

INSTRUCTION MANUAL

KEPCO An ISO 9001 Company.

**KEPCO SINGLE OUTPUT, 1U, 150 WATT
HOT SWAP PLUG-IN POWER SUPPLIES**

**HSF-1UR
150W**

I — INTRODUCTION

The Kepco HSF-1UR 150 Watt Series hot swappable, high frequency switching, plug-in power supplies with built-in power factor correction (PFC) employ forward conversion and are designed to operate in a fault tolerant power system with either a-c or d-c input. A thermistor soft-start circuit limits start-up surge; an input fuse (5A, 250V) protects against shorts. A built-in forced current share circuit and OR-ing diodes allow configuration of all (except 3.3V) models for hot-swap and parallel-redundant N+1 operation.

These power supplies are designed to be used with Kepco's Series RA 19-1U rack adapters. The RA 19-1U rack adapter accepts up to four 50-, 100- or 150-Watt units (see Figure 1). All input/output connections are through a 24-pin connector that plugs in to the rack adapter. All external connections are made through the rack adapter. Surface mount technology permits efficient component layout for minimum mounting space.

Seven models may be selected for outputs of 3.3, 5, 12, 15, 24, 28 or 48V (see Table 1).

When the input is cut off, the output is maintained for 20 milliseconds minimum. If the power supply shuts down due to an output overvoltage condition, it is then necessary to wait 60 seconds minimum before turning the unit on again. EMI filtering is designed to meet FCC Class B rating and VDE 0871 Class B rating. This page contains specifications for each model of the HSF-1UR 150 Watt Series. Environmental specifications for each model are the same.

TABLE 1. OUTPUT RATINGS AND SPECIFICATIONS, HSF-1UR 150W SERIES

MODEL	HSF 3.3-30-1UR	HSF 5-30-1UR	HSF 12-12-1UR	HSF 15-10-1UR	HSF 24-6.3-1UR	HSF 28-5.3-1UR	HSF 48-3.1-1UR	
OUTPUT VOLTS, d-c (NOMINAL)	3.3V	5V	12V	15V	24V	24V	48V	
ADJUSTMENT RANGE	2.8 - 3.4V	4.3 - 5.3V	9.8 - 13.0V	12.3 - 16.5V	19.2 - 26.0V	23.0 - 30.2V	40.0 - 52.2	
OVERVOLTAGE SETTING ⁽¹⁾⁽²⁾	3.75 - 5 V	5.6 - 6.7V	13.3 - 15.5V	16.8 - 18.8V	26.5 - 30.3V	31.5 - 34.8V	54.5 - 59.8V	
OUTPUT CURRENT, MAX	30A	30A	12.5A	10A	6.3A	5.3A	3.1A	
OVERCURRENT SETTING ^{(2) (3)}	38.5 - 45.5A	33.0-39.0A	13.7-16.3A	11.0-13.0A	10.5-13.5A	5.94-7.02A	3.52-4.16A	
OUTPUT POWER, MAX ⁽⁴⁾	100W	150W	150W	150W	151.2W	151.2W	153.6W	
RIPPLE AND NOISE ⁽⁵⁾ (mV p-p) 0-40°C, 10-100% LOAD	switching (typ.)	30	30	35	40	50	60	80
	spike noise (d-c—50MHz)	120	120	150	150	200	200	300

(1) Overtemperature or overvoltage shuts down the output. Recover by recycling a-c input (30 second delay required before resetting).

(2) 25°C, Nominal. Input

(3) Hiccup mode operation. After the cause of overcurrent is removed, output voltage recovers automatically.

(4) See power rating curve, Figure 4. Exceeding maximum power rating may result in oscillation or a drop in output current or voltage.

(5) Ripple and noise will be approximately 1.5 times higher in the operating temperature range -10 to 0°C.

II — FEATURES

FRONT PANEL ACCESS. The front panel provides a power ON/OFF switch controlling input power and a "VDC ON" light which indicates when the unit is operating. **NOTE: The ON/OFF switch must be set to OFF before removing unit from rack adapter.** The front panel "MASTER ON" LED lights when 1) the unit operates independently, or 2) the unit is used in parallel redundant configurations while a) the output is less than 10% of nominal or b) the output is within 10% to 100% of nominal and the unit is functioning as a master. In parallel redundant configurations, the module with the highest voltage functions as the master. The other units are slaves, and track the output voltage of the master. Refer to **Current Share Bus (CSB)** on page 3 for details. (The "MASTER ON" LED is not used on 3.3V model; it is always off.) The front panel Vadj trimmer provides adjustment of the output voltage within the limits specified in Table 1; test points connected to the +S and -S lines are available at the front panel for measuring the output.

FORCED CURRENT SHARE CIRCUIT (Not available on 3.3V model). When units are configured for N+1 parallel redundant operation, it is desirable (but not required) for current to be divided equally among the paralleled supplies. When the CSB (forced Current Share Bus) lines of paralleled HSF-1UR units are connected together, the load current is forced to divide equally between all paralleled units. If one unit fails, the remaining units will continue to supply the load, and the load current will be divided equally among the remaining operating units. The failed unit is automatically isolated from the circuit by a built-in isolation diode. Refer to **Current Share Bus (CSB)** on page 3 for details.

