| Remarks                       | <ul style="list-style-type: none"> <li>This attribute indicates the source auto range state. Its value will be smuX.AUTORANGE_OFF when the SMU source circuit is on a fixed range and smuX.AUTORANGE_ON when it is in auto range mode.</li> <li>Setting this attribute to smuX.AUTORANGE_OFF puts the SMU on a fixed source range. The fixed range used will be the range the SMU source circuit was currently using.</li> <li>Setting this attribute to smuX.AUTORANGE_ON puts the SMU source circuit into auto range mode. If the source output is on, the SMU will immediately change range to the range most appropriate for the value being sourced if that range is different from the SMU range.</li> <li>Auto range will disable if the source level is edited from the front panel.</li> </ul> |                                                                                                  |
| Details                       | See <a href="#">Range</a> in <a href="#">Section 6</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                  |

| Remarks                                                                                          | <ul style="list-style-type: none"> <li>• This function generates and activates new calibration constants for the given range. The positive and negative polarities of the source must be calibrated separately. Use a positive value for <code>range</code> to calibrate the positive polarity and a negative value for <code>range</code> to calibrate the negative polarity.</li> <li>• Typically the two calibration points used will be near zero for calibration point 1 and 90% of full-scale for calibration point 2. Full scale for calibration point 2 should be avoided if the SMU's source is substantially out of calibration.</li> <li>• Do not use 0.0 for a negative calibration point as 0.0 is considered a positive number.</li> <li>• The two reference measurements must be made with the source using the active calibration set. For example, source a value, measure it, and do not change the active calibration set before issuing this command.</li> <li>• The new calibration constants will be activated immediately but they will not be written to nonvolatile storage. Use <code>smuX.cal.save</code> to commit the new constants to nonvolatile storage. The active calibration constants will stay in effect until the instrument is power cycled or a calibration set is loaded from nonvolatile storage with the <code>smuX.cal.restore</code> function.</li> <li>• This function will be disabled until a successful call to <code>smuX.cal.unlock</code> is made.</li> </ul> |

| Remarks                   | <ul style="list-style-type: none"> <li>• This attribute configures the source level of the voltage or current source.</li> <li>• If the source is configured as a voltage source and the output is on, the new <code>smuX.source.levelv</code> setting will be sourced immediately. If the output is off or if the source is configured as a current source, the voltage level will be sourced when the source is configured as a voltage source and the output is turned on.</li> <li>• If the source is configured as a current source and the output is on, the new <code>smuX.source.leveli</code> setting will be sourced immediately. If the output is off or if the source is configured as a voltage source, the current level will be sourced when the source is configured as a current source and the output is turned on.</li> <li>• The sign of <code>sourceval</code> dictates the polarity of the source. Positive values generate positive voltage or current from the high terminal of the source relative to the low terminal. Negative values generate negative voltage or current from the high terminal of the source relative to the low terminal.</li> <li>• The <code>reset</code> function sets the source levels to 0V and 0A.</li> </ul> |                                                                                                  |

| Usage                                                                                  | <pre> offmode = smuX.source.offmode -- Reads output-off mode. smuX.source.offmode = offmode -- Writes output-off mode.  offmode                                The output-off setting. Set offmode to one of the following values: 0 or smuX.OUTPUT_NORMAL                Outputs 0V when the output is turned off. 1 or smuX.OUTPUT_ZERO                  Zero the output (in either volts or current) when off. 2 or smuX.OUTPUT_HIGH_Z                Opens the output relay when the output is turned off. </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Remarks                                                                                | <ul style="list-style-type: none"> <li>Reading this attribute gives the output-off mode of the source. Setting this attribute configures the SMU output-off mode.</li> <li>The default <code>offmode</code> is <code>smuX.OUTPUT_NORMAL</code>. In this mode, the SMU will source 0 volts. For the 2601A/2602A, the compliance is 10% of the current source range or 100µA, whichever is smaller. If the source function is voltage, the 10% compliance will inherently be a reduction in compliance current. If the source function is current, the 10% compliance value may be more or less than the current that was being sourced. For the 2611A/2612A/2635A/2636A, the compliance is the value specified by <code>smuX.source.offlimit</code> (default 1mA).</li> <li>When <code>offmode</code> is set to <code>smuX.OUTPUT_HIGH_Z</code>, the SMU will open the output relay when the output is turned off.</li> <li>When the <code>offmode</code> is set to <code>smuX.OUTPUT_ZERO</code>, the SMU will source 0 volts just as <code>OUTPUT_NORMAL</code> mode does. If the source function is voltage, the current limit will not be changed. If the source function was current, the current limit will be set to the current source level or 10% of the current source range, whichever is greater.</li> </ul> |

| Remarks                   | <ul style="list-style-type: none"> <li>Reading this attribute returns the positive full-scale value of the source range the SMU is currently using. Assigning to this attribute sets the SMU on a fixed range large enough to source the given value. The instrument will select the best range for sourcing a value of <code>rangeval</code>.</li> <li><code>smuX.source.rangeX</code> is primarily intended to eliminate the time required by the automatic range selection performed by a sourcing instrument. Because selecting a fixed range will prevent auto-ranging, an over-range condition can occur, for example, sourcing 10.0V on the Model 2601A/2602A 6.0V range, or sourcing 5.0V on the Model 2611A/2612A/2635A/2636A 2.0V range.</li> </ul> |                                                                                                  |

| Remarks                            | <ul style="list-style-type: none"> <li>This function configures a source action to be a linear source sweep in a subsequent sweep.</li> <li>During the sweep, the source will generate a uniform series of ascending or descending voltage or current changes called steps. The number of source steps is one less than the number of sourced data points.</li> <li>The <code>points</code> parameter does not set the number of steps in a sweep. It is only used to calculate source values within a subsequent sweep. If the subsequent sweep has more points than specified here, the source will restart at the beginning. If the subsequent sweep has fewer points than specified here, <code>endvalue</code> will not be reached during the sweep.</li> <li>In cases where the first sweep point is non-zero, it may be necessary to pre-charge the circuit so that the sweep will return a stable value for the first measured point without penalizing remaining points in the sweep.</li> <li>With linear sweeps it is acceptable to maintain a fixed source resolution over the entire sweep. To prevent source range changes during the sweep (especially when sweeping through 0.0), set the source range to a fixed range appropriate for the larger of either <code>startvalue</code> or <code>endvalue</code>.</li> <li>The SMU will only store the most recent configured source action. The last call to <code>smuX.trigger.source.linearY</code>, <code>smuX.trigger.source.listY</code>, or <code>smuX.trigger.source.logY</code> is used for the source action.</li> </ul> |                                                                                                                                |

| Remarks                          | <ul style="list-style-type: none"> <li>This function configures the source action to be a list sweep in a subsequent sweep.</li> <li>During the sweep, the source will output the sequence of source values given in the <code>sweeplist</code> array.</li> <li>If the subsequent sweep has more points than given in <code>sweeplist</code>, the source will restart at the beginning of the list for the extra points. If the subsequent sweep has less points than given in <code>sweeplist</code>, the extra values will be ignored.</li> <li>In cases where the first sweep point is non-zero, it may be necessary to pre-charge the circuit so that the sweep will return a stable value for the first measured point without penalizing remaining points in the sweep.</li> <li>The SMU will only store the most recent configured source action. The last call to <code>smuX.trigger.source.linearY</code>, <code>smuX.trigger.source.listY</code>, or <code>smuX.trigger.source.logY</code> is used for the source action.</li> </ul> |                                                                                                                                |

| Remarks                         | <ul style="list-style-type: none"> <li>• This function configures a geometric source sweep.</li> <li>• During the sweep, the source will generate a geometric series of ascending or descending voltage or current changes called steps. Each step is larger or smaller than the previous step by a fixed proportion. The constant of proportionality is determined by the starting value, the ending value, the asymptote, and the number of steps in the sweep. The number of source steps is one less than the number of sourced data points.</li> <li>• The <code>points</code> parameter does not set the number of steps in a sweep. It is only used to calculate source values within a subsequent sweep. If the subsequent sweep has more points than specified here, the source will restart at the beginning. If the subsequent sweep has less points than specified here, <code>endvalue</code> will not be reached during the sweep.</li> <li>• In cases where the first sweep point is non-zero, it may be necessary to pre-charge the circuit so that the sweep will return a stable value for the first measured point without penalizing remaining points in the sweep.</li> <li>• With logarithmic sweeps it is usually necessary to allow the source to auto range to maintain good source accuracy when sweeping over more than one decade or across range boundaries.</li> <li>• The <code>asymptote</code> parameter can be used to customize the inflection and/or offset of the source value curve. This allows log sweeps to cross zero. Setting this parameter to zero provides a conventional logarithmic sweep. The <code>asymptote</code> value is the value that the curve would have at either positive or negative infinity depending on the direction of the sweep.</li> <li>• The <code>asymptote</code> value must not be equal to or between the starting and ending values. It must be outside the range defined by the starting and ending values.</li> <li>• The SMU will only store the most recent configured source action. The last call to <code>smuX.trigger.source.linearY</code>, <code>smuX.trigger.source.listY</code>, or <code>smuX.trigger.source.logY</code> is used for the source action.</li> </ul> |                                                                                                                                |

## Status

The following provides a brief overview of the status model. Details on the status model are provided in [Appendix C](#) of this manual.

### Status register sets

A typical status register set is made up of a condition register, an event register, an event enable register, a negative transition register, and a positive transition register. A condition register is a read-only register that constantly updates to reflect the present operating conditions of the instrument. When an event occurs, and the appropriate NTR or PTR bit is set, the matching event register bit is set to 1. The bit remains latched to 1 until the register is read or reset. When an event register bit is set and its corresponding enable bit is set (as programmed by the user), the output (summary) of the register will set to 1, which in turn sets the condition bit in a higher-level register, and can ultimately cascade to the summary bit of the Status Byte Register.

### Negative and positive transition registers

- **Negative-transition register (NTR):** When a bit in an NTR register is set by the user, the corresponding bit in the event register will set when the corresponding bit in the condition register transitions from 1 to 0.
- **Positive-transition register (PTR):** When a bit in a PTR register is set by the user, the corresponding bit in the event register will set when the corresponding bit in the condition register transitions from 0 to 1.

### Status byte and SRQ

The Status Byte Register receives the summary bits of the five status register sets and two queues. The register sets and queues monitor the various instrument events. When an enabled event occurs, it sets a summary bit in the Status Byte Register. When a summary bit of the Status Byte is set and its corresponding enable bit is set (as programmed by the user), the RQS/MSS bit will set to indicate that an SRQ has occurred.

SRQs will affect both the GPIB and the VXI-11 connections. On the GPIB, the SRQ line will be asserted. On a VXI-11 connection, an SRQ event will be generated.

| Attribute               | Status byte register.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| TSP-Link accessibility  | This attribute can be accessed from a remote TSP-Link node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Usage                   | Reads the status byte register:<br><code>statbyte = status.condition</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Remarks                 | <ul style="list-style-type: none"> <li>• This attribute is used to read the status byte, which is returned as a numeric value. The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is bit 7.</li> <li>• For example, assume value 129 is returned for the condition register. The binary equivalent is 10000001. This value indicates that bit B0 (MSB) and bit B7 (OSB) are set.</li> <li>• The bits of the status byte register are described as follows: <ul style="list-style-type: none"> <li>• <b>Bit B0, Measurement Summary Bit (MSB):</b> Set summary bit indicates that an enabled measurement event has occurred.</li> <li>• <b>Bit B1, System Summary Bit (SSB):</b> Set summary bit indicates that an enabled system event has occurred.</li> <li>• <b>Bit B2, Error Available (EAV):</b> Set summary bit indicates that an error or status message is present in the Error Queue.</li> <li>• <b>Bit B3, Questionable Summary Bit (QSB):</b> Set summary bit indicates that an enabled questionable event has occurred.</li> <li>• <b>Bit B4, Message Available (MAV):</b> Set summary bit indicates that a response message is present in the Output Queue.</li> <li>• <b>Bit B5, Event Summary Bit (ESB):</b> Set summary bit indicates that an enabled standard event has occurred.</li> <li>• <b>Bit B6, Request Service (RQS)/Master Summary Status (MSS):</b> Set bit indicates that an enabled summary bit of the Status Byte Register is set. Depending on how it is used, Bit B6 of the Status Byte Register is either the Request for Service (RQS) bit or the Master Summary Status (MSS) bit: <ul style="list-style-type: none"> <li>- When using the GPIB or VXI-11 serial poll sequence of the SourceMeter instrument to obtain the status byte (serial poll byte), B6 is the RQS bit.</li> <li>- When using <code>status.condition</code> or the <code>*STB?</code> common command to read the status byte, B6 is the MSS bit.</li> </ul> </li> <li>• <b>Bit B7, Operation Summary (OSB):</b> Set summary bit indicates that an enabled operation event has occurred.</li> </ul> </li> </ul> |
| Details                 | See <a href="#">Status byte and service request (SRQ)</a> in <a href="#">Appendix C</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Example                 | Reads the status byte:<br><pre>statbyte = status.condition print(statbyte)</pre> Output: 1.29000e+02<br>The above output indicates that bits B0 (MSS) and B7 (OSB) are set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Remarks | <ul style="list-style-type: none"> <li>This attribute is used to read or write to the measurement event registers.</li> <li>Reading a status register returns a value. The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is bit 15.</li> <li>For example, assume value 257 is returned for the register. The binary equivalent is 0000000100000001. This value indicates that bit B1 (VLMT) and bit B8 (BAV) are set.</li> <li>The used bits of the measurement event registers are described as follows: <ul style="list-style-type: none"> <li><b>Bit B0, VLMT:</b> Set bit is a summary of the <code>status.measurement.voltage_limit</code> register.</li> <li><b>Bit B1, ILMT:</b> Set bit is a summary of the <code>status.measurement.current_limit</code> register.</li> <li><b>Bit B7, ROF:</b> Set bit is a summary of the <code>status.measurement.reading_overflow</code> register.</li> <li><b>Bit B8, BAV:</b> Set bit is a summary of the <code>status.measurement.buffer_available</code> register.</li> <li><b>Bit B11, OE:</b> Set bit indicates that output enable has been asserted.</li> <li><b>Bit B13, INST:</b> Set bit indicates that a bit in the measurement instrument summary register is set.</li> </ul> </li> </ul> |
| Details | See <a href="#">Status model (measurement event registers)</a> in <a href="#">Appendix C</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Example | Set the BAV bit of the measurement event enable register:<br><pre>status.measurement.enable = status.measurement.BAV</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Remarks | <ul style="list-style-type: none"> <li>• These attributes are used to read or write to the measurement event buffer available summary registers.</li> <li>• Reading a status register returns a value. The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is bit 15.</li> <li>• For example, assume value 6 is returned for the enable register. The binary equivalent is 000000000000110. This value indicates that bit B1(SMUA) and bit B2 (SMUB) are set.</li> <li>• The used bits of the measurement event buffer available summary registers are described as follows: <ul style="list-style-type: none"> <li>• <b>Bit B1, SMUA:</b> Set bit indicates the enabled BAV bit for the SMU A measurement event register is set.</li> <li>• <b>Bit B2, SMUB:</b> Set bit indicates the enabled BAV bit for the SMU B measurement event register is set.</li> </ul> </li> </ul> |
| Details | See <a href="#">Status model (measurement event registers)</a> in <a href="#">Appendix C</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Example | Sets the SMUA bit of the measurement event buffer available summary enable register:<br><pre>status.measurement.buffer_available.enable = status.measurement.buffer_available.SMUA</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Remarks | <ul style="list-style-type: none"> <li>• These attributes are used to read or write to the measurement event current limit summary registers.</li> <li>• Reading a status register returns a value. The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is bit 15.</li> <li>• For example, assume value 6 is returned for the enable register. The binary equivalent is 000000000000110. This value indicates that bit B1(SMUA) and bit B2 (SMUB) are set.</li> <li>• The used bits of the measurement event current limit summary registers are described as follows: <ul style="list-style-type: none"> <li>• <b>Bit B1, SMUA:</b> Set bit indicates the enabled ILMT bit for the SMU A measurement register is set.</li> <li>• <b>Bit B2, SMUB:</b> Set bit indicates the enabled ILMT bit for the SMU B measurement register is set.</li> </ul> </li> </ul> |
| Details | See <a href="#">Status model (measurement event registers)</a> in <a href="#">Appendix C</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Example | Sets the SMUA bit of the measurement event current limit summary enable register:<br><pre>status.measurement.current_limit.enable = status.measurement.current_limit.SMUA</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |   |                  |                                    |                     |                                    |                     |

| Remarks | <ul style="list-style-type: none"> <li>• These attributes are used to read or write to the measurement event instrument summary registers.</li> <li>• Reading a status register returns a value. The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is bit 15.</li> <li>• For example, assume value 6 is returned for the enable register. The binary equivalent is 000000000000110. This value indicates that bit B1 (SMUA) and bit B2 (SMUB) are set.</li> <li>• The used bits of the measurement event instrument summary registers are described as follows: <ul style="list-style-type: none"> <li>• <b>Bit B1, SMUA:</b> Set bit indicates one or more enabled bits for the SMU A measurement register is set.</li> <li>• <b>Bit B2, SMUB:</b> Set bit indicates one or more enabled bits for the SMU B measurement register is set.</li> </ul> </li> </ul> |
| Details | See <a href="#">Status model (measurement event registers)</a> in <a href="#">Appendix C</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Example | Sets the SMUA bit of the measurement event instrument summary enable register:<br><pre>status.measurement.instrument.enable = status.measurement.instrument.SMUA</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                     |   |                  |                                                  |                     |                                         |                     |                                                  |                     |                                         |                     |                                                     |                    |                                        |                    |                                                     |                    |                                        |                    |

| TSP-Link accessibility                       | This attribute can be accessed from a remote TSP-Link node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |                  |                                             |                              |                         |                              |                                     |                              |                         |                              |                                              |                              |                         |                              |                                       |                              |                         |                              |                                       |                              |                         |                              |                                           |                              |                         |                              |                                           |                              |                         |                              |
| Usage                                        | <p>Reads status node enable register:<br/> <code>nodeenabreg = status.node_enable</code></p> <p>Writes to system enable register:<br/> <code>status.node_enable = nodeenabreg</code><br/> Set <code>nodeenabreg</code> to one of the following values:</p> <table border="0"> <tr> <td>0</td> <td>Clears all bits.</td> </tr> <tr> <td><code>status.MEASUREMENT_SUMMARY_BIT</code></td> <td>Sets (enables) MSB bit (B0).</td> </tr> <tr> <td><code>status.MSB</code></td> <td>Sets (enables) MSB bit (B0).</td> </tr> <tr> <td><code>status.ERROR_AVAILABLE</code></td> <td>Sets (enables) EAV bit (B2).</td> </tr> <tr> <td><code>status.EAV</code></td> <td>Sets (enables) EAV bit (B2).</td> </tr> <tr> <td><code>status.QUESTIONABLE_SUMMARY_BIT</code></td> <td>Sets (enables) QSB bit (B3).</td> </tr> <tr> <td><code>status.QSB</code></td> <td>Sets (enables) QSB bit (B3).</td> </tr> <tr> <td><code>status.MESSAGE_AVAILABLE</code></td> <td>Sets (enables) MAV bit (B4).</td> </tr> <tr> <td><code>status.MAV</code></td> <td>Sets (enables) MAV bit (B4).</td> </tr> <tr> <td><code>status.EVENT_SUMMARY_BIT</code></td> <td>Sets (enables) ESB bit (B5).</td> </tr> <tr> <td><code>status.ESB</code></td> <td>Sets (enables) ESB bit (B5).</td> </tr> <tr> <td><code>status.MASTER_SUMMARY_STATUS</code></td> <td>Sets (enables) MSS bit (B6).</td> </tr> <tr> <td><code>status.MSS</code></td> <td>Sets (enables) MSS bit (B6).</td> </tr> <tr> <td><code>status.OPERATION_SUMMARY_BIT</code></td> <td>Sets (enables) OSB bit (B7).</td> </tr> <tr> <td><code>status.OSB</code></td> <td>Sets (enables) OSB bit (B7).</td> </tr> </table> <p><code>nodeenabreg</code> can also be set to the decimal weight of the bit to be set. Examples:<br/> To set bit B0 (MSB), set <code>nodeenabreg</code> to 1 (<math>2^0</math>).<br/> To set bit B2 (EAV), set <code>nodeenabreg</code> to 4 (<math>2^2</math>).<br/> To set bit B7 (OSB), set <code>nodeenabreg</code> to 128 (<math>2^7</math>).<br/> To set more than one bit of the register, set <code>nodeenabreg</code> to the sum of their decimal weights. For example, to set bits B0 and B7, set <code>nodeenabreg</code> to 129 (1 + 128).</p> | 0 | Clears all bits. | <code>status.MEASUREMENT_SUMMARY_BIT</code> | Sets (enables) MSB bit (B0). | <code>status.MSB</code> | Sets (enables) MSB bit (B0). | <code>status.ERROR_AVAILABLE</code> | Sets (enables) EAV bit (B2). | <code>status.EAV</code> | Sets (enables) EAV bit (B2). | <code>status.QUESTIONABLE_SUMMARY_BIT</code> | Sets (enables) QSB bit (B3). | <code>status.QSB</code> | Sets (enables) QSB bit (B3). | <code>status.MESSAGE_AVAILABLE</code> | Sets (enables) MAV bit (B4). | <code>status.MAV</code> | Sets (enables) MAV bit (B4). | <code>status.EVENT_SUMMARY_BIT</code> | Sets (enables) ESB bit (B5). | <code>status.ESB</code> | Sets (enables) ESB bit (B5). | <code>status.MASTER_SUMMARY_STATUS</code> | Sets (enables) MSS bit (B6). | <code>status.MSS</code> | Sets (enables) MSS bit (B6). | <code>status.OPERATION_SUMMARY_BIT</code> | Sets (enables) OSB bit (B7). | <code>status.OSB</code> | Sets (enables) OSB bit (B7). |

| <code>status.OSB</code>                      | Sets (enables) OSB bit (B7).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |   |                  |                                             |                              |                         |                              |                                     |                              |                         |                              |                                              |                              |                         |                              |                                       |                              |                         |                              |                                       |                              |                         |                              |                                           |                              |                         |                              |                                           |                              |                         |                              |
| Remarks                                      | <ul style="list-style-type: none"> <li>This attribute is used to read or write to the status node enable register.</li> <li>Reading the node enable status register returns a value. The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is Bit 7.</li> <li>For example, assume the value 129 is returned for the node enable register. The binary equivalent is 10000001. This value indicates that bit B0 (MSB) and bit B7 (OSB) are set.</li> <li>Assigning a value to this attribute enables one or more status events. When an enabled status event occurs, a summary bit is set in the appropriate system summary register. The register and bit that is set depends on the TSP-Link node number assigned to this instrument.</li> <li>The status node enable register uses most of the same summary events as the status byte. Bit B1 (MSB) is not used, and bit B6 is used as Master Summary Status (MSS). For details, see <a href="#">status.condition</a> register.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |   |                  |                                             |                              |                         |                              |                                     |                              |                         |                              |                                              |                              |                         |                              |                                       |                              |                         |                              |                                       |                              |                         |                              |                                           |                              |                         |                              |                                           |                              |                         |                              |

| Attribute                | Status node event register.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| TSP-Link accessibility   | This attribute can be accessed from a remote TSP-Link node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Usage                    | Reads the status node event register:<br><code>nodeeventreg = status.node_event</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Remarks                  | <ul style="list-style-type: none"> <li>• This attribute is used to read the status node event register, which is returned as a numeric value. Reading this register returns a value. The binary equivalent of the returned value. The least significant bit of the binary number is bit 0, and the most significant bit is bit 7.</li> <li>• For example, assume value 129 is returned for the event register. The binary equivalent is 10000001. This value indicates that bit B0 (MSB) and bit B7 (OSB) are set.</li> <li>• The status node event register uses most of the same summary events as the status byte. Bit B1(MSB) is not used, and bit B6 is used as Master Summary Status (MSS). For details, see <a href="#">status.condition</a> register.</li> </ul> |
| Details                  | See <a href="#">Status byte and service request (SRQ)</a> in <a href="#">Appendix C</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Example                  | Reads the status node event register:<br><pre>nodeeventreg = status.node_event print(nodeeventreg)</pre> Output: 1.29000e+02<br>The above output indicates that bits B0 (MSS) and B7 (OSB) are set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |                  |                              |                    |                      |                    |                           |                    |                      |                    |                            |                     |                       |                     |                                  |                        |                         |                        |                                 |                     |                      |                     |                       |                      |                                     |                      |                       |                      |                                  |                      |                       |                      |

