ICL-YN ICL-UN	OC WDT Disabled OC WDT Disabled

	Intel® SMBus ASD Mode Configuration This setting determines the native mode of operation for the Intel® SMBus ASD signal.	ICL-YN ICL-UN	Enable as GPP_C2 Enable as GPP_C2
Click on Internal PCH Buses in the left tabs menu> DMI Configuration is expanded by default:			
▼ DMI Configuration 3			
#	Parameter	Value	Help Text
	DMI Lane Reversal	No	This setting allow the DMI Lane signals to be reversed.
	DMI Port Staggering Enabled	Yes	This setting configures DMI for Port Staggering. For further details see Ice Lake LP Platform Controller Hub EDS.
3	Internal PCH Buses - DMI Configuration		
	DMI Lane Reversal Values: Yes/No - This setting allows the DMI Lane signals to be reversed. For further details see Ice Lake LP Platform Controller Hub EDS.	ICL-YN ICL-UN	No No
	DMI Port Staggering Values: Yes/No - This setting configures DMI for Port Staggering. For further details see Ice Lake LP Platform Controller Hub EDS.	ICL-YN ICL-UN	Yes Yes
Click on Internal PCH Buses in the left tabs menu> OPI Configuration is expanded by default:			
▼ OPI / DMI Configuration 4			
#	Parameter	Value	Help Text
	OPI / DMI Link Speed	4 GT/s	This setting configures the OPI Link Speed. For further details see Ice Lake LP Platform Controller Hub EDS.
	OPI / DMI Link Voltage	0.95 Volts	This setting configures the OPI Link Voltage. For further details see Ice Lake LP Platform Controller Hub EDS.
	OPI / DMI Link Width	8 Lanes	This setting configures the OPI Link Width. For further details see Ice Lake LP Platform Controller Hub EDS.
4	Internal PCH Buses - OPI / DMI Configuration		
#	Parameter	Value	Help Text
	OPI / DMI Link Speed	4 GT/s	This setting configures the OPI Link Speed. For further details see Ice Lake LP Platform Controller Hub EDS.
	OPI / DMI Link Voltage	0.95 Volts	This setting configures the OPI Link Voltage. For further details see Ice Lake LP Platform Controller Hub EDS.
	OPI / DMI Link Width	8 Lanes	This setting configures the OPI Link Width. For further details see Ice Lake LP Platform Controller Hub EDS.
	Internal PCH Buses - OPI / DMI Configuration		

Table 2-10. - Internal PCH Buses (Sheet 3 of 4)

4	Internal PCH Buses - OPI / DMI Configuration		
	OPI Link Speed Values: GT2/GT4 - This setting configures the OPI / DMI Link Speed. For further details see Ice Lake PCH EDS.	ICL-YN ICL-UN	4 GT/s 4 GT/s
	OPI Link Voltage Values: 0.85 Volts, 0.95 Volts - This setting configures the OPI / DMI Link Voltage. For further details see Ice Lake PCH EDS.	ICL-YN ICL-UN	0.95 Volts 0.95 Volts
	OPI Link Width Values: 1 Lanes, 2 Lanes, 4 Lanes, 8 Lanes - This setting configures the OPI / DMI Link Width. For further details see Ice Lake PCH EDS.	ICL-YN ICL-UN	8 Lanes 8 Lanes
Click on Internal PCH Buses in the left tabs menu > eSPI Configuration is expanded by default:			
▼ eSPI Configuration 5			
Parameter		Value	
eSPI / EC Bus Frequency		60MHz	
eSPI / EC Maximum I/O Mode		Single, Dual and Quad	
eSPI / EC CRC Check Enabled		Yes	
eSPI / EC Max Outstanding Request for Master Attached Flash Channel		2	
eSPI / EC Slave Attached Flash Multiple Outstanding Requests Enable		Single Outstanding Request	
eSPI / EC Slave Attached Flash Channel OOO Enable		In-Order SAF Requests	
#	Parameter	Platform	Settings
5	Internal PCH Buses - eSPI Configuration		
	eSPI / EC Bus Frequency Values: 20MHz, 24MHz, 30MHz, 40MHz, 60MHz This setting determines the maximum frequency of the eSPI bus that is supported by the eSPI Master and platform configuration. Note: The actual frequency depends on trace length, number of eSPI Slaves, etc.	ICL-YN ICL-UN	60MHz 60MHz
	eSPI / EC Maximum I/O Mode Values: Single, Single and Dual, Single and Quad, Single Dual and Quad This setting determines the maximum IO Mode (Single/Dual/Quad) of the eSPI bus that is supported by the eSPI Master and specific platform configuration. Note: The actual IO Mode of the eSPI bus will be the minimum of this field and the Slave's maximum IO Mode advertised in its General Capabilities register.	ICL-YN ICL-UN	Single, Dual and Quad Single, Dual and Quad
	eSPI / EC CRC Check Enabled Values: Yes/No This setting enables CRC checking on eSPI Slave 0 channel.	ICL-YN ICL-UN	Yes Yes