ALARM CIRCUIT. The HSF-1UR includes an isolated internal relay offering normally closed and normally open contacts referenced to an isolated common. These contacts may be used to configure "close on failure" or "open on failure" alarm circuits. (Refer to the RA 19-1U Manual for alarm configurations for multiple HSF-1UR power supplies.)

KEYING. Keying of the HSF-1UR is established at the factory (see Figure 2). The output voltage determines which key pins are installed. When the proper holes in the rack adapter are blocked by keying screws installed by the user, only a power supply of the correct voltage can be inserted in the rack adapter slot. (Refer to the RA 19-1U Manual for rack adapter keying instructions.)

III — SPECIFICATIONS

The following specifications apply to HSF-1UR 150 Watt Series models (also refer to Table 1). Other models are also available; consult your Kepco representative for their specifications.

INPUT:

Voltage: 100-120V a-c, 200-240V a-c nominal; Range 90-264V a-c; 130-370V d-c. (polarity insensitive; consult factory)
 Frequency: Nominal 50-60 Hz; Range 47-440Hz (from 66 to 440Hz leakage current exceeds UL/VDE safety spec.limit).
 Current (nominal output at 100% load):
 @100-120V a-c rms, 1.9A a-c rms max. (3.3V model: 1.6A rms max.; 24V Model: 2.7A rms typ. @100 Va-c input, peak output)
 @200-240V a-c rms: 1.0A a-c rms max. (3.3V model: 0.85A rms max.; 24V Model: 1.1A rms typ. @240 Va-c input, peak output)
 Initial Turn-on Surge: (cold start 25 °C, first surge only, not including the current flow into the EMI filter):
 @100V a-c rms, 14A typ., @200V a-c rms, 28A typ.
 Switching Frequency: 135KHz typical, PFC boost converter: 80KHz typical, nominal load

STABILIZATION:

Source Effect (85 to 132Va-c, 170-265 Va-c): 0.1% typ., 0.2% max.
 Load Effect (10% - 100% of rated output current): 0.2% typ., 0.4% max.
 Temperature Effect (Range -10 to 71°C): 0.5% typ., 1.0% max.
 Combined Effect (source, load, temperature): 0.9% typ., 1.8% max.
 Time Effect (drift): (1/2 to 8 hr. at 25°C) 0.2% typ., 0.5% max.

RECOVERY CHARACTERISTICS: A step load change from 50% to 100% produces less than $\pm 4\%$ output excursion. Recovery occurs to within $\pm 1\%$ of the original setting in < 2 ms (load change t_r or t_f equal to or greater than 50 μ sec).

START-UP TIME: 220mS. typ., 300mS max. @100V a-c; 120mS typ., 200mS max. @ 240V a-c (between 0 and 40° C).

ACCEPTABLE LOAD CAPACITANCE: (Start-up time is affected.) 3.3V-28V models: 100,000uF max; 48V model: 50,000uF max.

HOLDUP TIME: 35 mS. typ. (3.3V Model: 50mS typ.) @100V a-c; 40mS. typ.(3.3V Model: 50mS typ.) @240V a-c.

DIELECTRIC STRENGTH: (at 15 to 35°C ambient, 10 to 85% relative humidity):

Between input and output: 3KV a-c for one minute, cutout current 10ma..
 Between input and ground: 2KV a-c for one minute, cutout current 10ma.
 Between output and ground: 500V a-c for one minute, cutout current 20ma.

INSULATION RESISTANCE: Between input and ground, output and ground, input and output, \pm RC terminals and input, \pm RC terminals and output: 100 Megohms min. (500V d-c).

LEAKAGE CURRENT:

0.29mA typ, 0.45mA max at 100V a-c, 60 Hz (operating in conformance with Den-An).
 0.40mA typ, 0.65mA max at 240V d-c and 60 Hz (operating in conformance with IEC 950 and UL1950).

SAFETY: Designed to meet EN 60950:2001 Assistance for DEN-AN. U.S. UL 60950 First Edition.; Canada: CSA-22.2 No.60950-1. (ambient temp. 50°C). units are CE marked per the Low Voltage Directive (LVD), EN60950 73/23/EEC AND 93/68/EEC. [The standards do not apply with DC input operation.]

I/O CONNECTOR: The 24-pin I/O connector (Figure 2) mates with the corresponding connector in the RA 19-1U Rack Adapter.

(+) SENSE, (-) SENSE: These lines are provided to compensate for voltage drops in the load connecting wires. The Sense lines must be connected to their respective (+) and (-) output terminals, either at the load or at the rack adapter (see Rack Adapter Manual). The connection ensures the most accurate error tracking.

NOTE:

The Sense lines must be connected for the HSF-1UR Power supply to work properly!

