

# LeCroy Color Digital Oscilloscopes

## LC564DL

### Service Manual

Version B- September 2002

The LeCroy logo, consisting of the word "LeCroy" in a bold, blue, sans-serif font. The letter "C" is stylized with a horizontal bar extending to the right.

### **LeCroy Corporate Headquarters**

700 Chestnut Ridge Road  
Chestnut Ridge, NY 10977-6499  
USA

Tel : (845) 425-2000  
<http://www.lecroy.com>

### **LeCroy European Service**

LeCroy SA  
2, Chemin Pre-de-la Fontaine  
CH-1217 Meyrin 1 Geneva  
Switzerland

Tel : 41 (22) 719-21-11

### **LeCroy Japan Service**

LeCroy Japan Corporation  
Sasazuka Center Bldg – 6th floor,  
1-6, 2-Chome, Sasazuka, Shibuya-ku  
Tokyo Japan 151-0073

Tel. (81) 3 3376 9400

# 1. Warranty and Product Support

It is recommended that you thoroughly inspect the contents of the oscilloscope packaging immediately upon receipt. Check all contents against the packing list/invoice copy shipped with the instrument. Unless LeCroy is notified promptly of any missing or damaged item, responsibility for its replacement cannot be accepted. Contact your nearest LeCroy Customer Service Center or national distributor immediately (see chapter 2 for *contact numbers*).

## 1.1 Warranty

LeCroy warrants its oscilloscope products for normal use and operation within specifications for a period of three years from the date of shipment. Calibration each year is recommended to ensure in-spec. performance. Spares, replacement parts and repairs are warranted for 90 days. The instrument's firmware has been thoroughly tested and is thought to be functional, but is supplied without warranty of any kind covering detailed performance. Products not made by LeCroy are covered solely by the warranty of the original equipment manufacturer.

Under the LeCroy warranty, LeCroy will repair or, at its option, replace any product returned within the warranty period to a LeCroy authorized service center. However, this will be done only if the product is determined after examination by LeCroy to be defective due to workmanship or materials, and not to have been caused by misuse, neglect or accident, or by abnormal conditions or operation.

## 1.2 Product Assistance

*Note: This warranty replaces all other warranties, expressed or implied, including but not limited to any implied warranty of merchantability, fitness, or adequacy for any particular purpose or use. LeCroy shall not be liable for any special, incidental, or consequential damages, whether in contract or otherwise. The client will be responsible for the transportation and insurance charges for the return of products to the service facility. LeCroy will return all products under warranty with transport prepaid.*

Help on installation, calibration, and the use of LeCroy equipment is available from the LeCroy Customer Service Center in your country.

## 1.3 Maintenance Agreements

LeCroy provides a variety of customer support services under Maintenance Agreements. Such agreements give extended warranty and allow clients to budget maintenance costs after the initial three-year warranty has expired. Other services such as installation, training, enhancements and on-site repairs are available through special supplemental support agreements.

## 1.4 Staying Up to Date

LeCroy is dedicated to offering state-of-the-art instruments, by continually refining and improving the performance of LeCroy products. Because of the speed with which physical modifications may be implemented, this manual and related documentation may not agree in every detail with the products they describe. For example, there might be small discrepancies in the values of components affecting pulse shape, timing or offset, and — infrequently — minor logic changes. However, be assured the scope itself is in full order and incorporates the most up-to-date circuitry. LeCroy frequently updates firmware and software during servicing to improve scope performance, free of charge during warranty. You will be kept informed of such changes, through new or revised manuals and other publications.

**Nevertheless, you should retain this, the original manual, for future reference to your scope's unchanged hardware specifications.**

## 1.5 Service and Repair

Please return products requiring maintenance to the Customer Service Department in your country or to an authorized service facility. The customer is responsible for transportation charges to the factory, whereas all in-warranty products will be returned to you with transportation prepaid. Outside the warranty period, you will need to provide us with a purchase order number before we can repair your LeCroy product. You will be billed for parts and labor related to the repair work, and for shipping.

## 1.6 How to return a Product

Contact the nearest LeCroy Service Center or office to find out where to return the product. All returned products should be identified by model and serial number. You should describe the defect or failure, and provide your name and contact number. In the case of a product returned to the factory, a Return Authorization Number (RAN) should be used.

Return shipments should be made prepaid. We cannot accept COD (Cash On Delivery) or Collect Return shipments. We recommend air-freighting.

It is important that the RAN be clearly shown on the outside of the shipping package for prompt redirection to the appropriate LeCroy department.

## 1.7 What Comes with Your Scope

The following items are shipped together with the standard configuration of this oscilloscope:

- Front Scope Cover
- 10:1 10 M $\Omega$  PP005 Passive Probe — *one per channel*
- PP096 8GS/s adapter
- Two 250 V Fuses, AC Power Cord and Plug
- *Operator's Manual, Remote Control Manual, Hands-On Guide*
- Performance Certificate or Calibration Certificate, Declaration of Conformity

***Note: Wherever possible, please use the original shipping carton. If a substitute carton is used, it should be rigid and packed so that the product is surrounded by a minimum of four inches or 10 cm of shock-absorbent material.***

## 2. General Information

### 2.1 Product Assistance

Help on installation, calibration, and the use of LeCroy equipment is available from your local LeCroy office, or from LeCroy's

- Customer Care Center, 700 Chestnut Ridge Road, Chestnut Ridge, New York 10977-6499, U.S.A., tel. (914) 578-6020
- European Service Center, 2, rue du Pré-de-la-Fontaine, 1217 Meyrin 1, Geneva Switzerland, tel. (41) 22/719 21 11.
- LeCroy Japan Corporation, Sasazuka Center Bldg – 6<sup>th</sup> floor, 1-6, 2-Chome, Sasazuka, Shibuya-ku, Tokyo Japan 151-0073, tel. (81) 3 3376 9400

### 2.2 Installation for Safe and Efficient Operation

#### Operating Environment

The oscilloscope will operate to its specifications if the environment is maintained within the following parameters:

Temperature .....5 to 40 °C (41 to 104 °F) rated.

Humidity .....Maximum relative humidity 80 % RH (non-condensing) for temperatures up to 31 °C decreasing linearly to 50 % relative humidity at 40 °C

Altitude .....2000 m (6560 ft)

The oscilloscope has been qualified to the following EN61010-1 category:

Installation (Overvoltage) Category II

Pollution Degree .....2

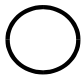

#### Safety Symbols

Where these symbols or indications appear on the front or rear panels, and in this manual, they have the following meanings:

 ..... **CAUTION:** Refer to accompanying documents (for Safety-related information). See *elsewhere in this manual wherever the symbol is present, as indicated in the Table of Contents.*

 ..... **CAUTION:** Risk of electric shock

 ..... **On (Supply)**

 ..... **Off (Supply)**

 ..... **Earth (Ground) Terminal**

 ..... **Protective Conductor Terminal**

 ..... **Earth (Ground) Terminal on BNC Connectors**

**WARNING** ..... Denotes a hazard. If a **WARNING** is indicated on the instrument, do not proceed until its conditions are understood and met.

  
**WARNING**

**Any use of this instrument in a manner not specified by the manufacturer may impair the instrument's safety protection.**

The oscilloscope has *not* been designed to make direct measurements on the human body. Users who connect a LeCroy oscilloscope directly to a person do so at their own risk.

---

## Power Requirements

The oscilloscope operates from a 115 V (90 to 132 V) or 220 V (180 to 250 V) AC power source at 45 Hz to 66 Hz. No voltage selection is required, since the instrument automatically adapts to the line voltage present.

The power supply of the oscilloscope is protected against short-circuit and overload by means of two 6.3 A/250 V AC, "T" rated fuses (size: 5 X 20 mm), located above the mains plug. Disconnect the power cord before inspecting or replacing a fuse. Open the fuse box by inserting a small screwdriver under the plastic cover and prying it open.

For continued fire protection at all line voltages, replace only with fuses of the specified type and rating (T 6.3 A/250 V).

Maintain the ground line to avoid an electric shock.

None of the current-carrying conductors may exceed 250 V rms with respect to ground potential. The oscilloscope is provided with a three-wire electrical cord containing a three-terminal polarized plug for mains voltage and safety ground connection.

The plug's ground terminal is connected directly to the frame of the unit. For adequate protection against electrical hazard, this plug must be inserted into a mating outlet containing a safety ground contact.

## Cleaning And Maintenance

Maintenance and repairs should be carried out exclusively by a LeCroy technician (see Chapter 2). Cleaning should be limited to the exterior of the instrument only, using a damp, soft cloth. Do not use chemicals or abrasive elements. Under no circumstances should moisture be allowed to penetrate the oscilloscope. To avoid electric shocks, disconnect the instrument from the power supply before cleaning.

CAUTION

**Risk of electrical shock:  
No user serviceable parts  
inside. Leave repair to  
qualified personnel.**

## Power On

Connect the oscilloscope to the power outlet and switch it on by pressing the power switch located on the rear panel. After the instrument is switched on, auto-calibration is performed and a test of the oscilloscope's ADCs and memories is carried out. The full testing procedure takes approximately 10 seconds, after which time a display will appear on the screen.

### 3. LC564DL Specifications

#### 3.1 Signal Capture

##### Acquisition System

**Bandwidth** (-3 dB):

@ 50 $\Omega$ : DC to 1 GHz

@ 1 M $\Omega$  DC: Bandwidth dependent on probe used

**No. of Channels:** 4

**Sample Rate:** 2 GS/s (4 ch); 4 GS/s (2 ch)

**Sensitivity:**

50 $\Omega$  : 2 mV/div to 1 V/div

1M $\Omega$  : 2 mV/div to 2 V/div

**Scale factors:** Choice of over 12 probe attenuation factors selectable via front panel menus.

**Offset Range:**

2.0 - 4.99 mV/div:  $\pm 400$  mV

5.0 - 99 mV/div (50 $\Omega$  only) :  $\pm 1$  V

5.0 - 100 mV/div (1 M $\Omega$  only) :  $\pm 1$  V

0.1 - 1.0V/div (50 $\Omega$  only):  $\pm 10$  V

102 mv - 2.0V/div (1 M $\Omega$  only):  $\pm 20$  V

$\pm 20$  V across the whole sensitivity range when using the AP020/AP022 FET probe.

**DC Accuracy:** typical  $\pm 2\%$  of full scale + 1% offset setting.

**Vertical Resolution:** 8 bits.

**Bandwidth Limiter:** 25 MHz, or 200MHz user selectable

**Input Coupling:** AC (> 10Hz typ.), DC, GND.

**Input Impedance:** 10M $\Omega$ //11pF (system capacitance using PP005) or 50  $\Omega$   $\pm 1.25\%$ .

**Max Input:** 50 $\Omega$ :  $\pm 5$ V DC (500mW) or 5V RMS.

1M $\Omega$ : 100 V (DC+ peak AC  $\leq 10$  kHz).

##### Acquisition System Configuration

Active Channels	Maximum Sample Rate	Maximum Record Length
4	2 GS/s	1 M
2	4 GS/s	2 M
1	4 GS/s	2 M

### 3.2 Acquisition Modes

**Random Interleaved Sampling (RIS):** 25GS/s.

For repetitive signals from 200 ps/div to 1  $\mu$ s/div.

**Single shot:** For transient and repetitive signals from 1 ns/div (2 Ch), 2 ns/div (4Ch)

**Sequence:** Stores multiple events- each of them time stamped- in segmented acquisition memories.

**Dead Time Sequence mode:** Typically 30  $\mu$ s

**Number of segments available** 2-2000,

### 3.3 Timebase System

**Timebases:** Main and up to 4 Zoom Traces.

**Time/Div Range:** 1ns/div (at 4 GS/s), 2ns/div (at 2 GS/s) to 1,000 s/div.

**Clock Accuracy:**  $\leq 10$  ppm.

**Interpolator resolution:** 10 ps.

**Roll Mode in normal trigger mode:** 500 ms to 1,000 s/div.

**External Clock:** Optional (CKTRIG) Zero crossing level DC to 500 MHz rear panel fixed frequency clock input (<20 ns rise/falltime)

**External Reference:** Optional (CKTRIG) 10 MHz rear-panel input.

### 3.4 Triggering System

**Trigger Modes:** Normal, Auto, Single, and Stop.

**Trigger Sources:** CH1, CH2, CH3, CH4, Line, Ext, Ext/5. Slope.

Level and Coupling are unique for each source.

**Slope:** Positive, Negative, Bi-Slope (Window in & out)

**Coupling:** AC (-3db at <10Hz), DC, HF (175 MHz to 1GHz), LFREJ (>50KHz), HFREJ (<100MHz).

**Pre-trigger recording:** 0 to 100% of full scale (adjustable in 1% increments).

**Post-trigger delay:** 0 to 10,000 divisions (adjustable in 0.1 div increments).

**Holdoff by time:** 2 ns to 20 s.

**Holdoff by events:** 1 to 99,999,999.

**Internal Trigger Range:**  $\pm 5$  div.

**Maximum Trigger Frequency:** 1 GHz (DC, AC), > 1.5 GHz (HF)

**EXT Trigger Max Input:** 1M $\Omega$ //20pF: 100V (DC + peak AC $\leq$  10kHz)

50 $\Omega$   $\pm 3\%$ :  $\pm 5$  V DC (500 mW) or 5 V RMS.

**EXT Trigger Range:**  $\pm 0.5$  V ( $\pm 2.5$  V with Ext/5).

**Trigger Output:** Optional ECL rear panel output (option CKTRIG). The calibrator output can provide a trigger status or a Pass/Fail test output.

---

### 3.5 Smart Trigger Types

**Pattern:** Trigger on the logic combination of 5 inputs - CH1, CH2, CH3, CH4 and EXT Trigger, where each source can be defined as High, Low or Don't Care.

The Trigger can be defined as the beginning or end of the specified pattern

**Signal or Pattern Width:** Trigger on glitches as short as 600 ps or on pulse widths Within/outside two limits selectable from 600 ps to 20 s.

**Slew Rate:** Trigger on rising, falling edges within/outside two time limits selectable from 600 ps to 20 s.

**Signal or Pattern Interval:** Trigger on an interval between two limits selectable from 2ns to 20s.

**Dropout:** Trigger if the signal drops out for longer than a time-out from 2 ns to 20s.

**Runt:** Trigger on positive or negative Runts within/outside two limits selectable from 600 ps to 20 s.

**State/Edge Qualified:** Trigger on any source only if a given state (or transition) has occurred on another source. The delay between these events can be defined as a number of events on the trigger channel or as a time interval.

**TV:** Allows selection of up to 1500 lines and field synchronization for PAL, SECAM, NTSC or non-standard video

**Exclusion Triggering:** Trigger on intermittent faults by specifying the normal width, period, risetime or amplitude of a signal.

The oscilloscope will trigger only on aberrations.

### 3.6 Autosetup

Automatically sets sensitivity, vertical offset and timebase on all display channels.

**Autosetup Time:** Approximately 3 seconds.

**Vertical Find:** Automatically sets sensitivity and offset for selected channel.

### 3.7 Probes

**Model:** One PP005 probe is supplied per channel. DC to 500 MHz typical at probe tip, 500 V max.

**Optional Probes:** 2.5 Ghz FET probe AP022, 1 GHz FET probe (AP020); 1 GHz active differential probe (AP034), 500 MHz active differential probe (AP033).

**Probe calibration:** Max 1 V into 1 M $\Omega$ , 500 mV into 50  $\Omega$ , frequency and amplitude programmable, pulse or square wave selectable, rise and fall time 1 ns typical. Alternatively, the Calibrator output can provide a trigger output or a Pass/Fail test output.

### 3.8 Display

**Type:** Color 10.4" TFT-LCD.

**Resolution:** VGA (640X480 pixels)

**Display Area:** 212mm x 160mm

**Controls:** Menu controls for brightness and color selection.

**Grid Styles:** Single, Dual, Octal, XY, Single+XY, Dual+XY, and Full Screen  
An enlarged view of each grid style.

**Graticules:** Internally generated; separate intensity control for grids and waveforms. Selectable blending of grid with displayed traces.

**Waveform Style:** Dot-joint with optional sample point highlight or Dots-only.

**Persistence Modes:** Color-graded persistence and Analog Persistence, infinite or variable with decay over time. In color-graded persistence, a color spectrum from red through violet is used to map signal intensity. With Analog Persistence, the brightness level of a single color denotes signal intensity. Each trace's persistence data is stored in 64K levels.

**Trace Display:** Opaque or transparent mode, with overlap management.

**Number of Traces:** 8 (supports a mix of channels, memories or math functions).

**Real-time Clock:** Date, hours, minutes, seconds.

**External Monitor:** Rear panel 15-pin socket for VGA compatible monitor.

**Vertical Zoom:** Up to 5x Vertical Expansion (50x with averaging, up to 40  $\mu$ V/div sensitivity).

**Horizontal Zoom:** Waveforms can be expanded to 0.4 points/division.

**Auto Scroll:** Use Auto Scroll to automatically "Play" the captured signal to identify anomalies quickly and easily. With a selectable zoom expansion and scrolling speed, you can set up Auto Scroll to match your signal viewing needs.

The scrolling speed can be adjusted during the scan to focus on the more interesting characteristics of the signal.

"REVERSE" enables you to quickly review any part of the signal.

### 3.9 Rapid Signal Processing

**Microprocessor:** 96 MHz PowerPC 603e

**System RAM:** 16 Mbytes

**Video Memory:** 1 Mbyte

**Persistence Data Map Memory:** 16 bits per displayed pixel (64k levels).

---

### 3.10 Waveform Processing

Up to four processing functions may be performed simultaneously. Functions available are: Add, Subtract, Multiply, Divide, Negate, Identity, Summation Averaging, Sine x/x, Integral, Derivative, Square Root, Ratio, Absolute Value and the advanced functions listed below.

**Average:** Summed averaging up to one million sweeps.

**Extrema:** Roof, Floor, or Envelope values up to one million sweeps.

**ERES:** Low-Pass digital filters provide up to 11-bit vertical resolution.

Sampled data is always available, even when a trace is turned off.

**FFT:** Spectral Analysis with four windowing functions and FFT averaging.

**Statistical Diagnostics:** The Parameter Analysis package permits in-depth diagnostics on waveform parameters. Live histogramming and trending of any waveform parameter measurement is possible. The histogram can be auto-scaled to display the center and width of the distribution. This package is only standard on the LC584 Series.

#### Internal Memory

**Waveform Memory:** Up to four 16-bit memories (M1, M2, M3, M4).

**Zoom & Math Memory:** Up to four 16-bit Waveform Processing memories (A,B,C,D), whose length corresponds to the length of the channel acquisition memory.

**Setup Memory:** Four non-volatile memories. The floppy drive and optional cards or disks may also be used for high-capacity waveform and setup storage.

#### Cursor Measurements

**Relative Time:** A pair of arrow cursors measures time differences and voltage differences relative to each other.

**Relative Voltage:** A pair of line cursors measures voltage differences relative to each other.

**Absolute Time:** A cross-hair marker measures time relative to the trigger and voltage with respect to ground.

**Absolute Voltage:** A reference bar measures voltage with respect to ground.

#### PASS/FAIL:

Pass/Fail testing allows any five items (parameters and/or masks) to be tested against selectable thresholds. Waveform Limit Testing is performed using Masks which may be defined either inside the instrument or by downloading templates created on a PC. Any failure will cause pre-programmed actions, such as Hardcopy, Save to Internal Memory, Save to mass storage device (card or disk), GPIB SRQ or Pulse Out.

### 3.11 Interfacing

**Remote Control:** All front-panel controls as well as all internal functions are possible by GPIB and RS-232-C.

**RS-232-C Port (Standard):** Asynchronous up to 115.2 kBaud for computer/terminal control or printer/plotter connection.

**GPIB Port (Standard):** (IEEE-488.2) Configurable as talker/listener for computer control and fast data transfer.

**Centronics Port (Standard):** Hard copy parallel interface.

**Hard copy:** Screen dumps are activated by a front-panel button or via remote control.

**Supported printers:**

**B/W:** LaserJet, DeskJet, Epson

**Color:** DeskJet 550C, Epson Stylus, Canon 200/600/800 series.

An optional, internal high-resolution graphics printer is also available for screen dumps; strip-chart output formats up to 2 m/div are achievable.

**Hard Copy Formats:** TIFF b/w, TIFF color, BMP color and BMP compressed.

**Output Formats:**

The ASCII waveform output and is compatible with spreadsheets, MATLAB, MathCad. Binary output is also available.

### 3.12 General

**Auto-calibration** Ensures specified DC and timing accuracy.

**Recommended Factory Calibration Interval:** 1 year

**Temperature:** 5° to 40°C rated accuracy (41° to 104°F).

0° to 45°C operating (32° to 113°F).

**Humidity:** <80% non-condensing.

**Altitude:** Up to 2000 m (operating), 12,000 m (non-operating).

**Shock and Vibration:** Conforms to selected sections of MIL-PRF-28800F, Class 3.

**Power:** 90-250 V AC, 45-66 Hz, 350 VA

**Battery Backup:** Front-panel settings maintained for two years.

**Dimensions:**(HWD) 10.4" x 15.65" x 17.85", 264 mm x 397 mm x 453 mm

**Weight:** Typ. 16 kg (35 lbs) net, typ. 24 kg (53 lbs) shipping.

**Warranty:** Three years.

### 3.13 CE Approval

**EMC:** Conforms to EN50081-1 (Emissions) and EN50082-1 (Immunity)

**Safety:** The oscilloscope has been designed to comply with EN61010-1 Installation Category (Over-voltage category) II, 300V, Pollution degree 2.

**UL and cUL approval:** UL Standard: UL 3111-1; cUL Canadian Standard CSA-C22.2 No. 1010. 1-92.

## 4. Theory of Operation

### 4.1 Processor Board : F9601-11-16

#### MPC603e Processor

This processor board is based on the Power MPC603e processor.

It is a 64-bit RISC processor with 2x32kbyte cache. It features high speed processing and fast memory accesses.

The F9601-11-16 processor is set to an internal clock of 96MHz and is used in a 32-bit mode.

There are two “worlds” on the board:

- the 32-bit world, including the main PowerPC processor, the dynamic RAM modules and the VGA interface;
- the 8 or 16-bit world, including all other on-board peripherals, external small peripherals and acquisition board.

A MC68150 dynamic bus sizer is used as an interface between the two worlds.

#### Power Supplies

The board uses three power supplies from the main acquisition board: Vcc, +15V and -15V. Vee is wired on a connector for board test purposes.

The +15V supply OP-amps on the 9601-11 board, and +15V and -15V supply small peripherals.

The current processor needs a 3.3V power supply, all the rest of the logic needs 5V. All signals are TTL compatible.

The PLL circuit (88916) generates a PLL\_LOCK signal, which is used to clamp the 3.3V and 2.5V references as long as the 32MHz clock is not stable. The processor also needs to be protected against too big voltage differences between 2.5V and 3.3V (diodes on the reference).

An OP-amp and a MOSFET transistor for each power supply are used. The reference voltages are taken directly from the 5V power supply by a resistive divider.