| Remarks | <ul style="list-style-type: none"> <li>• This attribute is used to read or write to the operation status registers.</li> <li>• Reading a status register returns a value. The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is bit 15.</li> <li>• For example, assume value 17 is returned for the enable register. The binary equivalent is 0000000000010001. This value indicates that bit B0 (CAL) and bit B4 (MEAS) are set.</li> <li>• The used bits of the operation status registers are described as follows: <ul style="list-style-type: none"> <li>• <b>Bit B0, CAL:</b> Set bit indicates that the summary bit of the <code>status.operation.calibrating</code> register has been set.</li> <li>• <b>Bit B3, SWE:</b> Set bit indicates that the summary bit from the <code>status.operation.sweeping</code> register is set.</li> <li>• <b>Bit B4, MEAS:</b> Set bit indicates that the summary bit of the <code>status.operation.measuring</code> register is set.</li> <li>• <b>Bit B10, TRGOVR:</b> Set bit indicates that the summary bit from the <code>status.operation.trigger_overrun</code> register is set.</li> <li>• <b>Bit B11, REM:</b> Set bit indicates that the summary bit of the <code>status.operation.remote</code> register is set.</li> <li>• <b>Bit B12, USER:</b> Set bit indicates that an enabled bit in the <code>status.operation.user</code> register is set.</li> <li>• <b>Bit B13, INST:</b> Set bit indicates that an enabled bit in the <code>status.operation.instrument</code> register is set.</li> <li>• <b>Bit B14, PROG:</b> Set bit indicates that a program is running.</li> </ul> </li> </ul> |
| Details | See <a href="#">Operation Event Registers</a> in <a href="#">Appendix C</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Example | Sets the MEAS bit of the operation status enable register:<br><code>status.operation.enable = status.operation.MEAS</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |   |                  |                                   |                     |                                   |                     |

| Remarks | <ul style="list-style-type: none"> <li>• These attributes are used to read or write to the operation status digital I/O overrun registers.</li> <li>• Reading a status register returns a value. The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is bit 15.</li> <li>• The used bits of the operation status digital I/O overrun registers are described as follows: <ul style="list-style-type: none"> <li>• <b>Bit B1, LINE1:</b> Set bit indicates that Line 1 generated an action overrun when it was triggered to generate an output trigger.</li> <li>• <b>Bit B2, LINE2:</b> Set bit indicates that Line 2 generated an action overrun when it was triggered to generate an output trigger.</li> <li>• <b>Bit B3, LINE3:</b> Set bit indicates that Line 3 generated an action overrun when it was triggered to generate an output trigger.</li> <li>• <b>Bit B4, LINE4:</b> Set bit indicates that Line 4 generated an action overrun when it was triggered to generate an output trigger.</li> <li>• <b>Bit B5, LINE5:</b> Set bit indicates that Line 5 generated an action overrun when it was triggered to generate an output trigger.</li> <li>• <b>Bit B6, LINE6:</b> Set bit indicates that Line 6 generated an action overrun when it was triggered to generate an output trigger.</li> <li>• <b>Bit B7, LINE7:</b> Set bit indicates that Line 7 generated an action overrun when it was triggered to generate an output trigger.</li> <li>• <b>Bit B8, LINE8:</b> Set bit indicates that Line 8 generated an action overrun when it was triggered to generate an output trigger.</li> <li>• <b>Bit B9, LINE9:</b> Set bit indicates that Line 9 generated an action overrun when it was triggered to generate an output trigger.</li> <li>• <b>Bit B10, LINE10:</b> Set bit indicates that Line 10 generated an action overrun when it was triggered to generate an output trigger.</li> <li>• <b>Bit B11, LINE11:</b> Set bit indicates that Line 11 generated an action overrun when it was triggered to generate an output trigger.</li> <li>• <b>Bit B12, LINE12:</b> Set bit indicates that Line 12 generated an action overrun when it was triggered to generate an output trigger.</li> <li>• <b>Bit B13, LINE13:</b> Set bit indicates that Line 13 generated an action overrun when it was triggered to generate an output trigger.</li> <li>• <b>Bit B14, LINE14:</b> Set bit indicates that Line 14 generated an action overrun when it was triggered to generate an output trigger.</li> </ul> </li> </ul> |
| Details | See <a href="#">Operation Event Registers</a> in <a href="#">Appendix C</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Example | Sets the LINE1 bit of the operation status digital I/O overrun enable register:<br><pre>status.operation.instrument.digio.trigger_overrun.enable = status.operation.instrument.digio.trigger_overrun.LINE1</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Remarks | <ul style="list-style-type: none"> <li>• These attributes are used to read or write to the operation status LAN trigger overrun registers.</li> <li>• Reading a status register returns a value. The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is bit 15.</li> <li>• For example, assume value 6 is returned for the enable register. The binary equivalent is 0000000000000110. This value indicates that bit B1 (LAN1) and bit B2 (LAN2) are set.</li> <li>• The used bits of the operation status LAN trigger overrun registers are described as follows:</li> <li>• <b>Bit B1, LAN1:</b> Set bit indicates LAN trigger 1 generated an action overrun when triggered to generate a trigger packet.</li> <li>• <b>Bit B2, LAN2:</b> Set bit indicates LAN trigger 2 generated an action overrun when triggered to generate a trigger packet.</li> <li>• <b>Bit B3, LAN3:</b> Set bit indicates LAN trigger 3 generated an action overrun when triggered to generate a trigger packet.</li> <li>• <b>Bit B4, LAN4:</b> Set bit indicates LAN trigger 4 generated an action overrun when triggered to generate a trigger packet.</li> <li>• <b>Bit B5, LAN5:</b> Set bit indicates LAN trigger 5 generated an action overrun when triggered to generate a trigger packet.</li> <li>• <b>Bit B6, LAN6:</b> Set bit indicates LAN trigger 6 generated an action overrun when triggered to generate a trigger packet.</li> <li>• <b>Bit B7, LAN7:</b> Set bit indicates LAN trigger 7 generated an action overrun when triggered to generate a trigger packet.</li> <li>• <b>Bit B8, LAN8:</b> Set bit indicates LAN trigger 8 generated an action overrun when triggered to generate a trigger packet.</li> </ul> |
| Details | See <a href="#">Operation Event Registers</a> in <a href="#">Appendix C</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Example | Sets the LAN1 bit of the operation status LAN trigger overrun enable register:<br><pre>status.operation.instrument.lan.trigger_overrun.enable = status.operation.instrument.lan.trigger_overrun.LAN1</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Examples:<br/> To set bit B0 (CAL), set operreg to 1 (2<sup>0</sup>).<br/> To set bit B4 (MEAS), set operreg to 16 (2<sup>4</sup>).<br/> To set more than one bit of the register, set operreg to the sum of their decimal weights. For example, to set bits B0 and B4, set operreg to 17 (1 + 16).</p> |                     | 0 | Clears all bits. | status.operation.instrument.smuX.CALIBRATING | Sets CAL bit (B0). | status.operation.instrument.smuX.CAL | Sets CAL bit (B0). | status.operation.instrument.smuX.SWEEPING | Sets SWE bit (B3). | status.operation.instrument.smuX.SWE | Sets SWE bit (B3). | status.operation.instrument.smuX.MEASURING | Sets MEAS bit (B4). | status.operation.instrument.smuX.MEAS | Sets MEAS bit (B4). | status.operation.instrument.smuX.TRIGGER_OVERRUN | Sets TRGOVR bit (B10). | status.operation.instrument.smuX.TRGOVR | Sets TRGOVR bit (B10). |

The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is bit 15.</li> <li>• For example, assume value 17 is returned for the enable register. The binary equivalent is 0000000000010001. This value indicates that bit B0 (CAL) and bit B4 (MEAS) are set.</li> <li>• The used bits of the operation status SMU X summary registers are described as follows: <ul style="list-style-type: none"> <li>• <b>Bit B0, CAL:</b> Set bit indicates that SMU X is calibrating.</li> <li>• <b>Bit B3, SWE:</b> Set bit indicates that SMU X is sweeping.</li> <li>• <b>Bit B4, MEAS:</b> Bit will be set when taking an overlapped measurement, but it will not set when taking a normal synchronous measurement.</li> <li>• <b>Bit B10, TRGOVR:</b> Set bit indicates a bit has been set in the operation status SMU X trigger overrun event register.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                     |   |                  |                                              |                    |                                      |                    |                                           |                    |                                      |                    |                                            |                     |                                       |                     |                                                  |                        |                                         |                        |

The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is bit 15.</li> <li>• The bits of the operation status trigger timer summary registers are described as follows: <ul style="list-style-type: none"> <li>• <b>Bit B10, TRGOVR:</b> Set bit indicates one or more enabled bits for the operation status trigger timer overrun register is set.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                   |   |                  |                                                           |                        |                                                  |                        |

The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is bit 15.</li> <li>• <b>Bit B1, CAV:</b> Set bit indicates there is a command available in the execution queue.</li> <li>• <b>Bit B2, PRMPT:</b> Set bit indicates command prompts are enabled.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |   |                  |                                           |                    |                             |                    |                                         |                       |                               |                       |

| Remarks | <ul style="list-style-type: none"> <li>• These attributes are used to read or write to the operation status trigger overrun registers.</li> <li>• Reading a status register returns a value. The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is bit 15.</li> <li>• For example, assume value 6 is returned for the enable register. The binary equivalent is 0000000000000110. This value indicates that bit B1(SMUA) and bit B2 (SMUB) are set.</li> <li>• The used bits of the operation status trigger overrun registers are described as follows:</li> <li>• <b>Bit B1, SMUA:</b> Set bit indicates one of the enabled bits in the operation status SMU A trigger overrun event register is set.</li> <li>• <b>Bit B2, SMUB:</b> Set bit indicates one of the enabled bits in the operation status SMU B trigger overrun event register is set.</li> <li>• <b>Bit B10, TRGBLND:</b> Set bit indicates one of the enabled bits in the operation status trigger blender overrun event register is set.</li> <li>• <b>Bit B11, TRGTMR:</b> Set bit indicates one of the enabled bits in the operation status trigger timer overrun event register is set.</li> <li>• <b>Bit B12, DIGIO:</b> Set bit indicates one of the enabled bits in the operation status digital I/O overrun event register is set.</li> <li>• <b>Bit B13, TSPLINK:</b> Set bit indicates one of the enabled bits in the operation status TSP-Link overrun event register is set.</li> <li>• <b>Bit B14, LAN:</b> Set bit indicates one of the enabled bits in the operation status LAN trigger overrun event register is set.</li> </ul> |
| Details | See <a href="#">Operation Event Registers</a> in <a href="#">Appendix C</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Example | Sets the SMUA bit of the operation status trigger overrun enable register:<br><pre>status.operation.trigger_overrun.enable = status.operation.trigger_overrun.SMUA</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Usage                                                                                                                                                                                       | <p>Reads condition, enable, event, NTR, and PTR registers:</p> <pre>operreg = status.operation.user.condition operreg = status.operation.user.enable operreg = status.operation.user.event operreg = status.operation.user.ntr operreg = status.operation.user.ptr</pre> <p>Writes to condition, enable, NTR, and PTR registers:</p> <pre>status.operation.user.condition = operreg status.operation.user.enable = operreg status.operation.user.ntr = operreg status.operation.user.ptr = operreg</pre> <p>Set operreg to one of the following values:</p> <table border="0"> <tr> <td>0</td> <td>Clears all bits.</td> </tr> <tr> <td>status.operation.user.BIT0</td> <td>Sets user BIT0.</td> </tr> <tr> <td>status.operation.user.BIT1</td> <td>Sets user BIT1.</td> </tr> <tr> <td>status.operation.user.BIT2</td> <td>Sets user BIT2.</td> </tr> <tr> <td>status.operation.user.BIT3</td> <td>Sets user BIT3.</td> </tr> <tr> <td>status.operation.user.BIT4</td> <td>Sets user BIT4.</td> </tr> <tr> <td>status.operation.user.BIT5</td> <td>Sets user BIT5.</td> </tr> <tr> <td>status.operation.user.BIT6</td> <td>Sets user BIT6.</td> </tr> <tr> <td>status.operation.user.BIT7</td> <td>Sets user BIT7.</td> </tr> <tr> <td>status.operation.user.BIT8</td> <td>Sets user BIT8.</td> </tr> <tr> <td>status.operation.user.BIT9</td> <td>Sets user BIT9.</td> </tr> <tr> <td>status.operation.user.BIT10</td> <td>Sets user BIT10.</td> </tr> <tr> <td>status.operation.user.BIT11</td> <td>Sets user BIT11.</td> </tr> <tr> <td>status.operation.user.BIT12</td> <td>Sets user BIT12.</td> </tr> <tr> <td>status.operation.user.BIT13</td> <td>Sets user BIT13.</td> </tr> <tr> <td>status.operation.user.BIT14</td> <td>Sets user BIT14.</td> </tr> </table> <p>operreg can also be set to the decimal weight of the bit to be set. Examples:<br/> To set user BIT0, set operreg to 1 (<math>2^0</math>).<br/> To set user BIT11, set operreg to 2048 (<math>2^{11}</math>).<br/> To set more than one bit of the register, set operreg to the sum of their decimal weights. For example, to set BIT0 and BIT4, set operreg to 17 (1 + 16).</p> | 0 | Clears all bits. | status.operation.user.BIT0 | Sets user BIT0. | status.operation.user.BIT1 | Sets user BIT1. | status.operation.user.BIT2 | Sets user BIT2. | status.operation.user.BIT3 | Sets user BIT3. | status.operation.user.BIT4 | Sets user BIT4. | status.operation.user.BIT5 | Sets user BIT5. | status.operation.user.BIT6 | Sets user BIT6. | status.operation.user.BIT7 | Sets user BIT7. | status.operation.user.BIT8 | Sets user BIT8. | status.operation.user.BIT9 | Sets user BIT9. | status.operation.user.BIT10 | Sets user BIT10. | status.operation.user.BIT11 | Sets user BIT11. | status.operation.user.BIT12 | Sets user BIT12. | status.operation.user.BIT13 | Sets user BIT13. | status.operation.user.BIT14 | Sets user BIT14. |

| Remarks                                                                                                                                                                                                                                                           | <ul style="list-style-type: none"> <li>• These attributes are used to read or write to the questionable status SMU X summary registers.</li> <li>• Reading a status register returns a value. The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is bit 15.</li> <li>• For example, assume value 4362 is returned for the enable register. The binary equivalent is 0001000100000000. This value indicates that bit B8 (CAL bit) and bit B12 (OTEMP bit) are set.</li> <li>• The used bits of the questionable status SMU X summary registers are described as follows: <ul style="list-style-type: none"> <li>• <b>Bit B8, CAL:</b> Set bit indicates that calibration is questionable.</li> <li>• <b>Bit B9, UO:</b> Set bit indicates that an unstable output condition was detected.</li> <li>• <b>Bit B12, OTEMP:</b> Set bit indicates that an over temperature condition was detected.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                     |   |                  |                                                 |                    |                                         |                    |                                                     |                   |                                        |                   |                                                      |                       |                                           |                       |

| Remarks                                      | <ul style="list-style-type: none"> <li>• These attributes are used to read or write to the service request enable register.</li> <li>• Reading the service request enable register returns a value. The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is bit 7.</li> <li>• For example, assume value 129 is returned for the service request enable register. The binary equivalent is 10000001. This value indicates that bit B0 (MSB) and bit B7 (OSB) are set.</li> <li>• Assigning a value to this attribute enables one or more status events for service request. When an enabled status event occurs, bit B6 of the status byte sets to generate an SRQ (service request).</li> <li>• The service request enable register uses most of the same summary events as the status byte. Bit B6 (MSS) is not used by the enable register. For details, see <a href="#">status.condition</a> register.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                |                  |                                             |                              |                         |                              |                                        |                              |                         |                              |                                     |                              |                         |                              |                                              |                              |                         |                              |                                       |                              |                         |                              |                                       |                              |                         |                              |                                           |                              |                         |                              |

| Attribute                   | Service request event register.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| TSP-Link accessibility      | This attribute can be accessed from a remote TSP-Link node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Usage                       | Reads the service request event register:<br><code>serveventreg = status.request_event</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Remarks                     | <ul style="list-style-type: none"> <li>• These attributes are used to read the service request event register, which is returned as a numeric value. Reading this register returns a value. The binary equivalent of the returned value. The least significant bit of the binary number is bit 0, and the most significant bit is bit 7.</li> <li>• For example, assume value 129 is returned for the event register. The binary equivalent is 10000001. This value indicates that bit B0 (MSB) and bit B7 (OSB) are set.</li> <li>• The service request event register uses most of the same summary events as the status byte. Bit B6 (MSS) is not used by the event register. For details, see <a href="#">status.condition</a>.</li> </ul> |
| Details                     | See <a href="#">Status byte and service request (SRQ)</a> in <a href="#">Appendix C</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Example                     | Reads the service request event register:<br><pre>serveventreg = status.request_event print(serveventreg)</pre> Output: 1.29000e+02<br>The above output indicates that bits B0 (MSS) and B7 (OSB) are set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>status.reset</b> |                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Function            | Resets all bits set in the status model.                                                                         |
| Usage               | <code>status.reset()</code>                                                                                      |
| Remarks             | This function clears all status data structure registers (enable, event, NTR, and PTR) to their power up states. |
| Details             | See <a href="#">Appendix C</a> .                                                                                 |

|                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |   |                  |                                    |                    |                     |                    |                             |                    |                     |                    |                                        |                    |                     |                    |                                 |                    |                     |                    |                               |                    |                     |                    |                              |                    |                     |                    |                          |                    |                     |                    |

| Remarks | <ul style="list-style-type: none"> <li>• These attributes are used to read or write to the standard event status registers.</li> <li>• Reading a status register returns a value. The binary equivalent of the returned value indicates which register bits are set. The least significant bit of the binary number is bit 0, and the most significant bit is bit 15.</li> <li>• For example, assume value 9 is returned for the enable register. The binary equivalent is 0000000000001001. This value indicates that bit 0 (OPC) and bit 3 (DDE) are set.</li> <li>• The used bits of the standard event status register are described as follows: <ul style="list-style-type: none"> <li>• <b>Bit B0, Operation Complete (OPC):</b> Set bit indicates that all pending selected instrument operations are completed and the SourceMeter instrument is ready to accept new commands. The bit is set in response to an *OPC command. The ICL function <code>opc ( )</code> can be used in place of the *OPC command. See Appendix C for details on *OPC</li> <li>• <b>Bit B2, Query Error (QYE):</b> Set bit indicates that you attempted to read data from an empty Output Queue.</li> <li>• <b>Bit B3, Device-Dependent Error (DDE):</b> Set bit indicates that an instrument operation did not execute properly due to some internal condition.</li> <li>• <b>Bit B4, Execution Error (EXE):</b> Set bit indicates that the SourceMeter instrument detected an error while trying to execute a command.</li> <li>• <b>Bit B5, Command Error (CME):</b> Set bit indicates that a command error has occurred. Command errors include:<br/>IEEE-488.2 syntax error: SourceMeter instrument received a message that does not follow the defined syntax of the IEEE-488.2 standard.<br/>Semantic error: SourceMeter instrument received a command that was misspelled or received an optional IEEE-488.2 command that is not implemented.<br/>The instrument received a Group Execute Trigger (GET) inside a program message.</li> <li>• <b>Bit B6, User Request (URQ):</b> Set bit indicates that the LOCAL key on the SourceMeter instrument front panel was pressed.</li> <li>• <b>Bit B7, Power ON (PON):</b> Set bit indicates that the SourceMeter instrument has been turned off and turned back on since the last time this register has been read.</li> </ul> </li> </ul> |

| Remarks                                                                                                                                             | <ul style="list-style-type: none"> <li>In an expanded system (TSP-Link), These attributes are used to read or write to the system summary registers.</li> <li>Reading a system summary register returns a numeric value whose binary equivalent indicates which register bits are set. The bits of the system summary register are identified as follows: <table border="0"> <tr> <td>Bit B0 - EXT bit</td> <td>Bit B4 - Node 4</td> <td>Bit B8 - Node 8</td> <td>Bit B12 - Node 12</td> </tr> <tr> <td>Bit B1 - Node 1</td> <td>Bit B5 - Node 5</td> <td>Bit B9 - Node 9</td> <td>Bit B13 - Node 13</td> </tr> <tr> <td>Bit B2 - Node 2</td> <td>Bit B6 - Node 6</td> <td>Bit B10 - Node 10</td> <td>Bit B14 - Node 14</td> </tr> <tr> <td>Bit B3 - Node 3</td> <td>Bit B7 - Node 7</td> <td>Bit B11 - Node 11</td> <td>Bit B15 - Not used</td> </tr> </table> </li> <li>For example, assume the value 9 is returned for the enable register. The binary equivalent is 000000000001001. This value indicates that bit 0 (EXT) and bit 3 (Node 3) are set.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Bit B0 - EXT bit  | Bit B4 - Node 4    | Bit B8 - Node 8             | Bit B12 - Node 12 | Bit B1 - Node 1   | Bit B5 - Node 5   | Bit B9 - Node 9     | Bit B13 - Node 13    | Bit B2 - Node 2     | Bit B6 - Node 6      | Bit B10 - Node 10   | Bit B14 - Node 14    | Bit B3 - Node 3     | Bit B7 - Node 7      | Bit B11 - Node 11   | Bit B15 - Not used   |                     |                      |                     |                      |                     |                      |                     |                      |                      |                        |                      |                        |                      |                        |                      |                        |                      |                        |

The bits of system summary register 2 are identified as follows: <table border="0"> <tr> <td>Bit B0 - EXT bit</td> <td>Bit B4 - Node 18</td> <td>Bit B8 - Node 22</td> <td>Bit B12 - Node 26</td> </tr> <tr> <td>Bit B1 - Node 15</td> <td>Bit B5 - Node 19</td> <td>Bit B9 - Node 23</td> <td>Bit B13 - Node 27</td> </tr> <tr> <td>Bit B2 - Node 16</td> <td>Bit B6 - Node 20</td> <td>Bit B10 - Node 24</td> <td>Bit B14 - Node 28</td> </tr> <tr> <td>Bit B3 - Node 17</td> <td>Bit B7 - Node 21</td> <td>Bit B11 - Node 25</td> <td>Bit B15 - Not used</td> </tr> </table> </li> <li>For example, assume value 9 is returned for the enable register. The binary equivalent is 000000000001001. This value indicates that bit 0 (EXT) and bit 3 (Node 17) are set.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Bit B0 - EXT bit  | Bit B4 - Node 18   | Bit B8 - Node 22             | Bit B12 - Node 26  | Bit B1 - Node 15   | Bit B5 - Node 19   | Bit B9 - Node 23      | Bit B13 - Node 27  | Bit B2 - Node 16      | Bit B6 - Node 20   | Bit B10 - Node 24     | Bit B14 - Node 28  | Bit B3 - Node 17      | Bit B7 - Node 21   | Bit B11 - Node 25     | Bit B15 - Not used |                       |                    |                       |                    |                       |                    |                       |                    |                       |                     |                       |                     |                       |                     |                       |                     |                       |                     |

The bits of the system summary register 3 register are identified as follows: <table border="0"> <tr> <td>Bit B0 - EXT bit</td> <td>Bit B4 - Node 32</td> <td>Bit B8 - Node 36</td> <td>Bit B12 - Node 40</td> </tr> <tr> <td>Bit B1 - Node 29</td> <td>Bit B5 - Node 33</td> <td>Bit B9 - Node 37</td> <td>Bit B13 - Node 41</td> </tr> <tr> <td>Bit B2 - Node 30</td> <td>Bit B6 - Node 34</td> <td>Bit B10 - Node 38</td> <td>Bit B14 - Node 42</td> </tr> <tr> <td>Bit B3 - Node 31</td> <td>Bit B7 - Node 35</td> <td>Bit B11 - Node 39</td> <td>Bit B15 - Not used</td> </tr> </table> </li> <li>For example, assume value 9 is returned for the enable register. The binary equivalent is 0000000000001001. This value indicates that bit 0 (EXT) and bit 3 (Node 31) are set.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Bit B0 - EXT bit  | Bit B4 - Node 32   | Bit B8 - Node 36             | Bit B12 - Node 40  | Bit B1 - Node 29   | Bit B5 - Node 33   | Bit B9 - Node 37      | Bit B13 - Node 41  | Bit B2 - Node 30      | Bit B6 - Node 34   | Bit B10 - Node 38     | Bit B14 - Node 42  | Bit B3 - Node 31      | Bit B7 - Node 35   | Bit B11 - Node 39     | Bit B15 - Not used |                       |                    |                       |                    |                       |                    |                       |                    |                       |                     |                       |                     |                       |                     |                       |                     |                       |                     |

The bits of the system summary register 4 register are identified as follows: <table border="0"> <tr> <td>Bit B0 - EXT bit</td> <td>Bit B4 - Node 46</td> <td>Bit B8 - Node 50</td> <td>Bit B12 - Node 54</td> </tr> <tr> <td>Bit B1 - Node 43</td> <td>Bit B5 - Node 47</td> <td>Bit B9 - Node 51</td> <td>Bit B13 - Node 55</td> </tr> <tr> <td>Bit B2 - Node 44</td> <td>Bit B6 - Node 48</td> <td>Bit B10 - Node 52</td> <td>Bit B14 - Node 56</td> </tr> <tr> <td>Bit B3 - Node 45</td> <td>Bit B7 - Node 49</td> <td>Bit B11 - Node 53</td> <td>Bit B15 - Not used</td> </tr> </table> </li> <li>For example, assume value 9 is returned for the enable register. The binary equivalent is 000000000001001. This value indicates that bit 0 (EXT) and bit 3 (Node 45) are set.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Bit B0 - EXT bit  | Bit B4 - Node 46   | Bit B8 - Node 50             | Bit B12 - Node 54  | Bit B1 - Node 43   | Bit B5 - Node 47   | Bit B9 - Node 51      | Bit B13 - Node 55   | Bit B2 - Node 44      | Bit B6 - Node 48    | Bit B10 - Node 52     | Bit B14 - Node 56   | Bit B3 - Node 45      | Bit B7 - Node 49    | Bit B11 - Node 53     | Bit B15 - Not used  |                       |                     |                       |                     |                       |                     |                       |                     |                       |                      |                       |                      |                       |                      |                       |                      |                       |                      |