Table 2-10. - Internal PCH Buses (Sheet 4 of 4)

	eSPI / EC Max Outstanding Request for Master Attached Flash Channel Values: 1, 2 This setting determines the Maximum outstanding requests on the eSPI / EC Master Attached Flash Channel.	ICL-YN ICL-UN	2 2
	eSPI / EC Slave Attached Flash Multiple Outstanding Requests Enable Values: Single Outstanding Request, Multiple Outstanding Requests This setting enabled multiple outstanding requests for the eSPI / EC Slave Attached Flash device.	ICL-YN ICL-UN	Single Outstanding Request Single Outstanding Request
	eSPI / EC Slave Attached Flash Channel OOO Enable Values: In-Order SAF Requests, Out-of-Order SAF Requests This setting enables Out or Order requests on the eSPI / EC Slave Attached Flash device.	ICL-YN ICL-UN	In-Order SAF Requests In-Order SAF Requests

7	Debug - eSPI Feature Overrides								
	eSPI / EC Low Frequency Debug Override When enabled this setting will divide eSPI clock frequency by 8. <i>Note:</i> This setting should only be used for debugging purposes. Leaving this setting enable will impact eSPI performance.	ICL-YN ICL-UN	No No						

Table 2-14. - CPU Straps (Sheet 1 of 2)

Click on CPU Straps in the left tabs menu > CPU Straps are expanded by default:

▼ CPU Straps 1

Parameter	Value	He
Disable Hyperthreading	No	This setting control enabling / disabling of Hyp
Number of Active Cores	All Cores Active	This setting controls the number of active proc
BIST Initialization	No	This setting determines if BIST will be run at p
Flex Ratio	0x0	This setting controls the maximum processor r
Processor Boot at P1 Frequency	Yes	Processor Boot at P1 Frequency
JTAG Power Disable	No JTAG Power on C10 and Lo...	This setting determines if JTAG power will be r
SVID Presence	SVID is present	This setting determine if SVID rails are presen
Platform IMON Disable	0x1	This strap should be left at the recommended
VCC Aux Present	No	This setting determines if VCC Aux exists as a
VCC IN SVID VR Address	0x0	This setting determines the VCC IN SVID VR Ad
VCC IN SVID VR Type	SVID	This setting determines the VCC IN SVID VR Ty
VCC SFR OC PG Present	No	This setting determines if VCC SFR OC PG is pi
VCC ST PG Present	No	This setting determines if VCC ST PG is preser
VCC STG PG Present	No	This setting determines if VCC STG PG is prese
VCCIN Aux Level LP	1.8v	This setting determines the VCCIN Aux Level LI

#	Parameter	Platform	Settings
1	CPU Straps - CPU Straps		
	Disable Hyperthreading Values: Yes/No This setting controls enabling or disabling of Hyper threading. Note: This strap is intended for debugging purposes only. See BIOS Spec for more details on enabling / disabling Hyperthreading.	ICL-YN ICL-UN	No No

Table 2-14. - CPU Straps (Sheet 2 of 2)

	Number of Active Cores Values: All, 1, 2, 3, 4, 5, 6, 7, 8 This setting controls the number of active processor cores. Note: This strap is intended for debugging purposes only. See BIOS Spec for more details on enabling or disabling processor cores.	ICL-YN ICL-UN	All All
	BIST Initialization Values: Yes/No This setting determines if BIST will be run at platform reset after BIOS requested actions. Note: This strap is intended for debugging purposes only.	ICL-YN ICL-UN	No No
	Flex Ratio This setting controls the maximum processor non-turbo ratio. Note: This strap is intended for debugging purposes only. See BIOS Spec for more details on maximum processor non-turbo ratio configuration.	ICL-YN ICL-UN	0x0 0x0
	Processor Boot at P1 Frequency Values: Yes/No This setting determines if the processor will operate at maximum frequency at power-on and boot. Note: This strap is intended for debugging purposes only.	ICL-YN ICL-UN	Yes Yes
	JTAG Power Disable Values: Yes - JTAG Power on C10 and Lower/No - No Power on C10 and Lower This setting determines if JTAG power will be maintained on C10 or lower power states. Note: This strap is intended for debugging purposes only.	ICL-YN ICL-UN	No JTAG Power on C10 and Lower No JTAG Power on C10 and Lower
	SVID Presence Value: SVID Present/SVID Not Present This setting determines if SVID rails are present on the platform. See Processor EDS for details.	ICL-YN ICL-UN	SVID Present SVID Present
	Platform IMON Disable This strap should be left at the recommended default setting.	ICL-YN ICL-UN	0x0 0x0
	VCCIN Aux Present Values: Yes/No This setting determines if VCC Aux exists as a separate VR.	ICL-YN ICL-UN	No No
	VCCIN SVID Address This setting determines the VCCIN SVID Address. See Processor EDS for details. Note: This strap should be left at the recommended default setting.	ICL-YN ICL-UN	0x0 0x0
	VCC SVID VR Type Values: SVID/Fixed VR This setting determines the VCC IN SVID VR Type. See Processor EDS for details.	ICL-YN ICL-UN	SVID SVID
	VCC SFR OC PG Present Values: Yes/No This setting determines if VCC SFR OC PG is present on the platform.	ICL-YN ICL-UN	No No
	VCC ST PG Present Values: Yes/No This setting determines if VCC ST PG is present on the platform.	ICL-YN ICL-UN	No No
	VCC STG PG Present Values: Yes/No This setting determines if VCC STG PG is present on the platform.	ICL-YN ICL-UN	No No
	VCCIN Aux Level LP Values: 1.8v/1.65v This setting determines the VCCIN Aux Level LP Voltage. Note: On Y based MCPs this setting can be configured to 1.65v. On all other MCP types set to 1.8v	ICL-YN ICL-UN	1.65v or 1.8v 1.8v