Capacitors and a few diodes ensure that the supplies do not exceed dangerous levels at power-up, nor rise too fast.

#### 32-bit Peripherals

There are only three devices hooked up on to the processors 32-bit data bus:

- the VGA video controller
- the DRAM system
- the bus sizer, bridge to the 68k-like world

## Processor Block Diagram

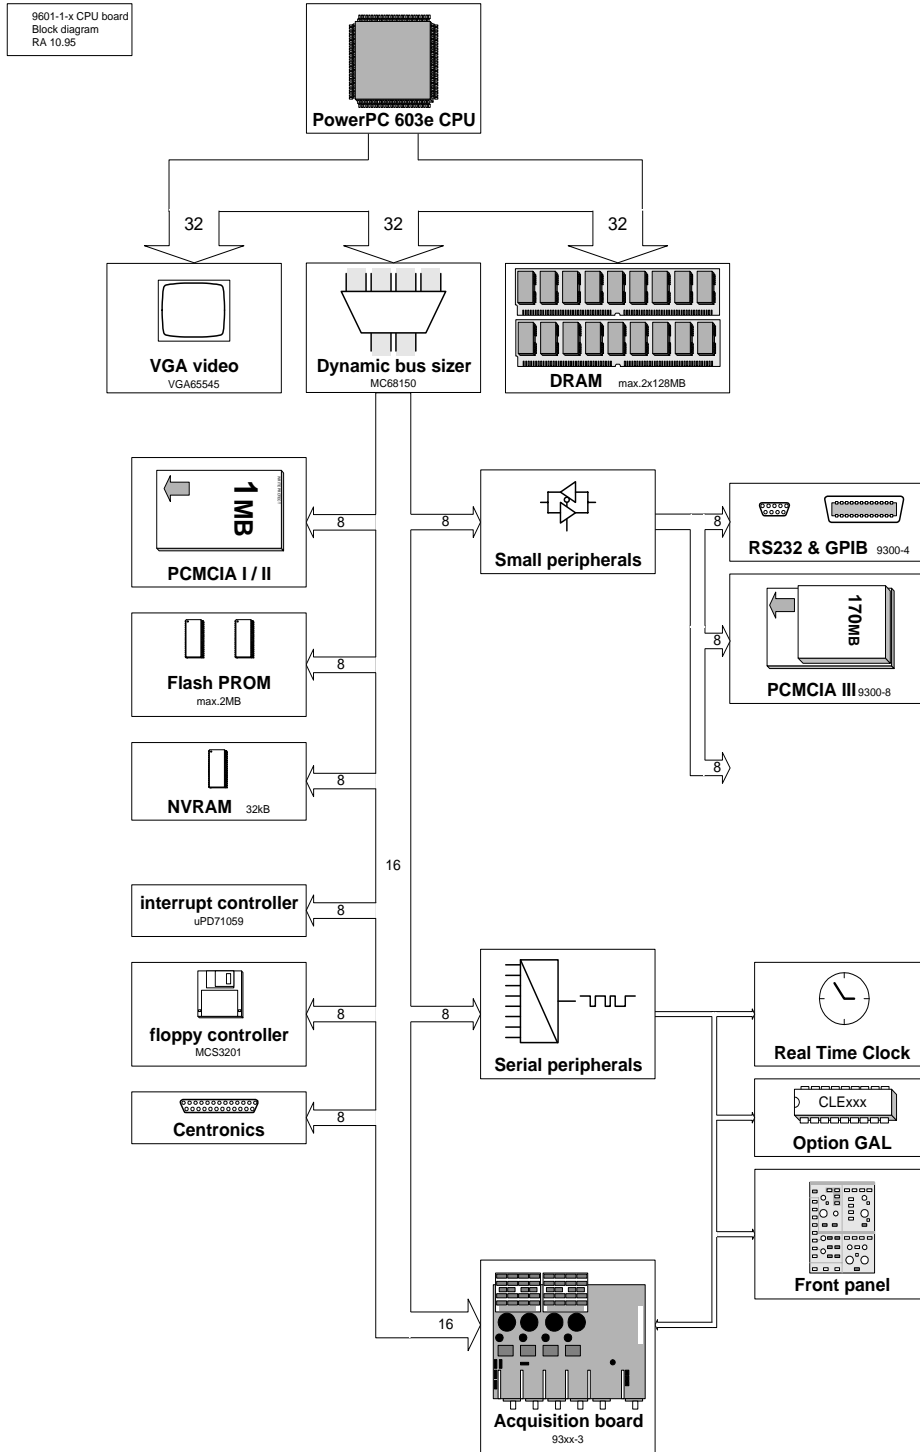

Fig 4-1: 9601-11 Block diagram

---

## DRAM

The DRAM consists of two SIMM modules from 4 MB up to 32 MB each.

By interleaving two SIMMs, the access time is dramatically reduced (one beat every 30ns, while the other module “recovers” from the previous access).

The DRAM control logic, including refresh control, is built around several GALs and a few gates.

RAMEUR (A44) is the main sequencer. It inserts refresh cycles whenever needed, and drives row and column addressing timing.

RASADE (A39) controls the row address select lines of the memory modules, and generates the addresses for double beat or burst accesses.

OCCASE (A37) generates the column address select lines of the SIMMs.

DRAME (A57) holds some glue logic, and a state machine that counts the number of beats, inserting pauses in the access if necessary (single SIMM support).

Four multiplexers (A40, 42, 46 and 47) switch between odd and even addresses to be sent to the address lines of the modules. One more multiplexer (A38) switches low order address bits, routing them either directly to the processor, or to the DRAM address generator in RASADE.

### Normal Access Timing

This is the simplest access possible: the processor puts an address onto the address bus, and reads back or writes one long word (32-bit wide) to DRAM.

Depending on the address (odd or even), bank A or bank B is selected in a dual SIMM configuration.

### Burst Access Timing

A burst access on a 603e configured as a 32-bit device, consists of either two (“double beat”) or eight (“burst”) successive reads in DRAM. The idea is to put a start address onto the address bus, and read back or write several data’s from or to DRAM every clock cycle, without the processor incrementing the address (this is done by the external logic). To increase system performance, the memory has been interleaved, allowing each module to access a memory location every 60ns, but with a delay of 30ns between the modules.

A burst access is signaled by an active low `_TBST` signal and a 32-bit access (`SIZ2..0= 011`), a double-beat access is indicated by a high `_TBST` but an access size of 64 bits (`SIZ2..0= 100`). The double-beat case is decoded by a GAL (`VIADUC`), and the signal is named `_DBEAT` (active low).

### Refresh Timing

The 32 kHz clock from the real time clock chip is used to refresh periodically the DRAM.

The GAL RAMEUR generates the refresh cycles, as well as the sequencing of `_RAS` and `_CAS`. Depending on the operating mode, it chooses to access slot A or selects alternately slots A and B.

## Memory Mapping

By default, the board is set to the biggest memory size possible. The software checks out for “holes” in the addressing space, and sets accordingly two configuration lines, MAP1 and MAP0.

MAP1..0	meaning
00	2x4, single sided SIMMs
01	2x8 MB SIMMs
10	2x32 MB SIMMs

## VGA

The VGA 65545 controller chip (A27) includes its own address decoding logic. It generates all video signals (red, green and blue video, horizontal and vertical syncs, and all control lines to drive a flat panel) and controls its associated 1 MB video dynamic RAM (reads, write and refresh cycles). All timings are extracted from the 16 MHz bus clock, so no external crystal or timebase is needed.

The horizontal and vertical sync. signals are sent to both the internal and the external video connector (high density DB15 on the 9601-2 board). The external syncs are direct, the internal syncs pass through the GAL VIADUC (A32), allowing to force these two lines to ground. This puts the internal display in power down mode (standby mode).

The chip can support several bus interfaces (PCI, ISA, VL,), it is configured as VL-bus.

The 65545 chip generates red, green and blue video signals. These are controlled-impedance lines (37.5 Ohm approximately, which corresponds to two 75 Ohm loads in parallel). A low-pass filter is implemented right at the outputs from the VGA controller, and another low-pass filter is located at each video connector on the 9601-2 board (just after the “active” load).

### 9601-2 Board: VGA proper termination (auto termination)

The 9601-2 board is a complement to the 9601-11 main processor board. It holds the external Centronics connector (female DB-25) with its EMI filters, both internal and external VGA connectors (female mini DB-15), and line termination for R, G and B signals.

The VGA controller is able to drive a load of 37.5 Ohms on its Red, Green and Blue outputs (two 75 Ohms loads in parallel). The line impedance of these signals on the processor board is therefore close to 37.5 Ohms. The 9601-2 board includes a special termination circuit that keeps the loads on the R, G and B lines at 37.5 Ohms, no matter if one or two 75 Ohms loads are connected. The circuit assumes that a 75 Ohms load is present on each output.

---

## Bus Sizer

The MPC603e processor does not support dynamic bus sizing, as did the 68k family. Many parts of the software and the hardware rely on that feature. A Motorola MC68150 chip 'translates' the PowerPC 32-bit data bus to a 68030 8 or 16-bit bus. Except DRAM and VGA controller, all peripherals work on this 68k-type bus. Full compatibility is therefore ensured with current acquisition boards and small peripherals.

## 16 and 8-bit Peripherals

The only 16-bit peripheral hooked on the bus is the acquisition board. RETINE (A36) generates wait state timings and is used to switch between cold boot (return to default state) and warm boot (do a RESET, but keep current scope settings), and generates a bus error if max. access time is out and no peripheral has acknowledged the access.

ASSISE (A21) generates chip select signals for the bus sizer, BUDGET (A28) creates typical 68k signals (\_BAS, \_BDS, 16MHz clock).

The peripheral address decoding is done by a set of GALs (GRANDS (A20), PETITS (A29)) and a few multiplexers (A30, A22). GRANDS selects between main peripheral categories (VGA, DRAM, memory card, flash PROM, acquisition board or other peripherals), PETITS generates chip select signals for 8-bit peripherals (flash PROM, memory card, non-volatile RAM, Centronics and "others"). It also determines how many wait states are needed for peripherals not able to acknowledge a bus access. This is done by pulling low \_DSACK0 after having sensed the corresponding number of wait states through \_BWT1 and \_BWT3, which ends the current access.

The multiplexer A30 does a finer decoding between "others" decoded in PETITS, namely interrupt controller, small peripherals, serial interface, flash PROM chip 1 or 2, and status registers.

## PCMCIA type I / II interface

This interface consists mainly of buffers for both data and address busses.

An OP amp (A10) and a MOS transistor (Q3) allow to switch off the memory card power supply while no card is plugged in, and turn it on slowly when plugged in.

The GAL CARDAN (A11) handles the card format and generates several control signals accordingly.

A16 (an hex D-type flip-flop) holds control bits for 12Vpp (flash programming voltage), DRAM memory mapping and memory card type. All bits of this register reset to zero when the \_RESET signal goes active low, which means that their state is also guaranteed at power-up.

A9 and A12 are the read registers for several status bits.

Several EXOR gates (A17 and A18) invert the most significant address bits of the memory card whenever the SWAP jumper is plugged in, so that the first bytes are always located at 0xFFF00000, regardless of the size of the memory card. This allows to boot directly from a PCMCIA memory card.

## Flash PROM

Two Intel 28F008-compatible 1MB PROMs (A24 and A25), are used. From a hardware point of view, a flash PROM is the same as an EPROM in read mode. To write to it, however, a programming voltage ( $V_{pp}$ ) needs to be applied to a pin. The 12V voltage is generated by a switching regulator (A26), controlled by a logic level ( $\_EPPP$ ).

## NVRAM

This chip is powered through the lithium battery (VCT) when power is off. The chip select is held high through a pull-up resistor to VCT to avoid accidental overwriting while power is off.

## Interrupt Controller

In order to keep compatibility with both 68k hardware and software, it is necessary to use a chip that prioritizes several interrupt sources. This is done by a NEC chip, an uPD71059. It scans eight interrupt pins and sends a unique interrupt to the processor when a (non-masked) interrupt appears.

Interrupt levels are assigned the following:

level 0	(lowest priority) acquisition board
level 1	small peripherals, unused
level 2	RS232
level 3	GPIB
level 4	small peripherals and acquisition board, unused
level 5	real time clock
level 6	time base (acquisition board)
level 7	(highest priority) only for test purposes. Linked to level 2 for debugging.

## Floppy Controller

The floppy controller chip directly interfaces to a double or high-density disk drive. The floppy controller has a digital 8-bit input/output register, which is used to read several status lines from the drive (disk inserted, etc.).

In principle, the controller is able to provide an interrupt when accesses are completed. As these accesses are performed in non-time critical paths of the program, The interrupt line has been wired to the input register, so that the program has to poll this register until the interrupt line goes active.

The controller has it's own timebase, a 24MHz crystal.

## Centronics

Both external and internal Centronics ports are write-only. The data get latched in a 74HCT374 register (A45 for internal Centronics, A55 for external).

---

## Small Peripheral Interface

This 8-bit interface is intended to allow external expansion to the processor board. A56 and A53 (74HCT541 tri-state buffers) buffer the address and control lines, and A62 (74HCT245, bi-directional tri-state buffers) buffer the data lines.

The address decoding is done on each peripheral board. The acknowledge for each access is also done by the peripheral device, so that there is no restriction on wait-states. The bus clock runs at 16mhz, and a reset line reinitializes the boards at the same time as the CPU.

Four interrupt lines are also included in this interface, so that interrupt-driven boards can be used (a good example is the 9300-4 GPIB/RS232 board, which uses interrupts 2 and 3).

## Serial Interface for on-board Peripherals

Two GALs (SEVERE and SAVEUR) are used to access serial on-board devices, like the real time clock, option GAL, front panel and some parts of the acquisition board. The principle of such a serial access is the following:

every write or read to the serial interface allows to write or read one bit (the MSB of the byte). To write a byte to a serial device, you need eight accesses to the serial interface.

Many serial devices need the same protocol: you first send a command byte (read, write, clear, etc.), and then read or write one or several data (if required).

Depending on the address the serial interface is been accessed, the corresponding device gets selected (`_SSER`, `_SFPR`, `_SLED` or `SRTC` lines). A clock (`_SCKA`), a read data (`SDRA` or `SDRD`) and a write data (`SDWA` or `SDWD`) constitute the serial interface itself (the D suffix on read and write data lines means Digital, i.e. devices on the CPU board; an A suffix means devices on the Acquisition board).

## RTC

The 68HC68T1 real time clock has several functions:

- keep a time-of-the-day and current-date information while the DSO is not powered on.
- generate a 32kHz clock for DRAM refreshment.
- generate a 128Hz periodic interrupt to force bus accesses from the processor (otherwise the watchdog timer would time out and reset the board) and allow periodic update of the time display ("scope alive").

The chip uses it's own 32.768kHz crystal to keep the time and derive all timings. A few discrete components around it leave the chip powered by the backup lithium battery while the rest of the board is not powered, and charge the battery when the power is on again.

## Front Panel

The front panel LED can be controlled by a serial write access. The LED (write only) shares the same address as the option GAL (read only).

The LED is driven by the less significant bit (LSB) of the control register.

## Watchdog and Reset Generation

The power supply is monitored by a TL7770-5 chip. Whenever the Vcc voltage goes below 4.8V (even for a short time !), a reset pulse is generated, whose width is determined by an RC time constant (33uF and internal resistor).

The second half of this chip serves as watchdog circuit. The processor needs to poll a sense line on that chip from time to time (typically a few ms). By doing this, a capacitor (33uF) is discharged. When not polled, it gets charged by a constant current, and when a given threshold is exceeded, a reset pulse is generated.

The LED connected goes off whenever the \_RESET line is low, so a blinking LED indicates either no bus access for longer than a few hundreds of ms, or a problem (glitch) on the Vcc power supply.

### **Bus Error Generation**

A bus error exception is generated when the \_TEA pin is pulled low on the processor. The 603e expects a \_TA signal as an acknowledge to the current data transaction, and inserts wait states as long as \_TA has not been pulled low at the correct timing (refer to the MPC603e documentation for exact timing information's). An external circuit is required to break the pending cycle if no device responds after a given time-out.

This is the job of the GAL RETINE (A36), which counts the number of wait states already passed (4 bit Gray counter). An external 4-bit counter (A59) extends the count to 160 (tbd) wait cycles before triggering a bus error.

An acknowledge (\_DSACK1..0 lines) aborts the time-out count and finishes successfully the current cycle.

### **I/O Structure and GALs Involved**

The following bloc diagram describes the peripheral decoding flow, and what GAL is involved in the decoding. The three frames group the peripherals into 8, 16 or 32-bit devices. The simple 3D-blocs represent an on-board device. The 3D-blocks with an arrow represent external devices (more generally: accessed through a connector).

GRANDS does the main decoding of peripherals and the 93xx-3 acquisition board.

PETITS does the sub-decoding for all 8-bit peripherals.

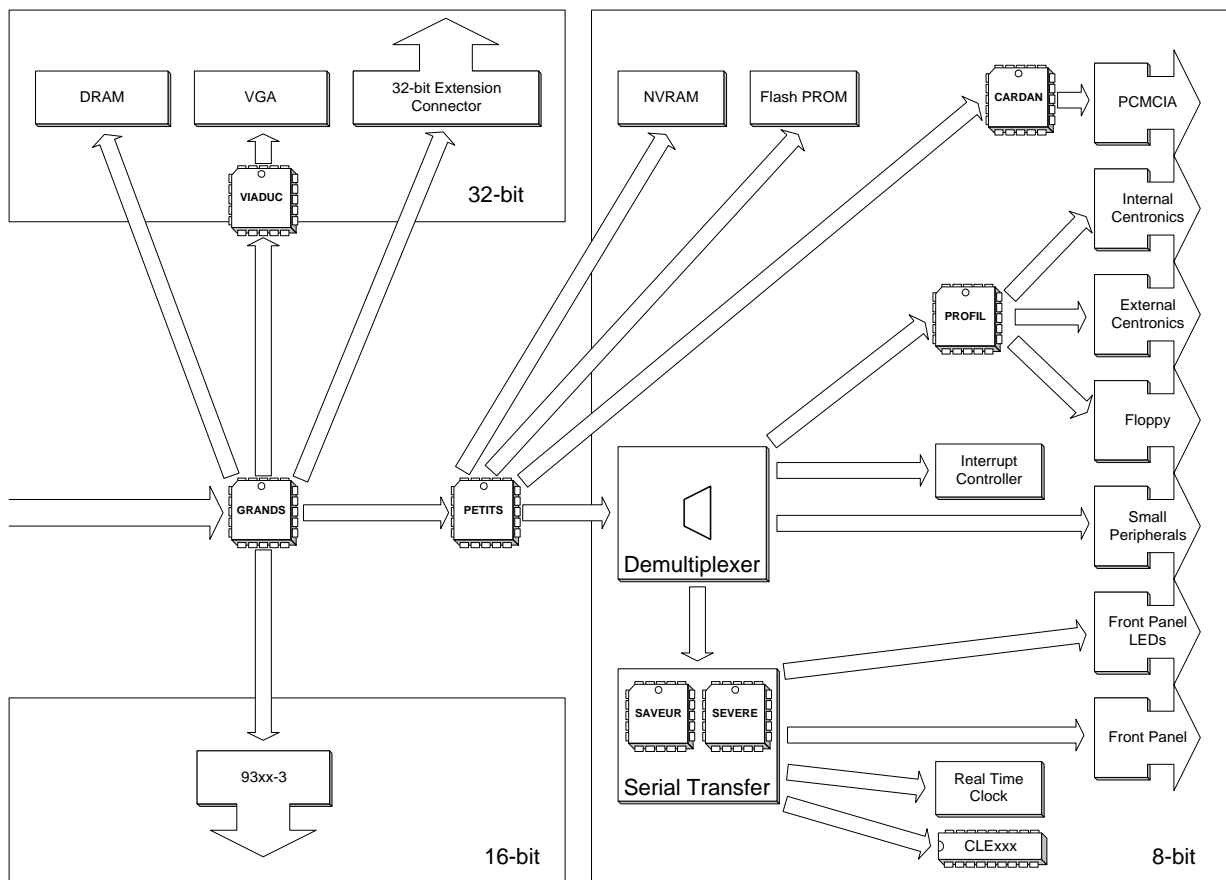

VIADUC handles the Motorola to Intel format decoding for the VGA controller.

CARDAN takes care of the PCMCIA interface timings.

PROFIL dispatches 8-bit data to the Centronics or the Floppy controller.

SAVEUR and SEVERE generate the serial clock and routes the data to the right serial device, including CLExxx, which is the option PAL.

**Fig 4-2: Peripheral Decoding and Data Bus Size**

Not shown in Fig.4-2, are a few GALs for miscellaneous functions (like DRAM refreshing).

RASADE generates the RAS signals and the lower addresses for DRAM. It also supports the signals needed for interleaved burst mode.

OCCASE generates the CAS signals for DRAM.

RAMEUR is the main sequencer for the DRAM, and handles the access precharge and the refresh system.

BUDGET translates a 680x0 bus cycle into a PPC cycle, and handles fast cycles, like accesses to DRAM or VGA.

RETINE counts the wait states and generates a bus error if no response after too many (153) wait states. It also generates the system reset.

ASSISE decodes CPU space cycles and controls the bus sizer.

## 4.2 900079 Main Board

### 4.2.1 Introduction

The board is divided into five sections :

- Microprocessor control based on the MTC428 EPLD pair.
- Front-end based on the Hybrid HFE444 & HSY430 switchyard board to combine the input channel.
- Trigger based on the Hybrids HTR420 discriminator & MST429A smart trigger
- Analog Converter based on the HAM435 Sample&Hold and A/D converter and MNX427 min/max to pre-compute the data.
- Digital Acquisition based on the HMM434 Acquisition memory and SIMM DRAM module for buffer memory.
- Time base based on the MCG426 clock generator & MTB411A controller

### 4.2.2 Front End

The front-end system provides the signal conditioning for the ADC system. All channel are identical, thus only one channel will be described here.