## timer

The functions in this group are used for the timer. The timer can be used to measure the time it takes to perform various operations. Use the `timer.reset` function at the beginning of an

operation to reset the timer to zero, and then use the `timer.measure.t` at the end of the operation to measure the elapsed time.

| <b>timer.measure.t</b> |                                                                                                                                                                                                                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function               | Measures the elapsed time since the timer was last reset.                                                                                                                                                                                                                                |
| TSP-Link accessibility | This function can be accessed from a remote TSP-Link node.                                                                                                                                                                                                                               |
| Usage                  | <code>time = timer.measure.t()</code><br><code>time</code> Returns the elapsed time in seconds (1µs resolution).                                                                                                                                                                         |
| Remarks                | <ul style="list-style-type: none"> <li>This function returns the elapsed time in seconds since the timer was reset.</li> </ul>                                                                                                                                                           |
| Also see               | <a href="#">timer.reset</a>                                                                                                                                                                                                                                                              |
| Example                | Resets the timer and then measures the time since the reset:<br><pre>timer.reset() ... time = timer.measure.t() print(time) Output: 1.469077e+01</pre> <p>The above output indicates that <code>timer.measure.t</code> was executed 14.69077 seconds after <code>timer.reset</code>.</p> |

| Example                | <p>Waits up to 10 seconds for a trigger:</p> <pre>triggered = trigger.wait(10) print(triggered)</pre> <p>Output: <code>false</code></p> <p>The above output indicates that no trigger was detected during the 10 second timeout.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## tsplink

| tsplink.group          |                                                                                                                                                                                                                                                                                                        |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Attribute              | Stores the group number assigned to the node.                                                                                                                                                                                                                                                          |
| Default                | 0                                                                                                                                                                                                                                                                                                      |
| TSP-Link accessibility | This attribute can be accessed from a remote TSP-Link node.                                                                                                                                                                                                                                            |
| Usage                  | <pre>groupnumber = tsplink.group tsplink.group = groupnumber</pre> <p>groupnumber                      The TSP-Link group number.</p>                                                                                                                                                                  |
| Remarks                | <ul style="list-style-type: none"> <li>• The default group number is 0.</li> <li>• Set the attribute value to 0 to remove the node from all groups.</li> <li>• Each time the node powers off, the group number for that node changes to 0.</li> <li>• Group numbers can range from 0 to 64.</li> </ul> |

| tsplink.master         |                                                                                                                                     |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Attribute              | Reads the node number assigned to the master node.                                                                                  |
| TSP-Link accessibility | This attribute can be accessed from a remote TSP-Link node.                                                                         |
| Usage                  | <pre>master = tsplink.master</pre> <p>master                              A custom variable that stores the master node number.</p> |
| Remarks                | This is a read-only attribute.                                                                                                      |

| tsplink.node           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Attribute              | Use this attribute to set the node number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Default                | 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| TSP-Link accessibility | This attribute can be accessed from a remote TSP-Link node.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Usage                  | <pre>mynode = tsplink.node              Reads the node number. tsplink.node = mynode              Writes the node number.</pre> <p>mynode                              Sets the node number. Choose from 1 to 64.</p>                                                                                                                                                                                                                                                                                         |
| Remarks                | <ul style="list-style-type: none"> <li>• This attribute sets the TSP-Link node number and saves the value in nonvolatile memory.</li> <li>• Changes to the node number do not take effect until the next time <code>tsplink.reset</code> is executed on any node in the system.</li> <li>• Each node connected to the TSP-Link must be assigned a different node number.</li> <li>• 32 nodes is the maximum number of nodes allowed.</li> <li>• This attribute may be any number between 1 and 64.</li> </ul> |
| Details                | See <a href="#">Section 14</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Also see               | <a href="#">tsplink.reset</a> , <a href="#">tsplink.state</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Example                | Sets the TSP-Link node to number 2:<br><code>tsplink.node = 2</code>                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>tsplink.readbit</b> |                                                                                                                                                                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function               | Reads the state of a TSP-Link synchronization line.                                                                                                                                                                                               |
| TSP-Link accessibility | This function can be accessed from a remote TSP-Link node.                                                                                                                                                                                        |
| Usage                  | <pre>data = tsplink.readbit(n)</pre> <p>data                                    A custom variable that stores the state of the synchronization line.</p> <p>n                                        Synchronization line to be read (1 - 3).</p> |
| Remarks                | <ul style="list-style-type: none"> <li>Returns a value of 0 if the line is low and a 1 if the line is high.</li> </ul>                                                                                                                            |
| Details                | See <a href="#">TSP-Link synchronization lines</a> in <a href="#">Section 8</a> .                                                                                                                                                                 |
| Also see               | <a href="#">tsplink.readbit</a> , <a href="#">tsplink.readport</a> , <a href="#">tsplink.writebit</a> .                                                                                                                                           |
| Example                | <p>Assume line 3 is set high, and it is then read:</p> <pre>data = tsplink.readbit(3) print(data) Output: 1.000000e+00</pre>                                                                                                                      |

| <b>tsplink.readport</b> |                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function                | Reads the TSP-Link synchronization lines as a digital I/O port.                                                                                                                                                                                                                                                                                                            |
| TSP-Link accessibility  | This function can be accessed from a remote TSP-Link node.                                                                                                                                                                                                                                                                                                                 |
| Usage                   | <pre>data = tsplink.readport()</pre>                                                                                                                                                                                                                                                                                                                                       |
| Remarks                 | <ul style="list-style-type: none"> <li>The binary equivalent of the returned value indicates the input pattern on the I/O port. The least significant bit of the binary number corresponds to line 1 and bit 3 corresponds to line 3. For example, a returned value of 2 has a binary equivalent of 010. Line 2 is high (1), and the other 2 lines are low (0).</li> </ul> |
| Details                 | See <a href="#">TSP-Link synchronization lines</a> in <a href="#">Section 8</a> .                                                                                                                                                                                                                                                                                          |

| Function               | Initializes (resets) all nodes (instruments) in the TSP-Link system. Also returns the number of nodes found.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| TSP-Link accessibility | This function cannot be accessed from a remote TSP-Link node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Usage                  | <pre>nodes_found = tsplink.reset() nodes_found = tsplink.reset(expected_nodes)</pre> <p> <code>expected_nodes</code>                      The number of nodes expected on the system.<br/> <code>nodes_found</code>                              The number of nodes actually on the system. </p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Remarks                | <ul style="list-style-type: none"> <li>• This function will erase all knowledge of other nodes connected on the TSP-Link and will regenerate the system configuration. This function must be called at least once before any remote nodes can be accessed. If the node number for any instrument is changed, the TSP-Link must again be initialized.</li> <li>• The value of <code>expected_nodes</code> must be a number between 1 and 64. If the <code>expected_nodes</code> parameter is not given, this function will generate an error if no other nodes are found on the TSP-Link network.</li> <li>• If the actual number of nodes is less than the expected number, an error is generated. Note that the node on which the command is running is counted as a node. For example, giving an expected node count of 1 will not generate any errors, even if there are no other nodes on the TSP-Link network.</li> </ul> |
| Details                | See <a href="#">Section 14</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Asserts a low TTL-low pulse for output. | 8 or <code>tsplink.TRIG_RISINGM</code> | Detects Rising Edge triggers as an input. Asserts a low TTL-low pulse as an output. Edge detection as an input is not available. Generates a TTL-high pulse as an output trigger. |
| 0 or <code>tsplink.TRIG_BYPASS</code>       | Allows direct control of the line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                            |                                       |                                    |                                        |                                      |                                       |                                                                                                                                                                                                                                                                                                                                        |                                       |                                                                           |                                             |                                                                                                                                                            |                                            |                                                                                                    |                                             |                                               |                                        |                                                                                   |                                        |                                                                                                                                                                                   |
| 1 or <code>tsplink.TRIG_FALLING</code>      | Detects falling edge input triggers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                            |                                       |                                    |                                        |                                      |                                       |                                                                                                                                                                                                                                                                                                                                        |                                       |                                                                           |                                             |                                                                                                                                                            |                                            |                                                                                                    |                                             |                                               |                                        |                                                                                   |                                        |                                                                                                                                                                                   |
| 2 or <code>tsplink.TRIG_RISING</code>       | Asserts TTL-low pulse as an output trigger. If the programmed state of the line is high, the <code>tsplink.TRIG_RISING</code> mode behaves similar to <code>tsplink.TRIG_RISINGA</code> . If the programmed state of the line is low, the <code>tsplink.TRIG_RISING</code> mode behaves similar to <code>tsplink.TRIG_RISINGM</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                            |                                       |                                    |                                        |                                      |                                       |                                                                                                                                                                                                                                                                                                                                        |                                       |                                                                           |                                             |                                                                                                                                                            |                                            |                                                                                                    |                                             |                                               |                                        |                                                                                   |                                        |                                                                                                                                                                                   |
| 3 or <code>tsplink.TRIG_EITHER</code>       | Detects rising or falling edge triggers. Asserts a TTL-low trigger pulse.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                            |                                       |                                    |                                        |                                      |                                       |                                                                                                                                                                                                                                                                                                                                        |                                       |                                                                           |                                             |                                                                                                                                                            |                                            |                                                                                                    |                                             |                                               |                                        |                                                                                   |                                        |                                                                                                                                                                                   |
| 4 or <code>tsplink.TRIG_SYNCHRONOUSA</code> | Detects the falling edge input triggers and automatically latches and drives the trigger line low. Asserting the output trigger releases the latched line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                            |                                       |                                    |                                        |                                      |                                       |                                                                                                                                                                                                                                                                                                                                        |                                       |                                                                           |                                             |                                                                                                                                                            |                                            |                                                                                                    |                                             |                                               |                                        |                                                                                   |                                        |                                                                                                                                                                                   |
| 5 or <code>tsplink.TRIG_SYNCHRONOUS</code>  | Detects the falling edge input triggers and automatically latches and drives the trigger line low.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                            |                                       |                                    |                                        |                                      |                                       |                                                                                                                                                                                                                                                                                                                                        |                                       |                                                                           |                                             |                                                                                                                                                            |                                            |                                                                                                    |                                             |                                               |                                        |                                                                                   |                                        |                                                                                                                                                                                   |

Asserts a low TTL-low pulse for output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                            |                                       |                                    |                                        |                                      |                                       |                                                                                                                                                                                                                                                                                                                                        |                                       |                                                                           |                                             |                                                                                                                                                            |                                            |                                                                                                    |                                             |                                               |                                        |                                                                                   |                                        |                                                                                                                                                                                   |
| 8 or <code>tsplink.TRIG_RISINGM</code>      | Detects Rising Edge triggers as an input. Asserts a low TTL-low pulse as an output. Edge detection as an input is not available. Generates a TTL-high pulse as an output trigger.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                            |                                       |                                    |                                        |                                      |                                       |                                                                                                                                                                                                                                                                                                                                        |                                       |                                                                           |                                             |                                                                                                                                                            |                                            |                                                                                                    |                                             |                                               |                                        |                                                                                   |                                        |                                                                                                                                                                                   |

| Function                       | Waits for a trigger.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                             |
| TSP-Link accessibility         | This function can be accessed from a remote TSP-Link node.                                                                                                                                                                                                                                                                                                                                                                                                            |                                                             |
| Usage                          | <pre>triggered = tsplink.trigger[n].wait(timeout)</pre> <p>timeout                                Specifies the time-out value in seconds.<br/>triggered                              A customized variable that stores the value true if a trigger trigger is detected, or false if a trigger is not detected during the time-out period.<br/>n                                        Trigger number on which to wait.</p>                                          |                                                             |
| Remarks                        | This function waits up to <code>timeout</code> value in seconds for an input trigger. If one or more trigger events were detected since the last time <code>tsplink.trigger[n].wait</code> or <code>tsplink.trigger[n].clear</code> was called, this function will return immediately. After waiting for a trigger with this function, the event detector is automatically rearmed and reset. This functionality is true regardless of the number of events detected. |                                                             |

| Usage                  | <p>To connect to any remote instrument on the LAN:</p> <pre>connection_id = tspnet.connect(ip_address, port_number, initialize_string)</pre> <p>To connect to a TSP-enabled remote instrument on the LAN:</p> <pre>connection_id = tspnet.connect(ip_address)</pre> <p><code>connection_id</code> Integer value used as a handle for other <code>tspnet</code> commands.<br/> <code>ip_address</code> String variable for passing the IP address.<br/> <code>port_number</code> Integer value of the port number.<br/> <code>initialize_string</code> The initialization string to send.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Remarks                | <ul style="list-style-type: none"> <li>• This command connects to another instrument by way of the LAN interface (using the optionally-specified port number). The default port number is 5025. If the port number is 23, the interface will use the Telnet protocol (and set appropriate termination characters) to communicate with the instrument.</li> <li>• If a port number and initialization string are provided, the remote instrument is assumed to be non-TSP-enabled. The Series 2600A does not perform any extra processing, prompt handling, error handling, or sending of commands. Additionally, the <code>tspnet.tsp</code> commands do not apply for use on this remote instrument.</li> <li>• If no port number and initialization string is provided, the remote instrument is assumed to be a Keithley Instruments TSP-enabled instrument. Depending on the state of <code>tspnet.tsp.abortonconnect</code>, the Series 2600A sends an <code>abort</code> to the remote instrument upon connection. The Series 2600A also enables TSP prompts on the remote instrument and error management. The Series 2600A places remote errors from the TSP-enabled instrument in its own error queue and prefaces these errors with "Remote Error," followed by an error description. Do not manually change either the prompt functionality (<code>localnode.prompts</code>) or show errors functionality (<code>localnode.showerrors</code>) on the remote TSP-enabled instrument, or subsequent <code>tspnet.tsp.*</code> commands using the connection may fail.</li> <li>• You can simultaneously connect to a maximum of 32 remote instruments.</li> <li>• Errors:<br/> Connection Failed<br/> Connection Failed, Timeout<br/> Invalid IP Address or Port Number</li> </ul> |
| Example                | <p>To connect to a TSP-enabled instrument:</p> <pre>mytspconnection = tspnet.connect("10.80.64.216")</pre> <p>To connect to a non-TSP-enabled instrument:</p> <pre>myconnection = tspnet.connect("192.168.1.51", 1394, "*rst\r\n")</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remarks | <ul style="list-style-type: none"> <li>• This command sends the command string to the remote instrument. A termination is added to the command string when it is sent to the remote instrument (see <a href="#">tspnet.termination</a>). Optionally, when a format string is specified, the command waits for a response from the remote instrument. The Series 2600A decodes the response message according to the format specified in the format string and returns this as return values from the function (see <a href="#">tspnet.read</a> for format specifiers).</li> <li>• When this command is sent to a TSP-enabled instrument, the Series 2600A suspends operation until a timeout error is generated or until the instrument responds, even if no format string is specified. The TSP prompt from the remote instrument is read and thrown away. The Series 2600A places any remotely-generated errors into its error queue. When the optional format string is not specified, this command is equivalent to <a href="#">tspnet.write</a>, except that a termination is automatically added to the end of the command.</li> <li>• Errors:<br/> Invalid Specified Connection<br/> Write Failed, Timeout<br/> Write Failed<br/> Read Failed, Timeout<br/> Read Failed<br/> Read Failed, Aborted<br/> Remote Error, &lt;remote error generated by command&gt;</li> </ul> |
| Example | <p>Command remote instrument to run script named 'myscript':</p> <pre>tspnet.execute(myconnection, 'myscript()')</pre> <p>Command remote instrument to execute a *idn?:</p> <pre>tspnet.execute(myconnection, '*idn?') print("instrument write/read returns:: " , tspnet.read(myconnection))</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Usage                         | <pre>array = tspnet.tsp.rhtablecopy(connection_id, name) array = tspnet.tsp.rhtablecopy(connection_id, name, start_index, end_index)</pre> <p>connection_id                    Integer value used as a handle for other <code>tspnet</code> commands.</p> <p>name                                The full name of the reading buffer synchronous table.</p> <p>start_index                        Integer start value.</p> <p>end_index                          Integer end value.</p> <p>array                                A copy of the synchronous table.</p>                                                                                                                                                                                                                                                                                                                                                                                              |
| Remarks                       | <ul style="list-style-type: none"> <li>• This convenience command reads the data from a reading buffer on a remote instrument and returns an array of numbers or a string representing the data. The name argument identifies the reading buffer name and synchronous table to copy. The optional <code>start_index</code> and <code>end_index</code> specify the portion of the reading buffer to read. If no index is specified, the entire buffer will be copied.</li> <li>• This command is limited to transferring 50,000 readings at a time.</li> <li>• Errors: <ul style="list-style-type: none"> <li>Invalid Specified Connection</li> <li>Read Failed, Timeout</li> <li>Read Failed, Aborted</li> <li>Read Failed</li> <li>Write Failed, Timeout</li> <li>Write Failed</li> <li>Invalid Reading Buffer Table</li> <li>Invalid Index Range</li> <li>Out of Memory</li> <li>Remote Error, &lt;remote error generated by command&gt;</li> </ul> </li> </ul> |
| Example                       | <pre>t = tspnet.tsp.rhtablecopy(myconnection, 'myremotebuffername.readings', 1, 3)  print(t[1], t[2], t[3])</pre> <p>Output:</p> <pre>4.5653423423e-1 4.5267523423e-1 4.5753543423e-1</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Function                    | Load and run a script on a remote instrument.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| TSP-Link accessibility      | This function can be accessed from a remote TSP-Link node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Usage                       | <pre>tspnet.tsp.runscript(connection_id, script) tspnet.tsp.runscript(connection_id, name, script)</pre> <p> <code>connection_id</code>                      Integer value used as a handle for other <code>tspnet</code> commands.<br/> <code>name</code>                                      The name the script will be assigned.<br/> <code>script</code>                                      The body of the script as a string. </p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Remarks                     | <ul style="list-style-type: none"> <li>• This convenience command downloads a script to a remote instrument and runs it. It automatically adds the appropriate <code>loadscript</code> and <code>endscript</code> around the script, captures any errors, and reads back any prompts. No additional substitutions are done on the text.</li> <li>• The script is automatically loaded, compiled, and run.</li> <li>• Any output from previous commands will be discarded.</li> <li>• This command will not wait for the script to complete.</li> <li>• To load only and run at a later time, simply make sure the script contains only functions. Use <a href="#">tspnet.execute</a> to execute those functions at a later time.</li> <li>• This command is appropriate only for TSP™-enabled instruments.</li> <li>• If no name is specified, the script will be unnamed.</li> <li>• Errors: <ul style="list-style-type: none"> <li>Invalid Specified Connection</li> <li>Write Failed, Timeout</li> <li>Write Failed</li> <li>Read Failed, Timeout</li> <li>Read Failed, Aborted</li> <li>Remote Error, &lt;remote error generated by command&gt;</li> </ul> </li> </ul> |
| Example                     | <pre>tspnet.tsp.runscript(myconnection, 'mytest', 'print([[start]]) for d = 1, 10 do print([[work]]) end print([[end]])')</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function               | Write a string to a remote instrument.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| TSP-Link accessibility | This function can be accessed from a remote TSP-Link node.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Usage                  | <pre>tspnet.write(connection_id, input_string)</pre> <p> <code>connection_id</code>                      Integer value used as a handle for other <code>tspnet</code> commands.<br/> <code>input_string</code>                         String type used for writing to the remote instrument. </p>                                                                                                                                                                                       |
| Remarks                | <ul style="list-style-type: none"> <li>• The <code>tspnet.write()</code> command sends the command string to the remote instrument. It does not wait for command completion on the remote instrument.</li> <li>• The Series 2600A sends the input string to the remote instrument exactly as given. The input string must contain any necessary new lines or terminations.</li> <li>• Errors:<br/> Invalid Specified Connection<br/> Write Failed, Timeout<br/> Write Failed </li> </ul> |
| Example                | <p>Command remote instrument to run script named 'myscript':</p> <pre>tspnet.write(myconnection, 'myscript()\n')</pre> <p>Send a *idn? to a remote instrument:</p> <pre>tspnet.write(myconnection, "*idn?\r\n")</pre>                                                                                                                                                                                                                                                                    |

## userstring

The functions in this group are used to store/retrieve user-defined strings in nonvolatile memory.

| <b>userstring.add</b>  |                                                                                                                                                                                                                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function               | Adds a user-defined string to nonvolatile memory.                                                                                                                                                                                                                                                                      |
| TSP-Link accessibility | This function can be accessed from a remote TSP-Link node.                                                                                                                                                                                                                                                             |
| Usage                  | <code>userstring.add(name, value)</code><br><br><div style="display: flex; justify-content: space-between;"> <div style="width: 45%;"> <p><code>name</code></p> <p><code>value</code></p> </div> <div style="width: 50%;"> <p>The name for the string.</p> <p>The string to associate with the name.</p> </div> </div> |
| Remarks                | This function will associate the string <code>value</code> with the string <code>name</code> and store the pair in nonvolatile memory. The value associated with the given name can be retrieved with the <code>userstring.get</code> function.                                                                        |
| Also see               | <a href="#">userstring.catalog</a> , <a href="#">userstring.delete</a> , <a href="#">userstring.get</a>                                                                                                                                                                                                                |
| Example                | Stores user-defined strings in nonvolatile memory:<br><pre>userstring.add("assetnumber", "236") userstring.add("department", "Widgets") userstring.add("contact", "John Doe")</pre>                                                                                                                                    |

| <b>userstring.catalog</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function                  | Creates an iterator for the user string catalog.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| TSP-Link accessibility    | This function cannot be accessed from a remote TSP-Link node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Usage                     | <code>for name in userstring.catalog() do ... end</code><br><br><div style="display: flex; justify-content: space-between;"> <div style="width: 45%;"> <p><code>name</code></p> </div> <div style="width: 50%;"> <p>The variable that assumes the name of each string.</p> </div> </div>                                                                                                                                                                                                                                                                                                              |
| Remarks                   | <ul style="list-style-type: none"> <li>Accessing the catalog for user string names allows the user to print or delete all string name values in nonvolatile memory. The entries will be enumerated in no particular order.</li> <li>Each time the body of the function executes, <code>name</code> takes on the value of one string in the catalog. The <code>for</code> loop repeats until all values have been retrieved.</li> </ul>                                                                                                                                                                |
| Also see                  | <a href="#">userstring.add</a> , <a href="#">userstring.delete</a> , <a href="#">userstring.get</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Example                   | Deletes all user strings in nonvolatile memory:<br><pre>for name in userstring.catalog() do   userstring.delete(name) end</pre> Prints all user string name value pairs in nonvolatile memory:<br><pre>for name in userstring.catalog() do   print(name .. " = " .. userstring.get(name)) end</pre> Output: <code>department = Widgets</code><br><code>assetnumber = 236</code><br><code>contact = John Doe</code><br>The above output lists the user strings added in the "Example" for the <code>userstring.add</code> function. Notice that they are not listed in the order that they were added. |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <code>tonumber(x [,base])</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Returns <code>x</code> converted to a number. If <code>x</code> is already a number, or a convertible string, then the number is returned; otherwise, it returns <code>nil</code> .<br>An optional argument specifies the base to interpret the numeral. The base may be any integer between 2 and 36, inclusive. In bases above 10, the letter 'A' (in either upper or lower case) represents 10, 'B' represents 11, and so forth, with 'Z' representing 35. In base 10, the default, the number may have a decimal part, as well as an optional exponent. In other bases, only unsigned integers are accepted. |
| <code>tostring(x)</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Receives an argument of any type and converts it to a string in a reasonable format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>type(v)</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Returns the type of its only argument, coded as a string. The possible results of this function are: <code>nil</code> , <code>number</code> , <code>Boolean</code> , <code>table</code> , or <code>function</code> .                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>NOTE:</b> TSL does automatic memory management. That means that you do not have to worry about allocating memory for new objects and freeing it when the objects are no longer needed. TSL manages memory automatically by running a garbage collector from time to time to collect all dead objects (that is, those objects that are no longer accessible from TSL). All objects in TSL are subject to automatic management: tables, variables, functions, threads, and strings. TSL uses two numbers to control its garbage-collection cycles. One number counts how many bytes of dynamic memory TSL is using; the other is a threshold. When the number of bytes crosses the threshold, TSL runs the garbage collector, which reclaims the memory of all dead objects. The byte counter is adjusted, and then the threshold is reset to twice the new value of the byte counter. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## String library functions

This library provides generic functions for string manipulation, such as finding and extracting substrings. When indexing a string in TSL, the first character is at position 1 (not 0 as in ANSI C). Indices may be negative and are interpreted as indexing backwards, from the end of the string. Thus, the last character is at position 1, and so on.