Compensation per lead = (min. overvoltage - max.adjustment range)/2; refer to Table 1. Compensation for 3.3V Model is 0.1V per lead. Higher compensation values are possible if output voltage is decreased below the maximum adjustment range shown in Table 1. Load wire length should not be more than 16.4ft. (5m). Transient recovery specs may not be met when remote sensing is used. To prevent oscillations and premature tripping of overvoltage protection, install one electrolytic (not tantalum) capacitor (470mF min) between +S and +V and one between \pm S terminals.

OUTPUT (+), OUTPUT (-): HSF-1UR power supply d-c output.

INPUT POWER: Line (either a-c or d-c source power) , Neutral and Ground (chassis)

CURRENT SHARE BUS (CSB): (Not available on 3.3V models.) Connecting the CSB lines of HSF-1UR power supplies operating in a parallel configuration causes output current to be shared equally. (See Rack Adapter Manual for additional information on parallel configurations.) For current sharing to work properly the outputs of all paralleled units must be within 250 mV (max) of each other and each unit must be operating at between 10% to 100% of rated output. If current to the load goes below 10% for each unit in current share mode, all MASTER ON lights may go on (see load effect specifications); this indicates that forced current share is no longer working, units are simply in current share mode. (If forced current sharing at less than 10% nominal current per supply is needed, contact Kepco application engineering.) Remote sensing is recommended. For master/slave operation to work properly each unit should be adjusted to 40 mV (optimum) less than the next paralleled unit (unit 1 is adjusted to VOUT, unit 2 to VOUT – 40mV, and unit 3 to VOUT – 80mV, etc. If the master fails, unit 2 will become the new master). The 40 mV difference can be reduced to a minimum of 25 mV as needed to parallel many units and still keep all units within 250 mV of each other. Adjust the outputs using Vadj trimmer on front panel.

- Optimum difference among output voltages of paralleled units: 40mV
- Maximum difference among output voltages of paralleled units: 250 mV
- Minimum difference among output voltages of paralleled units: 25 mV

ALARM: The Alarm NC (normally closed) - Open on Failure and Alarm NO (normally open) - Close on Failure lines are relay contacts referenced to Alarm Common. If the unit fails, the path between Alarm NC - Open on Failure and Alarm Common opens, the path between Alarm NO - Close on Fail and Alarm Common is a short circuit. Figure 3 illustrates typical Close on Fail and Open on Fail circuits to give a failure indication if any one of a number of power supplies fail; refer to RA 19-1U manual for complete information regarding other configurations. Units are shipped so that the alarm will trip and shutdown will occur upon overvoltage, open sense line and fan failure (fan failure shutdown can be disabled, see **COOLING** below and Figure 5). The alarm will also trip upon undervoltage, however shutdown may not occur, depending on the load. After shutdown occurs, a 60 second delay (minimum) is required before turning the unit on again.

Forced shutdown upon fan failure can be disabled by installing a jumper, Kepco P/N 172-0382 (Digikey P/N A26231-N) as shown in Figure 5. This allows the unit to continue to operate with the fan inoperative (see Figure 4 for safe operating conditions); the alarm signals noted above will report an alarm condition, and the VDC ON indicator will either light red (fan supply voltage missing) or flicker between red and green (mechanical failure). If the jumper is installed, the user is responsible for either reducing the load to within the specifications given in Figure 4, or shutting down the unit using the alarm signals provided.

COOLING: All models use forced convection, ball-bearing fans, life expectancy 50,000+ hours. Natural convection can be used if the load does not exceed 50% of max. (see Figure 4). Simply disconnect the fan and install jumper J1 (see Figure 5); the alarm signals described above are disabled and VDC ON lights red; overvoltage and open sense line conditions still force unit shutdown. Contact Kepco's Application Engineering for full-featured natural convection-cooled units.

REMOTE-ON: This model is capable of remote on and off functionality with slight alterations. Contact factory for detailed instructions.

FIGURE 2. REAR CONNECTOR PIN ASSIGNMENTS

FIGURE 3. TYPICAL ALARM CIRCUIT DIAGRAMS

EMI: Designed to meet FCC Class B (100-120V a-c) and VDE 0871 Class B (220-240V a-c).

VIBRATION: (non-operating, one hour on each one of the three axes):
5-10 Hz, 10 mm amplitude; 10-55 Hz, 2g acceleration.

SHOCK: (non-operating, one-half sinusoidal pulse, three shocks to each axis): Acceleration: 20g, Duration: 11ms ±5ms

OPERATING TEMPERATURE: See Figure 4.

STORAGE TEMPERATURE: -40°C to +75°C.

RELATIVE HUMIDITY: Operating and storage: 10% to 95% (wet bulb temp. <35°C non-condensing).

FUSE: Quick acting 5.0A, 250V; (5.2 x 20mm), (Littelfuse P/N 215005PF, Kepco P/N 541-0134).

DIMENSIONS: See Figure 5.

WARRANTY: 5 years.