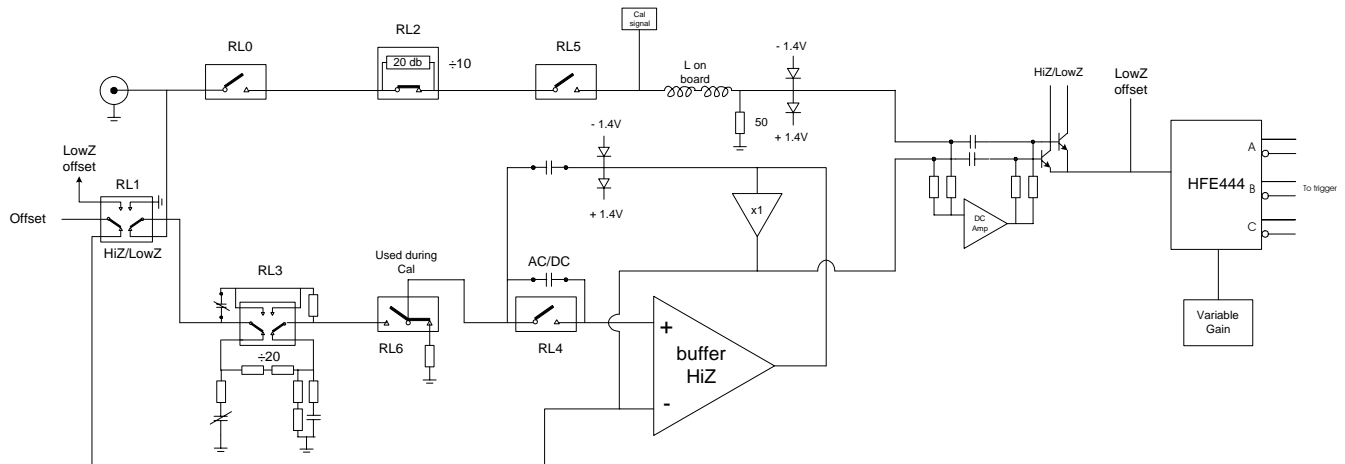

The main functions of the Front end without the amplifier (HFE444) are:

- Four channels operation, calibration with Software control
- Input protection (clamp + thermal detection) and coupling (AC, DC, 1 M $\Omega$ , 50  $\Omega$ ).
- Attenuator by 10 in the 50 $\Omega$  path and attenuator by 20 in 1M $\Omega$  path.
- Offset control and CAL control.

The main functions of HFE444 are:

- Amplitude normalization for the ADC system : at the BNC the dynamic range is 16 mV to 8V FS at 50 $\Omega$  and to 16V FS (full scale) at 1 MOhm in a 1-2-5 step sequence and the ADC system input is 500 mV differential.
- Fine gain control to fill in the fixed vertical sensitivities.
- Bandwidth limit filter at 25 MHz and 200 MHz.

## Power off State : 1 M $\Omega$ input

**Fig 4-3: Front End Power off State**

- Relay RL1 selects the input and offset voltage between the Hi-Z (1 M $\Omega$ ) and the 50 $\Omega$  path.
- The 50 $\Omega$  path is then disconnected by RL0 and the signal will be in the 1 Mohm input.
- Relay RL2 selects the input between divide-by-10 or direct for the signal in the 50 $\Omega$  path.
- Relay RL3 selects the input between direct or divide-by-20 for the signal in the HiZ path.
- Relay RL4 sets the AC/DC coupling in HiZ.
- Relay RL5 is only used during calibration.
- Relay RL6 clamps the HiZ amplifier when not selected..
- Bias\_HiZ and Bias\_LoZ is used to bias transistors Qx003 and Qx004 to select between the HiZ path or LowZ path as input to the HFE through the DC amplifier.
- There is no AC/DC coupling in the 50 $\Omega$  path.

### 50Ω input : Direct Path

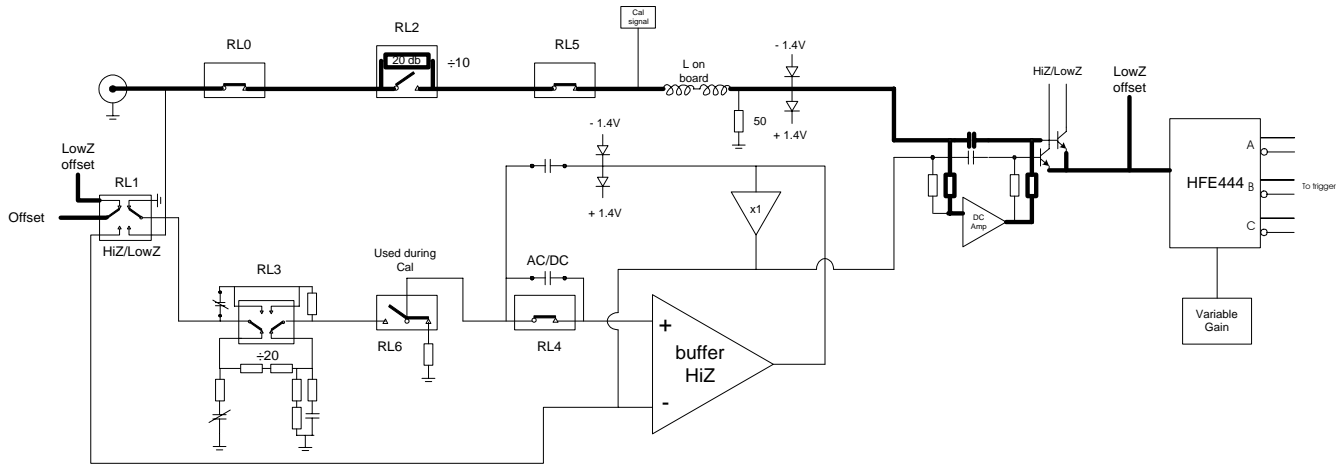

Fig 4-4: 50Ω input direct path

### 50Ω input : Divide-by-10 Path

Fig 4-5: 50Ω divide by 10 path

## 1M $\Omega$ input : Direct Path

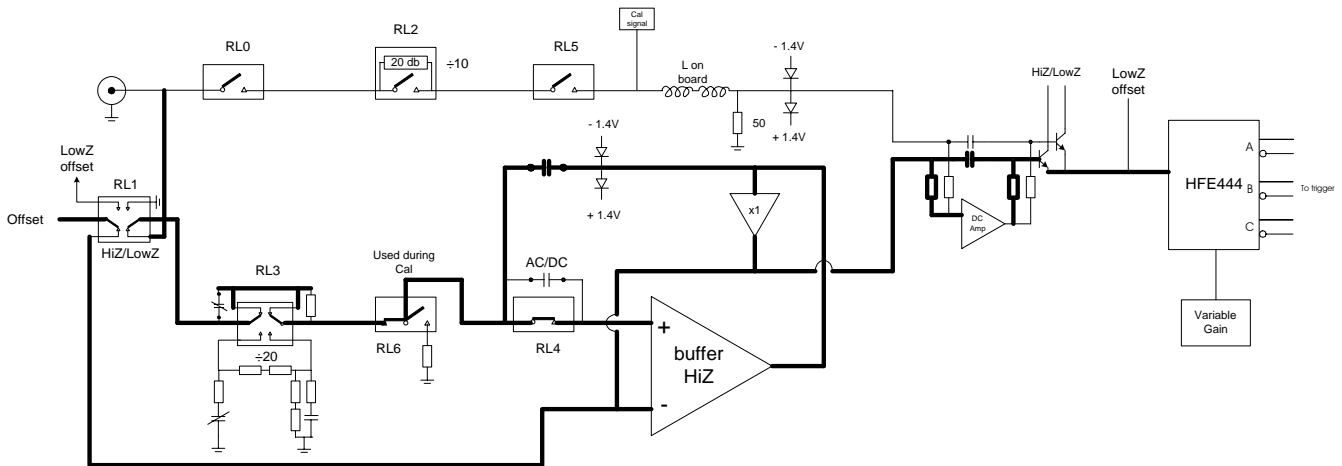

Fig 4-6: 1M $\Omega$  direct path

## 1M $\Omega$ divide by 10 AC coupled path

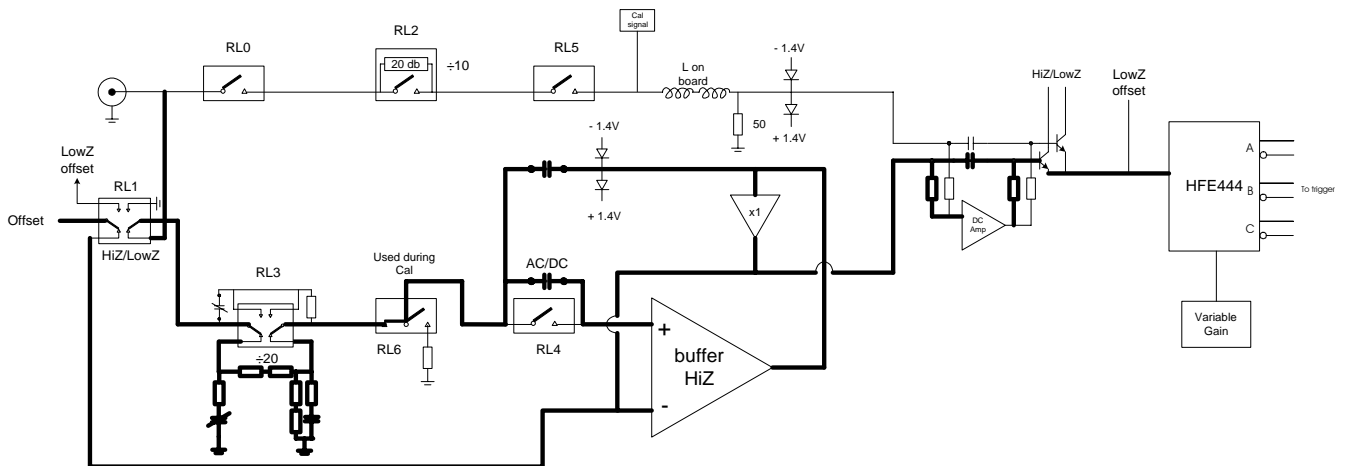

Fig 4-7: 1M $\Omega$  divide by 10 AC coupled path

## Front End Analog controls

- One precision DAC with an associate circular memory ( $\mu$ P system) drives and refreshes a multiple sample-and-hold system. The DC calibration control is common to all four channels. Each channel has two analog controls.

### 4.2.3 900079 Acquisition Block Diagram

Fig 4.8: Front End, Trigger, Sample&Hold, Analog to Digital, Memory

## 4.2.4 Two and Four Channel mode

### Four channel mode

- All BNC inputs are active

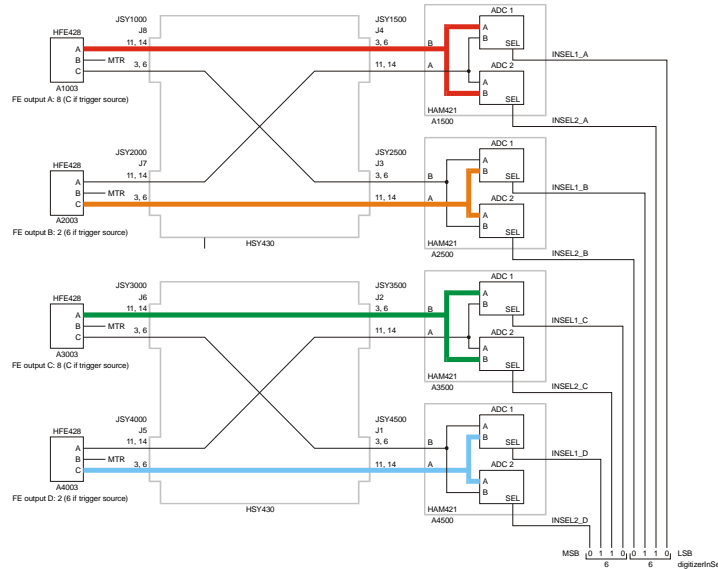

Figure 4-9 Four Channel Mode Signal Routing

### Two channel mode

- Two channel mode, BNC inputs for channel 2 and 3 are active, ADC's for channel 1 & 2 are used for signal on channel 2 input, ADC's for channel 3 & 4 are used for signal on channel 3 input.

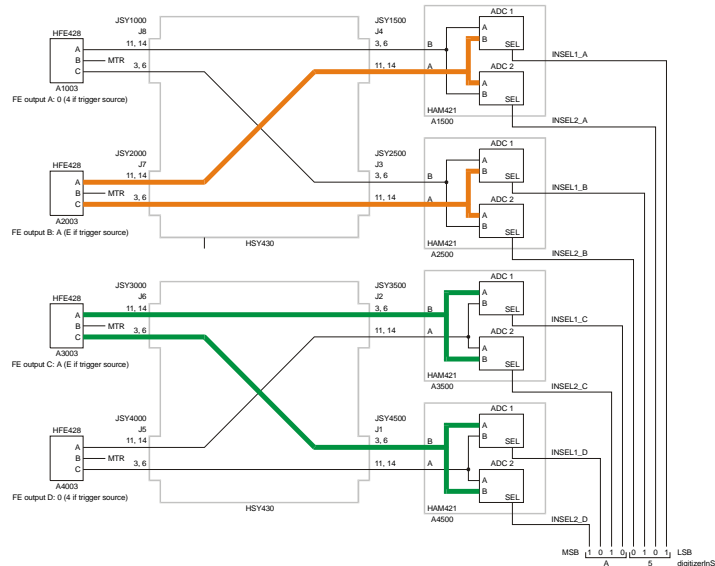

Figure 4-10 One and Two Channel Mode Signal Routing

## 4.2.5 90079 Control & Transfer Block Diagram

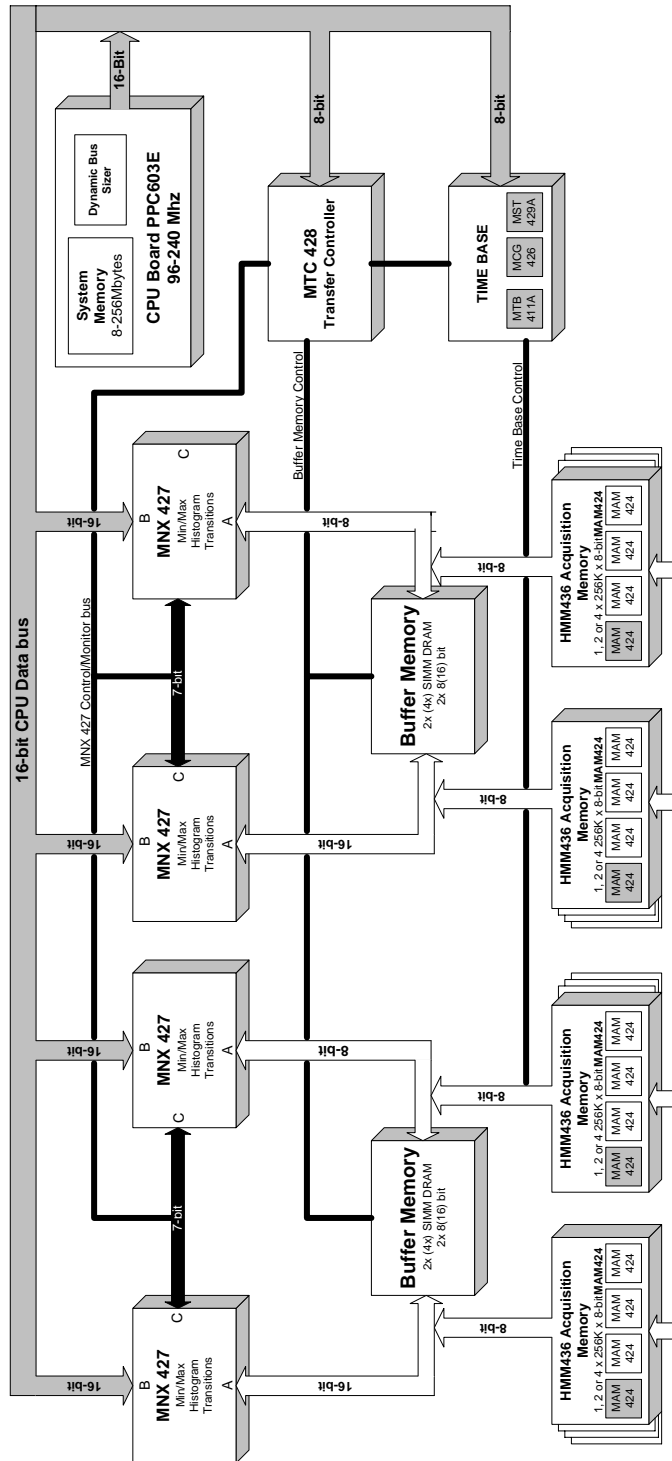

Fig 4.11: Processor Control, Min/Max, Buffer Memory, Transfer

---

## 4.2.6 Trigger

The different trigger couplings are :

- DC
- AC : cut off frequency is almost 10 Hz.
- LF REJ : single pole high pass filter with a cut off frequency at 50 kHz.
- HF REJ : single pole low pass filter with a cut off frequency at 50 kHz.
- TBWL : single pole low pass filter at 25 MHz.

## Analog Controls

A sample and hold fed by the precision DAC provides the threshold level.

The addresses are :

## TV Trigger

Each channel has a pick-off after the HFE428 or after the high impedance buffer for external trigger. The TV trigger source is selected via bit TVS and drives a times 10 amplifier with complementary outputs. These outputs are selected ( \_TVINV) depending on the state of the selected HFE428 gain.

The TV trigger uses a commercial chip (LM1881) and provides two outputs, TV1 & TV2. This circuit is able to trigger on different TV line number standards.

## 4.2.7 Analog to Digital Converter

### Introduction

The analog to digital converter system does the signal conversion to 8 bits, using the following circuits:

- **HAM435**: Hybrid Acquisition Module, Sample&Hold plus ADC
  - MSH437**: Monolithic Sample and Hold. performs the track&hold before the ADC.
  - MAD422**: Analog to Digital converter, maximum clock speed of 500 Ms/s
- **HMM436**: Hybrid Memory module, up to 4 Mbytes per Channel
  - MAM 424**: Monolithic Access Memory
- **MNX427**: Monolithic MIN-MAX
- **Buffer Memory** : 16Mbytes
- **HSY430**: Interleaving Channel

## 4.3 F9301-4 GPIB and RS 232 Interface

### 4.3.1 Block Diagram

**Fig 4.13: GPIB & RS232 Interface Block Diagram**

This board is connected to the processor through a flat cable.  
Data bus is 8 bits, address bus: 12 bits.  
Address 0180 000 to 0180 00FF.

### 4.3.2 F9301-4 RS 232 Serial Interface

Based on the ST16650 from EXAR or Startech.

- Clock frequency 1.8432 MHz.
- RTC/CTS signals are connected
- DCD input is biased and the DTR output is not wired
- Asynchronous communication up to 1Mbits/sec
- 32 bytes receive and transmit FIFOs buffer
- Connector compatible with a DB9-P (9 pin male).

### 4.3.3 F9301-4 GPIB Interface

Based on the circuit TNT4882 from National Instruments.

- Clock frequency 40 MHz.
- Up to 1.5 Mbytes/sec using interlocked IEEE 488.1 handshake
- Two 8-bit 16-deep FIFOs buffer data between GPIB and CPU

The GPIB address is set by software and stored in non-volatile memory.

#### 4.4 LCDFP9615 Front Panel

The front panel assy is connected to the processor board with a flat cable. Power supply and control signals are supplied from the processor. The front panel is divided into several sections:

- Display using 10.4inch TFT color LCD Module
- F9601-61 Floppy disk drive assy
- S9615-21 Buffer board which interfaces the digital signals from the processor to the TFT display unit
- S9615-52 board with Motorola 68HC05C4 processor, encoders, and serial data interface.
- F9615-5 matrix keypad with push buttons.

#### 4.5 F9300-7 Printer Controller Option

- Based on the Internal graphic printer LPT5446, and LPT5000 series control chip set from Seiko instrument Inc (Technical reference 39019-2234-01)
- PT501P01 CPU
- PT500GA1 Gate array
- Address 0130 0100
- Interrupt level 2

#### 4.6 PS9611 Power Supply

The PS9611 is a nine output 300 W AC-DC switching mode power supply.

##### 4.6.1 Specifications

###### AC Input Voltage

85-132VAC and 170-264VAC, auto-ranging universal input, provides automatic sensing of 115 or 230VAC input voltage. Power factor correction for compliance with EN61000-3-2: 1995 standard (harmonic current emissions) under all conditions of input voltage, input frequency, loads and temperature ranges.

AC power enters the DSO chassis thru an IEC320 input receptacle, fuses and an EMI line filter. The filter high frequency noise generated by the DSO from getting out on to the AC line.

**Input Frequency:** AC input Frequency range of 47 Hz to 63 Hz.

**Inrush Current:** less than 30 A over full line voltage ranges and input frequency

## DC Output Specifications

Output	Adjustment Range	Nominal Load	Maximum Load
+5 (1)	+4.8 to +5.4V	15A	20A
+3 (1)	+2.9 to +3.5V	10A	20A
-2 (1)	-1.9 to -2.6V	5A	15A
-5 (1)	-4.8 to -5.4V	15A	20A
+6 (1)	+5.6 to +6.2V	2.5A	4A
-6 (1)	-5.6 to -6.2V	2.5A	4A
+15	+14.8 to +15.4V	2.5A	4A
-15	-14.8 to -15.4V	2A	3A / 8A
-12	-11.5 to -14.0V	0.5A	1A

Note:(1) with remote sense.

