Kenwood R1000 shortwave receiver

We have modified a Kenwood R1000 shortwave receiver with a DRM mixer which was obtained from Sat. Service Schneider in Germany.

The mixer is a 467 kHz type with crystal option.

Attached you'll find the Kenwood user manual front page, the specification,

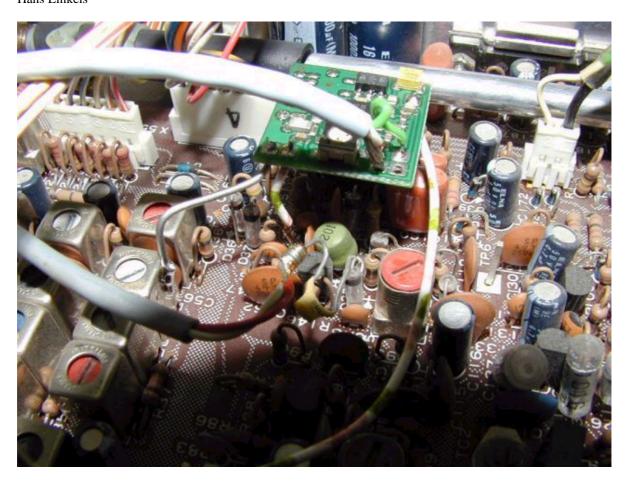

Attached you'll find the Kenwood user manual front page, the specification, the schematic, a picture of the mounting and the output spectrum.

The mixer is connected to the last IF buffer in the Kenwood receiver, on the connection of R148 with the emitter of Q24 (point A). The 'hot' connection of R148 is conveniently the upper wire of the resistor which is mounted vertically. The power connection was made at point B.

We connected the DRM modulator output to the antenna input of the Kenwood with a 40 dB attenuator inserted, and the resulting output spectrum was recorded. I think the spectrum looks quite well and usable.

Editors note: This receiver has yet to be tested and proved with the software, but this document will be updated when it has been tested

R-1000 SPECIFICATIONS

Frequency Range	200 kHz - 30.0 MHz
Mode	
Sensitivity (10 dB or more	
200 kHz-2 MHz Antenr	na impedance: 1 kΩ)
AM (NARROW, TONE:	
Center)	20µV
SSB	5µV
2 MHz - 30 MHz (Antenn	a impedance: 50(2)
AM (NARROW, TONE:	
Center)	2µV
SSB	0.5 _µ V
Image Ratio	More than 60 dB
IF Rejection	More than 70 dB
Selectivity	
AM (WIDE)	12 kHz at - 6 dB.
	25 kHz at - 50 dB
AM (NARROW)	6 kHz at - 6 dB.
	18 kHz at - 50 dB
SSB/CW	2.7 kHz at -6 dB.
	5 kHz et - 60 dB
Frequency Stability	±2 kHz max. from 1 to 60
Trequency occurry	minutes after power on
	±300 Hz max, in every
	subsequent 30 minutes
Antenna Impedance	
	1kt2 (unbalanced)
	SWA 2 MHz - 30 MHz,
	500 (Unbalanced)
	SWB 2 MHz - 30 MHz.
	1kΩ (unbalanced)
Audio Output	
	10% distortion
Audio Load	TON GISTORIO
	4 - 160, external speaker or
impedance	headphone
Power Consumption	
	100, 120, 220, 240V, AC,
rower negurements	50/60 Hz
Semiconductors	
	64 transistors, 72 diodes.
	1 display tube
Dimensions	W 300 mm /12-2/4 inch
	H 115 mm (4-1/2 inch)
	D 218 mm (8-9/16 inch)
Weight	
TT WINGS IL	D. D NY (12. 1 100)

Accuracy ±15 seconds max./month

1.1 GENERAL

To obtain maximum performance from your R-1000 receiver, it is recommended you read Sections 2 and 3 in their entirety before attempting to operate the unit.

1.2 ACCESSORIES

The	following accessory items are included:
1.	Operating manual 1 copy
2.	AC power cable 1 piece
3.	Wire for antenna
4.	Miniature Speaker plug
	Fuse (0.7A) for 100/120V operation
	or fuse (0.4A) for 220/240V operation 2 pieces
6	Remote connector (7P) 1 piece

1.3 OPERATING LOCATION

As with any solid state electronic equipment, the R-1000 should be kept from extremes of heat and humidity. Choose an operating location that is dry and cool, and avoid operating the receiver in direct sunlight.

1.4 ANTENNA

· Antenna and Grounding

Installation of antenna and grounding is important for optimum reception of short-wave, broadcast or amateur radio signals. A good outdoor antenna will provide the best results.

The following describes various antenna types and their installation.

NOTE:

A simple method is to install the supplied wire antenna as high as possible, It must be extended to its full length for good results.

Long Wire Antenna

This is the simplest antenna, using about $30\sim 1000$ feet $(10\sim 30\text{m})$ of wire installed between poles, trees or other convenient supports. The antenna wire should be heavy 8gauge vinyl insulated, stranded wire or 4-gauge copper wire or Copperweld. This type of antenna must be installed horizontally to a length of 60 feet (20m) or more, and be positioned as high as possible. Note that it should be as far away as possible from AC power lines, buildings, trees and other objects.

Fig. 1-1 shows an inverted L antenna. Other antenna types such as sloping, vertical, etc. are also possible.

A long-wire antenna, when installed in a open area, is suitable for all-band operation. (See Fig. 1-1)

Doublet Antenna

This type of antenna is suitable for reception of a specific band.

The relation between the overall length "L" and the tuned frequency is:

$$L(m) = \frac{143}{Freq (MHz)} \qquad K (feet) = \frac{468}{freq (MHz)}$$