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <code>string.byte(s [,i])</code>            | Returns the internal numerical code of the <code>i</code> -th character of string <code>s</code> , or <code>nil</code> if the index is out of range.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>string.char(i1, i1, ...)</code>       | Receives 0 or more integers. Returns a string with length equal to the number of arguments, in which each character has the internal numerical code equal to its corresponding argument.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>string.format(fs, e1, e2, ...)</code> | Returns a formatted version of its variable number of arguments following the description given in its first argument, which must be a string. The format string follows the same rules as the print family of ANSI C functions. The only differences are that the options/modifiers <code>*</code> , <code>l</code> , <code>L</code> , <code>n</code> , <code>p</code> , and <code>h</code> are not supported. The options <code>c</code> , <code>d</code> , <code>E</code> , <code>e</code> , <code>f</code> , <code>g</code> , <code>G</code> , <code>l</code> , <code>o</code> , <code>u</code> , <code>X</code> , and <code>x</code> all expect a numeric argument, where <code>s</code> expects a string argument. String values to be formatted with <code>%s</code> cannot contain embedded zeros. |
| <code>string.len(s)</code>                  | Returns the length of the strings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>string.lower(s)</code>                | Returns a copy of the string <code>s</code> with all uppercase letters changed to lowercase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>string.rep(s, n)</code>               | Returns a string that is the concatenation of <code>n</code> copies of the string <code>s</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>string.sub(s, i [,j])</code>          | Returns the substring of <code>s</code> that starts at <code>i</code> and continues until <code>j</code> . <code>i</code> and <code>j</code> may be negative. If <code>j</code> is absent, then it is assumed to be equal to <code>-1</code> , which is the same as the string length. In particular, the call <code>string.sub(s, 1, j)</code> returns a prefix <code>s</code> with length <code>j</code> , and <code>string.sub(s, -i)</code> returns a suffix <code>s</code> with length <code>i</code> .                                                                                                                                                                                                                                                                                               |
| <code>string.upper(s)</code>                | Returns a copy of the string <code>s</code> with all lowercase letters changed to uppercase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Math library functions

This library is an interface to most of the functions of the ANSI C math library. All trigonometric functions work in radians. The functions `math.deg()` and `math.rad()` convert between radians and degrees.

|                                   |                                                                                                                                                                                                                                                                                               |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>math.abs(x)</code>          | Returns the absolute value of the argument $x$ .                                                                                                                                                                                                                                              |
| <code>math.acos(x)</code>         | Returns the principal value of the trigonometric arc cosine function of $x$ .                                                                                                                                                                                                                 |
| <code>math.asin(x)</code>         | Returns the principal value of the trigonometric arc sine function of $x$ .                                                                                                                                                                                                                   |
| <code>math.atan(x)</code>         | Returns the principal value of the trigonometric arc tangent function of $x$ .                                                                                                                                                                                                                |
| <code>math.atan2(y,x)</code>      | Returns the principal value of the trigonometric arc tangent function of $y/x$ .                                                                                                                                                                                                              |
| <code>math.ceil(x)</code>         | Returns the smallest floating-point number not less than $x$ whose value is an exact mathematical integer.                                                                                                                                                                                    |
| <code>math.cos(x)</code>          | Returns the trigonometric cosine function of $x$ .                                                                                                                                                                                                                                            |
| <code>math.deg(x)</code>          | Returns the value of $x$ in degrees, where $x$ is in radians.                                                                                                                                                                                                                                 |
| <code>math.exp(x)</code>          | Returns the exponential function of $x$ ; that is, $e^x$ , where $e$ is the base of the natural logarithms.                                                                                                                                                                                   |
| <code>math.floor(x)</code>        | Returns the largest floating-point number not greater than $x$ whose value is an exact mathematical integer.                                                                                                                                                                                  |
| <code>math.log(x)</code>          | Returns the natural logarithm function of $x$ .                                                                                                                                                                                                                                               |
| <code>math.log10(x)</code>        | Returns the base-10 logarithm function of $x$ .                                                                                                                                                                                                                                               |
| <code>math.max(x, y, ...)</code>  | Returns the maximum value of its numeric argument(s).                                                                                                                                                                                                                                         |
| <code>math.min(x, y, ...)</code>  | Returns the minimum value of its argument(s).                                                                                                                                                                                                                                                 |
| <code>math.mod(x, y)</code>       | Returns an approximation to the mathematical value $f$ such that $f$ has the same sign as $x$ , the absolute value of $f$ is less than the absolute value of $y$ , and there exists an integer $k$ such that $k*y+f = x$ .                                                                    |
| <code>math.pi</code>              | Variable containing the value of $\pi$ (3.141592654).                                                                                                                                                                                                                                         |
| <code>math.pow(x, y)</code>       | Returns $x^y$ .                                                                                                                                                                                                                                                                               |
| <code>math.rad(x)</code>          | Returns the value of $x$ in radians, where $x$ is in degrees.                                                                                                                                                                                                                                 |
| <code>math.sin(x)</code>          | Returns the trigonometric sine function of $x$ .                                                                                                                                                                                                                                              |
| <code>math.sqrt(x)</code>         | Returns the non-negative square root of $x$ .                                                                                                                                                                                                                                                 |
| <code>math.tan(x)</code>          | Returns the trigonometric tangent function of $x$ .                                                                                                                                                                                                                                           |
| <code>math.frexp()</code>         | Splits $x$ into a fraction $f$ and exponent $n$ , such that $f$ is 0.0 or 0.5 $\leq  f  \leq 1.0$ , and $f * 2^n$ is equal to $x$ . Both $f$ and $n$ are returned; $f, n = \text{math.frexp}(x)$ .                                                                                            |
| <code>math.ldexp(x, n)</code>     | Returns the inverse of the <code>math.frexp()</code> function; it computes the value $x * 2^n$ .                                                                                                                                                                                              |
| <code>math.random([x],[y])</code> | When called without an argument, returns a pseudo-random real number in the range $[0, 1)$ .<br>When called with number $x$ , returns a pseudo-random integer in the range $[1,n]$ .<br>When called with two arguments, $x$ and $y$ , returns a pseudo-random integer in the range $[x, y]$ . |
| <code>math.randomseed(x)</code>   | Sets a "seed" for the pseudo-random generator. Equal seeds produce equal sequences of numbers.                                                                                                                                                                                                |

## Factory scripts

### Introduction

The Keithley Instruments Series 2600A System SourceMeter® instrument is shipped with one or more Factory Scripts saved in its flash firmware memory. A factory script is made up of a number of functions. Some of them can be called from the front panel LOAD TEST menu. All of them can be called using remote programming.

As Keithley Instruments develops additional factory scripts, they will be made available on the Keithley Instruments web site ([www.keithley.com](http://www.keithley.com)) as a flash firmware upgrade for the Series 2600A. See [Upgrading the firmware](#) for instructions on upgrading the flash firmware of your Series 2600A.

A factory script is similar to a user script, except a factory script is created by Keithley Instruments at the factory and is permanently stored in nonvolatile memory. The differences between a user script and a factory script include the following:

- A factory script cannot be deleted from nonvolatile memory.
- The script listing for a factory script can be retrieved and modified, but it will then be treated as a user script. A user script cannot be saved as a factory script.
- Factory scripts are not stored in global variables. The only references to factory scripts are in `script.factory.scripts`.

The `script.factory.catalog()` function returns an iterator that can be used in a for loop to iterate over all the factory scripts.

Example:

Retrieve the catalog listing for factory scripts:

```
for name in script.factory.catalog() do
 print(name)
end
```

As Keithley Instruments develops additional factory scripts, they will be available on the Keithley Instruments website ([www.keithley.com](http://www.keithley.com)) as a flash firmware upgrade for the Series 2600A.

## Running a factory script

Use either of the following commands to run a factory script:

```
script.factory.scripts.name()
script.factory.scripts.name.run()
```

where: `name` is the name of the factory script.

Example:

Run the factory script named “KIPulse”

```
script.factory.scripts.KIPulse()
```

## Running a factory script function from the Series 2600A front panel controls

1. Press the **LOAD** key.
2. Select **Factory**.
3. Select the function to run and press **RUN** key.

## Modifying a factory script

### Retrieving a factory script listing

The script listing for a factory script can be retrieved and modified. However, it cannot be saved as a factory script. The modified script can be saved as a user script using the same name or a new name.

---

**NOTE** An imported factory script can only be loaded back into the Series 2600A as a user script.

---

The following function retrieves a script listing. The script chunk is returned, along with the shell keywords (`loadscript` or `loadandrunscript`, and `endscript`):

```
script.factory.scripts.name.list()
```

where: `name` is the name of the factory script.

Example:

Retrieve the script listing for a factory script named “KIPulse”:

```
script.factory.scripts.KIPulse.list()
```

## Factory script information

### KISweep

The KISweep factory script provides simple sweep test programming and can be used as an example of how to use the sweeping function.

The KISweep factory script is made up of the following functions. All of these functions can be accessed from both the front panel and the remote interfaces. These functions provide simple sweeping operations and can be used as examples of how to use the sweeping functions. Details on these functions are provided in the tables that follow.

```
SweepILinMeasureV(smu, starti, stopi, stime, points)
SweepVLinMeasureI(smu, startv, stopv, stime, points)
SweepILogMeasureV(smu, starti, stopi, stime, points)
SweepVLogMeasureI(smu, startv, stopv, stime, points)
SweepIListMeasureV(smu, ilist, stime, points)
SweepVListMeasureI(smu, vlist, stime, points)
```

| Example                                                           | <p>SweepILogMeasureV(smua, 0.01, 0.1, 0.001, 5)</p> <p>This function performs a 5-point logarithmic current sweep starting at 10mA and stopping at 100mA. Voltage is measured at every step (point) in the sweep. The source will be allowed to settle on each step for 1ms before a measurement is performed.</p> <p>The following log values and corresponding source levels for the 5-point log sweep are listed as follows:</p> <table border="1"> <thead> <tr> <th><u>MeasurePoint</u></th> <th><u>LogStepSize</u></th> <th><u>LogStep</u></th> <th><u>SourceStepLevel</u></th> </tr> </thead> <tbody> <tr> <td>1</td> <td>0.25</td> <td>0.0</td> <td>0.01A</td> </tr> <tr> <td>2</td> <td>0.25</td> <td>0.25</td> <td>0.017783A</td> </tr> <tr> <td>3</td> <td>0.25</td> <td>0.5</td> <td>0.031623A</td> </tr> <tr> <td>4</td> <td>0.25</td> <td>0.75</td> <td>0.056234A</td> </tr> <tr> <td>5</td> <td>0.25</td> <td>1.0</td> <td>0.1A</td> </tr> </tbody> </table> | <u>MeasurePoint</u> | <u>LogStepSize</u>     | <u>LogStep</u> | <u>SourceStepLevel</u> | 1 | 0.25 | 0.0 | 0.01A | 2 | 0.25 | 0.25 | 0.017783A | 3 | 0.25 | 0.5 | 0.031623A | 4 | 0.25 | 0.75 | 0.056234A | 5 | 0.25 | 1.0 | 0.1A |

| Example                              | <pre>SweepVLogMeasureI(smua, 1, 10, 0.001, 5)</pre> <p>This function performs a 5-point logarithmic voltage sweep starting at 1V and stopping at 10V. Current is measured at every step (point) in the sweep. The source will be allowed to settle on each step for 1ms before a measurement is performed.</p> <p>The following log values and corresponding source levels for the 5-point log sweep are listed as follows:</p> <table border="1"> <thead> <tr> <th><u>MeasurePoint</u></th> <th><u>LogStepSize</u></th> <th><u>LogStep</u></th> <th><u>SourceStepLevel</u></th> </tr> </thead> <tbody> <tr> <td>1</td> <td>0.25</td> <td>0.0</td> <td>1.0000V</td> </tr> <tr> <td>2</td> <td>0.25</td> <td>0.25</td> <td>1.7783V</td> </tr> <tr> <td>3</td> <td>0.25</td> <td>0.5</td> <td>3.1623V</td> </tr> <tr> <td>4</td> <td>0.25</td> <td>0.75</td> <td>5.6234V</td> </tr> <tr> <td>5</td> <td>0.25</td> <td>1.0</td> <td>10.000V</td> </tr> </tbody> </table> | <u>MeasurePoint</u> | <u>LogStepSize</u>     | <u>LogStep</u> | <u>SourceStepLevel</u> | 1 | 0.25 | 0.0 | 1.0000V | 2 | 0.25 | 0.25 | 1.7783V | 3 | 0.25 | 0.5 | 3.1623V | 4 | 0.25 | 0.75 | 5.6234V | 5 | 0.25 | 1.0 | 10.000V |

| Description                                                | <p>Performs a voltage list sweep with current measured at every step (point):</p> <ul style="list-style-type: none"> <li>• Sets the <code>smu</code> to output the first <code>vlist</code> volts value, allows the source to settle for <code>stime</code> seconds and then performs a current measurement.</li> <li>• Sets the <code>smu</code> to output the next <code>vlist</code> volts value, allows the source to settle for <code>stime</code> seconds and then performs a current measurement.</li> <li>• Repeats the above sequence until the current is measured for the last volts value. The last point in the list to be measured is <code>points</code>.</li> </ul> |
| Parameters                                                 | <p><code>smu, vlist, stime, points</code></p> <p><code>smu</code>: SourceMeter instrument Channel (A or B). Defaults to SMU A if all parameters are omitted when function is called.</p> <p><code>vlist</code>: Arbitrary list of voltage source values:<br/> <code>vlist = {value1, value2, ...valueN}</code></p> <p><code>stime</code>: Settling time in seconds. Occurs after sourcing a value and before performing a measurement.</p> <p><code>points</code>: Number of sweep measure points (must be <math>\geq 2</math>).</p>                                                                                                                                                |
| Data                                                       | Current measurements, voltage source values and timestamps are stored in <code>smuX.nvbuffer1</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Example                                                    | <pre>myvlist = {-0.1, 0.1, -1, 1, -6, 6, -40, 40, 0, 0}</pre> <pre>SweepVListMeasureI(smua, myvlist, 500E-6, 10)</pre> <p>This function performs a 10-point voltage list sweep starting at the first point in <code>myvlist</code>. Current is measured at every step (point) in the sweep. The source will be allowed to settle on each value for 500<math>\mu</math>s before a measurement is performed.</p>                                                                                                                                                                                                                                                                      |

## KIPulse

The KIPulse factory script provides examples of how to generate pulses and to provide a simple pulsing interface. Pulses can be generated using the functions listed below.

---

**NOTE** This factory script only operates on the channels present in the SourceMeter instrument executing the pulse functions. These functions will not operate correctly if the user attempts to access SourceMeter instrument channels over the TSP-Link.

---

```
PulseIMeasureV
PulseVMeasureI
ConfigPulseIMeasureV
ConfigPulseVMeasureI
ConfigPulseIMeasureVSweepLin
ConfigPulseVMeasureISweepLin
ConfigPulseIMeasureVSweepLog
ConfigPulseVMeasureISweepLog
QueryPulseConfig
InitiatePulseTest
InitiatePulseTestDual
```

---

**NOTE** `PulseIMeasureV` and `PulseVMeasureI` may be accessed from the front panel. The remaining scripts may only be accessed remotely.

---

The “Config” functions are used to configure a pulse train and assign the configuration to the `tag` parameter. The `Initiate` functions are used to execute the pulse train(s) assigned to its `tag` argument(s). The conditions listed in the table below must be true for these functions to execute successfully.

Table 19-9  
Required true conditions for “Initiate” function execution

| Config                            | InitiatePulseTest                                               | InitiatePulseTestDual                                           |
|-----------------------------------|-----------------------------------------------------------------|-----------------------------------------------------------------|
| Source auto-range (I and V) off.  | Output on.                                                      | Output on.                                                      |
| Measure auto-range (I and V) off. | Enough free space in buffer.                                    | Enough free space in buffer.                                    |
| Measure NPLC < ton.               | Buffer <code>appendmode</code> on when pulse train is >1 point. | Buffer <code>appendmode</code> on when pulse train is >1 point. |
| Measure autozero OFF or ONCE.     | Safety interlock engaged when using the 200V range.             | Safety interlock engaged when using the 200V range.             |
|                                   |                                                                 | Different unique SMUs for each <code>tag</code> .               |
|                                   |                                                                 | Same NPLC setting for each <code>tag</code> .                   |
|                                   |                                                                 | Same <code>toff</code> for each <code>tag</code> .              |

| <b>Example</b>                                                                                     | PulseVMeasureI(smub, -1, 1, 1E-3, 2E-3, 20)<br>SMU B will output -1V and dwell for 1ms, output 1V and dwell for 2ms, and then perform a current measurement. After the measurement, the output will return to -1V and dwell for 2ms. This pulse-measure process will repeat 19 more times.                                                                                                                                                                                                                                                |

### Advanced features

#### Variable off time between pulses in a pulse train

The KIPulse “Configure” functions will accept the *off\_time* parameter as a table as well as just a number. The table allows defining different off times to be used after each pulse.

The following should be noted:

1. If *off\_time* is passed as a number or only a single value is used in the table, it will be used for all points in a multiple point pulse.
2. The number of times specified in the table must match the number of points called for in the sweep.
3. The times used in tables must match for dual channel pulsing.
4. Each specified *off\_time* must adhere to the duty cycle limits for the specified pulsing region.

Example:

```

local timelist1 = { 1, 2, 3, 4, 5 }
local timelist2 = { }
for i = 1,5 do timelist2[i] = math.pow(10, i) end

```

Configure a pulse with 1 second on time and variable off time, no measurement:

```
f,msg = ConfigPulseVMeasureI(smua, 0, 1, 100e-3, 1, timelist1, 5, nil, 1)
```

### Simultaneous IV measurement during pulse

The KIPulse “Configure” functions will optionally accept an extra reading buffer in order to activate simultaneous IV measurements during pulsing.

Previous usage of passing in a reading buffer or a nil (for no measurement) is still supported.

Example:

```

rbi = smua.makebuffer(10)
rbv = smua.makebuffer(10)
rbi.appendmode = 1
rbv.appendmode = 1

rbs = { i = rbi, v = rbv }

f,msg = ConfigPulseVMeasureI(smua, 0, 10, 1e-3, 1e-3, 1e-3,
2, rbs, 1)

```

### Additional hardware triggering parameters

Parameters added to the “Configure” functions after the `sync_out` parameter:

- `*sync_in_timeout`: specifies the length of time (in seconds) to wait for input trigger (defaults to 10s).
- `*sync_in_abort` (true or false), whether to abort pulse if in put trigger is not received before timeout expires (defaults to true).
- If pulse aborts due to missed trigger, message returned to the user indicates timer timeout.

---

NOTE \*These parameters are new to firmware version 1.3.0.

---

| Description                                                                                                                                             | Configures a current pulse train with a voltage measurement at each point. Measurement(s) will be made at the end of the <code>ton</code> time. This function does not cause the specified <code>smu</code> to output a pulse train. It simply checks to see if all of the pulse dimensions are achievable and if so, assigns the indicated <code>tag</code> or index to the pulse train. The <code>InitiatePulseTest(tag)</code> and <code>InitiatePulseTestDual(tag)</code> functions are used to initiate a pulse train assigned to a valid <code>tag</code> . |

| Description                                                                                                                                             | Configures a voltage pulse train with a current measurement at each point. Measurement(s) will be made at the end of the <code>ton</code> time. This function does not cause the specified <code>smu</code> to output a pulse train. It simply checks to see if all of the pulse dimensions are achievable and if so, assigns the indicated <code>tag</code> or index to the pulse train. The <code>InitiatePulseTest(tag)</code> and <code>InitiatePulseTestDual(tag)</code> functions are used to initiate a pulse train assigned to a valid <code>tag</code> . |

| Description                                                                                                                                                          | Configures a linear pulsed current sweep with a voltage measurement at each point. Measurement(s) will be made at the end of the <code>ton</code> time. The magnitude of the first pulse will be <code>start</code> amps. The magnitude of the last pulse will be <code>stop</code> amps. The magnitude of each pulse in between will be <code>step</code> amps larger than the previous pulse where:<br><br>$step = (stop - start) / (points - 1)$<br><br>This function does not cause the specified <code>smu</code> to output a pulse train. It simply checks to see if all of the pulse dimensions are achievable and if so, assigns the indicated <code>tag</code> or index to it. The <code>InitPulseTest(tag)</code> and <code>InitPulseTestDual(tag)</code> functions are used to initiate a pulse train assigned to a valid <code>tag</code> . |

| Description                                                                                                                                                                       | Configures a linear pulsed voltage sweep with a current measurement at each point. Measurement(s) will be made at the end of the ton time. The magnitude of the first pulse will be start volts. The magnitude of the last pulse will be stop volts. The magnitude of each pulse in between will be step volts larger than the previous pulse where:<br><br>$step = (stop - start) / (points - 1)$<br><br>This function does not cause the specified smu to output a pulse train. It simply checks to see if all of the pulse dimensions are achievable and if so, assigns the indicated tag or index to it. The <a href="#">InitPulseTest(tag)</a> and <a href="#">InitPulseTestDual(tag)</a> functions are used to initiate a pulse train assigned to a valid tag. |

| Description                                                                                                                                                                                                       | Configures a logarithmic pulsed current sweep with a voltage measurement at each point. Measurement(s) will be made at the end of the <code>ton</code> time. The magnitude of the first pulse will be <code>start</code> amps. The magnitude of the last pulse will be <code>stop</code> amps. The magnitude of each pulse in between will be <code>LogStep<sub>n</sub></code> amps larger than the previous pulse where:<br><br>$\text{LogStepSize} = (\log_{10}(\text{stop}) - \log_{10}(\text{start})) / (\text{points} - 1)$ $\text{LogStep}_n = (n - 1) \times (\text{LogStepSize}) \text{ where } n = [1, \text{points}]$ $\text{SourceStepLevel}_n = \text{antilog}(\text{LogStep}_n) \times \text{start}$<br>This function does not cause the specified <code>smu</code> to output a pulse train. It simply checks to see if all of the pulse dimensions are achievable and if so, assigns the indicated <code>tag</code> or index to it. The <code>InitiatePulseTest(tag)</code> and <code>InitiatePulseTestDual(tag)</code> functions are used to initiate a pulse train assigned to a valid <code>tag</code> . |

| Parameters                                                                                                                                                                                                                                                                          | <p><code>smu,bias,start,stop,limit,ton,toff,points,buffer,tag</code><br/> <code>[,sync_in][,sync_out])</code></p> <p><code>smu:</code> SourceMeter instrument channel. (for example, <code>smua</code>).</p> <p><code>bias:</code> Pulse bias level in amps.</p> <p><code>start:</code> Pulse sweep start level in amps.</p> <p><code>stop:</code> Pulse sweep stop level in amps.</p> <p><code>limit:</code> Voltage limit (for example, compliance) in volts.</p> <p><code>ton:</code> Pulse width (for example, on-time) in seconds.</p> <p><code>toff:</code> Pulse off time in seconds.</p> <p><code>points:</code> Number of pulse measure cycles.</p> <p><code>buffer:</code> Reading buffer where pulsed measurements will be stored. If this is <code>nil</code> when the function is called, no measurements will be made when the pulse train is initiated.</p> <p><code>tag:</code> Numeric identifier to be assigned to the defined pulse train.</p> <p><code>sync_in:</code> Defines a digital I/O trigger input line. If programmed, the pulse train will wait for a trigger input before executing each pulse. This parameter is optional.</p> <p><code>sync_out:</code> Defines a digital I/O trigger output line. If programmed, the pulse train will generate a trigger output immediately prior to the start of <code>ton</code>. This parameter is optional.</p> <p><code>sync_in_timeout:</code> Specifies the length of time (in seconds) to wait for input trigger (defaults to 10s).</p> <p><code>sync_in_abort:</code> (true or false) Whether to abort pulse if input trigger is not received before <code>timeout</code> expires (defaults to true).</p> |

| Description                                                                                                                                                                                                                    | Configures a logarithmic pulsed voltage sweep with a current measurement at each point. Measurement(s) will be made at the end of the ton time. The magnitude of the first pulse will be start volts. The magnitude of the last pulse will be stop volts. The magnitude of each pulse in between will be LogStep <sub>n</sub> volts larger than the previous pulse where:<br><br>$LogStepSize = (\log_{10}(stop) - \log_{10}(start)) / (points - 1)$<br>$LogStepn = (n - 1) \times (LogStepSize)$ where $n = [1, points]$<br>$SourceStepLeveln = \text{antilog}(LogStepn) \times start$<br><br>This function does not cause the specified smu to output a pulse train. It simply checks to see if all of the pulse dimensions are achievable and if so, assigns the indicated tag or index to it. The <a href="#">InitiatePulseTest(tag)</a> and <a href="#">InitiatePulseTestDual(tag)</a> functions are used to initiate a pulse train assigned to a valid tag. |

| Parameters                                                                                                                                                                                                                                                                                       | <p><code>smu, bias, start, stop, limit, ton, toff, points, buffer, tag</code><br/> <code>[, sync_in][, sync_out])</code></p> <p><code>smu</code>: SourceMeter instrument channel. (for example, <code>smua</code>).</p> <p><code>bias</code>: Pulse bias level in volts.</p> <p><code>start</code>: Pulse sweep start level in volts.</p> <p><code>stop</code>: Pulse sweep stop level in volts.</p> <p><code>limit</code>: Current limit (for example, compliance) in amps.</p> <p><code>ton</code>: Pulse width (for example, on-time) in seconds.</p> <p><code>toff</code>: Pulse off time in seconds.</p> <p><code>points</code>: Number of pulse measure cycles.</p> <p><code>buffer</code>: Reading buffer where pulsed measurements will be stored. If this is <code>nil</code> when the function is called, no measurements will be made when the pulse train is initiated.</p> <p><code>tag</code>: Numeric identifier to be assigned to the defined pulse train.</p> <p><code>sync_in</code>: Defines a digital I/O trigger input line. If programmed, the pulse train will wait for a trigger input before executing each pulse. This parameter is optional.</p> <p><code>sync_out</code>: Defines a digital I/O trigger output line. If programmed, the pulse train will generate a trigger output immediately prior to the start of <code>ton</code>. This parameter is optional.</p> <p><code>sync_in_timeout</code>: Specifies the length of time (in seconds) to wait for input trigger (defaults to 10s).</p> <p><code>sync_in_abort</code>: (true or false) Whether to abort pulse if input trigger is not received before <code>timeout</code> expires (defaults to true).</p> |

| Example                                                                                                                                                              | ConfigPulseVMeasureISweepLog(smub, 0, 1, 10, 1, 10e-3, 20e-3, 10, smub.nvbuffer1, 6)<br><br>Set up a pulsed log sweep that will use SourceMeter instrument Channel B. The pulsed sweep will start at 1V, end at 10V, and return to a 0V bias level between pulses. Each pulsed step will be on for 10ms and then at the bias level for 20ms. The current limit will be 1A during the entire pulsed sweep. The pulse train will be comprised of 10 pulsed steps and the pulse train will be assigned a tag index of 6. |

| Usage:<br>tbl = QueryPulseConfig(tag) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description                           | Once a pulse train has been configured and assigned to a tag, it is often desirable to inspect the settings of this pre-configured pulse train. QueryPulseConfig() can be used for this purpose. This function will return a table containing the various settings associated with the tag input parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Parameters                            | tag: Numeric identifier of pulse train configuration being queried.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Return values                         | <p>tostring(): A function that returns most elements in a string convenient for printing.</p> <p>tag: Identifying tag for this pulse train.</p> <p>smu: The smu configured for pulsing.</p> <p>func: Pulse function: smuX.OUTPUT_DCAMPS or smuX.OUTPUT_DCVOLTS</p> <p>bias: Pulse bias level.</p> <p>level: Pulse level for non sweeping pulses.</p> <p>start: Starting level for sweep pulses.</p> <p>stop: Ending level for sweep pulses.</p> <p>limit: Limit value.</p> <p>ton: On time in seconds.</p> <p>toff: Off time in seconds.</p> <p>points: The number of points in this pulse train.</p> <p>buf: Reference to buffer containing measurement data</p> <p>sync_in: The sync_in digio line, if used.</p> <p>sync_out: The sync_out digio line, if used.</p> <p>sourcevalues: A table containing the source value for each point in the pulse train.</p> |
| Output Data                           | None                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Channel A will pulse voltage from a bias level of 0V to pulse level of 5V. The pulse level will be present for 2ms and the bias level for 200 ms, with a 1A limit setting. A total of 10 pulses will be generated and the measurement data will be stored in SMU A.nvbuffer1. This pulse train will be assigned to tag = 1 </pre> |

| <p>Function:<br/>         InitiatePulseTestDual<br/>         Usage:<br/> <code>f, msg = InitiatePulseTestDual(tag1, tag2)</code></p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p>Description</p>                                                                                                                   | <p>This function initiates the pulse configurations assigned to <code>tag1</code> and <code>tag2</code>. The pulse trains associated with the indicated tags will be generated simultaneously. This is useful when testing devices such as voltage regulators where the input signal and output load must be applied to the instrument at the same time. When using this function, each <code>tag1</code> pulse will encapsulate each <code>tag2</code> pulse in time. That is, the <code>tag1</code> pulse will transition from its bias level to its pulse level before the <code>tag2</code> pulse. Both the <code>tag1</code> and <code>tag2</code> pulses will return to their respective bias levels at approximately the same time. Measurements for both pulse trains take place at the same time. (See Waveform below).</p> <p>To provide this encapsulation, the following rules are enforced:</p> <ul style="list-style-type: none"> <li>• The <code>tag1</code> pulse on time, <code>ton1</code>, must be configured to be at <math>&gt; 40\mu\text{s}</math> longer than the <code>tag2</code> pulse on time.</li> <li>• The <code>tag1</code> and <code>tag2</code> pulse off times, <code>toff</code>, must be the same.</li> </ul> |
| <p>Waveform</p>                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## KIHighC

The KIHighC factory script is made up of two functions: `i_leakage_measure()` and `i_leakage_threshold()`. These functions are intended to be used when HighC mode is active. Output is generally at a non-zero voltage prior to calling these functions. These functions can also be used to step the voltage to zero volts in order to measure the leakage current.