**Output power:** 300W

**Ripple and Noise:** less than 25 mV

**Hold up Time:** 25 mV at full load

**Transient response:** recovery time <1.2 msec to within 50 mV of its final value

**Protections:** over current, over voltage, over temperature

**Cooling:** PS9611 is cooled by a forced airflow provided by a fan that is integrated inside the unit.

**Environmental:** Operating temperature range 0 °C to + 55 °C  
Storage temperature range - 55 °C to + 85 °C  
Operating humidity from 5% to 95% RH.  
Operating Altitude (max) 5000m or 15000 feet

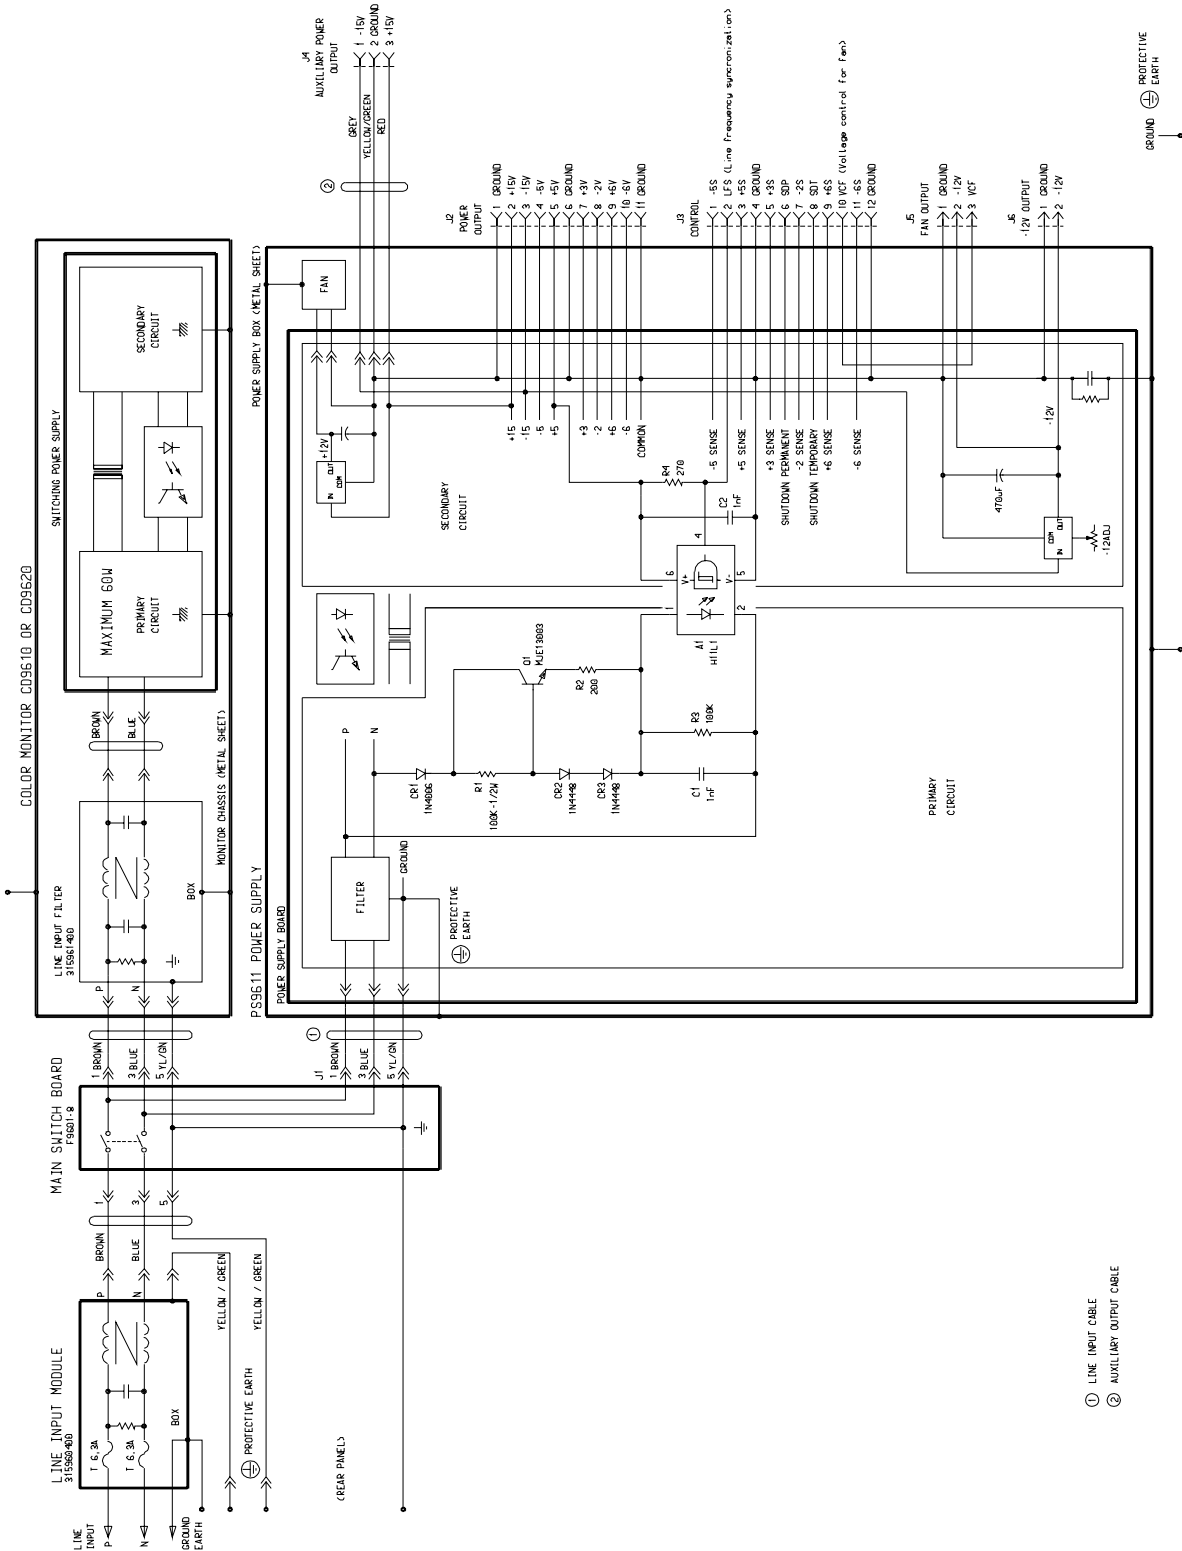

**Safety Standards:** CE, UL, CSA, TUV  
EN61010-1:1993 (IEC1010-1:1995), UL3111-1,  
CSA-C22.2 No.61010-1.  
Protection class I, pollution degree 2, installation category II.

**EMI:** EN50081-1:1992, EN55022:1987 Class B, EN61000-3-2&3:1995 Class D

**Immunity:** EN50082-1:1994, EN61000-4-2,4,5,8&11:1995,  
IEC1000-4-2,3,4,5,6,8&11

## 4.6.2 Power Supply Block Diagram

# 5. Performance Verification

## 5.1 Introduction

This chapter contains procedures suitable for determining if the LC564DL Digital Storage Oscilloscope performs correctly and as warranted. They check all the characteristics listed in subsection 5.1.1.

Because they require time and suitable test equipment, you may not need to perform all of these procedures, depending on what you want to accomplish.

In the absence of the computer automated calibration system based on LeCroy Calibration Software (LeCalsoft), this manual performance verification procedure can be followed to establish a traceable calibration.

It is the calibrating entities' responsibility to ensure that all laboratory standards used to perform this procedure are operating within their specifications and traceable to required standards if a traceable calibration certificate is to be issued for the LC564DL Digital Storage Oscilloscope.

### 5.1.1 List of Tested Characteristics

This subsection lists the characteristics that are tested in terms of quantifiable performance limits.

- Input Impedance
- Leakage Current
- Peak to Peak and RMS Average noise level
- Positive and Negative DC linearity
- Positive and Negative Offset
- Bandwidth
- Trigger Level
- Smart Trigger
- Time Base Accuracy
- Rise Time

### 5.1.2 Calibration Cycle

The LC564DL Digital Storage Oscilloscope requires periodic verification of performance. Under normal use (2,000 hours of use per year) and environmental conditions, this instrument should be calibrated once a year.

## 5.2 Test Equipment Required

These procedures use external, traceable signal generators, DC precision power supply, step generator and digital multimeter, to directly check specifications.

Instrument	Specifications	Recommended
Signal Generator Radio Frequency	Frequency : .5 MHz to 1 GHz Frequency Accuracy : 1 PPM	HP8648B or equivalent
Signal Generator Audio Frequency	Frequency : 0 to 5 kHz Amplitude : 8 V peak to peak	LeCroy LW420 or HP33120A or equivalent
Voltage Generator DC Power Supply	Range of 0 to 20 V, in steps of no more than 15 mV	HP6633A or equivalent
Step Generator Fast Pulser	Rise time 350ps $\pm$ 100 ps Overshoot 3.5 % $\pm$ 1 %	LeCroy 4969A + PB049 or equivalent
Power Meter + Sensor	Accuracy $\pm$ 1 %	HP437B + 8482A or equivalent
Digital Multimeter Volt & Ohm	Voltmeter Accuracy : 0.1 % Ohmmeter Accuracy : 0.1 %	Keithley 2000 or equivalent
Adapter	50 $\Omega$ to 1M $\Omega$	LeCroy 4962-10
Coaxial Cable, 1 ns	50 $\Omega$ , BNC, length 20 cm,	LeCroy 480232001
Coaxial Cable, 5 ns	50 $\Omega$ , BNC, length 100 cm,	LeCroy 480020101
2 Attenuators, 20 dB	50 $\Omega$ , BNC, 1 % accuracy	LeCroy 402200402
Attenuator, 6 dB	50 $\Omega$ , BNC, 1 % accuracy	LeCroy 402600403
Terminator, 2 W	50 $\Omega$ , BNC, Feed-Through	LeCroy 402323001
T adapter	50 $\Omega$ , BNC T adapter	LeCroy 402222002

**Table 5-1 : Test Equipment**

### 5.2.1 Test Records

The last pages of this document contain LC564DL test records in the format tables. Keep them as masters and use a photocopy for each calibration.

## 5.3 Turn On

If you are not familiar with operating the LC564DL, read the operator's manual.

- Switch on the power using the power switch.
- Wait for about 20 minutes for the scope to reach a stable operating temperature, and verify:
  - the display turns on after about 10 seconds and is stable.
  - the range of intensity and grid intensity is reasonable.

## 5.4 Input Impedance

### Specifications

DC 1.00 M $\Omega$   $\pm$ 1 %  
AC 1.027 M $\Omega$   $\pm$ 2 %  
DC 50 $\Omega$   $\pm$ 1.25 %  
EXT DC 50 $\Omega$   $\pm$ 3%  
EXT DC 1.00 M $\Omega$   $\pm$ 2%

The impedance values for 50 $\Omega$ , 1M $\Omega$  and Gnd couplings are measured with a high precision digital multimeter. The DMM is connected to the DSO in 4-wire configuration (input and sense), allowing for accurate measurements.

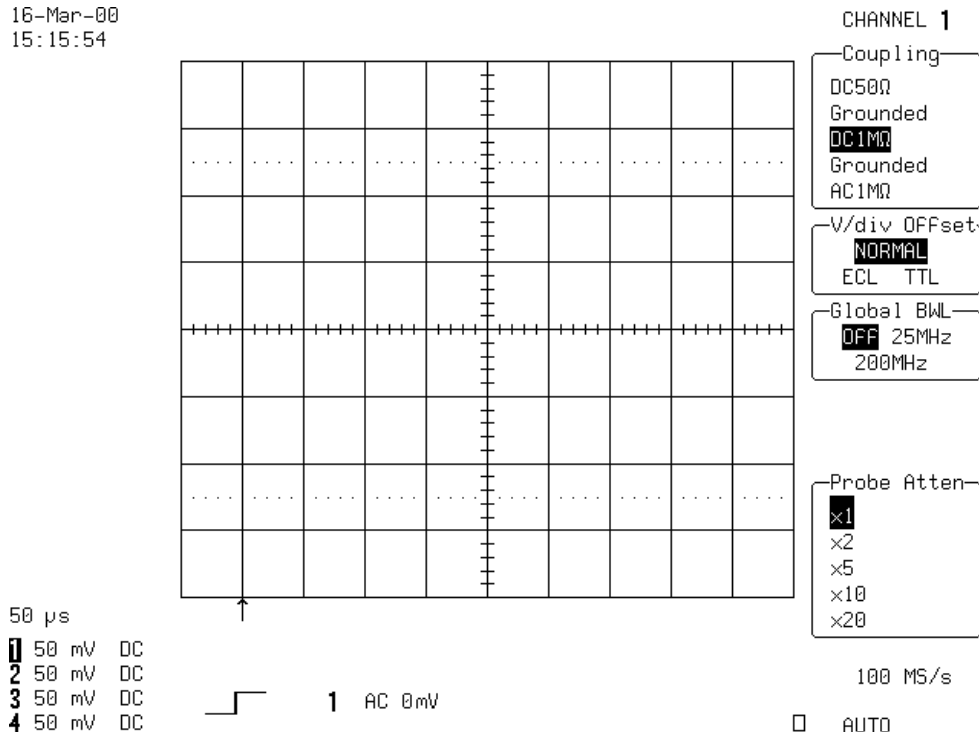

### 5.4.1 Channel Input Impedance

#### a. DC 1M $\Omega$

- Recall **LC564D001.PNL** or configure the DSO :

Panel Setups : **Recall FROM DEFAULT SETUP**  
Channels Trace OFF **Channel 1, Channel 2, Channel 3 & Channel 4**  
Input Coupling : **DC 1M $\Omega$**  on all 4 Channels  
Input gain : **50 mV/div.** on all 4 Channels  
Time base : **50  $\mu$ sec/div.**  
Trigger mode : **Auto**

16-Mar-00  
15:15:54

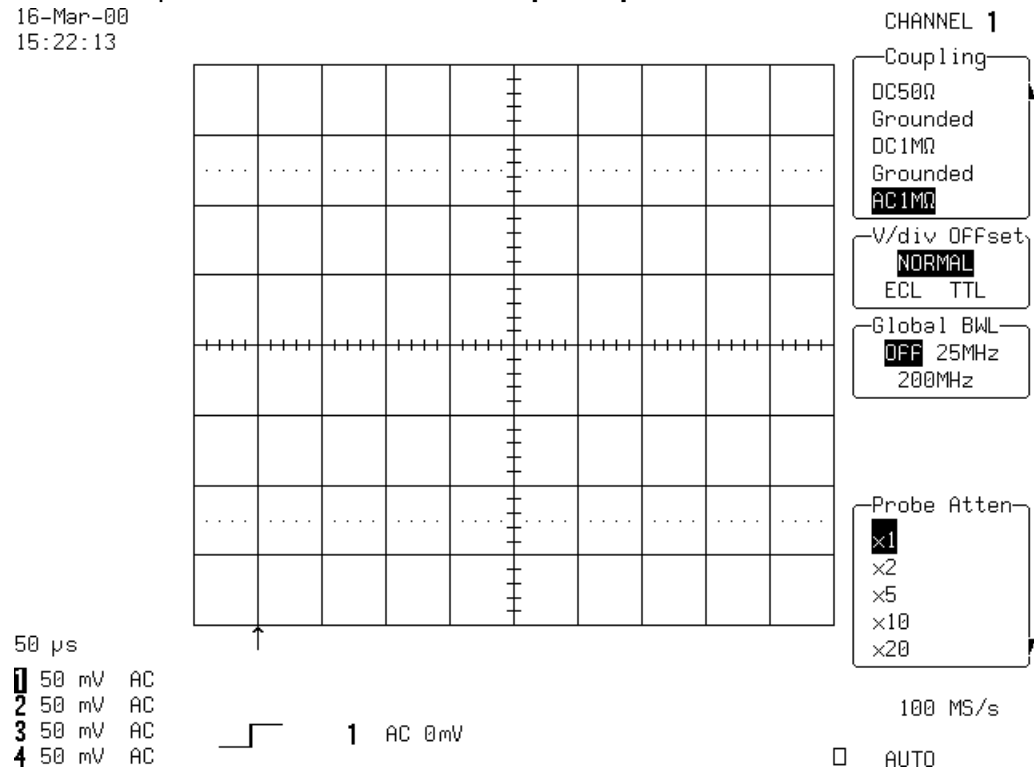

- Set the DMM with **Ohms and Ohms sense** to provide a 4 wire measurement.
- Connect it to Channel 1.
- Measure the **input impedance**. Record it in Table 2, and compare it to the limits.
- Repeat the above test for all input channels.
- Recall **LC564D002.PNL** or Set Input gain to **200 mV/div.** on all 4 Channels
- Repeat the test for all input channels.
- Record the measurements in Table 2, and compare the test results to the limits in the test record.

**b. AC 1MΩ**

- Recall **LC564D003.PNL** or configure the DSO as shown in 5.4.1.a, and for each Channel make the following change :

Input Coupling : **AC 1MΩ**

- For all input channels measure the **input impedance**.

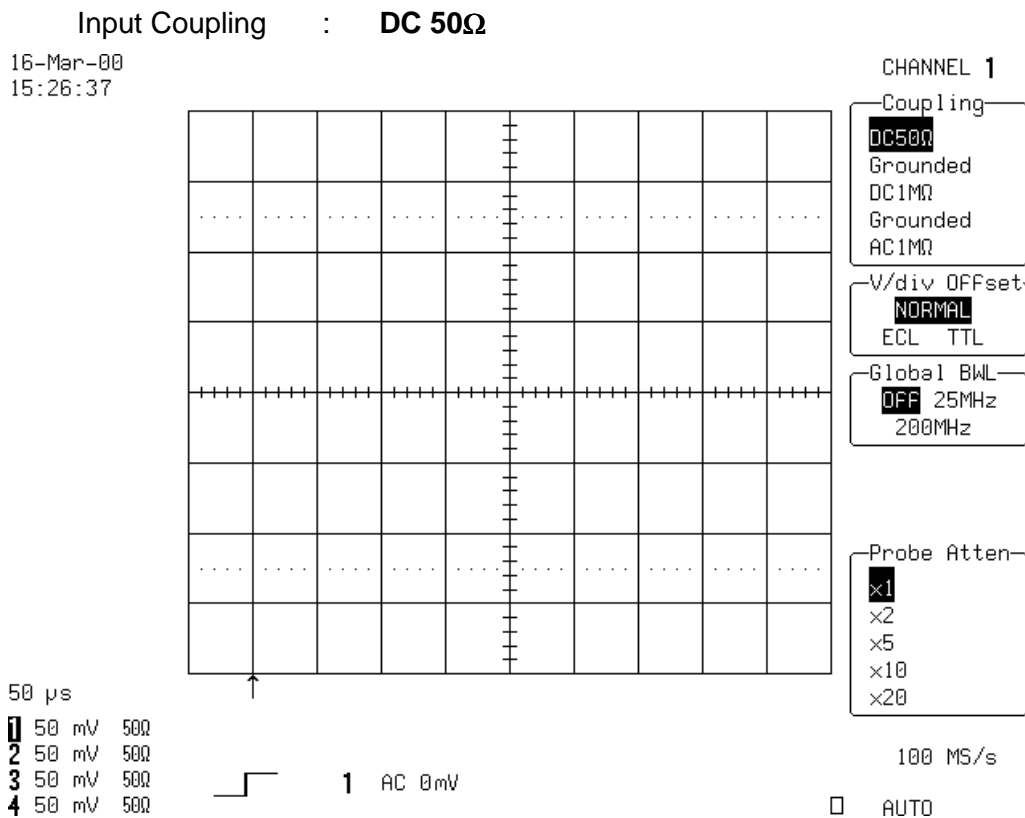

- Record the input impedance in Table 2, and compare it to the limits.

- Recall **LC564D004.PNL** or Set Input gain to **200 mV/div** on all 4 Channels.
- Repeat the test for all input channels.
- Record the measurements in Table 2, and compare the results to the limits in the test record.

**c. DC 50Ω**

- Recall **LC564D005.PNL** or configure the DSO as shown in 5.4.1.a, and for each Channel make the following change:

- For all input Channels, measure the input impedance.
- Record the **input impedance** in Table 2, and compare it to the limits.
- Recall **LC564D006.PNL** or set Input gain to **200 mV/div.** on all 4 Channels
- Repeat the test for all input channels. Record the measurements in Table 2, and compare the results to the limits in the test record.

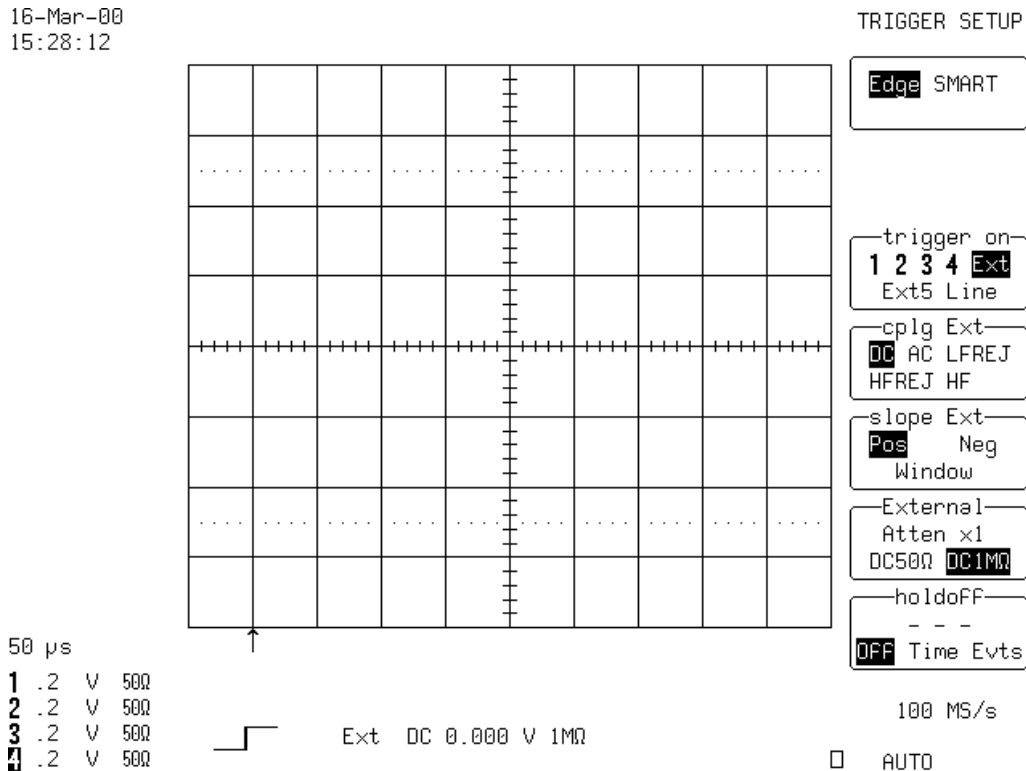

## 5.4.2 External Trigger Input Impedance

### a. DC 1MΩ

- Recall **LC564D007.PNL** or configure the DSO :

Trigger mode : **Auto**  
 Select Setup trigger  
 Trigger on : **EXT**  
 Cplg Ext : **DC**  
 External : **DC 1MΩ**  
 Time base : **50 μsec/div.**

16-Mar-00  
15:28:12

- Connect the DMM to External, and measure the input impedance.
- Record the input impedance in Table 2, and compare it to the limits.
- Recall **LC564D008.PNL** or set trigger to Ext/5
- Measure the **input impedance**.
- Record the test result in Table 2, and compare the result to the limits in the test record.

## b. DC 50Ω

- Recall **LC564D009.PNL** or configure the DSO :

Select Setup trigger

Trigger on : **EXT**

External : **DC 50Ω**

- Connect the DMM to External, and measure the **input impedance**.
- Record the input impedance in Table 2, and compare the result to the limit in the test record.
- Recall **LC564D010.PNL** or configure the DSO:

Trigger on : **EXT/5**

- Measure the **input impedance**.
- Record the input impedance in Table 2, and compare the result to the limit in the test record.

### 5.4.3 Ground

- Recall **LC564D011.PNL** or configure the DSO as shown in 5.4.1.a, and for each Channel make the following changes :

Input Coupling : **Grounded**

- Connect the DMM to Channel 1, and measure the **input impedance**.
- Record the input impedance in Table 2, and compare the result to the limit in the test record.
- Repeat the test for all input channels.
- Record the measurements in Table 2, and compare the results to the limits in the test record.

- Measure the **voltage** and enter it in Table 3. Compare it to the limits.
- Repeat the test for all input channels.
- Recall **LC564D013.PNL** or set Input gain to **200 mV/div.** on all 4 Channels
- Repeat the test for all input channels. Record the measurements in Table 3, and compare the results to the limits in the test record.

#### **b. DC 50Ω**

- Recall **LC564D014.PNL** or configure the DSO as shown in 5.5.1.a and for each Channel make the following changes :  
  
Set Input Coupling:    **DC 50Ω**
- Connect the DMM to Channel 1.
- Measure the **voltage** and enter it in Table 3. Compare it to the limits.
- Recall **LC564D015.PNL** or set Input gain to **200 mV/div.** on all 4 Channels
- Repeat the test for all input channels.
- Record the measurements in Table 3, and compare the results to the limits in the test record.

### **5.5.2 External Trigger Leakage Current**

#### **a. DC 50Ω**

- Recall **LC564D016.PNL** or configure the DSO as shown in 5.5.1.a and make the following changes :  
  
Select Setup trigger  
Set Trigger on       :   **EXT**  
  
External               :   **DC 50Ω**
- Connect the DMM to External.
- Measure the **voltage** and enter it in Table 3. Compare it to the limits.