Type-C Port 3 Re-Timer Present	Yes	Indicates whether a re-timer is present for the asso
Type-C Port 3 Re-timer Configuration Enabled	No	Indicates whether the associated re-timer requires c
Type-C Port 3 Re-timer SMBus Address	0x42	SMBus address for the associated re-timer
Type-C Port 3 SMBus Address	0x52	SMBus address for the associated Type-C port
Type-C port 4 Enabled	Yes	Indicates whether the associated Type-C port is ena
USB2 Port Number associated for Type-C Port 4	USB2 Port 8	USB2 port number for the associated Type-C port
USB3 Port Number associated for Type-C Port 4	USB3 Port 5	USB3 port number for the associated Type-C port
Type-C Port 4 Re-Timer Present	Yes	Indicates whether a re-timer is present for the asso
Type-C Port 4 Re-timer Configuration Enabled	No	Indicates whether the associated re-timer requires c
Type-C Port 4 Re-timer SMBus Address	0x0	SMBus address for the associated re-timer
Type-C Port 4 SMBus Address	0x53	SMBus address for the associated Type-C port
9	Power Delivery PD Controller Configuration	

Table 2-15. - Flex I/O Straps (Sheet 10 of 14)

	<p>PMC-PD controller USB-C Mode Enabled Values: 0: PMC interfaces with an eSPI connected agent via eSPI OOB 1: PMC interfaces with PD chips/Re-timer via ALERT# pin which triggers SMBus transactions.</p> <p>This bit defines how the PMC interfaces with the Type-C components on the board.</p> <p>Notes: 1. This setting is greyed and not configurable for LP based SKUs. for LP SKUs, PMC interfaces with PD chips/Re-timer via ALERT# pin. 2. if user selection is 0 where PMC interfaces with an eSPI connected agent, all of the below parameters are N/A and will be grayed out.</p>	ICL-YN ICL-UN	PMC / SMBus PMC / SMBus
	<p>Re-timer Power Gating Enabled Values: Yes / No This setting indicates whether platform Re-timer power gating is enabled.</p>	ICL-YN ICL-UN	No No
	<p>Type-C port 1 Enabled Values: Yes / No This setting indicates whether the associated Type-C port1 is enabled.</p> <p>Note: This setting is only available for configuration when PMC-PD controller USB-C Mode Enabled parameter is set to 1.</p>	ICL-YN ICL-UN	Yes Yes
	<p>USB2 Port Number associated for Type-C Port 1 Values: USB2 Port 1,USB2 Port 2,USB2 Port 3,USB2 Port 4,USB2 Port 5,USB2 Port 6,USB2 Port 7,USB2 Port 8,USB2 Port 9,USB2 Port 10 This indicates the USB2 port number for the associated Type-C port1.</p> <p>Notes: 1. This parameter is applicable only when Type-C port 1 Enabled is set to yes. 2. Once user selects USB2 port number associated with Type-C port1,the respective USB2 port connector selection will be greyed out and auto set to Type-C under the USB2 Port Configuration section. example: if USB2 Port number associated for Type-C Port 1 is set to "USB2 Port 2" ,Parameter under Flex I/O->USB2 Port Configuration->USB2 Port 2 Connector Type Select will be grayed out and auto set to "Type C". 3. OEMs are recommended to configure different USB-C connectors with increasing port numbers (TCP0_*, TCP1_*, TCP2_*, TCP3_*), should be paired with increasing number of USB2 ports from PCH. (this is needed to make split xDCI controller work functionally)E.g. (TCP0_*, USB2*_1), (TCP1_*, USB2*_3), (TCP2_*, USB2*_4), (TCP3_*, USB2*_5)</p>	ICL-YN ICL-UN	USB2 Port 1 USB2 Port 1
	<p>USB3 Port number associated for Type-C Port 1 Values: USB3 Port 1,USB3 Port 2,USB3 Port 3,USB3 Port 4 This indicates the USB3 port number for the associated Type-C port1.</p> <p>Notes: 1. This parameter is applicable only when Type-C port 1 Enabled is set to yes. 2. Once user selects USB3 port number associated with Type-C port1,the respective USB3 port connector selection will be greyed out and auto set to Type-C under the USB3 Port Configuration section. example: if USB Port number associated for Type-C Port 1 is set to "USB3 Port 6" ,Parameter under Flex I/O->USB3 Port Configuration->USB3 Port 6 Connector Type Select will be grayed out and auto set to "Type C". 3. OEMs are recommended to configure different USB-C connectors with increasing port numbers (TCP0_*, TCP1_*, TCP2_*, TCP3_*), should be paired with increasing number of USB2 ports from PCH. (this is needed to make split xDCI controller work functionally)E.g. (TCP0_*, USB2*_1), (TCP1_*, USB2*_3), (TCP2_*, USB2*_4), (TCP3_*, USB2*_5)</p>	ICL-YN ICL-UN	Type-C Port 1 Type-C Port 1
	<p>Type-C Port 1 Re-timer Present Values: Yes / No This indicates whether a re-timer is present for the associated Type-C port.</p>	ICL-YN ICL-UN	Yes Yes