Table 19-21

### KIHighC TSP test script: `i_leakage_measure()`

|                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## KIParlib

The KIParlib factory script is made up of two functions: `gm_vsweep()` and `gm_ismweep()`.

Table 19-23

### KIParlib TSP test script: `gm_vsweep()`

| Description                                                       | The <code>gm_vsweep()</code> function performs a linear voltage sweep, measuring voltage and current and then calculates the transconductance (Gm) at each point using the central difference method. It can return an array of Gm values, a reading buffer with the measured currents, and a reading buffer with the measured voltages.                                                                                          |

## Introduction

Use the procedures in this section to calibrate the Keithley Instruments Series 2600A System SourceMeter® instrument (Models 2601A, 2602A, 2611A, 2612A, 2635A, and 2636A). These procedures require accurate test equipment to measure precise DC voltages and currents.

---

---

**WARNING** *The information in this section is intended for qualified service personnel only. Do not attempt these procedures unless you are qualified to do so. Some of these procedures may expose you to hazardous voltages.*

---

---

## Environmental conditions

### Temperature and relative humidity

Conduct the calibration procedures at an ambient temperature of 18°C to 28°C (65°F to 82°F), with relative humidity of less than 70% (unless otherwise noted).

### Warm-up period

Allow the Series 2600A to warm up for at least two hours before performing calibration.

If the instrument has been subjected to temperature extremes (those outside the ranges stated above), allow additional time for the instrument's internal temperature to stabilize. Typically, allow one extra hour to stabilize a unit that is 10°C (18°F) outside the specified temperature range.

Also, allow the test equipment to warm up for the minimum time specified by the manufacturer.

### Line power

The Series 2600A requires a line voltage of 100V to 240V at line frequency of 50Hz or 60Hz. The instrument must be calibrated within this range.

## Calibration considerations

When performing the calibration procedures:

- Make sure that the test equipment is properly warmed up and connected to the correct Model 2600A terminals.
- Always allow the source signal to settle before calibrating each point.
- Do not connect test equipment to the Series 2600A through a scanner or other switching equipment.
- If an error occurs during calibration, the Series 2600A will generate an appropriate error message. See [Error summary](#) in [Appendix A](#) for more information.

---

---

**WARNING** *The maximum common-mode voltage (voltage between LO and chassis ground) is 250V DC. Exceeding this value may cause a breakdown in insulation, creating a shock hazard that could result in personal injury or death.*

*The Input/Output terminals of the Series 2600As are rated for connection to circuits rated Installation Category I only, with transients rated less than 1500V peak. Do not connect the Series 2600A terminals to CAT II, CAT III, or CAT IV circuits. Connection of the Series 2600A terminals to circuits higher than CAT I can cause damage to the equipment or expose the operator to hazardous voltage.*

*Hazardous voltages may be present on the output and guard terminals. To prevent electrical shock that could cause injury or death, NEVER make or break connections to the Series 2600A while the unit is on. Power off the equipment from the front panel or disconnect the main power cord from the rear of the Series 2600A before handling cables connected to the outputs. Putting the equipment into standby mode does not guarantee the outputs are not powered if a hardware or software fault occurs.*

---

---

## Calibration cycle

Perform calibration at least once a year to ensure the unit meets or exceeds its specifications.

## Recommended calibration equipment

[Table 20-1](#) lists the recommended equipment for the calibration procedures. You can use alternate equipment as long as that equipment has specifications equal to or greater than those listed in the table. When possible, test equipment specifications should be at least four times better than corresponding Series 2600A specifications.

Table 20-1  
**Recommended calibration equipment**

1. 90-day specifications show full-range accuracy of recommended model used for specified calibration point.
2. Id.
3. Id.
4. Resistor used to calibrate Model 2601A/2602A 3A and 10A ranges and Model 2611A/2612A/2635A/2636A 1.5A and 10A ranges should be characterized to uncertainty shown using resistance function of a digital multimeter before use.
5. Used for contact check calibration. Characterize resistors using ohms function of digital multimeter before use.
6. Standard is a guarded and characterized 1G $\Omega$  resistor used to test Model 2635A/2636A 100pA to 100nA current ranges.

## Calibration errors

The Series 2600A checks for errors after each calibration step, minimizing the possibility that improper calibration may occur due to operator error.

You can detect errors while in remote by testing the state of EAV (Error Available) bit (bit 2) in the status byte. (Use the \*STB? query to request the status byte.) Query the instrument for the type of error by using the `errorqueue.next` command. The Series 2600A will respond with the nature of the error. See [Appendix A](#) for error messages and [Appendix C](#) for status byte information.

## Calibration

Use the following procedure to perform remote calibration by sending commands over the IEEE-488 bus, RS-232 port, or LAN. The remote commands and appropriate parameters are separately summarized for each step.

### Calibration steps

#### Step sequence

Calibration steps must be performed in the order shown in [Table 20-2](#) (Model 2601A/2602A), or [Table 20-3](#) (Model 2611A/2612A), or [Table 20-5](#) (Model 2635A/2636A). Note that all steps are performed using 2-wire (local sensing) except as noted. Calibration of each range is performed as a four-point calibration:

- + ZERO
- + FULL SCALE
- - ZERO
- - FULL SCALE.

Table 20-2  
Model 2601A/2602A calibration steps

| Function <sup>1</sup>      | Calibration steps <sup>2</sup> | Calibration points <sup>4</sup> | Sense mode <sup>5</sup> |
|----------------------------|--------------------------------|---------------------------------|-------------------------|
| Voltage Source and Measure | 100mV                          | $\pm 1e-12, \pm 90mV$           | smuX.SENSE_LOCAL        |
|                            | 100mV                          | $\pm 1e-10, \pm 90mV$           | smuX.SENSE_REMOTE       |
|                            | 1V                             | $\pm 1e-10, \pm 0.9V$           | smuX.SENSE_LOCAL        |
|                            | 1V                             | $\pm 1e-10, \pm 0.9V$           | smuX.SENSE_CALA         |
|                            | 6V                             | $\pm 1e-10, \pm 5.4V$           | smuX.SENSE_LOCAL        |
|                            | 40V                            | $\pm 1e-10, \pm 36V$            | smuX.SENSE_LOCAL        |

1. Calibrate only the source for the SENSE\_CALA sense steps.
2. Steps must be performed in the order shown.
3. 10A range for changing calibration of range only and is not available for normal use.
4. Do not use actual 0 values for zero calibration points. Send very small values such as  $\pm 1e-10$ .  
Calibration polarities must also be set as shown in the procedures.
5. Output must be off before changing to the CALA sense mode.

1. Calibrate only the source for the SENSE\_CALA sense steps.
2. Steps must be performed in the order shown.
3. Do not use actual 0 values for zero calibration points. Send very small values such as  $\pm 1e-10$ . Calibration polarities must also be set as shown in the procedures.
4. Output must be off before changing to the CALA sense mode.
5. For Current Measure only.

### Parameter values

The full-scale parameters are actually 90% of full-scale as indicated in [Table 20-2](#), [Table 20-3](#), and [Table 20-5](#). Note that you cannot send a value of exactly 0 for the two zero parameters, but must instead send a very small value, for example  $1e-10$  or  $-1e-10$ .

### Sense modes

[Table 20-2](#), [Table 20-3](#), and [Table 20-5](#) list sense modes for the calibration steps. Note that all source and measure ranges are calibrated using the LOCAL sense mode. In addition, the 100mV or 200mV source and measure ranges are also calibrated using the REMOTE sense mode, and the 1mA and 1V or 2V source ranges are also calibrated using the CALA sense mode.

## Calibration commands

Table 20-5 summarizes remote calibration commands. For a more complete description of these commands, refer to [Section 19](#).

Table 20-5  
Calibration commands

| Command <sup>1</sup>                                                                                                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                            |

| <pre>calstate = smuX.cal.state</pre>                                                                                                                                  | <p>Request calibration state:<br/>    smuX.CALSTATE_CALIBRATING<br/>    smuX.CALSTATE_LOCKED<br/>    smuX.CALSTATE_UNLOCKED</p>                                                                                                                                                                                                                                                                                        |
| <pre>smuX.cal.unlock("password")</pre>                                                                                                                                | <p>Unlock calibration (default password: KI0026XX)</p>                                                                                                                                                                                                                                                                                                                                                                 |
| <pre>smuX.measure.calibratei(range, cp1measured, cplreference, cp2measured, cp2reference)</pre>                                                                       | <p>Calibrate current measure range:<sup>2</sup><br/>    ±range (measurement range to calibrate).<br/>    cp1measured (Series 2600A measured value for cal. point 1).<br/>    cp1reference (reference measurement for cal. point 1).<br/>    cp2measured (Series 2600A measured value for cal. point 2).<br/>    cp2reference (reference measurement for cal. point 2).</p>                                             |
| <pre>smuX.measure.calibratev(range, cp1measured, cplreference, cp2measured, cp2reference)</pre>                                                                       | <p>Calibrate voltage measure range:<sup>2</sup><br/>    ±range (measurement range to calibrate).<br/>    cp1measured (Series 2600A measured value for cal. point 1).<br/>    cp1reference (reference measurement for cal. point 1).<br/>    cp2measured (Series 2600A measured value for cal. point 2).<br/>    cp2reference (reference measurement for cal. point 2).</p>                                             |

1. smuX = smua for the Model 2601A/2611A/2635A; smuX = smua (Channel A) or smub (Channel B) for the Model 2602A/2612A/2636A.
2. Calibration point 1 should be performed at approximately 0% of range; calibration point 2 should be performed at approximately 90% of range. See [Table 20-2](#) or [Table 20-3](#) for calibration points.

Table 20-5 (cont.)

**Calibration commands**

| Command <sup>1</sup>                                                                             | Description                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

1. smuX = smua for the Model 2601A/2611A/2635A; smuX = smua (Channel A) or smub (Channel B) for the Model 2602A/2612A/2636A.

2. Calibration point 1 should be performed at approximately 0% of range; calibration point 2 should be performed at approximately 90% of range. See [Table 20-2](#) or [Table 20-3](#) for calibration points.

**Calibration procedure****Step 1. Prepare the Series 2600A for calibration**

- a. Connect the Series 2600A to the controller IEEE-488 interface, RS-232 port, or LAN using an appropriate interface cable.
- b. Turn on the Series 2600A and the test equipment, and allow them to warm up for at least two hours before performing calibration.
- c. Make sure the IEEE-488, RS-232, or LAN interface parameters are set up properly (press **MENU > RS232**, **MENU > LAN**, or **MENU > GPIB** to configure the interface).

**Step 2. Voltage Calibration**

- a. Connect the Series 2600A to the digital multimeter using the 4-wire connections shown in [Figure 20-1](#), and select the multimeter DC volts function.
- b. Send the following commands in order to initialize voltage calibration:

```
smua.cal.unlock("KI0026XX")
smua.reset()
smua.source.func = smua.OUTPUT_DCVOLTS
```

Figure 20-1  
Connections for voltage calibration

- c. Perform each calibration step listed in [Table 20-2](#) (Model 2601A/2602A), or [Table 20-3](#) (Model 2611A/2612A), or (Model 2635A/2636A) as follows:
  - 1) Select the range being calibrated with this command:  
`smua.source.rangev = range`

---

**NOTE** (Note that it is not necessary to set the measure range for calibration.) For example, for the Model 2601A/2602A 1V range, the following command would be sent:

```
smua.source.rangev = 1
```

For Models 2611A/2612A/2635A/2636A 2V range, the following command would be sent:

```
smua.source.rangev = 2
```

---

- 2) Select the correct sense mode based on the calibration step from [Table 20-2](#), or [Table 20-3](#), or , for example:

```
smua.sense = smua.SENSE_LOCAL
```

- 3) Select positive polarity, then set the source output to the positive zero value:

```
smua.cal.polarity = smua.CAL_POSITIVE
```

```
smua.source.levelv = 1e-10
```

- 4) Turn on the output:

```
smua.source.output = smua.OUTPUT_ON
```

- 5) Allow the readings to settle, then get both the multimeter and Series 2600A voltage readings at the positive zero value (the Series 2600A measurement is not necessary if this calibration step is being done on the CALA sense mode). The two measurements should be made as close as possible in time. Use this command for the Series 2600A:

```
Z_rdg = smua.measure.v()
```

- 6) Turn off the output:

```
smua.source.output = smua.OUTPUT_OFF
```

- 7) Set the source output to the positive full-scale value for the present range, for example:

```
smua.source.levelv = 0.9 Model 2601A/2602A
```

```
smua.source.levelv = 1.8 Model 2611A/2612A/2635A/2636A
```

- 8) Turn on the output:

```
smua.source.output = smua.OUTPUT_ON
```

- 9) Allow the readings to settle, then get both the multimeter and Series 2600A voltage readings at the positive full-scale output value (the Series 2600A measurement is not necessary if this calibration step is being done on the CALA sense mode). The two measurements should be made as close as possible in time. Use this command for the Series 2600A:

```
FS_rdg = smua.measure.v()
```

- 10) Turn off the output:

```
smua.source.output = smua.OUTPUT_OFF
```

- 11) Send the source calibration command using the range, +zero and +FS multimeter readings, and +zero and +FS source values for the parameters:

```
smua.source.calibratev(range,src_Z,DMM_Z_rdg,
```

```
src_FS,DMM_FS_rdg)
```

Where:

|            |                                    |
|------------|------------------------------------|
| range      | -- present calibration range       |
| src_Z      | -- +zero 2600A source output value |
| DMM_Z_rdg  | -- +zero DMM measurement           |
| src_FS     | -- +FS 2600A source output value   |
| DMM_FS_rdg | -- +FS DMM measurement             |

Typical values for the Model 2601A/2602A 1V range:

```
smua.source.calibratev(1,1e-10,1e-5,0.9,0.903)
```

Typical values for the Models 2611A/2612A/2635A/2636A 2V range:

```
smua.source.calibratev(2,1e-10,1e-5,1.8,1.802)
```

- 12) If this step is not on the CALA sense mode, send the measure calibration command using the multimeter and Series 2600A readings, and range setting for the parameters:

```
smua.measure.calibratev(range,Z_rdg,DMM_Z_rdg,
FS_rdg,DMM_FS_rdg)
```

Where:

|            |                              |
|------------|------------------------------|
| range      | -- present calibration range |
| Z_rdg      | -- +zero 2600A measurement   |
| DMM_Z_rdg  | -- +zero DMM measurement     |
| FS_rdg     | -- +FS 2600A measurement     |
| DMM_FS_rdg | -- +FS DMM measurement       |

Typical Model 2601A/2602A 1V range values:

```
smua.measure.calibratev(1,1e-4,1e-5,0.92,0.903)
```

Typical Model 2611A/2612A/2635A/2636A 2V range values:

```
smua.measure.calibratev(2,1e-4,1e-5,1.82,1.802)
```

- 13) Select negative polarity, then set the source output to the negative zero value, for example:

```
smua.cal.polarity = smua.CAL_NEGATIVE
smua.source.levelv = -1e-10
```

- 14) Turn on the output:

```
smua.source.output = smua.OUTPUT_ON
```

- 15) Allow the readings to settle, then get both the multimeter and Series 2600A voltage readings at the negative zero value. (The Series 2600A measurement is not necessary if this calibration step is being done on the CALA sense mode.) The two measurements should be made as close as possible in time. Use this command for the Series 2600A:

```
Z_rdg = smua.measure.v()
```

- 16) Turn off the output:

```
smua.source.output = smua.OUTPUT_OFF
```

- 17) Set the source output to the negative full-scale value, for example:

```
smua.source.levelv = -0.9 (Models 2601A/2602A)
smua.source.levelv = -1.8 (Models 2611A/2612A/2635A/2636A)
```

- 18) Turn on the output:

```
smua.source.output = smua.OUTPUT_ON
```

- 19) Allow the readings to settle, then get both the multimeter and Series 2600A voltage readings at the negative full-scale output value (the Series 2600A measurement is not necessary if this calibration step is being done on the CALA sense mode). The two measurements should be made as close as possible in time. Use this command for the Series 2600A:

```
FS_rdg = smua.measure.v()
```

- 20) Turn off the output:

```
smua.source.output = smua.OUTPUT_OFF
```

- 21) Send the source calibration command using the range, -zero and -FS multimeter readings, and -zero and -FS source values for the parameters:

```
smua.source.calibratev(-range,src_Z,DMM_Z_rdg,
src_FS,DMM_FS_rdg)
```

Where:

|           |                                              |
|-----------|----------------------------------------------|
| -range    | -- negative of the present calibration range |
| src_Z     | -- zero 2600A source output value            |
| DMM_Z_rdg | -- zero DMM measurement                      |

```
src_FS -- FS 2600A source output value
DMM_FS_rdg -- FS DMM measurement
```

Typical values for the Model 2601A/2602A 1V range:

```
smua.source.calibratev(-1,-1e-10,-1e-4,-0.9,-0.896)
```

Typical values for the Model 2611A/2612A/2635A/2636A 2V range:

```
smua.source.calibratev(-2,-1e-10,-1e-4,-1.8,-1.805)
```

- 22) If this step is not on the CALA sense mode, send the measure calibration command using the multimeter and Series 2600A readings, and range setting for the parameters:

```
smua.measure.calibratev(-range,Z_rdg,DMM_Z_rdg,
FS_rdg,DMM_FS_rdg)
```

Where:

```
range -- negative of the present calibration range
Z_rdg -- zero 2600A measurement
DMM_Z_rdg -- zero DMM measurement
FS_rdg -- FS 2600A measurement
DMM_FS_rdg -- FS DMM measurement
```

Typical Model 2601A/2602A 1V range values:

```
smua.measure.calibratev(-1,-1e-4,-1e-6,-0.89,-0.896)
```

Typical Model 2611A/2612A/2635A/2636A 2V range values:

```
smua.measure.calibratev(-2,-1e-4,-1e-6,-1.81,-1.805)
```

- d. Be sure to complete steps a through v for all six voltage steps in [Table 20-2](#), [Table 20-3](#), or [Table 20-5](#) before continuing with current calibration.
- e. Select auto polarity mode:
- ```
smua.cal.polarity = smua.CAL_AUTO
```

Figure 20-2
Connections for current calibration (100nA to 1A ranges)

Connections for current calibration (1uA to 1A ranges)

Step 3. Current Calibration

Models 2601A/2602A/2611A/2612A:

1. Connect the Series 2600A to the digital multimeter (see [Figure 20-2](#)), and select the multimeter DC current function.
2. Send this command to initialize current calibration:
`smua.source.func = smua.OUTPUT_DCAMPS`
3. Perform each calibration step listed in [Table 20-2](#) (Model 2601A/2602A), [Table 20-3](#) (Model 2611A/2612A), or (Model 2635A/2636A):
 - a. Select the range being calibrated with this command:
`smua.source.rangei = range`
(Note that it is not necessary to set the measure range for calibration.) For example, for the 1A range, the following command would be sent:
`smua.source.rangei = 1`
 - b. Select the correct sense mode based on the calibration step from [Table 20-2](#), [Table 20-3](#), or , for example:
`smua.sense = smua.SENSE_LOCAL`
 - c. Select positive polarity, then set the source output to the positive zero value:
`smua.cal.polarity = smua.CAL_POSITIVE`
`smua.source.leveli = 1e-10`
 - d. Turn on the output:
`smua.source.output = smua.OUTPUT_ON`
 - e. Allow the readings to settle, then get both the multimeter and Series 2600A current readings at the positive zero value (the Series 2600A measurement is not necessary if this calibration step is being done on the CALA sense mode). The two measurements should be made as close as possible in time. Use this command for the Series 2600A:
`Z_rdg = smua.measure.i()`
 - f. Turn off the output:
`smua.source.output = smua.OUTPUT_OFF`
 - g. Set the source output to the positive full-scale value for the present range, for example:
`smua.source.leveli = 0.9`
 - h. Turn on the output:
`smua.source.output = smua.OUTPUT_ON`
 - i. Allow the readings to settle, then get both the multimeter and Series 2600A voltage readings at the positive full-scale output value (the Series 2600A measurement is not necessary if calibration is being done on the CALA sense mode). The two measurements should be made as close as possible in time. Use this command for the Series 2600A:
`FS_rdg = smua.measure.i()`
 - j. Turn off the output:
`smua.source.output = smua.OUTPUT_OFF`

- k. Send the source calibration command using the range, zero and +FS multimeter readings, and zero and +FS source values for the parameters:
`smua.source.calibratei(range,src_Z,DMM_Z_rdg, src_FS,DMM_FS_rdg)`

Where: `range` -- present calibration range
`src_Z` -- +zero 2600A source output value
`DMM_Z_rdg` -- +zero DMM measurement
`src_FS` -- +FS 2600A source output value
`DMM_FS_rdg` -- +FS DMM measurement

Typical values for the 1A range:

`smua.source.calibratei(1,1e-10,1e-4,0.9,0.88)`

- l. If this step is not on the CALA sense mode, send the measure calibration command using the multimeter and Series 2600A readings, and range setting for the parameters:
`smua.measure.calibratei(range,Z_rdg,DMM_Z_rdg,FS_rdg,DMM_FS_rdg)`

Where: `range` -- present calibration range
`Z_rdg` -- +zero 2600A measurement
`DMM_Z_rdg` -- +zero DMM measurement
`FS_rdg` -- +FS 2600A measurement
`DMM_FS_rdg` -- +FS DMM measurement

Typical 1A range values:

`smua.measure.calibratei(1,1e-5,1e-4,0.89,0.88)`

- m. Select negative polarity, then set the source output to the negative zero value, for example:
`smua.cal.polarity = smua.CAL_NEGATIVE`
`smua.source.leveli = -1e-10`
- n. Turn on the output:
`smua.source.output = smua.OUTPUT_ON`
- o. Allow the readings to settle, then get both the multimeter and Series 2600A current readings at the negative zero full-scale value (the Series 2600A measurement is not necessary if this calibration step is being done on the CALA sense mode). The two measurements should be made as close as possible in time. Use this command for the Series 2600A:
`Z_rdg = smua.measure.i()`
- p. Turn off the output:
`smua.source.output = smua.OUTPUT_OFF`
- q. Set the source output to the negative full-scale value, for example:
`smua.source.leveli = -0.9`
- r. Turn on the output:
`smua.source.output = smua.OUTPUT_ON`
- s. Allow the readings to settle, then get both the multimeter and Series 2600A current readings at the negative full-scale output value (the Series 2600A measurement is not necessary if this calibration step is being done on the CALA sense mode). The two measurements should be made as close as possible in time. Use this command for the Series 2600A:
`FS_rdg = smua.measure.v()`
- t. Turn off the output:
`smua.source.output = smua.OUTPUT_OFF`

- u. Send the source calibration command using the -range, -zero and -FS multimeter readings, and -zero and -FS source values for the parameters:
- ```
smua.source.calibratei(-range,src_Z,DMM_Z_rdg,
src_FS,DMM_FS_rdg)
```

Where: -range            -- negative of the present calibration range  
src\_Z                    -- zero 2600A source output value  
DMM\_Z\_rdg               -- zero DMM measurement  
src\_FS                   -- FS 2600A source output value  
DMM\_FS\_rdg              -- FS DMM measurement

Typical values for the 1A range:

```
smua.source.calibratei(-1,-1e-10,-1e-5,-0.9,-0.892)
```

- v. If this step is not on the CALA sense mode, send the measure calibration command using the multimeter and Series 2600A readings, and range setting for the parameters:
- ```
smua.measure.calibratei(-range,Z_rdg,DMM_Z_rdg,
FS_rdg,DMM_FS_rdg)
```

Where: -range -- negative of the present calibration range
Z_rdg -- zero 2600A measurement
DMM_Z_rdg -- zero DMM measurement
FS_rdg -- FS 2600A measurement
DMM_FS_rdg -- FS DMM measurement

Typical 1A range values:

```
smua.measure.calibratei(-1,-1e-4,-1e-5,-0.91,-0.892)
```

4. Be sure to complete steps a through v for the 100nA to 1A ranges before continuing with 3A and 10A range calibration (Model 2601A/2602A) or 1.5A and 10A range calibration (Model 2611A/2612A/2635A/2636A).
5. Change connections as shown in [Figure 20-3](#) (use 4-wire connections to the 0.5Ω resistor as shown).
6. Select the DMM DC volts function.
7. Repeat steps a through v for the 3A and 10A ranges (Model 2601A/2602A) or 1.5A and 10A ranges (Model 2611A/2612A/2635A/2636A). Compute the current reading from the DMM voltage reading and characterized 0.5Ω resistance value: $I = V/R$.
8. Select auto polarity mode:

```
smua.cal.polarity = smua.CAL_AUTO
```

Figure 20-3
Connections for current calibration

Models 2635A and 2636A:

1. Connect the Series 2600A to the digital multimeter (see [Figure 20-2](#)), and select the multimeter DC current function.
2. Calibrate the low current ranges (100pA, 1nA, 10nA, 100nA¹) using a suitably guarded and characterized 1G Ω resistance standard, such as the Keithley Instruments Model 2600-STD-RES (see [Table 20-1](#)). Step-by-step procedures, connection diagrams, and a factory script for calibrating the low current ranges are included with the Model 2600-STD-RES. The general process entails forcing a characterized voltage across the 1G Ω resistor and comparing the 2635A/2636A measured results against the standard resistance and voltage derived current.
 - a. Characterize the appropriate +/- V source values with the Digital Multimeter according to .
 - b. Characterize the desired Model 2635A/2636A current ranges.
 - 1) Connect the guarded resistance standard.
 - 2) Source the appropriate voltage for +/- full-scale reading.
 - 3) Wait 30 seconds for stable measurement.
 - 4) Capture the Model 2635A/2636A reported current measurement.
 - 5) Initiate HI-Z mode to open the resistor standard (source zero current) and the characterize offset.
 - 6) Repeat the above steps for each low current range.

Table 20-6

Settings of Model 2635A/2636A Characterization of Voltage Source

Low Current Range	Voltage Source	Compliance
100pA	+/- 100.00mV	1.5A
1nA	+/- 1.0000mV	1.5A
10nA	+/- 10.000mV	1.5A
100nA	+/- 100.00V	100mA

Step 4. Contact check calibration (For 2601A/2602A/2611A/2612A only)

- a. Short the Series 2600A sense low and output low terminals, as shown in [Figure 20-4](#). Also short the sense high and output high terminals together, as shown in the figure.

1. The 2601A/2602A/2611A/2612A could be calibrated with this method for the 100nA setting only if desired.

Figure 20-4

Connections for contact check 0Ω calibration

- b. Allow the readings to settle, then get the Series 2600A readings:
`r0_hi, r0_lo = smua.contact.r()`
- c. Connect a 50Ω resistor between the sense low and output low terminals, as shown in [Figure 20-5](#). Also connect a second 50Ω resistor between the sense high and output high terminals as shown in the figure.
- d. Allow the readings to settle, then get the Series 2600A readings:
`r50_hi, r50_lo = smua.contact.r()`
- e. Send the contact check low calibration command:
`smua.contact.calibratelo(r0_lo, Z_actual, r50_lo, 50_ohm_actual)`

Where:

<code>r0_lo</code>	--	Series 2600A 0W low measurement
<code>Z_actual</code>	--	actual zero value
<code>r50_lo</code>	--	Series 2600A 50W low measurement
<code>50_ohm_actual</code>	--	actual 50W resistor value

Typical values:

```
smua.contact.calibratelo(r0_lo, 0, r50_lo, 50.15)
```

- f. (Where `r0_lo` and `r50_lo` are measurements taken in steps 2 and 4 above.)
- g. Send the contact check high calibration command:
`smua.contact.calibratehi(r0_hi, Z_actual, r50_hi, 50_ohm_actual)`

Where:

<code>r0_hi</code>	--	Series 2600A 0W high measurement
<code>Z_actual</code>	--	actual zero value
<code>r50_hi</code>	--	Series 2600A 50W high measurement
<code>50_ohm_actual</code>	--	actual 50W resistor value

Typical values:

```
smua.contact.calibratehi(r0_hi, 0, r50_hi, 50.15)
```

(Where `r0_hi` and `r50_hi` are measurements taken in steps 2 and 4 above.)

Figure 20-5
Connections for contact check 50Ω calibration

Step 5. Program calibration dates

Use the following command to set the calibration adjustment date:

```
smua.cal.adjustdate = os.time{year=2005, month=1, day=1}
```

Optionally, it is possible to set the calibration date and calibration due date with the following commands:

```
smua.cal.date = os.time{year=2005, month=1, day=1}
smua.cal.due = os.time{year=2006, month=1, day=1}
```

If you do not wish to set a calibration date or calibration due date and want to clear the previous values, use the following commands:

```
smua.cal.date = 0
smua.cal.due = 0
```

The actual year, month, and day, as well as (optional) hour, and minute should be used (seconds can be given but will essentially be ignored due to the precision of the internal date storage format). The allowable range for the `year` is from 2005 to 2037, the `month` is from 1 to 12, and the `day` is from 1 to 31.

Step 6. Save calibration constants

Calibration is now complete, so you can store the calibration constants in nonvolatile memory by sending the following command:

```
smua.cal.save()
```

Calibration just performed will be temporary unless you send the `save` command.

Step 7. Lock out calibration

To lock out further calibration, send the following command after completing the calibration procedure:

```
smua.cal.lock()
```

Step 8. Repeat calibration procedure for Model 2602A/2612A/2636A Channel B

For the Models 2602A, 2612A, and 2636A only, repeat the entire procedure above for Channel B. Be sure to:

- Make test connections to Channel B terminals.
- Substitute “smub” for “smua” in all commands.

Routine Maintenance**In this section:**

Introduction	21-1
Line fuse replacement	21-2
Front panel tests	21-3
Keys test	21-3
Display Patterns test	21-3
Upgrading the firmware	21-4
Using TSB for flash firmware upgrade	21-4

Introduction

The information in this section deals with routine maintenance of the Keithley Instruments Series 2600A System SourceMeter® instrument that can be performed by the operator.

Line fuse replacement

WARNING *Disconnect the line cord at the rear panel, and remove all test leads connected to the instrument before replacing the line fuse. Failure to do so could expose the operator to hazardous voltages that could result in personal injury or death.*

NOTE The power line fuse is accessible from the rear panel, just below the AC power receptacle (Figure 21-1).

Figure 21-1
Line fuse replacement

Perform the following steps to replace the line fuse:

1. Carefully grasp and squeeze together the locking tabs that secure the fuse carrier to the fuse holder.
2. Pull out the fuse carrier, and replace the fuse with the type specified in [Table 21-1](#).

CAUTION To prevent instrument damage, use only the fuse type specified in [Table 21-1](#).

3. Reinstall the fuse carrier.

If the power line fuse continues to blow, a circuit malfunction exists and must be corrected. Return the unit to Keithley Instruments for repair.

Table 21-1

Line fuse

Line voltage	Rating	Keithley Instruments part no.
100-240V	250V, 3.15A, Slow Blow 5 × 20mm	FU-106-3.15

Front panel tests

There are two front panel tests: one to test the functionality of the front panel keys and one to test the display.

Keys test

The KEYS test lets you check the functionality of each front panel key. Perform the following steps to run the KEYS test.

1. Press **MENU > DISPLAY > TEST**.
2. Select **DISPLAY-TESTS**, and press **ENTER** or the **navigation wheel**.
3. Select **KEYS**, and press **ENTER** or the **navigation wheel** to start the test. When a key is pressed, the label name for that key will be displayed to indicate that it is functioning properly. When the key is released, the message “No keys pressed” is displayed.
4. Pressing **EXIT** tests the **EXIT** key. However, the second consecutive press of **EXIT** aborts the test and returns the instrument to the DISPLAY menu. Continue pressing **EXIT** to back out of the menu structure.

Display Patterns test

The Display Patterns test lets you verify that each pixel and indicator in the vacuum fluorescent display is working properly. Perform the following steps to run the display test:

1. Press **MENU > DISPLAY > TEST**.
2. Select **DISPLAY-TESTS**, and press **ENTER** or the **navigation wheel**.
3. Select **DISPLAY_PATTERNS**, and press **ENTER** or the **navigation wheel** to start the display test. There are three parts to the display test. Each time **ENTER** or the **navigation wheel** is pressed, the next part of the test sequence is selected. The three parts of the test sequence are as follows:

- Checkerboard pattern and the indicators that are on during normal operation.
 - Checkerboard pattern (alternate pixels on) and all indicators.
 - Each digit (and adjacent indicator) is sequenced. All of the pixels of the selected digit are on.
4. When finished, abort the display test by pressing **EXIT**. The instrument returns to the FRONT PANEL TESTS MENU. Continue pressing **EXIT** to back out of the menu structure.

Upgrading the firmware

You can use USB flash drive to upgrade and install the firmware.

CAUTION Disconnect the input and output terminals before you upgrade.

Complete the following steps to upgrade the firmware.

1. From your PC, go to **www.keithley.com** and then download the latest version of firmware from the website.
2. Insert the USB flash drive into the USB port on your PC.
3. Transfer the firmware file to the USB flash drive.
4. Insert a USB flash drive into the USB port on the front panel of the Series 2600A.
5. From the front panel, press **MENU > UPGRADE**.
6. Select the appropriate version of firmware on the USB flash drive.
7. Press **ENTER** to upgrade the firmware.

CAUTION Do not turn the Series 2600A off while an upgrade is in progress.

Using TSB for flash firmware upgrade

CAUTION Disconnect input/output terminals before performing a flash upgrade.

After downloading the new flash file from the Keithley Instruments website, use the Test Script Builder (TSB) to upgrade the firmware of your Series 2600A:

1. On the PC desktop, double-click the icon for the Test Script Builder.
2. On the Instrument Console toolbar, click the Open Instrument icon and then select your communication interface from the Select Instrument Resource dialog box. Details on opening communications are provided in Figure 2-8.

Figure 21-2
Pulse sweep example

Open Instrument icon

3. On the Instrument Console toolbar, click the Menu icon to display the menu.

Figure 21-3
Pulse sweep example

4. From the drop-down menu, select Instrument and then click Flash.
5. From the Select A Firmware Data File dialog box, use the browser to select the File name of the new firmware and click Open to upgrade the firmware of the Series 2600A.

This page left blank intentionally.

Introduction

Use the procedures in this section to verify that the Keithley Instruments Series 2600A System SourceMeter® instrument accuracy is within the limits stated in the instrument's one-year accuracy specifications. Perform the verification procedures:

- When you first receive the instrument to make sure that it was not damaged during shipment.
- To verify that the unit meets factory specifications.
- To determine if calibration is required.
- Following calibration to make sure it was performed properly.

WARNING *The information in this section is intended for qualified service personnel only. Do not attempt these procedures unless you are qualified to do so. Some of these procedures may expose you to hazardous voltages, which could cause personal injury or death if contacted. Use appropriate safety precautions when working with hazardous voltages.*

NOTE If the instrument is still under warranty and its performance is outside specified limits, contact your Keithley Instruments representative or the factory to determine the correct course of action.

Verification test requirements

Be sure that you perform the verification tests:

- Under the proper environmental conditions.
- After the specified warm-up period.
- Using the correct line voltage.
- Using the proper test equipment.
- Using the specified output signal and reading limits.

Environmental conditions

Conduct your performance verification procedures in a test environment with:

- An ambient temperature of 18-28°C (65-82°F).
- A relative humidity of less than 70% unless otherwise noted.

Warm-up period

Allow the Series 2600A to warm up for at least two hours before conducting the verification procedures. If the instrument has been subjected to temperature extremes (those outside the ranges stated above), allow additional time for the instrument's internal temperature to stabilize. Typically, allow one extra hour to stabilize a unit that is 10°C (18°F) outside the specified temperature range.

Also, allow the test equipment to warm up for the minimum time specified by the manufacturer.

Line power

The Series 2600A requires a line voltage of 100V to 240V and a line frequency of 50Hz or 60Hz. Verification tests should be performed within this range.

Recommended test equipment

Table 22-1 summarizes recommended verification equipment. You can use alternate equipment as long as that equipment has specifications equal to or greater than those listed in Table 22-1. Keep in mind, however, that test equipment uncertainty will add to the uncertainty of each measurement. Generally, test equipment uncertainty should be at least four times better than corresponding Series 2600A specifications. Table 22-1 lists the uncertainties of the recommended test equipment.

Table 22-1
Recommended verification equipment

Description	Manufacturer/Model	Accuracy	
Digital Multimeter	Keithley Instruments Model 2002 or Agilent 3458A	DC Voltage ¹ (2601A/2602A)	90mV: ±8ppm 0.9V: ±5ppm 5.4V: ±4ppm 36V: ±6ppm

4. Resistor used to test Model 2601A/2602A 3A range and Model 2611A/2612A/2635A/2636A 1.5A range only should be characterized to uncertainty shown using resistance function of digital multimeter before use.
5. Standard is a guarded and characterized 1 GΩ resistor used to test Model 2635A/2636A 100pA to 100nA current ranges.

Verification limits

The verification limits stated in this section have been calculated using only the Series 2600A one-year accuracy specifications, and they do not include test equipment uncertainty. If a

particular measurement falls outside the allowable range, recalculate new limits based both on the Series 2600A specifications and corresponding test equipment specifications.

Example limits calculations

Model 2601A/2602A example

As an example of how verification limits are calculated, assume you are testing the Model 2601A/2602A 6V DC output range using a 5.4V output value. Using the Model 2601A/2602A one-year accuracy specification for 5.4V DC output of $\pm (0.02\% \text{ of output} + 1.8\text{mV offset})$, the calculated output limits are:

$$\text{Output limits} = 5.4\text{V} \pm [(5.4\text{V} \times 0.02\%) + 1.8\text{mV}]$$

$$\text{Output limits} = 5.4\text{V} \pm (0.00108 + 0.0018)$$

$$\text{Output limits} = 5.4\text{V} \pm 0.00288\text{V}$$

$$\text{Output limits} = 5.39712\text{V to } 5.40288\text{V}$$

Model 2611A/2612A/2635A/2636A example

Similarly, assume you are testing the Model 2611A/2612A/2635A/2636A 20V DC output range using an 18V output value. Using the Model 2611A/2612A/2635A/2636A one-year accuracy specification for 18V DC output of $\pm (0.02\% \text{ of output} + 5\text{mV offset})$, the calculated output limits are:

$$\text{Output limits} = 18\text{V} \pm [(18\text{V} \times 0.02\%) + 5\text{mV}]$$

$$\text{Output limits} = 18\text{V} \pm (0.0036 + 0.005)$$

$$\text{Output limits} = 18\text{V} \pm 0.0086\text{V}$$

$$\text{Output limits} = 17.9914\text{V to } 18.0086\text{V}$$

Restoring factory defaults

Before performing the verification procedures, restore the instrument to its factory front panel (bench) defaults as follows:

1. Press **MENU** > **SETUP** then press the **ENTER** key.
2. Select **RECALL** then press the **ENTER** key.
3. Select **INTERNAL** then press the **ENTER** key.
4. Select **FACTORY** then press the **ENTER** key to restore defaults.

Performing the verification test procedures

Test summary

- DC voltage output accuracy
- DC voltage measurement accuracy
- DC current output accuracy
- DC current measurement accuracy

If the Series 2600A is not within specifications and not under warranty, see the calibration procedures in [Section 20](#) for information on calibrating the unit.

Test considerations

When performing the verification procedures:

- Be sure to restore factory front panel defaults as outlined above.
- Make sure that the test equipment is properly warmed up and connected to the Series 2600A output terminals (use 4-wire sensing for voltage).
- Make sure the Series 2600A is set to the correct source range.
- Be sure the Series 2600A output is turned on before making measurements.
- Be sure the test equipment is set up for the proper function and range.
- Allow the Series 2600A output signal to settle before making a measurement.
- Do not connect test equipment to the Series 2600A through a scanner, multiplexer, or other switching equipment.

WARNING *The maximum common-mode voltage (voltage between LO and chassis ground) is 250V DC. Exceeding this value may cause a break down in insulation, creating a shock hazard. The Input/Output terminals of the Series 2600A are rated for connection to circuits rated Installation Category I only, with transients rated less than 1500V peak. Do not connect the Series 2600A terminals to CAT II, CAT III, or CAT IV circuits. Connection of the Series 2600A terminals to circuits higher than CAT I can cause damage to the equipment or expose the operator to hazardous voltage.*

Hazardous voltages may be present on the output and guard terminals. To prevent electrical shock that could cause injury or death, NEVER make or break connections to the Series 2600A while the unit is on. Power off the equipment from the front panel or disconnect the main power cord from the rear of the Series 2600A before handling cables connected to the outputs. Putting the equipment into standby mode does not guarantee the outputs are not powered if a hardware or software fault occurs.

Setting the source range and output value

Before testing each verification point, you must properly set the source range and output value as outlined below:

1. Press the **SRC** key to select the appropriate source function.
2. Press the **navigation wheel** or the **ENTER** key to enable the edit mode (EDIT indicator on).
3. When the cursor in the source display field is flashing, set the source range to the lowest possible range for the value being sourced. Use the up or down **RANGE** key to set the value.
4. Use the **navigation wheel** and **CURSOR** keys to set the source value to the required value, then press the **ENTER** key or the **navigation wheel** to complete editing.

Setting the measurement range

When simultaneously sourcing and measuring either voltage or current, the measure range is coupled to the source range, and you cannot independently control the measure range. Thus, it is not necessary for you to set the range when testing voltage or current measurement accuracy.

Output voltage accuracy

Follow the steps below to verify that the Series 2600A output voltage accuracy is within specified limits. This test involves setting the output voltage to each full-range value and measuring the voltages with a precision digital multimeter.

1. With the power off, connect the digital multimeter (DMM) to the Series 2600A output terminals using 4-wire connections, as shown in [Figure 22-1](#).

Figure 22-1
Connections for voltage verification

2. Select the multimeter DC volts measuring function.
3. Select the Model 2602A/2612A/2636A single-channel display mode. Press the **SRC** key to source voltage and make sure the source output is turned on.
4. Enable the Series 2600A 4-wire (remote sense) mode by pressing **CONFIG** then **SRC**, then select **V-SOURCE** > **SENSE-MODE** > **4-WIRE**.
5. Verify output voltage accuracy for each of the voltages listed in [Table 22-2](#) (Model 2601A/2602A) or [Table 22-3](#) (Model 2611A/2612A/2635A/2636A). For each test point:
 - Select the correct source range.

- Set the Series 2600A output voltage to the indicated value.
 - Verify that the multimeter reading is within the limits given in the table.
1. Repeat the procedure for negative output voltages with the same magnitudes as those listed in [Table 22-2](#) or [Table 22-3](#).

Table 22-2

Model 2601A/2602A output voltage accuracy limits

Model 2601A/2602A source range	Model 2601A/2602A output voltage setting	Output voltage limits (1 year, 18°C–28°C)
100mV	90.000mV	89.732 to 90.268mV
1V	0.90000V	0.89942 to 0.90058V
6V	5.4000V	5.39712 to 5.40288V
40V	36.000V	35.9808 to 36.0192V

Table 22-3

Model 2611A/2612A/2635A/2636A output voltage accuracy limits

Model 2611A/2612A/2635A/2636A source range	Model 2611A/2612A/2635A/2636A output voltage setting	Output voltage limits (1 year, 18°C–28°C)
200mV	180.000mV	179.589 to 180.411mV
2V	1.80000V	1.79904 to 1.80096V
20V	18.000V	17.9914 to 18.0086V
200V	180.000V	179.914 to 180.086V

2. For the Model 2602A/2612A/2636A, repeat the above procedure for the other channel.

Voltage measurement accuracy

Follow the steps below to verify that the Series 2600A voltage measurement accuracy is within specified limits. The test involves setting the source voltage, as measured by a precision digital multimeter, and then verifying that the Series 2600A voltage readings are within required limits.

1. With the power off, connect the digital multimeter to the Series 2600A output terminals using 4-wire connections, as shown in [Figure 22-1](#).
2. Select the multimeter DC volts function.
3. Select the Model 2602A/2612A/2636A single-channel display mode.
4. Enable the Series 2600A 4-wire (remote sense) mode by pressing **CONFIG** then **MEAS**, then select **V-MEAS > SENSE-MODE > 4-WIRE**.
5. Set the Series 2600A to both source and measure voltage by pressing the **SRC** and **MEAS** keys, and make sure the source output is turned on.
6. Verify voltage measurement accuracy for each of the voltages listed in [Table 22-4](#) (Model 2601A/2602A) or [Table 22-5](#) (Model 2611A/2612A/2635A/2636A). For each test point:
 - Select the correct source range.
 - Set the Series 2600A output voltage to the indicated value as measured by the digital multimeter.
 - If necessary, press the **TRIG** key to display readings.
 - Verify that the Series 2600A voltage reading is within the limits given in the table. It may not be possible to set the voltage source to the required value. Use the closest possible setting, and modify reading limits accordingly.
7. Repeat the procedure for negative source voltages with the same magnitudes as those listed in [Table 22-4](#) or [Table 22-5](#).

8. For the Model 2602A/2612A/2636A, repeat the above procedure for the other channel.

Table 22-4

Model 2601A/2602A voltage measurement accuracy limits

Model 2601A/2602A source and measure range ¹	Source voltage ²	Model 2601A/2602A voltage reading limits (1 year, 18°C–28°C)
100mV	90.000mV	89.8365 to 90.1635mV
1V	0.90000V	0.899665 to 0.900335V
6V	5.4000V	5.39819 to 5.40181V
40V	36.000V	35.9866 to 36.0134V

1. Measure range coupled to source range when simultaneously sourcing and measuring voltage.
2. As measured by precision digital multimeter. Use closest possible value, and modify reading limits accordingly if necessary.

Table 22-5

Model 2611A/2612A/2635A/2636A voltage measurement accuracy limits

Model 2611A/2612A/2635A/2636A source and measure range ¹	Source voltage ²	Model 2611A/2612A/2635A/2636A voltage reading limits (1 year, 18°C–28°C)
200mV	180.000mV	179.748 to 180.252mV
2V	1.80000V	1.79929 to 1.80071V
20V	18.0000V	17.9923 to 18.0077V
200V	180.000V	179.923 to 180.077V

1. Measure range coupled to source range when simultaneously sourcing and measuring voltage.
2. As measured by precision digital multimeter. Use closest possible value, and modify reading limits accordingly if necessary.

Output current accuracy

Series 2600A output current accuracy 100nA and higher

Follow the steps below to verify that the Series 2600A output current accuracy is within specified limits.

NOTE An alternate procedure for 100nA current accuracy is shown in the 1nA to 100nA Output current accuracy procedure for the Model 2635A/2636A.

1. With the power off, connect the digital multimeter to the Series 2600A output terminals, as shown in [Figure 22-2](#).
2. Select the multimeter DC current measuring function.
3. Select the Model 2602A/2612A/2636A single-channel display mode.
4. Press the Series 2600A **SRC** key to source current, and make sure the source output is turned on.
5. Verify output current accuracy for each of the currents for the 1µA to 1A ranges listed in [Table 22-6](#) (Model 2601A/2602A), or [Table 22-7](#) (Model 2611A/2612A), or [Table 22-8](#) (Model 2635A/2636A). For each test point:

- Select the correct source range.
 - Set the Series 2600A output current to the correct value.
 - Verify that the multimeter reading is within the limits given in the table.
6. Repeat the procedure for negative output currents with the same magnitudes as those listed in [Table 22-6](#), or [Table 22-7](#), or [Table 22-8](#).