---

## b. DC 50Ω EXT/5

- Recall **LC564D017.PNL** or configure the DSO as shown in 5.5.1.a and make the following changes :

Select Setup trigger  
Set Trigger on : **EXT/5**

External : **DC 50Ω**

- Connect the DMM to External.
- Measure the **voltage** and enter it in Table 3. Compare it to the limits.

## 5.6 Average Noise Level

### Description

Noise tests with open inputs are executed on all channels for both 1MΩ and 50Ω input impedance, with AC and DC input coupling, 0 mV offset, at a gain setting of 10 mV/div., and different Time base settings.

The scope parameters functions are used to measure the Peak and RMS amplitude

### 5.6.1 Peak to Peak Noise

#### Specifications

9 % of full scale or 7.2 mV Peak-Peak at 10 mV/div.

#### a. DC 1MΩ

With no signal connected to the inputs

- Recall **LC564D018.PNL** or configure the DSO :

Panel Setups : **Recall FROM DEFAULT SETUP**  
Channels Trace ON : **Channel 1, Channel 2, Channel 3 & Channel 4**  
Input Coupling : **DC 1MΩ** on all 4 Channels  
Input gain : **10 mV/div.** on all 4 Channels  
Input offset : **0.0 mV** on all 4 Channels  
Trigger setup : **Edge**  
Trigger on : **1**  
Coupling 1 : **DC**  
Trigger Mode : **Auto**

Time base : **20 msec/div.**  
Channel use : **4**

STOPPED

- Press **Clear Sweeps**.
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the four **high pkpk** parameter values in Table 4, and compare the test results to the limits in the test record.
- Repeat the test for Time base : **1 msec/div**.
- Record the measurements (high pkpk of 1,2,3,4) in Table 4, and compare the results to the limits in the test record.

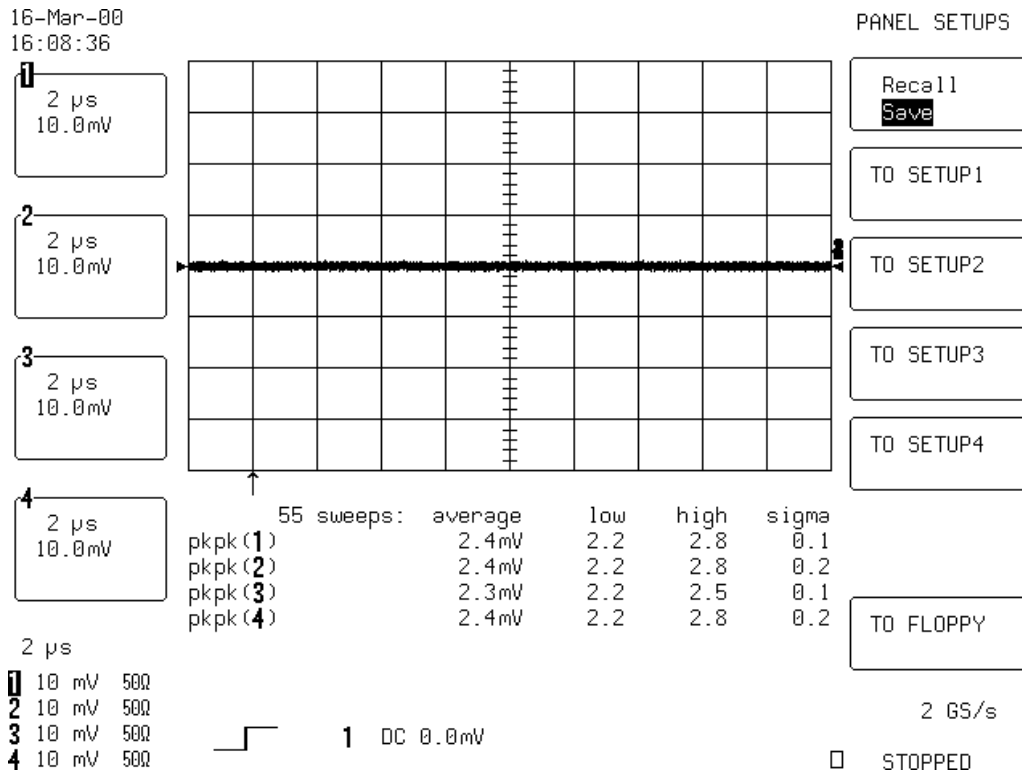

**b. AC 1M $\Omega$**

- Recall **LC564D019.PNL** or configure the DSO as shown in 5.6.1.a, and for each Channel make the following changes :
  - Input Coupling : **AC 1M $\Omega$**  on all 4 Channels
  - Time base : **2  $\mu$ sec/div**
- Press **Clear Sweeps**.
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the four **high pkpk** parameter values in Table 4, and compare the test results to the limits in the test record.

### c. DC 50 $\Omega$

- Recall **LC564D020.PNL** or configure the DSO as shown in 5.6.1.a, and for each Channel make the following changes :
  - Input Coupling : **DC 50 $\Omega$**  on all 4 Channels
  - Time base : **2  $\mu$ sec/div**
- Press **Clear Sweeps**.
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the four **high pkpk** parameter values in Table 4, and compare the test results to the limits in the test record.
- Repeat the test for Time base: **20  $\mu$ sec/div**.
- Record the measurements (high pkpk of 1,2,3,4) in Table 4, and compare the results to the limits in the test record.

#### d. DC 50 $\Omega$ , 2 Channel Mode

##### Channel 2 & Channel 3

- Recall **LC564D021.PNL** or configure the DSO as shown in 5.6.1.a. and make the following changes :

Input Coupling : **DC 50 $\Omega$**  on all 4 Channels

Input gain : **10 mV/div.** on all 4 Channels

Channels Trace ON **Channel 2, Channel 3**

Channels Trace OFF **Channel 1, Channel 4**

Time base : **1  $\mu$ sec/div.**

Select Time base Setup

Channel use : **2**

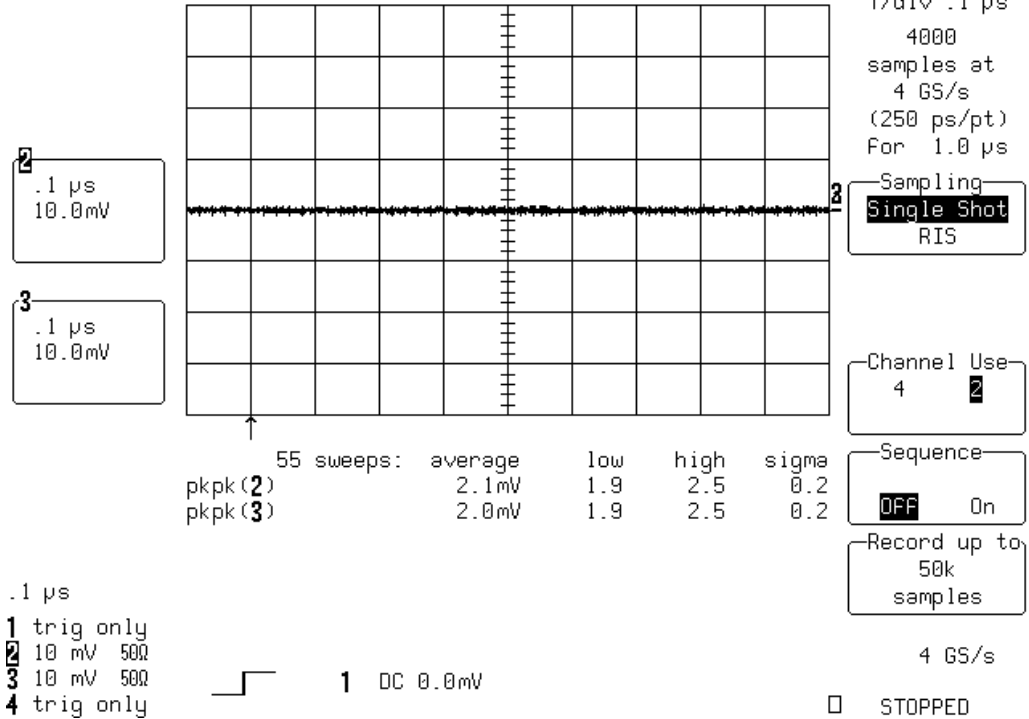

Press : **Cursors/Measure**

Change parameters

On line 1 : **Measure pkpk of Ch2**

On line 2 : **Measure pkpk of Ch3**

16-Mar-00  
16:11:18

- Check that the Sampling rate is **4 GS/s**
- Press **Clear Sweeps**.
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the two **high pkpk of Ch2 & Ch3** in Table 4, and compare the test results to the limits in the test record.

## 5.6.2 Rms Noise

### Specifications

0.9 % of full scale or 0.72 mV at 10 mV/div.

#### a. DC 1M $\Omega$

### Procedure

With no signal connected to the inputs

- Recall **LC564D024.PNL** or configure the DSO :

Panel Setups	:	<b>Recall FROM DEFAULT SETUP</b>
Channels Trace ON	:	<b>Channel 1, Channel 2, Channel 3 &amp; Channel 4</b>
Input Coupling	:	<b>DC 1M<math>\Omega</math></b> on all 4 Channels
Input gain	:	<b>10 mV/div.</b> on all 4 Channels
Input Offset	:	<b>0mv</b> on all 4 Channels

Trigger setup	:	<b>Edge</b>
Trigger on	:	<b>1</b>
Coupling 1	:	<b>DC</b>
Trigger Mode	:	<b>Auto</b>

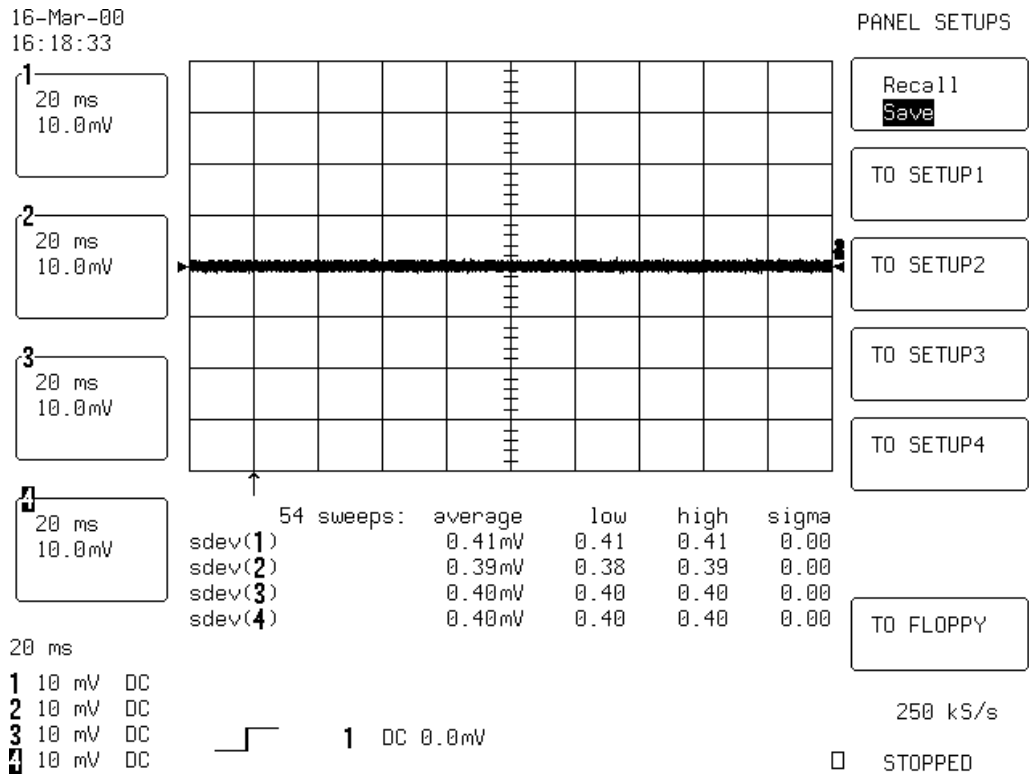

Time base	:	<b>20 msec/div.</b>
Channel use	:	<b>4</b>
Record up to	:	<b>50 k Samples</b>
Press	:	<b>Cursors/Measure</b>
Measure	:	<b>Parameters</b>
Mode	:	<b>Custom</b>
Statistics	:	<b>On</b>

Change parameters

Category	:	<b>All</b>
----------	---	------------

On line 1	:	<b>Measure sdev of Ch1</b>
On line 2	:	<b>Measure sdev of Ch2</b>
On line 3	:	<b>Measure sdev of Ch3</b>
On line 4	:	<b>Measure sdev of Ch4</b>
On line 5	:	<b>no parameter selected for line 5</b>

- Press **Clear Sweeps**.
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the four **high sdev** parameter values in Table 5, and compare the test results to the limits in the test record.
- Repeat the test for Time base : **1 msec/div**.
- Record the measurements (high sdev of 1,2,3,4) in Table 5, and compare the results to the limits in the test record.

**b. AC 1MΩ**

- Recall **LC564D025.PNL** or configure the DSO as shown in 5.6.2.a. and for each Channel make the following change :

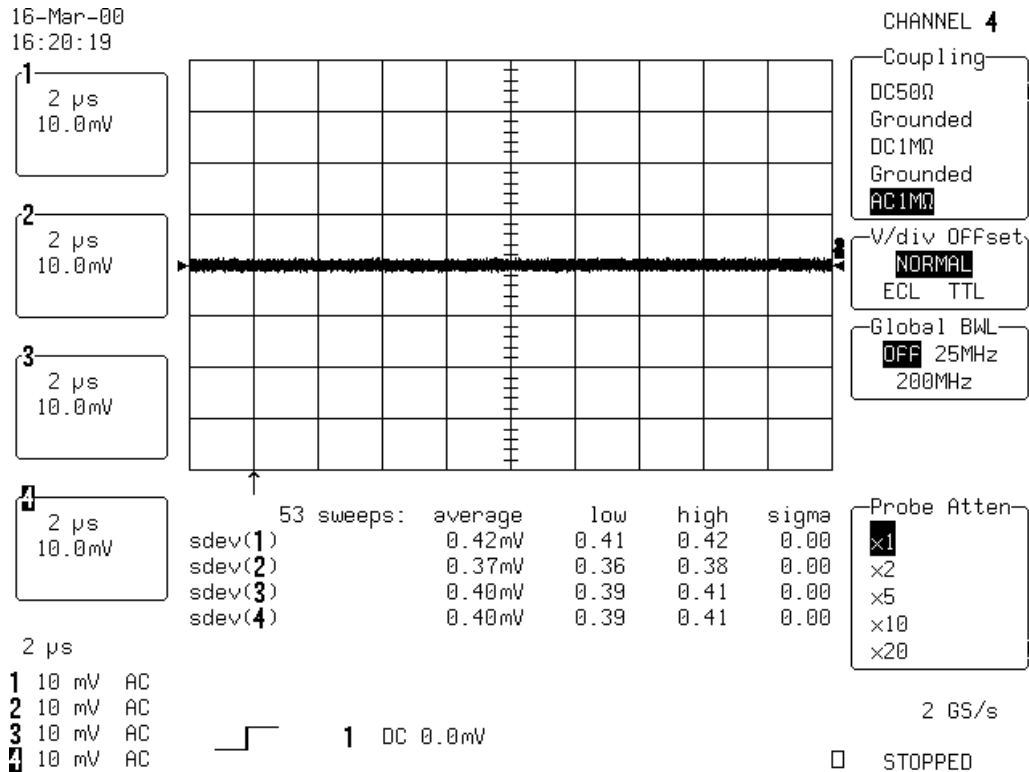

Input Coupling : **AC 1MΩ** on all 4 Channels

Time base : **2 μsec/div**.

- Press **Clear Sweeps**.
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.

- Record the four **high sdev** parameter values in Table 5, and compare the test results to the limits in the test record.

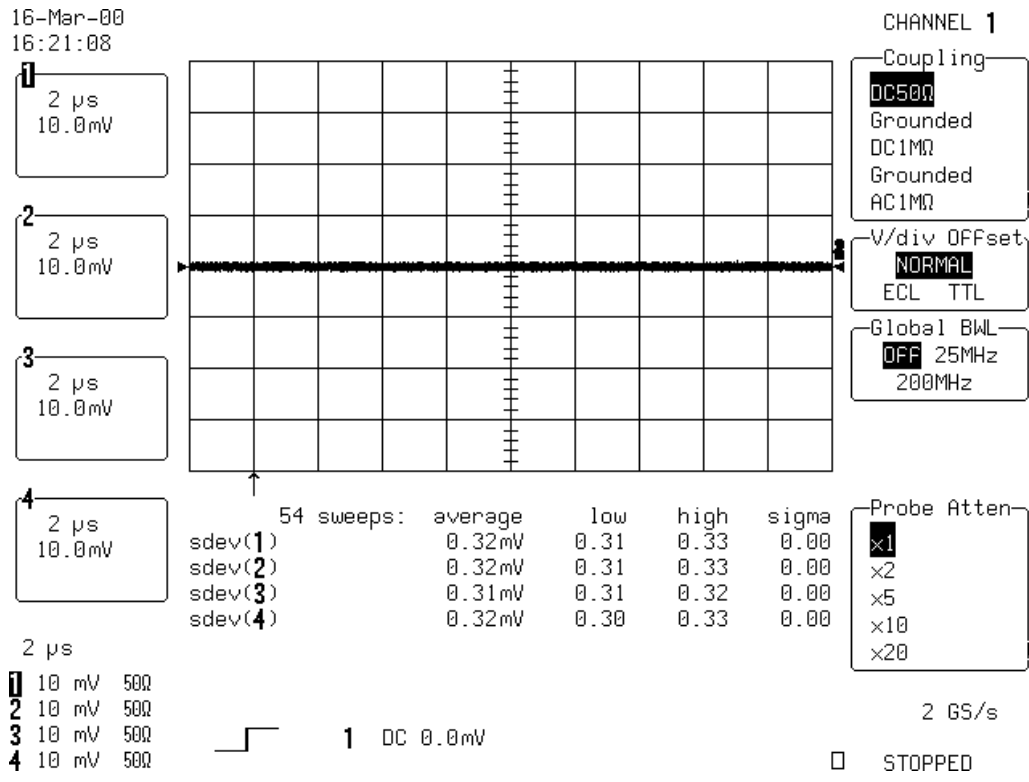

### c. DC 50 $\Omega$

- Recall **LC564D026.PNL** or configure the DSO as shown in 5.6.2.a and make the following changes :

Input Coupling : **DC 50 $\Omega$**  on all 4 Channels

Time base : **2  $\mu$ sec/div.**

- Press **Clear Sweeps**.
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.

- Record the four **high sdev** parameter values in Table 5, and compare the test results to the limits in the test record.
- Repeat the test for Time base : **20 μsec/div.**
- Record the measurements (high sdev of 1,2,3,4) in Table 5, and compare the results to the limits in the test record.

**d. DC 50Ω, 2 Channel Mode**

**Channel 2 & Channel 3**

- Recall **LC564D027.PNL** or configure the DSO as shown in 5.6.2.a. and make the following changes :

- Input Coupling : **DC 50Ω** on all 4 Channels
- Input gain : **10 mV/div.** on all 4 Channels
- Channels Trace ON **Channel 2, Channel 3**
- Channels Trace OFF **Channel 1, Channel 4**
- Time base : **1 μsec/div.**

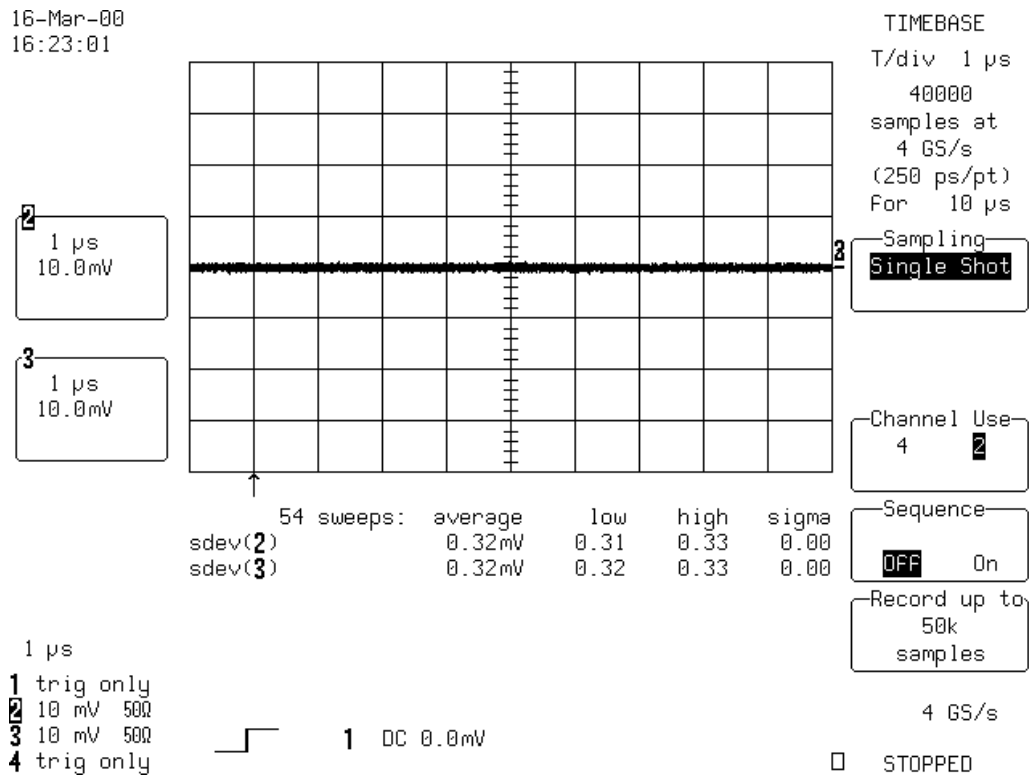

Select Time base Setup  
 Channel use : 2

Press : **Cursors/Measure**  
 Change parameters

On line 1 : **Measure sdev of Ch2**

On line 2 : **Measure sdev of Ch3**

- Check that the Sampling rate is **4 GS/s**
- Press **Clear Sweeps**.
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the two **high sdev of Ch2 & Ch3** in Table 5, and compare the test results to the limits in the test record.

---

### 5.6.3 Ground Line Test

#### Specifications

- ±5 % of full scale at 2 mV/div.
- ±3 % of full scale at 5 mV/div.
- ±2 % of full scale at 10 mV/div. and above.

#### Procedure

The stability of the ground line is verified for each channel at each fixed gain. The measured average values are checked against the desired limits.