Table 2-15. - Flex I/O Straps (Sheet 11 of 14)

	Type-C Port 1 Re-timer Configuration Enabled Values: Yes / No Indicates whether the associated re-timer requires configuration. Yes = configuration done via PMC; No = configuration done via PD Controller.	ICL-YN ICL-UN	No No
	Type-C Port 1 Re-timer SMBus Address Value: Hex This indicates the SMBus address for the associated re-timer.	ICL-YN ICL-UN	0x38 0x38
	Type-C Port 1 SMBus Address Value: Hex This indicates the SMBus address for the associated Type-C port. <i>Note:</i> OEMs are recommended to set unique SMBus address allocation for Type-C port and Re-timer associated.	ICL-YN ICL-UN	0x38 0x38
	Type-C port 2 Enabled Values: Yes / No This setting indicates whether the associated Type-C port is enabled. <i>Note:</i> This setting is only available for configuration when PMC-PD controller USB-C Mode Enabled parameter is set to 1.	ICL-YN ICL-UN	Yes Yes
	USB2 Port Number associated for Type-C Port 2 Values: USB2 Port 1,USB2 Port 2,USB2 Port 3,USB2 Port 4,USB2 Port 5,USB2 Port 6,USB2 Port 7,USB2 Port 8,USB2 Port 9,USB2 Port 10 This indicates the USB2 port number for the associated Type-C port. <i>Notes:</i> <ol style="list-style-type: none"> This parameter is applicable only when Type-C port 2 Enabled is set to yes. Once user selects USB2 port number associated with Type-C port2,the respective USB2 port connector selection will be greyed out and auto set to Type-C under the USB2 Port Configuration section. example: if USB2 Port number associated for Type-C Port 2 is set to "USB2 Port 2" ,Parameter under Flex I/O->USB2 Port Configuration->USB2 Port 2 Connector Type Select will be grayed out and auto set to "Type C". OEMs are recommended to configure different USB-C connectors with increasing port numbers (TCP0_*, TCP1_*, TCP2_*, TCP3_*), should be paired with increasing number of USB2 ports from PCH. (this is needed to make split xDCI controller work functionally)E.g. (TCP0_*, USB2*_1), (TCP1_*, USB2*_3), (TCP2_*, USB2*_4), (TCP3_*, USB2*_5) 	ICL-YN ICL-UN	USB2 Port 2 USB2 Port 2
	USB3 Port number associated for Type-C Port 2 Values: USB3 Port 1,USB3 Port 2,USB3 Port 3,USB3 Port 4 This indicates the USB3 port number for the associated Type-C port. <i>Notes:</i> <ol style="list-style-type: none"> This parameter is applicable only when Type-C port 2Enabled is set to yes. Once user selects USB3 port number associated with Type-C port2,the respective USB3 port connector selection will be greyed out and auto set to Type-C under the USB3 Port Configuration section. example: if USB Port number associated for Type-C Port 2is set to "USB3 Port 6" ,Parameter under Flex I/O->USB3 Port Configuration->USB3 Port 6 Connector Type Select will be grayed out and auto set to "Type C". OEMs are recommended to configure different USB-C connectors with increasing port numbers (TCP0_*, TCP1_*, TCP2_*, TCP3_*), should be paired with increasing number of USB2 ports from PCH. (this is needed to make split xDCI controller work functionally)E.g. (TCP0_*, USB2*_1), (TCP1_*, USB2*_3), (TCP2_*, USB2*_4), (TCP3_*, USB2*_5) 	ICL-YN ICL-UN	Type-C Port 2 Type-C Port 2
	Type-C Port 2 Re-timer Present Values: Yes / No This indicates whether a re-timer is present for the associated Type-C port.	ICL-YN ICL-UN	Yes Yes
	Type-C Port 2 Re-timer Configuration Enabled Values: Yes / No Indicates whether the associated re-timer requires configuration. Yes = configuration done via PMC; No = configuration done via PD Controller.	ICL-YN ICL-UN	No No