Table 22-6

Model 2601A/2602A output current accuracy limits

Model 2601A/2602A source range	Model 2601A/2602A output current setting	Output current limits (1 year, 18°C–28°C)
100nA	90.000nA	89.846 to 90.154nA
1µA	0.90000µA	0.89913 to 0.90087µA
10µA	9.0000µA	8.9953 to 9.0047µA
100µA	90.000µA	89.943 to 90.057µA
1mA	0.90000mA	0.89953 to 0.90047mA
10mA	9.0000mA	8.9943 to 9.0057mA
100mA	90.000mA	89.953 to 90.047mA
1A	0.90000A	0.89865 to 0.90135A
3A	2.40000A	2.39706 to 2.40294A

Table 22-7

Model 2611A/2612A output current accuracy limits

Model 2611A/2612A source range	Model 2611A/2612A output current setting	Output current limits (1 year, 18°C–28°C)
100nA	90.000nA	89.846 to 90.154nA
1µA	0.90000µA	0.89893 to 0.90107µA
10µA	9.0000µA	8.9923 to 9.0077µA
100µA	90.000µA	89.913 to 90.087µA
1mA	0.90000mA	0.89943 to 0.90057mA
10mA	9.0000mA	8.9913 to 9.0087mA
100mA	90.000mA	89.943 to 90.057mA
1A	0.90000A	0.89775 to 0.90225A
1.5A	1.35000A	1.34519 to 1.35481A

7. Turn the output off, and change connections as shown in [Figure 22-3](#) (use 4-wire connections to the 0.5Ω resistor as shown).
8. Select the DMM DC volts function.
9. Repeat steps 4 through 7 for the 3A range (Model 2601A/2602A) or 1.5A range (Model 2611A/2612A/2635A/2636A). Calculate the current from the DMM voltage reading and characterized 0.5Ω resistance value: $I=V/R$.
10. For the Model 2602A/2612A/2636A, repeat the above procedure for the other channel.

Model 2635A/2636A output current accuracy 1nA to 100nA ranges

A suitably guarded and characterized 1 G Ω resistance standard, such as the Keithley Instruments Model 2600-STD-RES is necessary for the following measurements. Step-by-step procedures and connection diagrams for verifying the output current accuracy for the low current ranges are included with the Model 2600-STD-RES. The general process entails measuring the voltage across the characterized 1G Ω resistor for a given output current and comparing the derived current to the current accuracy of Table 15-8 for each current range.

1. Connect the guarded resistance standard to the 2635A/2636A and the DMM.
2. Source the appropriate current for +/- full-scale reading.
3. Wait 30 seconds for stable measurement.
4. Capture the reported voltage measurement.
5. Calculate the current from measured voltage and characterized resistance.
6. Verify output current accuracy for each of the currents for the 1nA to 100nA ranges listed in [Table 22-8](#) (Model 2635A/2636A).

Figure 22-2
Current verification connections (2602A/2612A(3A); 2636A(1.5A))

Current verification connections (1uA to 1A ranges)

Figure 22-3
Connection ranges (2601A/2602A (3A); 2611A/2612A/2635A/2636A (1.5A))

Table 22-8
Model 2635A/2636A output current accuracy limits

2635A/2636A Source range	2635A/2636A output current setting	Output current limits (1 year 18C - 28C)
1nA	0.90000nA	0.89665 to 0.90335nA
10nA	9.0000nA	8.9815 to 9.0185nA
100nA	90.000nA	89.8960 to 90.0140nA
1uA	0.90000uA	0.89903 to 0.90097uA
10uA	9.0000uA	8.9923 to 9.0077uA
100uA	90.000uA	89.913 to 90.087uA
1mA	0.90000mA	0.89943 to 0.90057mA
10mA	9.0000mA	8.9913 to 9.0087mA
100mA	90.000mA	89.943 to 90.057mA
1A	0.90000A	0.89775 to 0.90225A
1.5A	1.35000A	1.34519 to 1.35481A

Current measurement accuracy

Series 2600A current measurement accuracy 100nA and higher

Follow the steps below to verify that Series 2600A current measurement accuracy is within specified limits. The procedure involves applying accurate currents from the Series 2600A current source and then verifying that Series 2600A current measurements are within required limits.

1. With the power off, connect the digital multimeter to the Series 2600A terminals as shown in [Figure 22-2](#).
2. Select the multimeter DC current function.
3. Select the Model 2602A/2612A/2636A single-channel display mode.
4. Set the Series 2600A to both source and measure current by pressing the **SRC** and **MEAS** keys, and make sure the source output is turned on.
5. Verify measure current accuracy for each of the currents listed in [Table 22-10](#) (Model 2601A/2602A), or [Table 22-11](#) (Model 2611A/2612A), or [Table 22-12](#) (Model 2635A/2636A). For each measurement:
 - Select the correct source range.
 - Set the Series 2600A source output to the correct value as measured by the digital multimeter.
 - If necessary, press the **TRIG** key to display readings.
 - Verify that the Series 2600A current reading is within the limits given in the table. It may not be possible to set the current source to the required value. Use the closest possible setting, and modify reading limits accordingly.
6. Repeat the procedure for negative calibrator currents with the same magnitudes as those listed in [Table 22-10](#), [Table 22-11](#), and [Table 22-12](#).
7. Turn the output off, change connections as shown in [Figure 22-3](#), then select the DMM volts function.
8. Repeat steps 4 through 6 for the 3A range (Model 2601A/2602A) or 1.5A range (Model 2611A/2612A/2635A/2636A). Calculate the current from the DMM voltage reading and characterized 0.5Ω resistance value.
9. For the Model 2602A/2612A/2636A, repeat the above procedure for the other channel.

Model 2635A/2636A current measurement accuracy 100pA to 100nA ranges

A suitably guarded and characterized 1 G Ω resistance standard, such as the Keithley Instruments Model 2600-STD-RES is necessary for the following measurements. Step-by-step procedures and connection diagrams for verifying the current measurement accuracy for the low current ranges are included with the Model 2600-STD-RES. The general process entails forcing a characterized voltage across the 1G Ω resistor and comparing the Model 2636A/2636A measured results against the standard resistance and voltage derived current.

1. Characterize the appropriate +/- V source values with the DMM according to [Table 22-9](#).

Table 22-9

Model 2635A/2636A Characterization of Voltage Source settings

Low Current Range	Voltage Source	Compliance
100 pA	+/- 100.00 mV	1.5 A
1 nA	+/- 1.0000 V	1.5 A
10 nA	+/- 10.000 V	1.5 A
100 nA	+/- 100.00 V	100 mA

2. Characterize the desired Model 2635A/2636A current ranges.
 - a. Connect guarded resistance standard.
 - b. Source the appropriate voltage for +/- full-scale reading.
 - c. Wait 30 seconds for stable measurement.
 - d. Capture the Model 2635A/2636A reported current measurement.
 - e. Verify output current accuracy for each of the currents for the 100pA to 100nA ranges listed in [Table 22-12](#) (Model 2635A/2636A).

Table 22-10

Model 2601A/2602A current measurement accuracy limits

Model 2601A/2602A source and measure range ¹	Source current ²	Model 2601A/2602A current reading limits (1 year, 18°C–28°C)
100nA	90.000nA	89.855 to 90.145nA
1 μ A	0.9000 μ A	0.899475 to 0.900525 μ A
10 μ A	9.0000 μ A	8.99625 to 9.00375 μ A
100 μ A	90.000 μ A	89.957 to 90.043 μ A
1mA	0.9000mA	0.89962 to 0.90038mA
10mA	9.0000mA	8.9957 to 9.0043mA
100mA	90.000mA	89.962 to 90.038mA
1A	0.90000A	0.89823 to 0.90177A
3A	2.4000A	2.3953 to 2.4047A

1. Measure range coupled to source range when simultaneously sourcing and measuring current.
2. As measured by precision digital multimeter. Use closest possible value, and modify reading limits accordingly if necessary.

Table 22-11

Model 2611A/2612A current measurement accuracy limits

Model 2611A/2612A source and measure range ¹	Source current ²	Model 2611A/2612A current reading limits (1 year, 18°C–28°C)
100nA	90.000nA	89.855 to 90.145nA
1µA	0.9000µA	0.899275 to 0.900725µA
10µA	9.0000µA	8.99625 to 9.00375µA
100µA	90.000µA	89.957 to 90.043µA
1mA	0.9000mA	0.89962 to 0.90038mA
10mA	9.0000mA	8.9957 to 9.0043mA
100mA	90.000mA	89.962 to 90.038mA
1A	0.90000A	0.89823 to 0.90177A
1.5A	1.3500A	1.345825 to 1.354175A

1. Measure range coupled to source range when simultaneously sourcing and measuring current.
2. As measured by precision digital multimeter. Use closest possible value, and modify reading limits accordingly if necessary.

Table 22-12

Model 2635A/2636A current measurement accuracy limits

2635A/2636A Source and measure range ^a	35/36 Source current ^b	Current reading limits (1 year 18C - 28C)
100pA	90.000pA	89.7850 to 90.2150pA
1nA	0.90000nA	0.89841 to 0.90159nA
10nA	9.0000nA	8.9835 to 9.0165nA
100nA	90.000nA	89.9060 to 90.0940nA
1uA	0.90000uA	0.899375 to 0.900625uA
10uA	9.0000uA	8.99625 to 9.00375uA
100uA	90.000uA	89.957 to 90.043uA
1mA	0.90000mA	0.89962 to 0.90038mA
10mA	9.0000mA	8.9957 to 9.0043mA
100mA	90.000mA	89.962 to 90.038mA
1A	0.90000A	0.89823 to 0.90177A
1.5A	1.35000A	1.345825 to 1.354175A

- a. Measure range coupled to source range when simultaneously sourcing and measuring current.
- b. As measured by precision digital multimeter. Use closest possible value, and modify reading limits accordingly if necessary.

Reading errors	A-2

Introduction

This appendix includes information on the Keithley Instruments Series 2600A System SourceMeter® instrument error levels, how to read errors, and a complete listing of error messages.

Error summary

Error messages are listed in [Table A-2](#). Error levels are listed below:

- NO_SEVERITY: Informational status message only.
- INFORMATIONAL: Informational status message only.
- RECOVERABLE: Error not serious, can be recovered.
- SERIOUS: Error serious, but unit still operational by correcting error.
- FATAL: Unit non-operational.

Error effects on scripts

Most errors will not abort a running script. The only time a script is aborted is when a Lua run-time error (error number -286) is detected. Run-time errors are caused by actions such as trying to index into a variable that is not a table. Syntax errors (error number -285) in a script/command will not technically abort the script, but it will prevent the script/command from being executed in the first place.

Reading errors

When errors occur, the error messages will be placed in the error queue (see [Queues](#)). [Table A-1](#) lists commands associated with the error queue (see [Section 19](#) for more information). For example, the following commands request the next complete error information from the error queue and return the message portion of the error:

```
errorcode, message, severity, node = errorqueue.next()
print(message)
```

Table A-1

Error queue commands

Error queue command	Description
<code>errorqueue.clear()</code>	Clear error queue of all errors.
<code>errorqueue.count</code>	Number of messages in the error/event queue.
<code>errorqueue.next()</code>	Request error message.

Table A-2
Error summary

Error number	Error level	Error Message
-430	RECOVERABLE	Query Deadlocked
-420	RECOVERABLE	Query Unterminated
-410	RECOVERABLE	Query Interrupted

Common commands

Command summary

Common commands supported by the Keithley Instruments Series 2600A System SourceMeter® instrument are summarized in [Table B-1](#). Although commands are shown in upper-case, common commands are not case sensitive, and either upper or lower case can be used. Note that although these commands are essentially the same as those defined by the IEEE-488.2 standard, the Series 2600A does not strictly adhere to that standard.

Table B-1
Common commands

Mnemonic	Name	Description ¹
*CLS	Clear status	Clears all event registers and Error Queue.
*ESE <mask>	Event enable command	Program the Standard Event Enable Register.
*ESE?	Event enable query	Read the Standard Event Enable Register.
*ESR?	Event status register query	Read/clear the Standard Event Enable Register.
*IDN?	Identification query	Returns the manufacturer, model number, serial number, and firmware revision levels of the unit.
*OPC	Operation complete command	Set the Operation Complete bit in the Standard Event Register after all pending commands have completed.
*OPC?	Operation complete query	Places an ASCII "1" into the Output Queue when all selected device operations have completed.
*RST	Reset command	Returns the SourceMeter instrument to default conditions.
*SRE <mask>	Service request enable command	Programs the Service Request Enable Register.
*SRE?	Service request enable query	Reads the Service Request Enable Register.
*STB?	Status byte query	Reads the Status Byte Register. ¹
*TRG	Trigger command	Sends a remote trigger to the SourceMeter.
*TST?	Self-test query	Returns a 0.
*WAI	Wait-to-continue command	Waits until all previous commands have completed.

1. Status commands are covered in [Appendix C](#).

Script command equivalents

Script command equivalents for the common commands in [Table B-1](#) are summarized in [Table B-2](#). See Section 12 for details on script commands.

Table B-2
Script command equivalents

Common command	Script command equivalent
*CLS	status.reset()
*ESE?	print(tostring(status.standard.enable))
*ESE <mask>	status.standard.enable = <mask>
*ESR?	print(tostring(status.standard.event))
*IDN?	print([[Keithley Instruments Inc., Model]]..localnode.model..[[,]].localnode.serialno..[[,]].localnode.revision)
*OPC?	waitcomplete() print([[1]])
*OPC	opc()
*RST	reset()
*SRE?	print(tostring(status.request_enable))
*SRE <mask>	status.request_enable = <mask>
*STB?	print(tostring(status.condition))
*TRG	N/A
*TST?	print([[0]])
*WAI	waitcomplete()

Command reference

Details on all common commands except those associated with the status model are covered below. See [Appendix C](#) for information on using status commands.

*IDN? — identification query

Reads ID information

The identification string includes the manufacturer, model number, serial number, and firmware revision levels and is sent in the following format:

Keithley Instruments Inc., Model nnnn, xxxxxxx, yyyy

Where:

nnnn is the model number (Model 2601A/2602A/2611A/2612A/2635A/2636A).

xxxxxxx is the serial number.

yyyyy is the firmware revision level.

*OPC — operation complete

Sets OPC bit

*OPC? — operation complete query

Places a “1” in output queue

When *OPC is sent, the OPC bit in the Standard Event Register (see [Appendix C](#)) will set when all overlapped commands complete. An ASCII "1" is also placed in the Output Queue to be read by the *OPC? query when overlapped commands complete.

RST: reset*Return SourceMeter instrument to defaults**

When the *RST command is sent, the Series 2600A returns to the default conditions.

TRG: trigger*Send remote trigger to SourceMeter instrument**

Use the *TRG command to issue a GPIB, LAN, or RS-232 trigger to the SourceMeter instrument. It has the same effect as a group execute trigger (GET).

TST?: self-test query*Return 0**

This command always places a 0 in the Output Queue. It is included for common command compatibility, but the Series 2600A does not actually perform a self-test.

WAI: wait-to-continue*Wait until commands are completed**

Two types of device commands exist:

- Sequential command: A command whose operations are allowed to finish before the next command is executed.
- Overlapped command: A command that allows the execution of subsequent commands while device operations of the overlapped command are still in progress.

The *WAI command is used to suspend the execution of subsequent commands until the device operations of all previous overlapped commands are finished. The *WAI command is not needed for sequential commands.

Overview

The Keithley Instruments Series 2600A System SourceMeter® instrument provides a number of status registers and queues, allowing the operator to monitor and manipulate the various instrument events. The status model is shown in [Figure C-1](#) through [Figure C-8](#). The heart of the status model is the Status Byte Register. This register can be read by the user's test program to determine if a service request (SRQ) has occurred, and what event caused it.

Status byte and SRQ

The Status Byte Register receives the summary bits of five status register sets and two queues. The register sets and queues monitor the various instrument events. When an enabled event occurs, it sets a summary bit in the Status Byte Register. When a summary bit of the Status Byte is set and its corresponding enable bit is set (as programmed by the user), the RQS/MSS bit will set to indicate that an SRQ has occurred.

SRQs will affect both the GPIB and the VXI-11 connections. On the GPIB, the SRQ line will be asserted. On a VXI-11 connection, an SRQ event will be generated.

Status register sets

A typical status register set is made up of a condition register, an event register, an event enable register, a negative transition register, and a positive transition register. A condition register is a read-only register that constantly updates to reflect the present operating conditions of the instrument.

When an event occurs, and the appropriate NTR or PTR bit is set, the matching event register bit is set to 1. The bit remains latched to 1 until the register is reset. When an event register bit is set and its corresponding enable bit is set (as programmed by the user), the output (summary) of the register will set to 1. This in turn sets the condition bit in a higher-level register, and can ultimately cascade to a summary bit of the Status Byte Register.

Queues

The SourceMeter instrument uses an Output Queue and an Error Queue. The response messages, such as requested readings, are placed in the Output Queue. As various programming errors and status messages occur, they are placed in the Error Queue. When a queue contains data, it sets the appropriate summary bit of the Status Byte Register (EAV for the Error Queue; MAV for the Output Queue).

Status function summary

The following functions and attributes control and read the various registers ([Table C-1](#)). Additional information is included later in the section in command listings for the various register sets.

Table C-1

Status function summary

Type	Function or attribute ¹
System summary	status.condition status.node_enable status.node_event status.request_enable status.request_event status.reset
Measurement event	status.measurement.* status.measurement.buffer_available.* status.measurement.current_limit.* status.measurement.instrument.* status.measurement.instrument.smuX.* status.measurement.reading_overflow.* status.measurement.voltage_limit.*
Operation event	status.operation.* status.operation.calibrating.* status.operation.instrument.* status.operation.instrument.digio.* status.operation.instrument.digio.trigger_overrun.* status.operation.instrument.lan.* status.operation.instrument.lan.trigger_overrun.* status.operation.instrument.smuX.* status.operation.instrument.smuX.trigger_overrun.* status.operation.instrument.trigger_blender.* status.operation.instru- ment.trigger_blender.trigger_overrun.* status.operation.instrument.trigger_timer.* status.operation.instru- ment.trigger_timer.trigger_overrun.* status.operation.instrument.tsplink.* status.operation.instrument.tsplink.trigger_overrun.* status.operation.measuring.* status.operation.remote.* status.operation.sweeping.* status.operation.trigger_overrun.* status.operation.user.*
Questionable event	status.questionable.* status.questionable.calibration.* status.questionable.instrument.* status.questionable.instrument.smuX.* status.questionable.over_temperature.* status.questionable.unstable_output.* status.questionable.over_temperature.* status.questionable.unstable_output.*
Standard event	status.standard.*
System events	status.system.* status.system2.* status.system3.* status.system4.* status.system5.*

1. * = '.condition', '.event', '.ntr', '.ptr' and '.enable'; smuX = smua or smub.

Clearing registers and queues

When the SourceMeter instrument is turned on, various register status elements will be set as follows:

- The PON bit in the `status.condition` register will be set.
- Bits such as the output enable and over-temperature bits will be set appropriately.
- All enable registers will be set to 0.
- All NTR registers will be set to 0.
- All used PTR register bits will be set to 1.
- The two queues will be empty.

Commands to reset the status registers and the Error Queue are listed in [Table C-2](#). In addition to these commands, any programmable register can be reset by sending the 0 parameter value with the individual command to program the register.

Table C-2

Commands to reset registers and clear queues

Commands	Description
To Reset Registers: <code>status.reset()</code>	Clears the output queue Reset bits of status registers to 0. Reset bits of status registers to 0.
To Clear Error Queue:	Clear all messages from Error Queue.

The instrument automatically clears the output queue when the instrument transitions from the local control state to the remote control state.

Programming and reading registers

Programming enable and transition registers

The only registers that can be programmed by the user are the enable and transition registers. All other registers in the status structure are read-only registers. The following explain how to determine the parameter values for the various commands used to program enable registers. The actual commands are summarized in [Appendix B](#) and [Table C-1](#).

A command to program an event enable or transition register is sent with a parameter value that determines the desired state (0 or 1) of each bit in the appropriate register. The bit positions of the register ([Figure C-9](#)) indicate the binary parameter value and decimal equivalent. To program one of the registers, send the decimal value for the bit(s) to be set. The registers are discussed further in [Enable and transition registers](#).

Figure C-9
16-bit status register

Bit Position	B7	B6	B5	B4	B3	B2	B1	B0
Binary Value	0/1	0/1	0/1	0/1	0/1	0/1	0/1	0/1
Decimal	128	64	32	16	8	4	2	1
Weights	(2 ⁷)	(2 ⁶)	(2 ⁵)	(2 ⁴)	(2 ³)	(2 ²)	(2 ¹)	(2 ⁰)

A. Bits 0 through 7

Bit Position	B15	B14	B13	B12	B11	B10	B9	B8
Binary Value	0/1	0/1	0/1	0/1	0/1	0/1	0/1	0/1
Decimal	32768	16384	8192	4096	2048	1024	512	256
Weights	(2 ¹⁵)	(2 ¹⁴)	(2 ¹³)	(2 ¹²)	(2 ¹¹)	(2 ¹⁰)	(2 ⁹)	(2 ⁸)

B. Bits 8 through 15

When using a numeric parameter, registers are programmed by including the appropriate <mask> value, for example:

```
*ese <mask>
status.standard.enable = <mask>
```

To convert from decimal to binary, use the information shown in [Figure C-9](#). For example, to set bits B0, B4, B7, and B10, a decimal value of 1169 would be used for the mask parameter (1169 = 1 + 16 + 128 + 1024).

Reading registers

Any register in the status structure can be read either by sending the common command query (where applicable), or by including the script command for that register in either the `print()` or `print(tostring())` command. The `print()` command returns a numeric value, while the `print(tostring())` command returns the string equivalent. For example, any of the following commands requests the Service Request Enable register value:

```
*SRE?
print(tostring(status.request_enable))
print(status.request_enable)
```

The response message will be a decimal value that indicates which bits in the register are set. That value can be converted to its binary equivalent using [Figure C-9](#). For example, for a decimal value of 37 (binary value of 100101), bits B5, B2, and B0 are set.

Status byte and service request (SRQ)

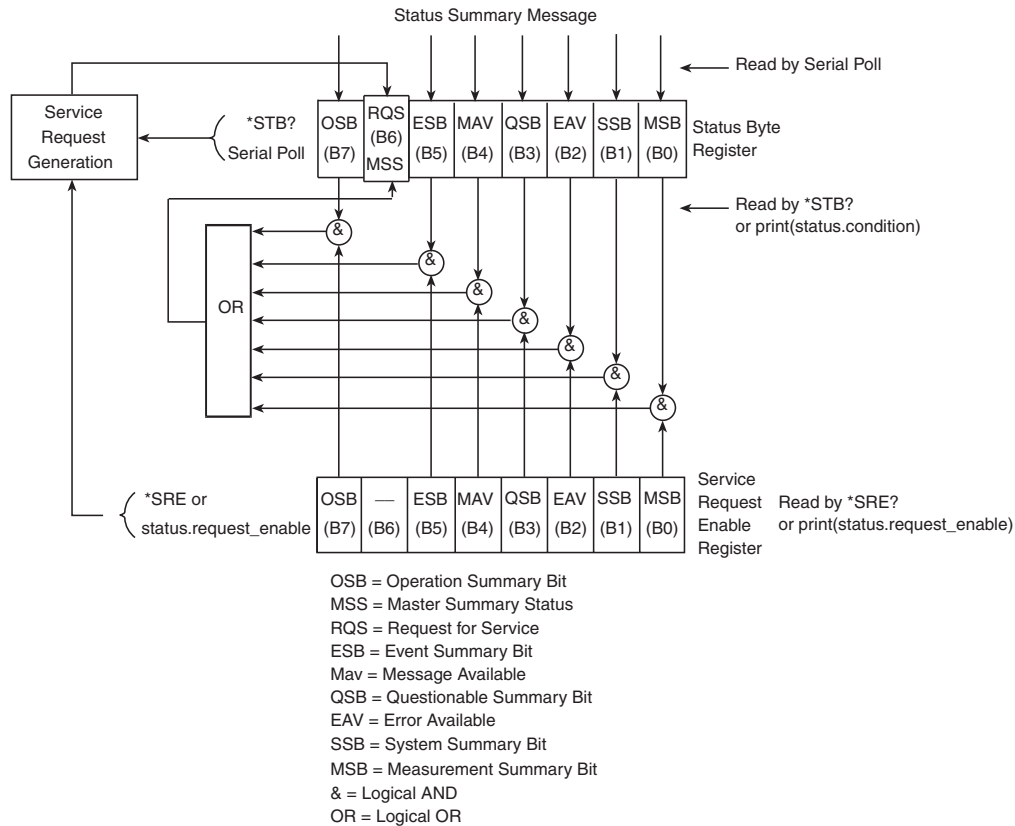

Service request is controlled by two 8-bit registers: the Status Byte Register and the Service Request Enable Register. [Figure C-10](#) shows the structure of these registers.

Status byte register

The summary messages from the status registers and queues are used to set or clear the appropriate bits (B0, B1, B2, B3, B4, B5, and B7) of the Status Byte Register. These summary bits do not latch, and their states (0 or 1) are solely dependent on the summary messages (0 or 1). For

example, if the Standard Event Register is read, its register will clear. As a result, its summary message will reset to 0, which in turn will reset the ESB bit in the Status Byte Register.