##### a. DC 1MΩ

With no signal connected to the inputs

- Recall **LC564D029.PNL** or configure the DSO :
  - Channels Trace ON **Channel 1, Channel 2, Channel 3 & Channel 4**
  - Input Coupling : **DC 1MΩ** on all 4 Channels
  - Input gain : **from 2mV/div to 1 V/div. (see Table 6)** on all 4 Ch
  - Offset : **Zero** on all 4 Channels
  - Trigger on : **Channel 1, DC**
  - Trigger mode : **Auto**
  - Time base : **0.5 μsec/div.**
  - Channel use : **4**
  - Record up to : **50 k**

## Change parameters

On line 1 : **Measure mean of A**  
 On line 2 : **Measure mean of B**  
 On line 3 : **Measure mean of C**  
 On line 4 : **Measure mean of D**

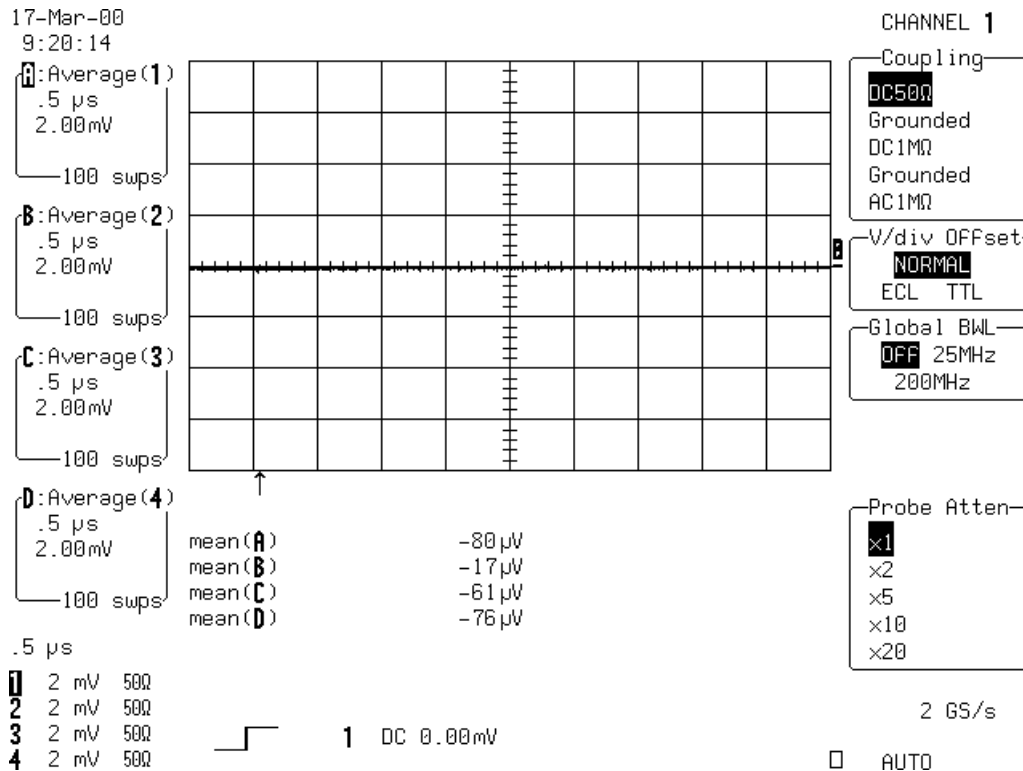

- Press **Clear Sweeps**.
- After **100 sweeps** record the **mean** value of **A, B, C & D** in Table 6, and compare the test results to the limits in the test record.
- Repeat step 5.6.3.a. for all vertical scale settings listed in Table 6, and check that the test results (mean value of A, B, C, D) are within the limits specified.
- Record the measurements in Table 6.

## b. DC 50Ω

- Recall **LC564D030.PNL** or configure the DSO as shown in 5.6.3.a. and for each Channel make the following change:

Input Coupling : **DC 50Ω** on all 4 Channels  
 Input gain : from **2mV/div** to **.2 V/div**. (see Table 7) on all 4 Ch

- Press **Clear Sweeps**.
- After **100 sweeps** record the **mean** value of **A, B, C & D** in Table 7, and compare the test results to the limits in the test record.
- Repeat step 5.6.3.b. for all vertical scale settings listed in Table 7, and check that the test results (mean value of A, B, C, D) are within the limits specified.
- Record the measurements in Table 7.

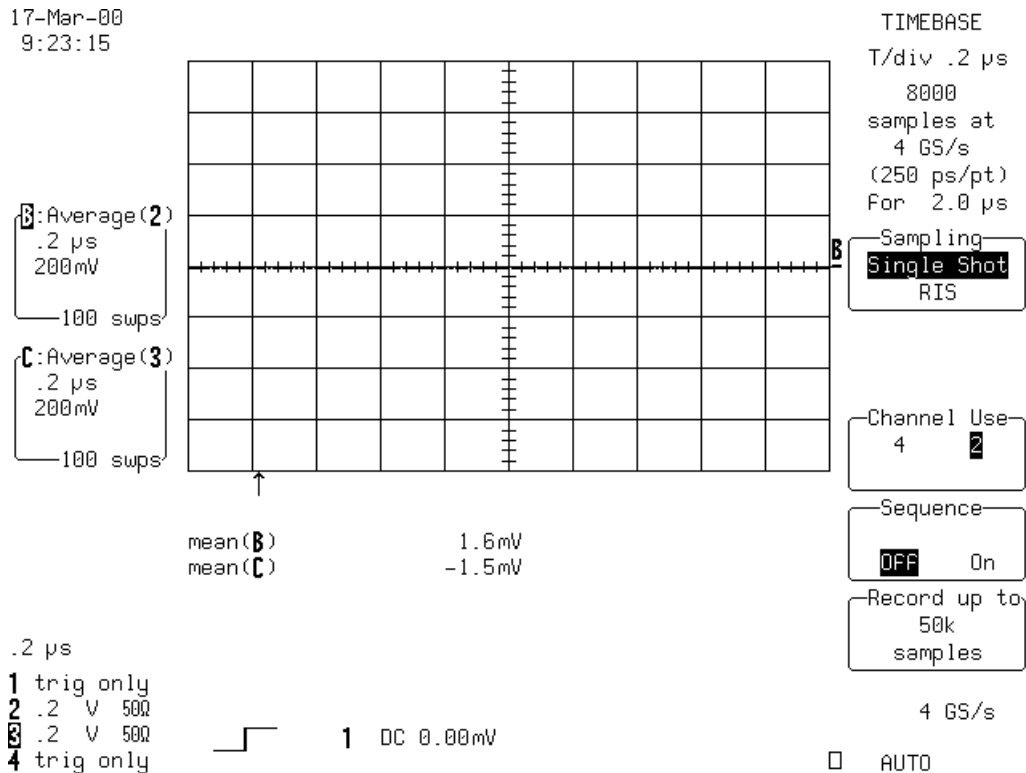

### c. DC 50Ω, 2 Channel Mode

#### Channel 2 & Channel 3

- Recall **LC564D031.PNL** or configure the DSO as shown in 5.6.3.a and make the following change :

Input Coupling : **DC 50Ω** on all 4 Channels  
 Input gain : **0.2 V/div.** on all 4 Channels  
 Trace ON : **A:Average of (2), C:Average of (3)**  
 Trace OFF : **B:Average of (1), D:Average of (4)**  
 Time base : **0.2 μsec/div.**  
 Select Time base Setup  
 Channel use : **2**  
 Press : **Cursors/Measure**  
 Change parameters  
 On line 1 : **Mean of B**  
 On line 2 : **Mean of C**  
 On line 3, 4, 5 : **No parameter selected**

- Check that the Sampling rate is **4 GS/s**
- Press **Clear Sweeps**.
- After **100 sweeps** record the **mean** value of **B & C** in Table 7, and compare the test results to the limits in the test record.

## 5.7 DC Accuracy

### Specification

- ≤ ±5 % of full scale at 2mV/div, with 0 mV offset.
- ≤ ±3 % of full scale at 5mV/div, with 0 mV offset.
- ≤ ±2 % of full scale at 10mV/div and above, with 0 mV offset.

### Description

This test measures the DC Accuracy within the gain range specified. It requires a DC source with a voltage range of 0 V to 20 V adjustable in steps of no more than 15 mV, and a calibrated DMM that can measure voltage to 0.1 %. Measurements are made using voltage values applied by the external voltage reference source, measured by the DMM, and in the oscilloscope using the parameters Std voltage. For each known input voltage, the deviation is checked against the tolerance.

### 5.7.1 Positive DC Accuracy

#### a. DC 50Ω

#### Procedure

- Recall **LC564D045.PNL** or configure the DSO :

Panel Setups	:	<b>Recall FROM DEFAULT SETUP</b>
Channels Trace ON	:	<b>Channel 1, Channel 2, Channel 3 &amp; Channel 4</b>
Input Coupling	:	<b>DC 50Ω</b> on all 4 Channels
Input offset	:	<b>0.0 mV</b> on all 4 Channels
Input gain	:	from <b>2mV/div to 1 V/div.</b> (see Table 9) on all 4 Ch
Trigger setup	:	<b>Edge</b>
Trigger on	:	<b>Line</b>
Slope line	:	<b>Positive</b>
Mode	:	<b>Auto</b>
Time base	:	<b>2 msec/div.</b>
Channel use	:	<b>4</b>
Record up to	:	<b>25 k</b>
Channels Trace OFF	:	<b>Channel 1, Channel 2, Channel 3 &amp; Channel 4</b>
Zoom+Math Trace ON	:	<b>A, B, C &amp; D</b>
Select Math Setup	:	
For Math	:	<b>Use at most 5000 points</b>
Redefine A, B, C, D	:	<b>Channel 1, Channel 2, Channel 3 &amp; Channel 4</b>
Use Math ?	:	<b>Yes</b>
Math Type	:	<b>Average</b>
Avg. Type	:	<b>Summed</b>

For : 100 sweeps  
Cursors/Measure : Parameters  
Mode : Custom  
Statistics : off

Change parameters

On line 1 : Measure mean of A  
On line 2 : Measure mean of B  
On line 3 : Measure mean of C  
On line 4 : Measure mean of D

- For the low sensitivities: 2 mV, 5 mV, 10 mV and 20 mV/div., connect the test equipment as shown in Figure 5-1.

Figure 5-1 : DC 50Ω Accuracy Equipment Setup for 2, 5, 10 and 20 mV/div

- For the sensitivities : 50 mV and 100 mV/div, connect the test equipment as shown in Figure 5-2.
- For the range 1 V/div no attenuator is required, connect the test equipment as shown in Figure 5-3.

Figure 5-2 : DC 50 $\Omega$  Accuracy Equipment Setup for 50 and 100 mV/div

Figure 5-3 : DC 50 $\Omega$  Accuracy Equipment Setup for 1 V/div.

- For each **DSO Volts/div**, set the output of the external **DC voltage reference source** as shown in Table 8, column PS output.
  - 1) Connect the DMM and record the **voltage reading** in Table 8, column **DMM**.
  - 2) Disconnect the DMM from the BNC T connector.
  - 3) Press **Clear Sweeps**
  - 4) After 100 sweeps, read off the **DSO mean parameter**, and record the measurement in Table 8, column **Mean**.
- For each DC voltage applied to the DSO input, repeat parts 1), 2), 3) and 4).
- Calculate the **Difference (  $\Delta$  )** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading. Record the test result in Table 8, and compare the **Difference (  $\Delta$  )** to the corresponding limit in the test record.
- Repeat step 5.7.1.a. for the other channels, substituting channel controls and input connector.

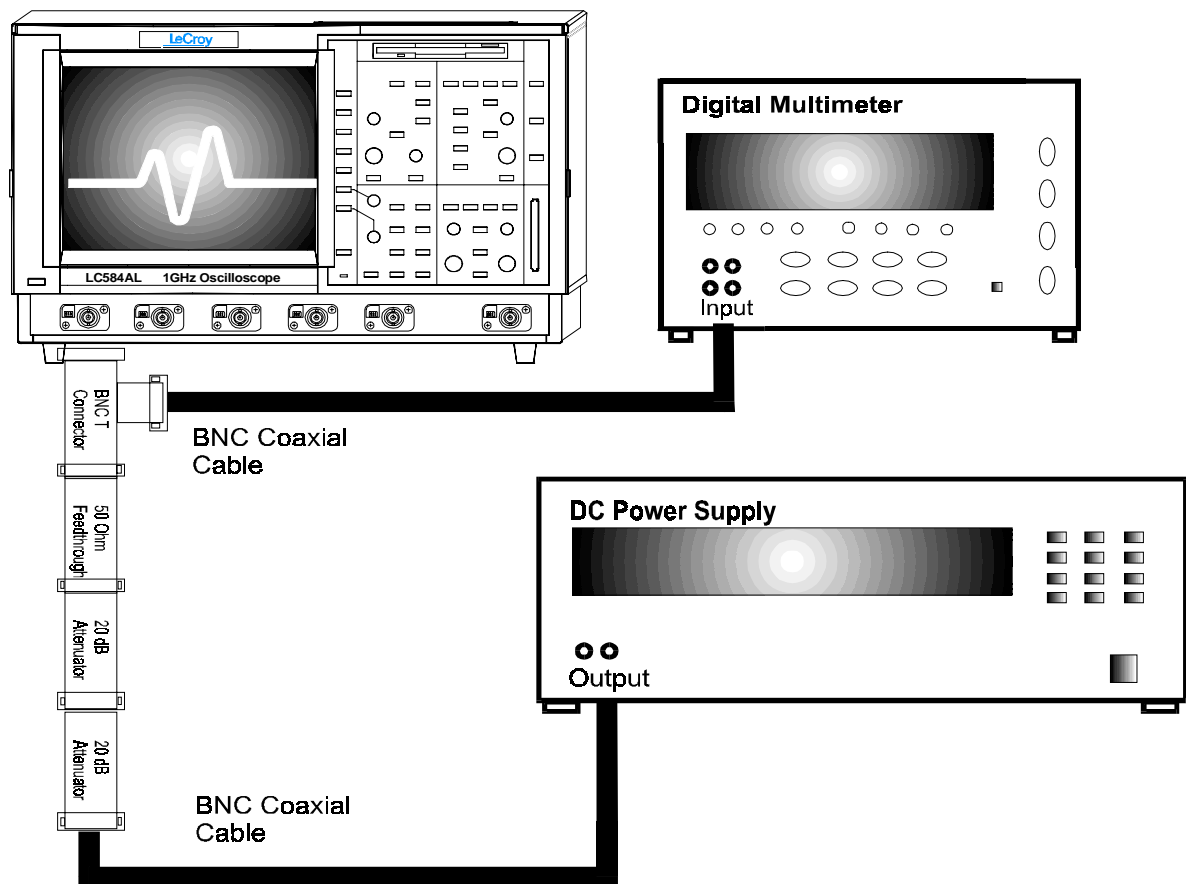

**b. DC 1M $\Omega$**

**Procedure**

- Recall **LC564D046.PNL** or configure the DSO as shown in 5.7.1.a. and make the following change :

Input gain : **5mV/div, 0.1 V/div, and 2V/dv** (see Table 10) on all 4 Ch  
Input Coupling : **DC 1M $\Omega$**  on all 4 Channels

- For 5 mV/div., connect the test equipment as shown in Figure 5-4.

**Figure 5-4: DC 1M $\Omega$  Accuracy Equipment Setup for 5 mV/div.**

- For 100 mV/div, connect the test equipment as shown in Figure 5-5.
- For 2V/div no attenuator is required, connect the test equipment as shown in Figure 5-6.

Figure 5-5 : DC 1MΩ Accuracy Equipment Setup for 100 mV/div

Figure 5-6 : DC 1MΩ Accuracy Equipment Setup for 2V/div.

- For each **DSO Volts/div**, set the output of the external **DC voltage reference source** as shown in Table 9, column PS output.
  - 1) Connect the DMM and record the **voltage reading** in Table 9, column **DMM**.
  - 2) Disconnect the DMM from the BNC T connector.
  - 3) Press **Clear Sweeps**
  - 4) After 100 sweeps, read off the **DSO mean parameter**, and record the measurement in Table 9, column **Mean**.
- For each DC voltage applied to the DSO input, repeat parts 1), 2), 3) and 4).
- Calculate the **Difference (  $\Delta$  )** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading. Record the test result in Table 9, and compare the **Difference (  $\Delta$  )** to the corresponding limit in the test record.
- Repeat step 5.7.1.b. for the other channels, substituting channel controls and input connector.

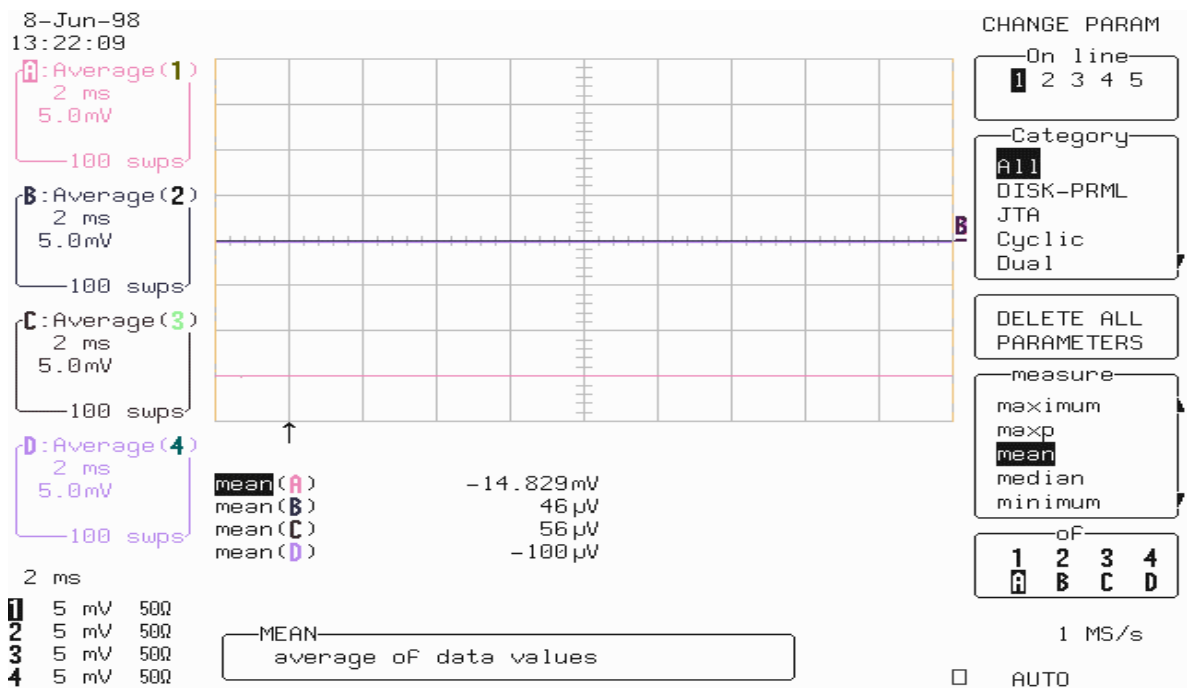

## 5.7.2 Negative DC Accuracy

### a. DC 50Ω

- Recall **LC564D045.PNL** or configure the DSO as shown in 5.7.1.a.
- Connect the test equipment as shown in either Figure 5-1 or 5-2 or 5-3.
- For each **DSO Volts/div**, set the output of the external **DC voltage reference source** as shown in Table 10, column PS output. (if a banana-BNC adapter is being used it can simply be turned to get the opposite polarity)
  - 1) Connect the DMM and record the **voltage reading** in Table 10, column **DMM**.
  - 2) Disconnect the DMM from the BNC T connector.
  - 3) Press **Clear Sweeps**
  - 4) After 100 sweeps, read off the **DSO mean parameter**, and record the measurement in Table 11, column **Mean**.
- For each DC voltage applied to the DSO input, repeat parts 1), 2), 3) and 4).
- Calculate the **Difference ( Δ )** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading. Record the test result in Table 10, and compare the **Difference ( Δ )** to the corresponding limit in the test record.
- Repeat step 5.7.2.a. for the other channels, substituting channel controls and input connector.

## b. DC 1 MΩ

- Recall **LC564D046.PNL** or configure the DSO as shown in 5.7.1.a. and make the following change :
  - Input gain : **5mV/div, 0.1 V/div, and 2V/div** (see Table 11) on all 4 Ch
  - Input Coupling : **DC 1 MΩ** on all 4 Channels
- Connect the test equipment as shown in either Figure 5-4 or 5-5 or 5-6.
- For each **DSO Volts/div**, set the output of the external **DC voltage reference source** as shown in Table 11, column PS output.
  - 1) Connect the DMM and record the **voltage reading** in Table 11, column **DMM**.
  - 2) Disconnect the DMM from the BNC T connector.
  - 3) Press **Clear Sweeps**
  - 4) After 100 sweeps, read off the **DSO mean parameter**, and record the measurement in Table 11, column **Mean**.
- For each DC voltage applied to the DSO input, repeat parts 1), 2), 3) and 4).
- Calculate the **Difference ( Δ )** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading. Record the test result in Table 11, and compare the **Difference ( Δ )** to the corresponding limit in the test record.
- Repeat step 5.7.2.b. for the other channels, substituting channel controls and input connector.

---

## 5.8 Offset Accuracy

### Specifications

Offset range at 2 mV/div:  $\pm 0.4$  Volt, Accuracy  $\leq \pm 4.8$  mV (5% of FS + 1% of offset).  
Offset range at 5 mV/div:  $\pm 1$  Volt, Accuracy  $\leq \pm 11.2$  mV (3% of FS + 1% of offset).

### Description

The offset test is done at 2 mV/div and 5 mV/div for 50 $\Omega$  and at 5 mV/div for 1M $\Omega$  coupling, with a signal of  $\pm 0.4$  Volt or  $\pm 1$  Volt cancelled by an offset of the opposite polarity.

### 5.8.1 Positive Offset Accuracy

#### a. DC 50 $\Omega$

#### Procedure

- Recall **LC564D047.PNL** or configure the DSO:

Panel Setups	:	<b>Recall FROM DEFAULT SETUP</b>
Channels Trace ON	:	<b>Channel 1, Channel 2, Channel 3 &amp; Channel 4</b>
Input Coupling	:	<b>DC 50<math>\Omega</math></b> on all 4 Channels
Input gain	:	<b>2mV/div</b> on all 4 Channels
Input offset	:	<b>+0.4 Volt</b> on all 4 Channels
Trigger setup	:	<b>Edge</b>
Trigger on	:	<b>Line</b>
Coupling 1	:	<b>DC</b>
Mode	:	<b>Auto</b>
Time base	:	<b>2 msec/div.</b>
Channel use	:	<b>4</b>
Record up to	:	<b>25 k</b>
Channels Trace OFF	:	<b>Channel 1, Channel 2, Channel 3 &amp; Channel 4</b>
Zoom+Math Trace ON	:	<b>A, B, C &amp; D</b>
Select Math Setup	:	
For Math	:	<b>Use at most 5000 points</b>
Redefine A, B, C, D	:	<b>Channel 1, Channel 2, Channel 3 &amp; Channel 4</b>
Use Math ?	:	<b>Yes</b>
Math Type	:	<b>Average</b>
Avg. Type	:	<b>Summed</b>
For	:	<b>100 sweeps</b>
Cursors/Measure	:	<b>Parameters</b>
Mode	:	<b>Custom</b>
Statistics	:	<b>off</b>
Change parameters	:	

On line 1 : Measure mean of A  
On line 2 : Measure mean of B  
On line 3 : Measure mean of C  
On line 4 : Measure mean of D

- Connect the test equipment as shown in Figure 5-7.