Table 2-15. - Flex I/O Straps (Sheet 12 of 14)

Type-C Port 2 Re-timer SMBus Address Value: Hex This indicates the SMBus address for the associated re-timer.	ICL-YN ICL-UN	0x3F 0x3F
Type-C Port 2 SMBus Address Value: Hex This indicates the SMBus address for the associated Type-C port. <i>Note:</i> OEMs are recommended to set unique SMBus address allocation for Type-C port and Re-timer associated.	ICL-YN ICL-UN	0x3F 0x3F
Type-C port 3 Enabled Values: Yes / No This setting indicates whether the associated Type-C port is enabled. <i>Note:</i> This setting is only available for configuration when PMC-PD controller USB-C Mode Enabled parameter is set to 1.	ICL-YN ICL-UN	No Yes
USB2 Port Number associated for Type-C Port 3 Values: USB2 Port 1,USB2 Port 2,USB2 Port 3,USB2 Port 4,USB2 Port 5,USB2 Port 6,USB2 Port 7,USB2 Port 8,USB2 Port 9,USB2 Port 10 This indicates the USB2 port number for the associated Type-C port. <i>Notes:</i> 1. This parameter is applicable only when Type-C port 3 Enabled is set to yes. 2. Once user selects USB2 port number associated with Type-C port3 ,the respective USB2 port connector selection will be greyed out and auto set to Type-C under the USB2 Port Configuration section. example: if USB2 Port number associated for Type-C Port 3 is set to "USB2 Port 2" ,Parameter under Flex I/O->USB2 Port Configuration->USB2 Port 2 Connector Type Select will be grayed out and auto set to "Type C". 3. 3 Programming SPI Flash Devices and Checking Firmware Status

Now that the Flash image file has been created, it can be programmed into the SPI Flash device(s) of the target machine. For platforms that don't boot, a Flash Chip Programmer will be required. For platforms that can boot to DOS or Windows*, the Intel® FPT can be used.

3.1 Flash Burner/Programmer

The specific use of a Flash burner/programmer is beyond the scope of this document. Here are some general steps that may be followed:

1. Navigate to your **Output Directory** (as specified in Table 2-2) where your generated SPI Flash image(s) are saved. It is assumed that this image file is named **outimage.bin**.

If two total SPI Flash devices were specified during the build process, then additional image files will be saved, one for each SPI Flash device. These files are assumed to be named **outimage(1).bin** and **outimage(2).bin**.

2. Utilize a Flash burner/programmer to program the image(s). For multiple SPI Flash devices, the images are numbered sequentially to correspond to the first and second SPI Flash device accordingly.

3.1.1 In-Circuit SPI Flash Programming for CRB

Mobile CRBs have the SPI Flash devices soldered down. As a result, to program the SPI Flash for mobile CRBs, follow these steps:

1. Leave CRB powered on.
2. Connect Flash Programmer (such as DediProg SF600) header to connector **J3F3** which is labelled "**SPI TPM**". Make sure to line up pin 1 on the header.
3. Program the first image [outimage(1).bin] to the CRB.
4. In DediProg software, select application memory chip 2 button and load second image if created.
5. Program the second image [outimage(2).bin] to the CRB if created.
6. Once programming is complete, disconnect the Flash Programmer header. Power off and unplug CRB. Remove cell coin battery, wait approximately 10 seconds. Replace cell coin battery, plug CRB back in and power on.

3.2 Flash Programming Tool (Intel® FPT)

Intel® FPT can be used to substitute for a Flash burner/programmer, provided the system is capable of booting to a DOS or Windows* OS.

Note: Intel® FPT will automatically disable the Intel® ME or EFI prior to flashing the image to the platform.

Intel® FPT DOS Version

The DOS versions supported by Intel® FPT are: DOS, Free DOS, and DRMK DOS. Use the following steps to program the SPI Flash devices,

1. Copy all the files in the “(root)\Tools\System Tools\Flash Programming Tool\DOS” directory to the root directory of a bootable USB key.
2. Navigate to your **Output Directory** (as specified in Table 2-2) where your generated SPI Flash image(s) are saved. It is assumed that this image file is named **outimage.bin**. Copy this image file to the root directory of the USB key.
3. Boot the target system to DOS and change to the root directory of the bootable USB key. At the DOS prompt type:

```
fpt.exe -i
```

The system should respond with the number of SPI Flash devices available. For example:

```
--- Flash Devices Found ---
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)
```

Note: If the SPI Flash device does not currently contain a descriptor it may report only a single device.