Figure C-10
Status byte and service request (SRQ)

The bits of the Status Byte Register are described as follows:

- **Bit B0, Measurement Summary Bit (MSB):** Set summary bit indicates that an enabled measurement event has occurred.
- **Bit B1, System Summary Bit (SSB):** Set summary bit indicates that an enabled system event has occurred.
- **Bit B2, Error Available (EAV):** Set bit indicates that an error or status message is present in the Error Queue.
- **Bit B3, Questionable Summary Bit (QSB):** Set summary bit indicates that an enabled questionable event has occurred.
- **Bit B4, Message Available (MAV):** Set bit indicates that a response message is present in the Output Queue.
- **Bit B5, Event Summary Bit (ESB):** Set summary bit indicates that an enabled standard event has occurred.
- **Bit B6, Request Service (RQS)/Master Summary Status (MSS):** Set bit indicates that an enabled summary bit of the Status Byte Register is set. Depending on how it is used, Bit B6 of the Status Byte Register is either the Request for Service (RQS) bit or the Master Summary Status (MSS) bit:
 - When using the GPIB serial poll sequence of the SourceMeter instrument to obtain the status byte (serial poll byte), B6 is the RQS bit. See [Serial polling and SRQ](#) for details on using the serial poll sequence.

- When using the `*STB?` common command or `status.condition` ([Table C-3](#)) to read the status byte, B6 is the MSS bit.
- **Bit B7, Operation Summary (OSB):** Set summary bit indicates that an enabled operation event has occurred.

Service request enable register

The generation of a service request is controlled by the Service Request Enable Register. This register is programmed by the user and is used to enable or disable the setting of bit B6 (RQS/MSS) by the Status Summary Message bits (B0, B2, B3, B4, B5, and B7) of the Status Byte Register. As shown in [Figure C-10](#), the summary bits are logically ANDed (&) with the corresponding enable bits of the Service Request Enable Register. When a set (1) summary bit is ANDed with an enabled (1) bit of the enable register, the logic “1” output is applied to the input of the OR gate and, therefore, sets the MSS/RQS bit in the Status Byte Register.

The individual bits of the Service Request Enable Register can be set or cleared by using the `*SRE` common command or its script equivalent. To read the Service Request Enable Register, use the `*SRE?` query or script equivalent. The Service Request Enable Register clears when power is cycled or a parameter value of 0 is sent with the `*SRE` command (i.e. `*SRE 0`). The commands to program and read the SRQ Enable Register are listed in [Table C-3](#).

Serial polling and SRQ

Any enabled event summary bit that goes from 0 to 1 will set bit B6 and generate an SRQ (service request). In your test program, you can periodically read the Status Byte to check if an SRQ has occurred and what caused it. If an SRQ occurs, the program can, for example, branch to an appropriate subroutine that will service the request.

SRQs can be managed by the serial poll sequence of the SourceMeter instrument. If an SRQ does not occur, bit B6 (RQS) of the Status Byte Register will remain cleared, and the program will simply proceed normally after the serial poll is performed. If an SRQ does occur, bit B6 of the Status Byte Register will set, and the program can branch to a service subroutine when the SRQ is detected by the serial poll.

The serial poll automatically resets RQS of the Status Byte Register. This allows subsequent serial polls to monitor bit B6 for an SRQ occurrence generated by other event types.

For common and script commands, B6 is the MSS (Message Summary Status) bit. The serial poll does not clear MSS. The MSS bit stays set until all Status Byte summary bits are reset.

SPE, SPD (serial polling)

For the GPIB interface only, the SPE, SPD General Bus Command sequence is used to serial poll the SourceMeter instrument (see [General bus commands](#)). Serial polling obtains the serial poll byte (status byte). Typically, serial polling is used by the controller to determine which of several instruments has requested service with the SRQ line.

Status byte and service request commands

The commands to program and read the Status Byte Register and Service Request Enable Register are listed in [Table C-3](#). Note that the table includes both common commands and their script command equivalents. For details on programming and reading registers, see [Programming enable and transition registers](#) and [Reading registers](#).

To reset the bits of the Service Request Enable Register to 0, use 0 as the parameter value for the command (for example, `*SRE 0`).

Table C-3
Status Byte and Service Request Enable Register commands

Command	Description
*STB? or print(status.condition)	Read Status Byte Register.
*SRE <mask> or status.request_enable = <mask>	Program the Service Request Enable Register: <mask> = 0 to 255
*SRE? or print(status.request_enable)	Read the Service Request Enable Register.

Enable and transition registers

In general, there are three types of user-writable registers that are used to configure which bits feed the register summary and when it occurs. The registers are identified in the command table footnotes as follows:

- Enable register (identified as “enable” in the table footnotes): allows various associated events to be included in the summary bit for the register.
- Negative-transition register (NTR; identified as “ntr” in the table footnotes): a particular bit in the event register will be set when the corresponding bit in the NTR is set, and the corresponding bit in the condition register transitions from 1 to 0.
- Positive-transition register (PTR; identified as “ptr” in the table footnotes): a particular bit in the event register will be set when the corresponding bit in the PTR is set, and the corresponding bit in the condition register transitions from 0 to 1.

Controlling node and SRQ enable registers

Attributes to control system node and SRQ enable bits and read associated registers are summarized in the [Status register sets](#). For example, either of the following will set the system node MSB enable bit:

```
status.node_enable = status.MSB
status.node_enable = 1
```

Status register sets

As shown in [Figure C-1](#) through [Figure C-8](#), there are five status register sets in the status structure of the SourceMeter instrument; System Summary Event Status, Standard Event Status, Operation Event Status, Measurement Event Status, and Questionable Event Status.

System Summary Event Registers

As shown in [Figure C-1](#) and [Figure C-2](#), there are five register sets associated with System Event Status. These registers summarize system status for various nodes connected to the TSP-Link (see Section 9). Note that all nodes on the TSP-Link share a copy of the system summary registers once the TSP-Link has been initialized. This feature allows all nodes to access the status models of other nodes, including SRQ.

In a TSP-Link system, the status model can be configured such that a status event in any node in the system can set the RQS (Request for Service) bit of the Master Node Status Byte. See [TSP-Link system status](#) in this appendix for details on using the status model in a TSP-Link system.

Commands for the system summary registers are summarized in [Table C-4](#).

For example, either of the following commands will set the EXT enable bit:

```
status.system.enable = status.system.EXT
```

```
status.system.enable = 1
```

When reading a register, a numeric value is returned. The binary equivalent of this value indicates which bits in the register are set. For details, see [Reading registers](#). For example, the following command will read the system enable register:

```
print(status.system.enable)
```

The used bits of the system event registers are described as follows:

- **Bit B0, Extension Bit (EXT):** Set bit indicates that an extension bit from a another system status register is set.
- **Bits B1-B14,¹ NODEn:** Indicates a bit on TSP-Link node n has been set (n = 1 to 64).

¹.status.system5 does not use bits B9 through B15.

Standard Event Register

The bits used in the Standard Event Register (shown in [Figure C-11](#)) are described as follows:

- **Bit B0, Operation Complete (OPC):** Set bit indicates that all pending selected device operations are completed and the SourceMeter instrument is ready to accept new commands. The bit is set in response to an *OPC command. The ICL function `opc()` can be used in place of the *OPC command. See [Appendix B](#) for details on *OPC.
- **Bit B1:** Not used.
- **Bit B2, Query Error (QYE):** Set bit indicates that you attempted to read data from an empty Output Queue.
- **Bit B3, Device-Dependent Error (DDE):** Set bit indicates that an instrument operation did not execute properly due to some internal condition.
- **Bit B4, Execution Error (EXE):** Set bit indicates that the SourceMeter detected an error while trying to execute a command.
- **Bit B5, Command Error (CME):** Set bit indicates that a command error has occurred. Command errors include:
 - IEEE-488.2 syntax error: The SourceMeter instrument received a message that does not follow the defined syntax of the IEEE-488.2 standard.
 - Semantic error: SourceMeter instrument received a command that was misspelled or received an optional IEEE-488.2 command that is not implemented.
 - The instrument received a Group Execute Trigger (GET) inside a program message.
- **Bit B6, User Request (URQ):** Set bit indicates that the LOCAL key on the SourceMeter instrument front panel was pressed.
- **Bit B7, Power ON (PON):** Set bit indicates that the SourceMeter instrument has been turned off and turned back on since the last time this register has been read.

Commands to program and read the register are summarized in [Table C-4](#), and bits are summarized in [Status register sets](#).

Figure C-11
Standard event register

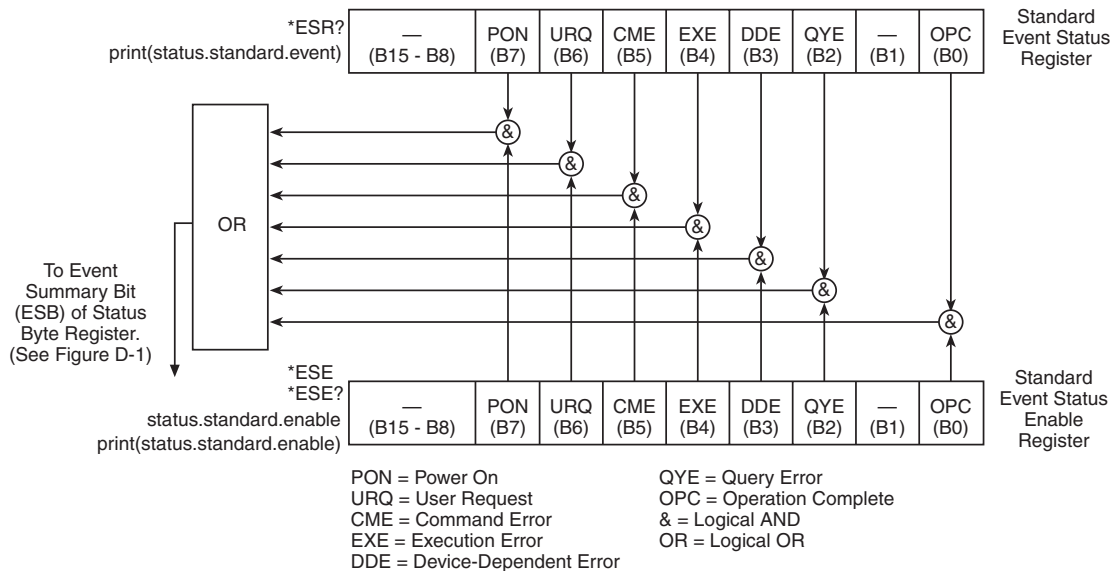

Table C-4
Standard event commands

Command	Description
<code>*ESR?</code> or <code>print(status.standard.event)</code>	Read Standard Event Status Register.
<code>*ESE <mask></code> or <code>status.standard.enable = <mask></code>	Program the Event Status Enable Register: <mask> = 0 to 255 See Status register sets .
<code>*ESE?</code> or <code>print(status.standard.enable)</code>	Read Event Status Enable Register.

Operation Event Registers

As shown in [Figure C-3](#), there are 22 register sets associated with Operation Event Status. Commands are summarized in the [Status register sets](#). Keep in mind that bits can also be set by using numeric parameter values. For details, see [Programming enable and transition registers](#).

For example, either of the following commands will set the CAL enable bit (B0):

```
status.operation.enable = status.operation.CAL
```

```
status.operation.enable = 1
```

When reading a register, a numeric value is returned. The binary equivalent of this value indicates which bits in the register are set. For details, see [Reading registers](#). For example, the following command will read the operation enable register:

```
print(status.operation.enable)
```

Operation Status Register

This register set feeds to bit B7 (OSB) of the Status Byte. The bits used in the Operation Status Register set are described as follows:

- **Bit B0, Calibrating (CAL):** Set bit indicates that one or more channels are calibrating.
- **Bit B3, Sweeping (SWE):** Set bit indicates that one or more channels are sweeping.
- **Bit B4, Measuring (MEAS):** Bit will be set when taking an overlapped measurement, but it will not set when taking a normal synchronous measurement.
- **Bit B10, Trigger Overrun (TRGOVR):** Set bit indicates that an enabled bit in the Operation Status Trigger Overrun Summary register is set.
- **Bit B11, Remote Summary (REM):** Set bit indicates that an enabled in the Operation Status Remote Summary Register is set.
- **Bit B12, User (USER):** Set bit indicates that an enabled bit in the operation status user register is set.
- **Bit B13, Instrument Summary (INST):** Set bit indicates that an enabled bit in the operation status instrument summary register is set.
- **Bit B14, Program Running (PROG):** Set bit indicates that a program is running.

For more information on the Operation Status Registers, refer to [Status register sets](#) and the charts in this appendix.

Questionable Event Registers

As shown in [Figure C-7](#), there are seven register sets associated with Questionable Event Status. Commands are summarized in the [Status register sets](#). Keep in mind that bits can also be set by using numeric parameter values. For details, see [Programming enable and transition registers](#) in this appendix.

For example, either of the following commands will set the CAL enable bit (B8):

```
status.questionable.enable = status.questionable.CAL
```

```
status.questionable.enable = 256
```

When reading a register, a numeric value is returned. The binary equivalent of this value indicates which bits in the register are set. For details, see [Reading registers](#). For example, the following command will read the questionable enable register:

```
print(status.questionable.enable)
```

For more information on the Questionable Event Registers, refer to [Status register sets](#) and the charts in this appendix.

Questionable Status Register

This register set feeds to bit B3 (QSB) of the Status Byte. The bits used in the Questionable Status Register set are described as follows:

- **Bit B8, Calibration (CAL):** Set bit indicates that calibration is questionable.
- **Bit B9, Unstable Output (UO):** Set bit indicates that an unstable output condition was detected.
- **Bit B12, Over Temperature (OTEMP):** Set bit indicates that an over temperature condition was detected.
- **Bit B13, Instrument Summary (INST):** Set bit indicates that a bit in the questionable instrument summary register is set.

For more information on the Questionable Status Register, refer to [Status register sets](#) and the charts in this appendix.

Measurement Event Registers

As shown in [Figure C-8](#), there are eight register sets associated with Measurement Event Status. Commands are summarized in the [Status register sets](#). Keep in mind that bits can also be set by using numeric parameter values. For details, see [Programming enable and transition registers](#).

For example, either of the following commands will set the VOLTAGE_LIMIT enable bit:

```
status.measurement.enable = status.measurement.VOLTAGE_LIMIT
```

```
status.measurement.enable = 1
```

When reading a register, a numeric value is returned. The binary equivalent of this value indicates which bits in the register are set. For details, see [Reading registers](#). For example, the following command will read the measurement enable register:

```
print(status.measurement.enable)
```

This register set feeds to bit B0 (MSB) of the Status Byte. The bits used in the Measurement Event Registers are described as follows:

- **Bit B0, Voltage Limit (VLMT):** Set bit indicates that the voltage limit was exceeded. This bit will be updated only when (1) a measurement is taken or (2) the `smuX.source.compliance` command is invoked.
- **Bit B1, Current Limit (ILMT):** Set bit indicates that the current limit was exceeded. This bit will be updated only when (1) a measurement is taken or (2) the `smuX.source.compliance` command is invoked.
- **Bit B7, Reading Overflow (ROF):** Set bit indicates that an overflow reading has been detected.
- **Bit B8, Buffer Available (BAV):** Set bit indicates that there is at least one reading stored in either or both of the nonvolatile reading buffers.
- **Bit B11, Output Enable (OE):** Set bit indicates that output enable has been asserted.
- **Bit B13, Instrument Summary (INST):** Set bit indicates that a bit in the measurement instrument summary register is set.

For more information on the Measurement Event Registers, refer to [Status register sets](#) and the charts in this appendix.

Register programming example

The command sequence below programs the instrument to generate an SRQ and set the system summary bit in all TSP-Link nodes when the current limit on Channel A is exceeded.

```
status.reset()                -- Clear all registers.

status.measurement.current_limit.enable = -- Enable current limit bit in
status.measurement.current_limit.SMUA    -- current limit register.

status.measurement.enable =          -- Enable status measure
status.measurement.ILMT              -- current limit bit.

status.system_enable = status.MSB     -- Set system summary; enable MSB.

status.request_enable = status.MSB    -- Enable status SRQ MSB.
```

Queues

The SourceMeter instrument uses two queues, which are first-in, first-out (FIFO) queues:

- Output queue: Used to hold response messages.
- Error queue: Used to hold error and status messages (see [Table A-2](#)).

The SourceMeter instrument status model ([Figure C-1](#)) shows how the two queues are structured with the other registers.

Output queue

The output queue holds data that pertains to the normal operation of the instrument. For example, when a `print` command is sent, the response message is placed in the Output Queue.

When data is placed in the Output Queue, the Message Available (MAV) bit in the Status Byte Register sets. A response message is cleared from the Output Queue when it is read. The Output Queue is considered cleared when it is empty. An empty Output Queue clears the MAV bit in the Status Byte Register.

A message is read from the Output Queue by addressing the SourceMeter instrument to talk.

Error queue

The Error Queue holds error and status messages. When an error or status event occurs, a message that defines the error or status is placed in the Error Queue.

When a message is placed in the Error Queue, the Error Available (EAV) bit in the Status Byte Register is set. An error or status message is cleared from the Error Queue when it is read. The Error Queue is considered cleared when it is empty. An empty Error Queue clears the EAV bit in the Status Byte Register.

The commands to control the Error Queue are listed in [Table C-5](#). When you read a single message in the Error Queue, the oldest message is read and then removed from the queue. On power-up, the Error Queue is initially empty. If there are problems detected during power-on, entries will be placed in the queue. When empty, the error number 0 and “No Error” is placed in the queue.

Messages in the Error Queue include a code number, message text, severity, and TSP-Link node number. The messages are listed in [Table A-2](#).

Table C-5
Error queue commands

Error queue command	Description
<code>errorqueue.clear()</code>	Clear error queue of all errors.
<code>errorqueue.count</code>	Number of messages in the error/event queue.
<code>errorcode, message, severity, node = errorqueue.next()</code>	Request error code, text message, severity, and TSP-Link node number.

TSP-Link system status

The TSP-Link is an expansion interface that allows the instruments to communicate with each other. The test system can be expanded to include up to 64 TSP-Link-enabled instruments. In a TSP-Link system, one node (instrument) is the Master and the other nodes are the Slaves. The Master can control the other nodes (Slaves) in the system. See [Section 14](#) for details on the TSP-Link.

The system summary registers (shown in [Figure C-1](#) and [Figure C-2](#)) are shared by all nodes in the TSP-Link system. A status event that occurs at a Slave node can generate an SRQ (service request) in the Master node. After detecting the service request, your program can then branch to an appropriate subroutine that will service the request. See [Status byte and service request \(SRQ\)](#) for details.

Status model configuration example

[Figure C-12](#) shows an example status model configuration for a TSP-Link system. In this example, a current limit (compliance) event in SMU A or SMU B of Node 15 will set the RQS bit of the Status Byte of the Master Node. The commands to configure the status model for this example are provided in [Status configuration \(enable\) commands](#) in this appendix.

When a current limit (compliance) condition occurs in SMU A or SMU B of Node 15, the following sequence of events will occur:

- **Node 15:** Bit B1 or B2 of the Measurement Event Current Limit Summary register sets when the current limit (compliance) event occurs.
- **Node 15:** Bit B1 (ILMT) of the Measurement Event Register sets.
- **Node 15:** Bit B0 (MSB) of the Status Byte sets.
- **System Summary Registers:** Bit B1 (Node 15) of the System2 Summary Register sets.

NOTE The System Summary Registers are shared by all nodes in the TSP-Link system. When a bit in a system register of Node 15 sets, the same bit in the Master Node system register also sets.

- **System Summary Registers:** Bit B0 (Extension) of the System Summary Register sets.
- **Master Node:** Bit B0 (MSB) of the Status Byte sets.
- **Master Node:** With service request enabled, bit B6 (RQS) of the Status Byte sets. When your program performs the next serial poll of the Master Node, it will detect the current limit event and can branch to a routine to service the request.

Status configuration (enable) commands

The following commands (sent from the Master Node) enable the appropriate register bits for the above example:

Node 15 status registers: The following commands enable the current limit events for SMU A and SMU B of Node 15:

```
node[15].status.measurement.current_limit.enable = 6
node[15].status.measurement.enable = 2
node[15].status.node_enable = 1
```

The affected status registers for the above commands are indicated by labels A, B and C in [Figure C-12](#).

System registers: The following commands enable the required system summary bits for Node 15:

```
status.system2.enable = 2
status.system.enable = 1
```

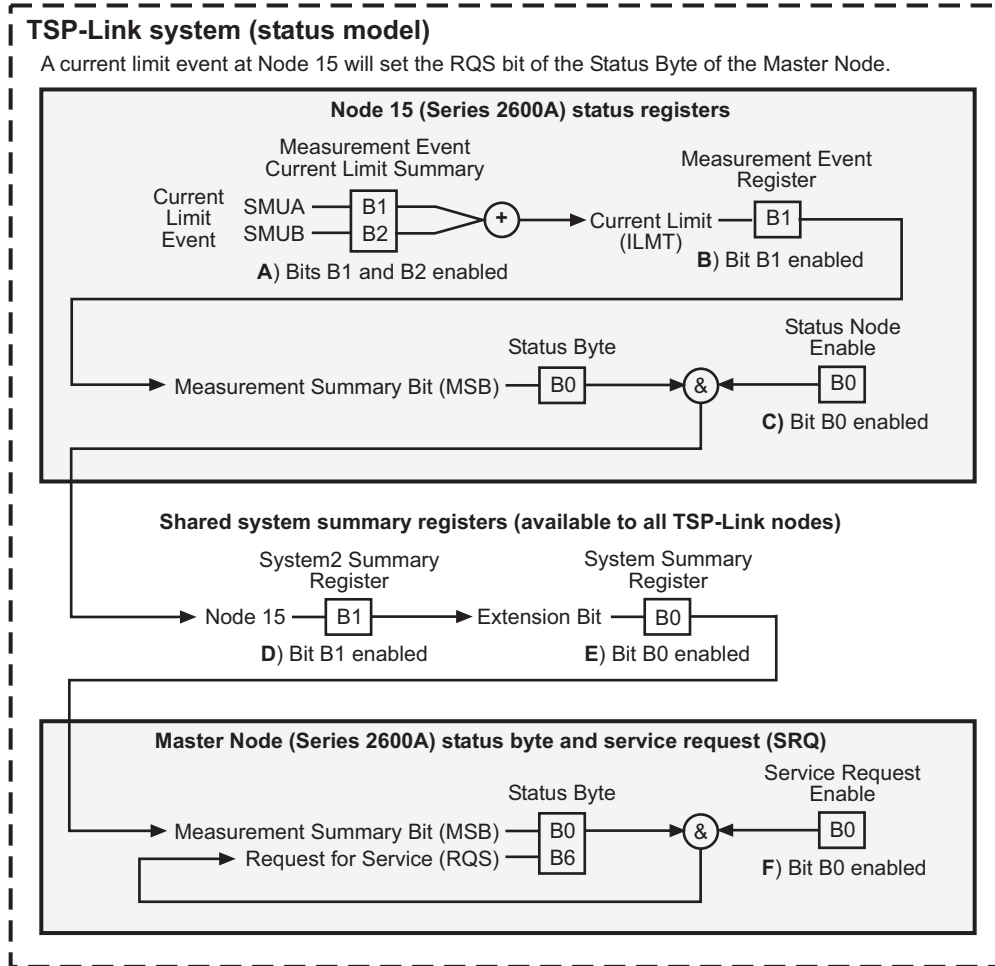

The affected system registers for the above commands are indicated by labels D and E in [Figure C-12](#).

Master Node service request: The following command enables the service request for the measurement event:

```
status.request_enable = 1
```

The affected status register for the above command is indicated by label E in [Figure C-12](#).

WARRANTY

Keithley Instruments, Inc. warrants this product to be free from defects in material and workmanship for a period of one (1) year from date of shipment.

Keithley Instruments, Inc. warrants the following items for 90 days from the date of shipment: probes, cables, software, rechargeable batteries, diskettes, and documentation.

During the warranty period, Keithley Instruments will, at its option, either repair or replace any product that proves to be defective.

To exercise this warranty, write or call your local Keithley Instruments representative, or contact Keithley Instruments headquarters in Cleveland, Ohio. You will be given prompt assistance and return instructions. Send the product, transportation prepaid, to the indicated service facility. Repairs will be made and the product returned, transportation prepaid. Repaired or replaced products are warranted for the balance of the original warranty period, or at least 90 days.

LIMITATION OF WARRANTY

This warranty does not apply to defects resulting from product modification without Keithley Instruments' express written consent, or misuse of any product or part. This warranty also does not apply to fuses, software, non-rechargeable batteries, damage from battery leakage, or problems arising from normal wear or failure to follow instructions.

THIS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE. THE REMEDIES PROVIDED HEREIN ARE BUYER'S SOLE AND EXCLUSIVE REMEDIES.

NEITHER KEITHLEY INSTRUMENTS, INC. NOR ANY OF ITS EMPLOYEES SHALL BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OF ITS INSTRUMENTS AND SOFTWARE, EVEN IF KEITHLEY INSTRUMENTS, INC. HAS BEEN ADVISED IN ADVANCE OF THE POSSIBILITY OF SUCH DAMAGES. SUCH EXCLUDED DAMAGES SHALL INCLUDE, BUT ARE NOT LIMITED TO: COST OF REMOVAL AND INSTALLATION, LOSSES SUSTAINED AS THE RESULT OF INJURY TO ANY PERSON, OR DAMAGE TO PROPERTY.