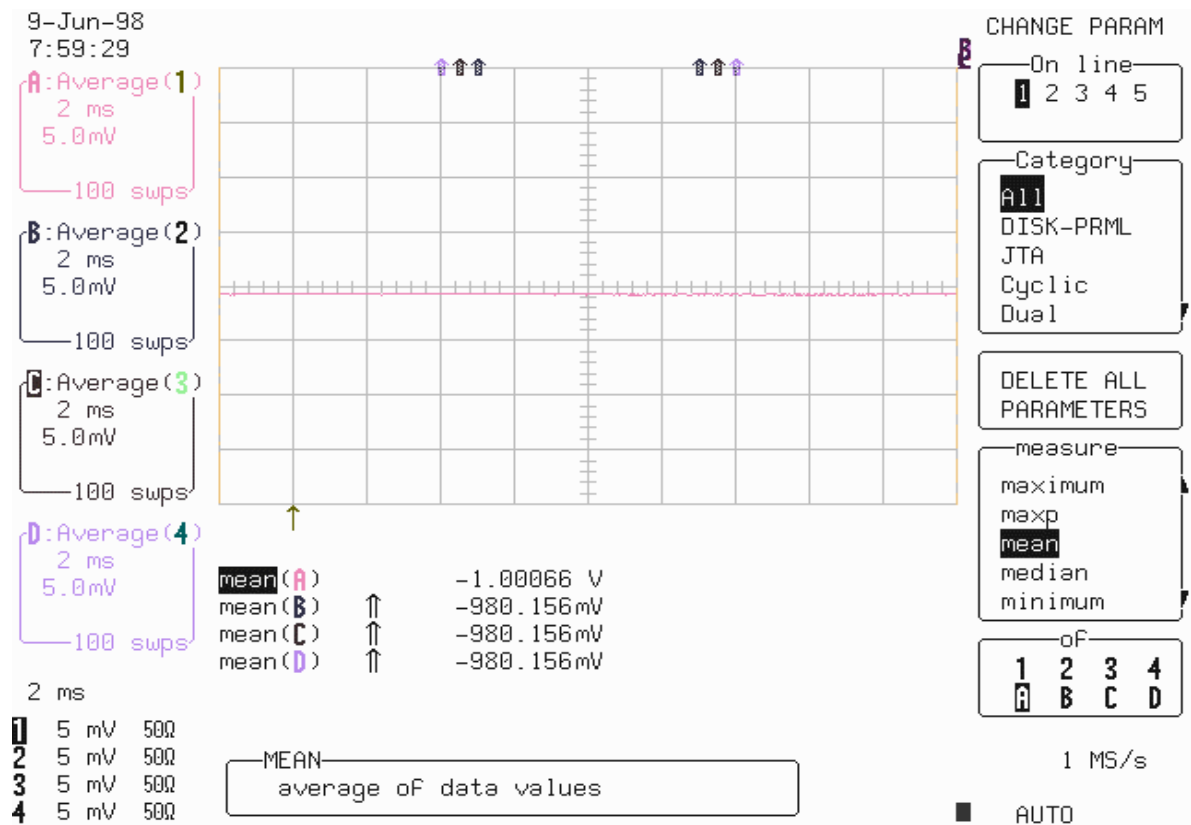

Figure 5-7 : Offset Accuracy Equipment Setup

- Set the output of the external **DC voltage reference source** to **-0.4 Volt**.
  - 1) Verify that the displayed trace A : Average (1) is on the screen, near the center horizontal graticule line. If the trace is not visible, modify the **DC voltage reference source output** until the trace is within  $\pm 2$  divisions of center.
  - 2) Connect the DMM and record the **voltage reading** in Table 12, column **DMM**.
  - 3) Disconnect the DMM from the BNC T connector.
  - 4) Press **Clear Sweeps**
  - 5) After 100 sweeps, Read off the **DSO Mean parameter** voltage, and record the measurement in Table 12, column **Mean**.

- Repeat the test for the other channels, substituting channel controls and input connector. Record the measurements in Table 12.
- Set DSO input gain to **5 mV/div** and DSO Offset to **+1 Volt** on all 4 Channels.
- Set the output of the external **DC voltage reference source** to **-1 Volt**.
- Repeat steps 1), 2), 3), 4) and 5) on all 4 Channels.
- Record the measurements in Table 12.

- Calculate the **Difference ( Δ )** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading.
- Record the test result in Table 12, and compare the **Difference ( Δ )** to the corresponding limit in the test record.

## b. DC 1M $\Omega$

### Procedure

- Recall **LC564D048.PNL** or configure the DSO as shown in 5.8.1.a. and for each Channel make the following change :
  - Input Coupling : **DC 1M $\Omega$**  on all 4 Channels
  - Input gain : **5mV/div** on all 4 Channels
  - Input offset : **+1 Volt** on all 4 Channels
- Connect the test equipment as shown in Figure 5-7.
- Set the output of the external **DC voltage reference source** to **-1 Volt**.
  - 1) Verify that the displayed trace A : Average (1) is on the screen, near the center horizontal graticule line. If the trace is not visible, modify the **DC voltage reference source output** until the trace is within  $\pm 2$  divisions of center.
  - 2) Connect the DMM and record the **voltage reading** in Table 12, column **DMM**.
  - 3) Disconnect the DMM from the BNC T connector.
  - 4) Press **Clear Sweeps**
  - 5) After 100 sweeps, Read off the **DSO Mean parameter** voltage, and record the measurement in Table 12, column **Mean**.
- Repeat the test for the other channels, substituting channel controls and input connector. Record the measurements in Table 12.
- Calculate the **Difference (  $\Delta$  )** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading.
- Record the test result in Table 12, and compare the **Difference (  $\Delta$  )** to the corresponding limit in the test record.

## 5.8.2 Negative Offset Accuracy

### a. DC 50Ω

#### Procedure

- Recall **LC564D049.PNL** or configure the DSO as shown in 5.8.1.a. and for each Channel make the following change :

Input offset : **-0.4 Volt** on all 4 Channels

- Connect the test equipment as shown in Figure 5-7.
- Set the output of the external **DC voltage reference source** to **+0.4 Volt**.

- 1) Verify that the displayed trace A : Average (1) is on the screen, near the center horizontal graticule line. If the trace is not visible, modify the **DC voltage reference source output** until the trace is within  $\pm 2$  divisions of center.
  - 2) Connect the DMM and record the **voltage reading** in Table 13, column **DMM**.
  - 3) Disconnect the DMM from the BNC T connector.
  - 4) Press **Clear Sweeps**
  - 5) After 100 sweeps, Read off the **DSO Mean parameter** voltage, and record the measurement in Table 13, column **Mean**.
- Repeat the test for the other channels, substituting channel controls and input connector. Record the measurements in Table 13.
  - Set DSO input gain to **5 mV/div** and DSO Offset to **-1 Volt** on all 4 Channels.
  - Set the output of the external **DC voltage reference source** to **+1 Volt**.
  - Repeat steps 1), 2), 3), 4) and 5) on all 4 Channels.
  - Record the measurements in Table 13.
  - Calculate the **Difference (  $\Delta$  )** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading. Record the test result in Table 13, and compare the **Difference (  $\Delta$  )** to the corresponding limit in the test record.

#### b. DC 1M $\Omega$

- Recall **LC564D050.PNL** or configure the DSO as shown in 5.8.1.a. and for each Channel make the following changes :
  - Input Coupling : **DC 1M $\Omega$**  on all 4 Channels
  - Input Gain : **5 mV/div** on all 4 Channels
  - Input offset : **-1 Volt** on all 4 Channels
- Connect the test equipment as shown in Figure 5-7.
- Set the output of the external **DC voltage reference source** to **+1 Volt**.
  - 1) Verify that the displayed trace A : Average (1) is on the screen, near the center horizontal graticule line. If the trace is not visible, modify the **DC voltage reference source output** until the trace is within  $\pm 2$  divisions of center.
  - 2) Connect the DMM and record the **voltage reading** in Table 13, column **DMM**.

3) Disconnect the DMM from the BNC T connector.

4) Press **Clear Sweeps**

5) After 100 sweeps, Read off the **DSO Mean parameter** voltage, and record the measurement in Table 13, column **Mean**.

- Repeat the test for the other channels, substituting channel controls and input connector. Record the measurements in Table 13.
- Calculate the **Difference ( Δ )** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading. Record the test result in Table 13, and compare the **Difference ( Δ )** to the corresponding limit in the test record.

## 5.9 Bandwidth

### 5.9.1 Description

The purpose of this test is to ensure that the entire system has a bandwidth of at least 1.0 GHz. An external source is used as the reference to provide a signal where amplitude and frequency are well controlled.

The amplitude of the generator as a function of frequency and power is calibrated using an HP8482A sensor on an HP437B power meter or equivalent.

### Specifications

**50Ω** : DC to at least 1.0 GHz (–3 dB) at 10 mV/div. and above.

**1MΩ** : DC to 500 MHz typical at 100 mV/div.

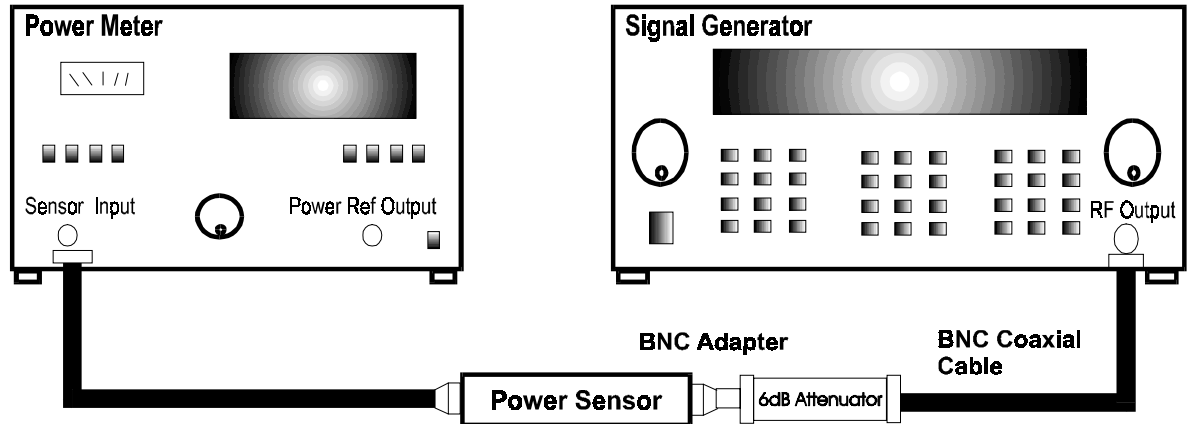

#### a. DC 50Ω

- Recall **LC564D051.PNL** or configure the DSO :

Panel Setups	:	<b>Recall FROM DEFAULT SETUP</b>
Channels Trace ON	:	<b>Channel 1, Channel 2, Channel 3 &amp; Channel 4</b>
Input Coupling	:	<b>DC 50Ω</b> on all 4 Channels
Input gain	:	<b>50 mV/div</b> on all 4 Channels
Input offset	:	<b>0 mV</b> on all 4 Channels
Trigger setup	:	<b>Edge</b>
Trigger on	:	<b>Line</b>
Slope line	:	<b>Pos</b>
Mode	:	<b>Auto</b>
Time base	:	<b>1 μsec/div.</b>
Channel use	:	<b>4</b>
Record up to	:	<b>25 k</b>
Cursors/Measure	:	<b>Parameters</b>
Mode	:	<b>Custom</b>
Statistics	:	<b>On</b>
Change parameters	:	
On line 1	:	<b>Sdev of 1</b>
On line 2	:	<b>Sdev of 2</b>
On line 3	:	<b>Sdev of 3</b>
On line 4	:	<b>Sdev of 4</b>

- Connect the HP8482A power sensor to the power meter.
- Zero and **calibrate** the HP8482A power sensor using the power meter **Power Ref output**.

- Connect a **BNC adapter** to the HP8482A power sensor.
- Connect a 5ns 50Ω BNC cable to the **RF output** of the HP8648B generator and then through a 6dB attenuator and the necessary adapters to the power sensor.

**Figure 5-8 : Power Meter Equipment Setup**

- Set the generator frequency to **300 kHz**
- Set the generator amplitude to measure **0.200 mW** on the power meter.
- Read the displayed **generator output amplitude**, and record it in the third column of Table 14.
- Repeat the above measurement for **1.1 MHz, 30.1 MHz, 300.1 MHz, 700.1 MHz & 1000.1 MHz** Record the generator output amplitude readout in the third column of Table 14.
- Disconnect the **RF output** of the HP8648B generator from the HP8482A power sensor.
- Connect the **RF output** of the HP8648B generator through a 5ns 50 Ohm BNC cable and a 6 dB attenuator into Channel 1.
- Set the generator frequency to **300 kHz**.
- From the generator, apply the **recorded generator signal amplitude** to Channel 1.
- Press **Clear Sweeps**.

Figure 5-9 : 50Ω Bandwidth Equipment Setup

- Measure for at least 100 sweeps, record the average value of **sdev(1)** in Table 14
- Repeat the above 3 steps for Channel 2, Channel 3 & Channel 4 substituting channel controls and input connector. Record the measurements in Table 14.
- Repeat the above measurement for all channels for 1.1 MHz, 30.1 MHz, 300.1 MHz, 700.1 MHz and 1000.1 MHz and record the values in Table 14.
- Calculate the ratio to .3 MHz for each frequency,  $sdev_{1.1}/sdev_{0.3}$ ,  $sdev_{30.1}/sdev_{0.3}$  ...  $sdev_{1000.1}/sdev_{0.3}$ , and compare the results to the limits in the test record.

- 
- Recall **LC564D052.PNL** or configure the DSO as shown in 5.9.1.a. and for each Channel make the following change :
    - Input gain : **100mV/div**
  - Connect the test equipment as shown in Figure 5-8.
  - Set the generator frequency to **300 kHz**
  - Set the generator amplitude to measure **0.800 mW** on the power meter.
  - Read the displayed **generator output amplitude**, and record it in the third column of Table 15.
  - Repeat the above measurement for **1.1 MHz, 30.1 MHz, 300.1 MHz, 700.1 MHz & 1000.1 MHz**. Record the generator output amplitude readout in the third column of Table 15.
  - Disconnect the **RF output** of the HP8648B generator from the HP8482A power sensor.
  - Connect the test equipment as shown in Figure 5-9.
  - Set the generator frequency to **300 kHz**.
  - From the generator, apply the **recorded generator signal amplitude** to Channel 1.
  - Press **Clear Sweeps**.
  - Measure for at least 100 sweeps, record the average value of **sdev(1)** in Table 15
  - Repeat the above 3 steps for Channel 2, Channel 3 & Channel 4 substituting channel controls and input connector. Record the measurements in Table 15.
  - Repeat the above measurement for all channels for 1.1 MHz, 30.1 MHz, 300.1 MHz, 700.1 MHz & 1000.1 MHz and record the values in Table 15.
  - Calculate the ratio to .3 MHz for each frequency,  $sdev_{1.1}/sdev_{0.3}$ ,  $sdev_{30.1}/sdev_{0.3}$  ...  $sdev_{1000.1}/sdev_{0.3}$ , and compare the results to the limits in the test record.

## b. DC 50Ω with Bandwidth Limiter On

- Recall **LC564D053.PNL** or configure the DSO

Panel Setups	:	<b>Recall FROM DEFAULT SETUP</b>
Channels Trace ON	:	<b>Channel 1</b>
Input Coupling	:	<b>DC 50Ω</b>
Global BWL	:	<b>25 MHz</b>
Input gain	:	<b>100 mV/div.</b>
Input offset	:	<b>0 mV</b>
Trigger setup	:	<b>Edge</b>
Trigger on	:	<b>1</b>
Slope line	:	<b>Pos</b>
Mode	:	<b>Auto</b>
Time base	:	<b>1 μsec/div.</b>
Channel use	:	<b>4</b>
Record up to	:	<b>25 k</b>
Cursors/Measure	:	<b>Parameters</b>
Mode	:	<b>Custom</b>
Statistics	:	<b>Off</b>
Change parameters	:	
On line 1	:	<b>Sdev of 1</b>
On line 2	:	<b>Freq of 1</b>

- Connect the test equipment as shown in Figure 5-9.
- Set the generator frequency to **300 kHz**.
- Adjust the generator signal amplitude to measure **sdev(1) = 200 mV**.
- Set Time base : **50 nsec/div.**
- Increase the generator frequency until **sdev(1) = 140 mV**. (typically 25 MHz)
- Press **Clear Sweeps**
- When **sdev(1) = 140 mV**, record Freq(1) in Table 16.
- Check that the frequency is within the limits specified in Table 16.

AUTO

- Set Global BWL : **200 MHz**
- Set Timebase : **5 nsec/div.**
- Increase the generator frequency until **sdev(1) = 140 mV.** (typically 200 MHz)

- Press **Clear Sweeps**
- When **sdev(1) = 140 mV**, record **Freq(1)** in Table 16.
- Repeat the 25 MHz and 200 MHz Bandwidth limiter tests for the other channels, substituting channel controls and input connector.
- Recall **LC564D054.PNL** for Channel 2, **LC564D055.PNL** for Channel 3, **LC564D056.PNL** for Channel 4, or configure the DSO as shown in 5.9.1.b. and make the necessary changes.
- Record the test results in Table 16, and compare the results to the limits.

## 5.9.2 DC 1MΩ

- Recall **LC564D057.PNL** or configure the DSO :

Panel Setups : **Recall FROM DEFAULT SETUP**

Channels Trace ON : **Channel 1, Channel 2, Channel 3 & Channel 4**

Input Coupling : **DC 1MΩ** on all 4 Channels

Input gain : **100 mV/div.** on all 4 Channels

Input offset : **0 mV** on all 4 Channels

Trigger setup : **Edge**

Trigger on : **Line**

Slope line : **Pos**

Mode : **Auto**

Time base : **1 μsec/div.**

Channel use : **4**

Record up to : **25 k**

Cursors/Measure : **Parameters**

Mode : **Custom**

Statistics : **On**

Change parameters

On line 1 : **Sdev of 1**

On line 2 : **Sdev of 2**

On line 3 : **Sdev of 3**

On line 4 : **Sdev of 4**

- Connect the test equipment as shown in Figure 5-10.

**Figure 5-10 : 1MΩ Bandwidth Equipment Setup**

- Set the generator frequency to **300 kHz**.

- Adjust the generator signal amplitude to measure **sdev(1) = 200 mV**.

- Disconnect the coaxial cable from the 4962-10 adapter. Connect the test equipment as shown in Figure 5-11.

Figure 5-11 : Power Meter Equipment Setup

- Record the displayed power meter value in mW.
- Set the generator frequency to **500.1 MHz**.
- Now fine adjust the generator amplitude output until the power meter readout indicates the value measured just above at 300 kHz.
- Reconnect the signal generator to DSO Channel 1, as shown in Figure 5-10.
- Press **Clear Sweeps**.
- Measure for at least **100 sweeps**, record the average value of **sdev(1)** in Table 17.
- Repeat the above steps for Channel 2, Channel 3 & Channel 4, substituting channel controls and input connector.
- Record the sdev measurements in Table 17.
- Calculate the ratio **sdev500.1/sdev0.3** for each Channel, and test each value against the limits shown in the test record.

## 5.10 Trigger Level

### 5.10.1 Description

The trigger capabilities are tested for several cases of the standard edge trigger:

- Channel (internal), and External Trigger sources
- Three levels: -3, 0, +3 major screen divisions
- DC coupling
- Positive and negative slopes

### 5.10.2 Channel Trigger at 0 Division Threshold

#### DC Coupling

Recall **LC564D058.PNL** or configure the DSO:

Panel Setups : **Recall FROM DEFAULT SETUP**  
Channels Trace ON **Channel 1, Channel 2, Channel 3 & Channel 4**  
Input Coupling : **DC 50Ω** on all 4 Channels  
Input gain : **100 mV/div.** on all 4 Channels  
Input offset : **0 mV** on all 4 Channels (use show status to verify)

Trigger setup : **Edge**  
Trigger on : **1**  
Slope 1 : **Pos**  
Coupling : **DC**  
Mode : **Auto**  
Set Trigger level : **DC 0.0 mV**  
Pre-Trigger Delay : **50 %**

Time base : **0.1 msec/div.**  
Record up to : **50 k samples**

Channels Trace OFF **Channel 1, Channel 2, Channel 3 & Channel 4**

Zoom+Math Trace ON **A, B, C & D**

Select Math Setup

For Math : **Use at most 5000 points**  
Redefine A, B, C, D **Channel 1, Channel 2, Channel 3 & Channel 4**  
Use Math ? : **Yes**  
Math Type : **Average**  
Avg. Type : **Summed**  
For : **10 sweeps**

- Set the output of the LeCroy LW420 or equivalent audio frequency signal generator to **1 kHz**.
- Connect the output of the generator to Channel 1 through a 50 Ohm coaxial cable and adjust the sine wave output amplitude to get **8 divisions peak to peak**.
- Select Cursors/Measure: **Cursors, Time, Absolute**
- Use the "cursor position" knob, to move the **Time marker** at 0.0  $\mu$ s

- Press **Clear Sweeps**,
- Acquire 10 sweeps and record in Table 18 the **level** readout displayed below 100 mV in the icon **1**, at top left.
- Compare the test results to the corresponding limit in the test record.
- Set Trigger Slope 1 : **Neg**
- Acquire 10 sweeps and record in Table 18 the **level** readout displayed below 100 mV in the icon **1**, at top left.

- Repeat these steps for all input channels, substituting channel controls ( DC, Pos, Neg ) and input connector.  
Recall **L564D059.PNL** for Channel 2, **L564D0060.PNL** for Channel 3, **L564D061.PNL** for Channel 4, or select **Trigger on** the Channel under test.  
The **Trigger level** is displayed in either the icon **2, 3 or 4**
- Record the measurements in Table 18 and compare the test results to the corresponding limits in the test record.

### 5.10.3 Channel Trigger at +3 Divisions Threshold

#### DC Coupling

- Recall **LC564D062.PNL** or configure the DSO as shown in 5.10.2.a and for each Channel make the following change :

Set Trigger level : **DC +300 mV**

- Connect the output of the generator to Channel 1 through a 50 Ohm coaxial cable.
- Press **Clear Sweeps**,
- Acquire 10 sweeps and record in Table 18 the **level** readout displayed below 100 mV in the icon **1**, at top left.
- Compare the test results to the corresponding limit in the test record.

- Set Trigger Slope 1 : **Neg**
- Acquire 10 sweeps and record in Table 18 the **level** readout displayed below 100 mV in the icon **1**, at top left.