4. Program the SPI Flash image to the Flash device(s) by issuing the following command at the prompt:

```
fpt.exe -f outimage.bin
```

If the programming was successful, then the following message will be shown.

```
FPT Operation Passed
```

If the programming was **NOT** successful, then repeat this step to try again. If programming problems persist, then check the SPI Flash devices and platform hardware.

5. Execute a platform global reset using Intel® FPT -greset. Next go to [Section 3.3](#) to check the Intel® ME Firmware status.

3.2.1 Intel® FPT Windows* Version

The Windows* OS versions supported by Intel® FPT are: Windows* PE 64, Windows* 7, Windows* 8/8.1. There are two versions of Intel® FPT for Windows*: a 32-bit version and a 64-bit version. Most Windows* OS, Windows* 7 (32-bit or 64-bit), Windows* 8/8.1 (32-bit or 64-bit) can use Windows* version of Intel® FPT. However, Windows* OS which do not support 32 bit compatible mode (Win PE 64-bit) **must use** Intel® FPT Windows* 64-bit version due to compatibility issues.

Use the following steps to program the SPI Flash devices,

1. Navigate to your **Output Directory** (as specified in [Table 2-2](#)) where your generated SPI Flash image(s) are saved. It is assumed that this image file is named **outimage.bin**. Copy this image file to Intel® FPT directory located at "(root)\Tools\System Tools\Flash Programming Tool\Windows".
2. Boot the target system to Windows* and open a Command Prompt window. In this window, change to the Intel® FPT directory and at the prompt type:

```
fptw.exe -i
```

The system should respond with the number of SPI Flash devices available. For example:

```
--- Flash Devices Found ---  
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)  
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)
```

Note: If the SPI Flash device does not currently contain a descriptor it may report only a single device.

3. Program the SPI Flash image to the Flash device(s) by issuing the following command at the prompt:

```
fptw.exe -f outimage.bin
```

If the programming was successful, then the following message will be shown.

```
FPT Operation Passed
```

If the programming was **NOT** successful, then repeat this step to try again. If programming problems persist, then check the SPI Flash devices and platform hardware.

4. Use `fptw.exe -greset` to perform a G3 power cycle. Next go to [Section 3.3](#) to check the Intel® ME Firmware status.

3.3 Checking Intel® ME Firmware Status

Use the following steps to check the platform health and Intel® ME FW status,

1. Copy the file **MEInfo.exe** in the "(root)\Tools\System Tools\MEInfo\DOS" directory to the root directory of a bootable USB key.
2. Boot the target system and use F2 or Del to enter the BIOS setup menu. Load default values for BIOS (on Intel® CRBs press F3 to load default values). Save and reboot (on Intel® CRBs press F4 and select Yes).
3. Boot the target system to DOS and change to the root directory of the bootable USB key. At the DOS prompt type:

```
MEInfo.exe -fwsts
```

The system should respond with a message similar to below.

```
Intel® MEInfo Version: 13.0.0.xxxx
Copyright(C) 2005 - 2017, Intel Corporation. All rights reserved.

FW Status Register1: 0x1E000255
FW Status Register2: 0x60002306
FW Status Register3: 0x00000300
FW Status Register4: 0x00004001
FW Status Register5: 0x00000101
FW Status Register6: 0x03C00FC9

Current State: Normal
ManufacturingMode: Enabled
FlashPartition: Valid
OperationalState: M0 with UMA
InitComplete: Complete
BUPLoadState: Success
ErrorCode: No Error
ModeOfOperation: Normal
Phase: HOSTCOMM Module
ICC: Valid OEM data, ICC programmed
SPI Flash Log: Not Present
ME File System Corrupted: No
FPF and ME Config Status: Not committed
```

As in the above example if there are NO errors shown, then

- your platform's health is good
- Intel® ME FW has successfully initialized
- Intel® ME FW is operating normally

Note: This section is only intended to show how to use the MEInfo.exe tool for checking firmware status. For full usage and capabilities of the MEInfo.exe tool, please see the System Tools User Guide.

3.4 Common Bring Up Issues and Troubleshooting Table

Table 3-1. Common Bring Up Issues and Troubleshooting Table

Problem / Issue	Solution / Workaround
System does not boot to DOS	By default, the system will boot to EFI Shell. To boot to DOS, 1. Enter BIOS menu, then go to the 'Boot' screen 2. Change 'Boot Option #1' to be your USB key (ensure USB key is formatted to be DOS bootable) 3. Press 'F4' to save settings and reboot
Hear 3 beeps when platform powers on	Possible device is disconnected or device not found, check <ul style="list-style-type: none"> • platform power and MCP fan power connectors • DIMM memory modules (if applicable for memory down modules) • USB devices (keyboard, mouse, USB key) may be plugged into inactive USB port • missing/incorrect jumpers • missing or poorly socketed MCP
No display on monitor	Ensure Corporate FW SKU supports integrated graphics. Try external graphics card.
USB device not detected or does not work	USB device may be plugged into inactive USB port
System does not boot (Post Code 00)	Incorrect Flash image – possible reasons: <ul style="list-style-type: none"> • wrong FW selected during Flash image build process • wrong Flash size selected Re-build image with correct settings and re-flash using Flash burner.

§ §

A Appendix — Flash Configurations

This chapter covers only the basic information needed for clock control parameter programming. For a more detailed treatment of Mainstream - Mobile Family clocks, see Intel® Ice Lake PCH-H / LP Clocks and Intel® Converged Security and Management Engine — Platform Compliancy Guide for ME Hardware.

Figure A-1. Configuration “A” — Desktop/Server/Workstation or Mobile

Figure A-2. Configuration “B” — Mobile Only

Figure A-3. Configuration “C” — Desktop/Server/Workstation Only

Figure A-4. Configuration “D” — Mobile Only

§ §

B Appendix — Intel® ICCS SKU Support Matrix

The following table describes ICC features supported for specific PCH SKU, clock range (maximum and minimum), spread mode supported by Ice Lake-N SKUs.

Note: Please refer to Ice Lake-H/LP Platform Controller Hub (PCH) External Design Specification (EDS) for details about Ice Lake-H/LP Chipset Clock architecture

In below tables,

Min = Clock Div Max (minimum allowed frequency)

Max = Clock Div Min (maximum allowed frequency)

B.1 Intel® ICCS SKU Matrix - ICP-LP

Note: ICC SKU is divided into 2 categories: Basic and Enhanced. Mark "x" indicates category supported by PCH SKU.

Table B-1. Intel® ICCS SKU Matrix - ICP-LP

PCH SKU	Basic	Enhanced
Premium Y		x
Premium U		x
Base U		x
Features Supported	Standard Clock Configuration	Standard Clock Configuration Adaptive Clock Configuration
Pre-Defined ICC profile supported	Standard	Standard Adaptive
Clock Range Supported	[Min-Max]=100 MHz.	BCLK [Min-Max] = 98 - 100 MHz.
SSC Supported	Down SSC: 0 - 0.5%	Down SSC: 0 - 0.5%

B.2 How to configure CLKREQ# parameters

Below table provides guideline on how to configure CLKREQ# parameters for SRC[0:15] output clocks depending on dynamic control of the clock via CLKREQ is required or not.

Configuring CLKREQ# and assigning GPIO depends on how CLKOUT_SRCx configuration via FIT is done (Enabled or Disabled) and if CLKREQ is required or not.

Note: In below table, Mask Control CLKREQ cannot be configured via Intel® FIT Tool. It's configured to default once by FW during cold boot and bios can set/clear bits anytime.

C Appendix — Boot Guard Configuration

C.1 Boot Guard Profiles

The following table describes the profiles available for Boot Guard Configuration.

Table C-1. Profile Description

Index	Profile Name	F	V	M	ENF	PBE	Description
0	Boot Guard Profile - No_FVME	0	0	0	00	0	This configuration will invoke Boot Guard during boot with neither Verification nor Measurement. For platforms with all the required Boot Guard components but do not wish to enable Boot Guard boot block verification protection.
1	Boot Guard VE	0	1	0	01	1	When Verification is desired but if verification fails the platform will continue to boot with the unverified IBB for a short period, to allow remediation.
2	Boot Guard VME	0	1	1	01	1	When Verification and Measured are desired and the asset protection is provided by both TPM protection and a timed remediation period.
3	Boot Guard VM	0	1	1	00	1	When Verification and Measured are desired and the asset protection is provided by TPM protection.
4	Boot Guard FVE	1	1	0	11	1	Strict Verification enforcement.
5	Boot Guard FVME	1	1	1	11	1	Strict Verification and Measured enforcement. Prevents unverified IBB from running.

C.2 Enforcement Policies

Table C-2. Enforcement Policy Description

Error Enforcement Policy (ENF)	Enforcement Mode Name	Description
0	Unrestricted Mode	Infinite time before shutdown – don't shutdown the platform, let everything run normally.
1	Remediation Mode	30 minutes before shutdown – enough time to remediate the system, e.g. update BIOS or other data on flash via host tools.
2	Reserved	
3	Restricted Mode	0 minutes before shutdown – instant shutdown policy.

C.3 OEM Profile Parameters

Table C-3. Profile Parameters Description

Parameter	Description	Settings
Force Boot Guard ACM Enabled (F)	Force Boot Guard Boot determines if the platform starts the Force Boot Guard Boot timer. If it successfully starts it indicates success. When the Force Boot Guard timer stops, it starts the Protect Bios Environment timer, if indicated by the boot policy restrictions. Anchor ACM then jumps to the Initial Boot Block (IBB) with the Force Boot Guard Boot time stopped and the Protect BIOS enable timer running.	false - Allow the CPU to jump to the legacy reset vector if the Boot Guard Module cannot be successfully loaded. (default) true - Force the Boot Guard ACM to execute.
Verified Boot Enabled (V)	Boot Guard cryptographically verifies the platform Initial Boot Block (IBB) using the boot policy key. On successful verification, Boot Guard executes Initial Boot Block (IBB) using the boot policy key. If the verification fails, Anchor signals or enters Remediation.	false - Platform does not perform verified boot (default) true - Platform performs verified boot
Measured Boot Enabled (M)	Boot Guard measures the Initial Boot Block (IBB) into the TPM. Boot Guard perform no verification that the IBB is correct or from the platform manufacturer. The Skylake implementation of Boot Guard will support measurements into TPM or Intel's Platform Trust Technology.	false - Platform does not perform measured boot (default) true - Platform performs measured boot
Protect Bios Environment Enabled (PBE)	Platform manufacturer may want Initial boot block to be protected between verification/ measurement and execution from attacks on buses and non-CPU components. Boot Guard accomplishes this by allowing the initial boot block to be verified and executed in LLC in NEM if PBE is enabled.	false - Take no actions to control the environment during execution of the BIOS components (default) true - Takes actions to control the environment during the execution of the BIOS components.
Error Enforcement Policy (ENF)	Boot Guard invokes the Enforcement Policy when a fatal error is encountered. The action taken by ENF is determined by the OEM set persistent policies. Like, <ul style="list-style-type: none"> • Allowing platform to continue to boot • Immediate Shutdown • Shutdown with Timeout intervals When the ENF logic is invoked, PTT or TPM also disconnects.	See Section C-2 for details.

D Appendix — Intel® Platform Trust Technology

D.1 Intel® Platform Trust Technology

The following table describes the platform configurations supported by Intel® Platform Trust Technology.

Note: Intel® Platform Trust Technology does not support the full TPM functionality requirements and should not be used for Intel® vPro™ based platforms.

Table D-1. Intel® Platform Trust Technology Configuration table

Configuration	Platform Protection> Intel® PTT Configuration Intel® PTT Initial power up state	Platform Protection> Intel® PTT Configuration Intel® PTT Supported	Platform Protection> Intel® PTT Configuration Intel® PTT Supported [FPF]	Description
Intel® PTT Permanently Disabled in HW via FPF	Disabled	No	No	After the End of Manufacturing command, this setting will permanently set into the FPFs contained in the MCP. If disabled, the specific MCP can never be enabled for Intel® PTT.
Intel® PTT Permanently Disabled in base firmware image	Disabled	No	Yes	This setting allows Intel® PTT to be set to disabled without disabling the MCP FPFs. This is the recommended option to permanently disable Intel® PTT on a platform.
Intel® PTT Ship State Disabled in base firmware image	Disabled	Yes	Yes	Intel® PTT initially shipped in disabled mode, can be enabled by BIOS command.
Intel® PTT Enabled	Enabled	Yes	Yes	This is the recommended option to enable Intel® PTT on a platform.

E Appendix — Integrated Sensor Hub (ISH) Public Key Settings

The following table describes the configuration matrix required for ISH configuration for the Intel® FIT tool. Please see System Tools User Guide within ME kit, Manufacturing Test with Intel® Converged Security and Management Engine (Intel® CSME) Firmware 12 and Intel® Integrated Sensor Solution on Ice Lake Mobile, Ice Lake Desktop, (CDI # WIP) for additional details.

CLSMNF = Close Manufacturing switch used with Flash Programming Tool (FPT)

PV = Production Version

For additional information on FPT see System Tools User Guide included with ME kit under system tools folder.

Table E-1. ISH Public Key Settings

Firmware	MCP	FPF Automatic Commit	FPF MEI command after CLSMNF (Yes/No)	FPF MEI command before CLSMNF (Yes/No)
Pre-production	Production	No	No - Not a valid combination	No - Not a valid combination
Production (PV not set)	Pre-production	No	Yes	No
Production (PV not set)	Production	No	Yes	No
Pre-production	Pre-production	No	Yes	No
Production (PV not set)	Production	Yes	No	No

Note: The Intel® FIT allows integration of binary files within Integrated Sensor Hub section under ISH Image and ISH Data. The Intel® FIT does not generate or create the required files. The table above lists configuration combinations that can be used.