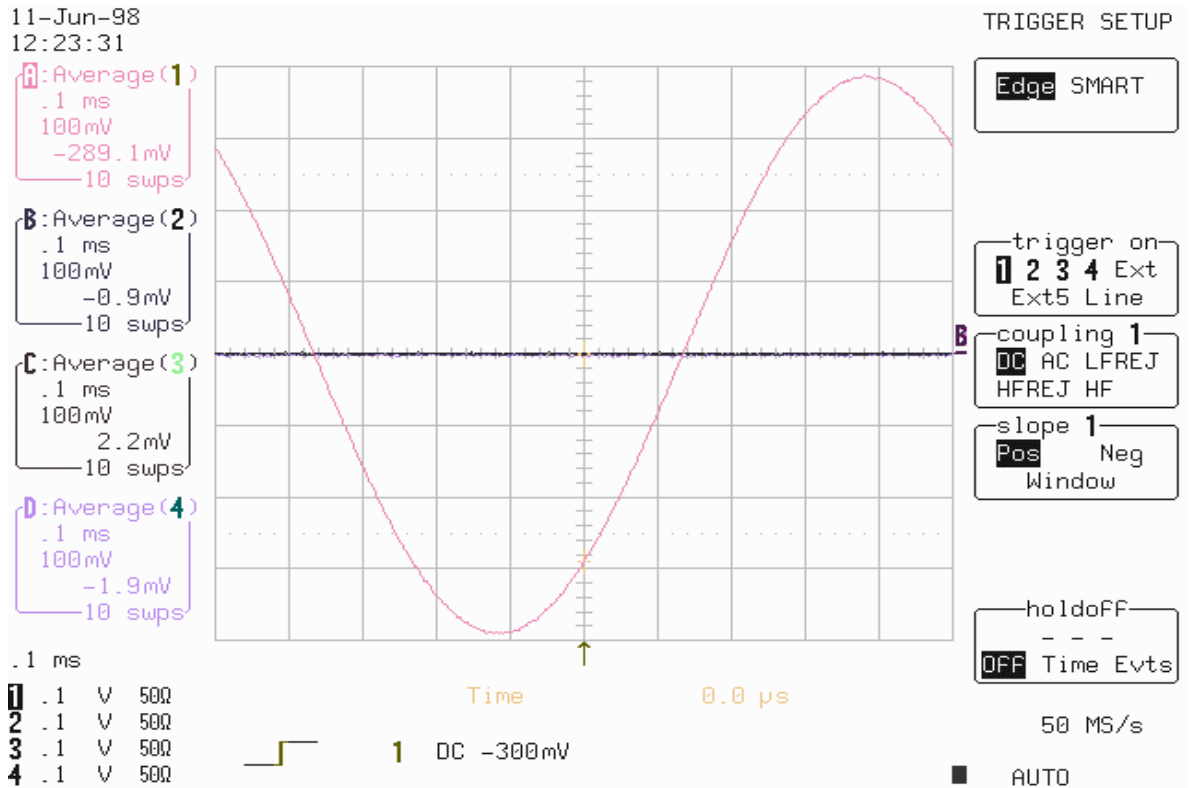

- Repeat these steps for all input channels, substituting channel controls ( DC, Pos, Neg ) and input connector.  
Recall **L564D063.PNL** for Channel 2, **L564D064.PNL** for Channel 3, **L564D065.PNL** for Channel 4, or select **Trigger on** the Channel under test.  
The **Trigger level** is displayed in either the icon **2, 3** or **4**
- Record the measurements in Table 18 and compare the test results to the corresponding limits in the test record.

#### 5.10.4 Channel Trigger at –3 Divisions Threshold

##### DC Coupling

- Recall **LC564D066.PNL** or configure the DSO as shown in 5.10.2.a and for each channel make the following change :  
  
Set Trigger level : **DC –300 mV**
- Connect the output of the generator to Channel 1 through a 50 Ohm coaxial cable.
- Press **Clear Sweeps**,
- Acquire 10 sweeps and record in Table 18 the **level** readout displayed below 100 mV in the icon **1**, at top left.
- Compare the test results to the corresponding limit in the test record.

- Set Trigger Slope 1 : **Neg**
- Acquire 10 sweeps and record in Table 18 the **level** readout displayed below 100 mV in the icon **1**, at top left.
- Repeat these steps for all input channels, substituting channel controls ( DC, Pos, Neg ) and input connector.  
Recall **L564D067.PNL** for Channel 2, **L564D068.PNL** for Channel 3, **L564D069.PNL** for Channel 4, or select **Trigger on** the Channel under test.  
The **Trigger level** is displayed in either the icon **2, 3 or 4**
- Record the measurements in Table 18 and compare the test results to the corresponding limits in the test record.

### 5.10.5 External Trigger at 0 Division Threshold

#### DC Coupling

- Recall **LC564D070.PNL** or configure the DSO :

Panel Setups : **Recall FROM DEFAULT SETUP**  
Channel Trace ON **Channel 2**  
Input Coupling : **DC 50Ω**  
Input gain : **100 mV/div.**  
Input offset : **0 mV**

Trigger setup : **Edge**  
Trigger on : **Ext**  
Slope Ext : **Pos**  
Coupling Ext : **DC**  
Set Trigger level : **0.0 mV**  
External : **DC 1MΩ**  
Mode : **Auto**  
Pre-Trigger Delay : **50 %**  
Time base : **0.1 msec/div.**  
Record up to : **50 k samples**

Channel Trace OFF **Channel 2**  
Zoom+Math Trace ON **B**  
Select Math Setup  
For Math : **Use at most 5000 points**  
Redefine B : **Channel 2**  
Use Math ? : **Yes**  
Math Type : **Average**  
Avg. Type : **Summed**  
For : **10 sweeps**

- Connect the test equipment as shown in Figure 5-12.
- Set the output of the LeCroy LW420 or equivalent audio frequency signal generator to **1 kHz**.
- Adjust the sine wave output amplitude to get **8 divisions peak to peak** .
- Select Cursors/Measure : **Cursors, Time, Absolute**
- Use the "cursor position" knob, to move the **Time marker** at 0.0 μs

Figure 5-12 : External Trigger Equipment Setup

- Press **Clear Sweeps**
- Acquire 10 sweeps and record in Table 19 the **level** readout displayed below 100 mV in the icon **2**, at top left.

- Set Trigger Slope Ext : **Neg**
- Acquire 10 sweeps and record in Table 19 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

### 5.10.6 External Trigger at +3 Divisions Threshold

#### DC Coupling

- Recall **LC564D071.PNL** or configure the DSO as shown in 5.10.5.a and make the following change :

Set Ext Trigger level : **DC +300 mV**

- Connect the test equipment as shown in Figure 5-12.
- Press **Clear Sweeps**,
- Acquire 10 sweeps and record in Table 19 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

- Set Trigger Slope Ext : **Neg**
- Acquire 10 sweeps and record in Table 21 the **level** readout displayed below 100 mV in the icon **2**, at top left.

### 5.10.7 External Trigger at -3 Divisions Threshold

#### DC Coupling

- Recall **LC564D072.PNL** or configure the DSO as shown in 5.10.5.a and make the following change :

Set Ext Trigger level : **DC -300 mV**

- Connect the test equipment as shown in Figure 5-12.
- Press **Clear Sweeps**.
- Acquire 10 sweeps and record in Table 19 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

- Set Trigger Slope Ext : **Neg**
- Acquire 10 sweeps and record in Table 19 the **level** readout displayed below 100 mV in the icon **2**, at top left.

### 5.10.8 External/5 Trigger at 0 Division Threshold

#### DC Coupling

- Recall **LC564D073.PNL** or configure the DSO :

Panel Setups : **Recall FROM DEFAULT SETUP**  
Channel Trace ON **Channel 2**  
Input Coupling : **DC 1M $\Omega$**   
Input gain : **1V/div**  
Input offset : **0 mV**  
Trigger setup : **Edge**  
Trigger on : **Ext5**  
Slope Ext/5 : **Pos**  
Mode : **Auto**  
Coupling : **DC**  
Set Trigger level : **0.0 mV**  
External : **DC 1M $\Omega$**   
Pre-Trigger Delay : **50 %**  
Time base : **0.1 msec/div.**  
Record up to : **50 k samples**

Channel Trace OFF **Channel 2**  
Zoom+Math Trace ON **B**  
Select Math Setup  
For Math : **Use at most 5000 points**  
Redefine B : **Channel 2**  
Use Math ? : **Yes**  
Math Type : **Average**  
Avg. Type : **Summed**  
For : **10 sweeps**

- Connect the test equipment as shown in Figure 5-12.
- Set the output of the LeCroy LW420 or equivalent audio frequency signal generator to **1 kHz**.
- Adjust the sine wave output amplitude to get **8 divisions peak to peak** .
- Select Cursors/Measure : **Cursors, Time, Absolute**

- Use the "cursor position" knob, to move the **Time marker** at  $0.0 \mu\text{s}$
- Press **Clear Sweeps**
- Acquire 10 sweeps and record in Table 19 the **level** readout displayed below  $100 \text{ mV}$  in the icon **2**, at top left.

- Set Trigger Slope Ext5 : **Neg**
- Acquire 10 sweeps and record in Table 21 the **level** readout displayed below  $100 \text{ mV}$  in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

### 5.10.9 External/5 Trigger at +3 Divisions Threshold

## DC Coupling

- Recall **LC564D074.PNL** or configure the DSO as shown in 5.10.8.a and make the following change :

Set Ext/5 Trigger level : **DC +3 V**

- Connect the test equipment as shown in Figure 5-12.
- Press **Clear Sweeps**,
- Acquire 10 sweeps and record in Table 21 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

- Set Trigger Slope Ext/5 : **Neg**
- Acquire 10 sweeps and record in Table 19 the **level** readout displayed below 100 mV in the icon **2**, at top left.

### 5.10.10 External/5 Trigger at -3 Divisions Threshold

## DC Coupling

- Recall **LC564D075.PNL** or configure the DSO as shown in 5.10.5.a and make the following change :

Set Ext/5 Trigger level : **DC -3 V**

- Connect the test equipment as shown in Figure 5-12.
- Press **Clear Sweeps**.
- Acquire 10 sweeps and record in Table 19 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

- Set Trigger Slope Ext/5 : **Neg**
- Acquire 10 sweeps and record in Table 19 the **level** readout displayed below 100 mV in the icon **2**, at top left.

## 5.11 Smart Trigger

### 5.11.1 Trigger on Pulse Width 10 nsec

#### a. Pulse Width < 10 nsec

- Recall **LC564D076.PNL** or configure the DSO
  - Panel Setups : **Recall FROM DEFAULT SETUP**
  - Channels trace ON **Channel 1**
  - Input coupling : **DC 50Ω**
  - Input gain : **.5 V/div.**
  - Input offset : **0 mV**
  - Trigger setup : **Smart**
  - Setup Smart Trigger **Glitch**
  - Trigger on : **1**
  - At the end of : **Neg.**
  - Width < 10 nsec : **On**
  - Width > 10 nsec : **Off**
  - Trigger mode : **Norm**
  - Time base : **5 nsec/div.**
- Connect the **RF output** of the HP8648B generator through a 5ns 50 Ohm BNC coaxial cable into Channel 1.
- Set the generator frequency to **100 MHz**. Adjust the generator output amplitude to get **5 divisions peak to peak** .
- Check that the scope Triggers. Record the test result in Table 20.
- Set Width < 10 nsec **Off** and Width > 10 nsec **ON**
- Check that the scope **doesn't trigger** : slow trigger and no flashes in box next to normal. Record the test result in Table 20.

#### b. Pulse Width > 10 nsec

- Set the generator frequency to **40 MHz**.
- Set Width < 10 nsec **Off** and Width > 10 nsec **ON**
- Check that the scope Triggers. Record the test result in Table 20.
- Set Width < 10 nsec **On** and Width > 10 nsec **Off**
- Check that the scope **doesn't trigger** : slow trigger and no flashes in box. Record the test result in Table 20.

### 5.11.2 Trigger on Pulse Width 100 nsec

#### a. Pulse Width < 100 nsec

- Recall **LC564D077.PNL** or configure the DSO as shown in 5.11.1.a and make the following changes :

Width < 100 nsec : **On**

Width > 100 nsec : **Off**

Time base : **20 nsec/div.**

- Set the generator frequency to **10 MHz**.
- Check that the scope Triggers. Record the test result in Table 20.
- Set Width < 100 nsec **Off** and Width > 100 nsec **ON**
- Check that the scope **doesn't trigger** : slow trigger and no flashes in box next to normal. Record the test result in Table 20.

#### b. Pulse Width > 100 nsec

- Set the generator frequency to **4 MHz**.
- Time base : **50 nsec/div.**
- Set Width < 100 nsec **Off** and Width > 100 nsec **ON**
- Check that the scope Triggers. Record the test result in Table 20.
- Set Width < 100 nsec **On** and Width > 100 nsec **Off**
- Check that the scope **doesn't trigger** : slow trigger and no flashes in box. Record the test result in Table 20.

---

## 5.12 Time Base Accuracy

### 5.12.1 Description

An external sine wave generator of **0.1 MHz** with a frequency accuracy better than 1 PPM is used.

#### Specifications

500 MHz clock : accuracy :  $\leq \pm 0.001\%$  or  $\leq \pm 10$  PPM

### 5.12.2 500 MHz Clock Verification Procedure

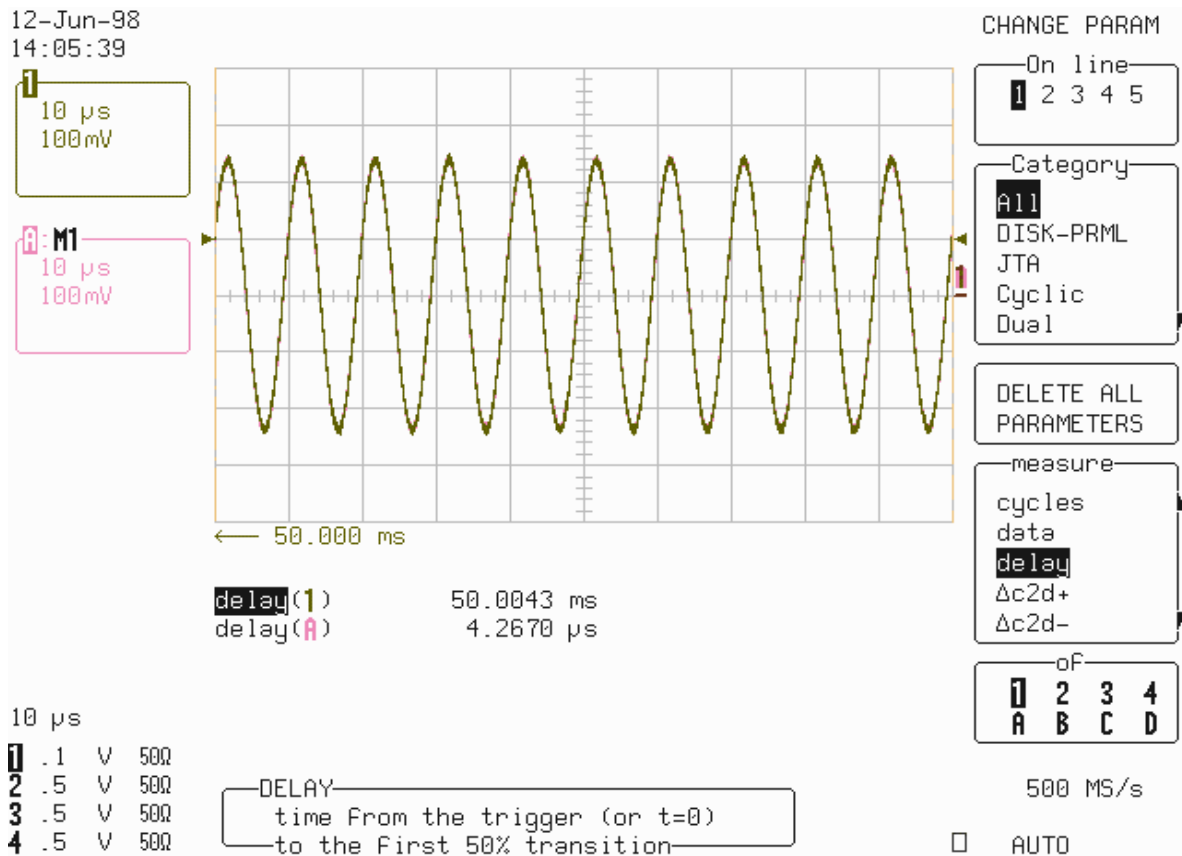

- Recall **LC564D078.PNL** or configure the DSO

Panel Setups	:	<b>Recall FROM DEFAULT SETUP</b>
Channels trace ON	:	<b>Channel 1</b>
Input coupling	:	<b>DC 50<math>\Omega</math></b>
Input gain	:	<b>.1 V/div.</b>
Input offset	:	<b>0 mV</b>
Trigger setup	:	<b>Edge</b>
Trigger on	:	<b>1</b>
Coupling 1	:	<b>DC</b>
Slope 1	:	<b>Pos</b>
Level 1	:	<b>100 mV</b>
Trigger mode	:	<b>Norm</b>
Delay	:	<b>0 %</b>
Time base	:	<b>10 <math>\mu</math>sec/div.</b>
Channel use	:	<b>4</b>
Record up to	:	<b>50 k</b>

- Connect the **RF output** of the HP8648B generator through a 5ns 50 Ohm BNC coaxial cable into Channel 1.
- Set the generator frequency to **0.1 MHz**.
- Adjust the generator output amplitude to get **5 divisions peak to peak** .
- Store Channel 1 in Memory 1
- Recall **LC564D079.PNL** or make the following change :
- Set Post-trigger delay to **50.00 msec**
- Recall Memory **1 to A**
- Press : **Cursors/Measure**

- Measure : **Parameters**
- Mode : **Custom**
- Statistics : **Off**
  
- Change parameters
  
- On line 1 : **Delay of 1**
- On line 2 : **Delay of A**
  
- Check that the displayed Channel 1 trace is **aligned** with the sine wave from memory 1.
  
- This allows the accuracy of the time base clock to be checked **5000 periods** after the trigger point. A difference of **±0.5 μsec** corresponds to **±10 PPM**.

- Calculate the Difference **{[delay(A) - delay(1)]+ 50 msec}**.
- Record the test result in Table 21, and compare it to the limit in the test record.

---

## 5.13 Rise time (10 % - 90 %)

### Specifications

DC 50 $\Omega$ , 50 mV/div., : rise time < 0.50 ns

DC 1M $\Omega$ , 100 mV/div., : rise time < 0.90 ns

#### a. DC 50 $\Omega$

- Recall **LC564D080.PNL** or configure the DSO

Panel Setups	:	<b>Recall FROM DEFAULT SETUP</b>
Channels trace ON	:	<b>Channel 1</b>
Input coupling	:	<b>DC 50<math>\Omega</math></b> on all 4 Channels
Input gain	:	<b>0.1 V/div.</b> on all 4 Channels
Input offset	:	<b>-250 mV</b> on all 4 Channels
Trigger setup	:	<b>Edge</b>
Trigger on	:	<b>1</b>
Coupling 1	:	<b>DC</b>
Slope 1	:	<b>Pos</b>
Level 1	:	<b>250 mV</b>
Trigger mode	:	<b>Norm</b>
Delay	:	<b>30 % Pre-Trigger</b>
Time base	:	<b>1 nsec/div.</b>
Channel use	:	<b>4</b>
Record up to	:	<b>50 k</b>
Turn on trace	:	<b>A</b>
Select Math Setup	:	
For Math	:	<b>Use at most 1000 points</b>
Use Math ?	:	<b>Yes</b>
Math Type	:	<b>Average</b>
Avg Type	:	<b>Summed</b>
Of	:	<b>Channel 1</b>
Sweeps	:	<b>100</b>
Turn off trace	:	<b>Channel 1</b>
Cursors/Measure	:	<b>Parameters</b>
Mode	:	<b>Custom</b>
Statistics	:	<b>Off</b>
Change Parameters	:	
On displayed trace	:	<b>A</b>
On line 1	:	
Measure	:	<b>Over + of A</b>
On line 2	:	
Measure	:	<b>Rise of A</b>

- Connect the fast pulse generator 4969A and PB049 power adapter, or equivalent as shown in Figure 5-13.
- Set the 4969A frequency to **1 kHz**

**Figure 5-13: 50  $\Omega$  Rise time Equipment Setup**

- Press **Clear Sweep**
- After 100 sweeps record **rise(A)** measurements in Table 22.
- Repeat the DC 50 $\Omega$  Rise time test for the other channels, substituting channel controls and input connector.
- Recall **LC564D081.PNL** for Channel 2, **LC564D082.PNL** for Channel3 **LC564D083.PNL** for Channel 4, or configure the DSO as shown in 5.13.a. and make the necessary changes.
- Record the test results in Table 22, and compare the results to the limits.

## b. DC 1MΩ

- Recall **LC564D084.PNL** or configure the DSO as shown in 5.13.a. and make the following change :
  - Set Input Coupling: **DC 1MΩ** on all 4 Channels
  - Input gain : **50 mV/div.** on all 4 Channels
  - Input offset : **-150 mV** on all 4 Channels
  - Trigger Level : **75 mV**
  - Time base : **1 nsec/div.**
- Terminate the output of the 4969A Pulser with the 4962-10 adapter (50Ω to 1MΩ) as shown in Figure 5-14.
- Press **Clear Sweep**. After **100 sweeps** record **rise(A)** in Table22.
- Repeat the DC 1MΩ Overshoot and Rise time test for the other channels, substituting channel controls and input connector.
- Recall **LC564D085.PNL** for Channel 2, **LC564D086.PNL** for Channel3 **LC564D087.PNL** for Channel 4, or configure the DSO as shown in 5.13.a. and make the necessary changes.
- Record the test results in Table 22, and compare the results to the limits.

Figure 5-14 : 1M $\Omega$  Rise time Equipment Setup

## 6. Maintenance

### 6.1 Introduction

This section contains information necessary to disassemble, assemble, maintain, calibrate and troubleshoot the LeCroy LC564DL digital storage oscilloscopes.

#### 6.1.1 Safety Precautions

The  symbol used in this manual indicates dangers that could result in personal injury.

The  symbol used in this manual identify conditions or practices that could damage the instrument.

 The following servicing instructions are for use by qualified personnel only. Do not perform any servicing other than contained in service instructions. Refer to procedures prior to performing any service.

 Exercise extreme safety when testing high energy power circuits. Always turn the power OFF, disconnect the power cord, discharge the cathode ray tube and all capacitors before disassembling the instrument.

#### 6.1.2 Antistatic Precautions

 Any static charge that builds on your person or clothing may be sufficient to destroy CMOS components, integrated circuits, Gate array's.....etc.

In order to avoid possible damage, the usual precautions against static electricity are required.

- Handle the boards in antistatic boxes or containers with foam specially designed to prevent static build-up.
- Ground yourself with a suitable wrist strap.
- Disassemble the instrument at a properly grounded work station equipped with antistatic mat.
- When handling the boards, do not touch the pins.
- Stock the boards in antistatic bags.

## 6.2 Disassembly and Assembly Procedure

The disassembly and assembly procedures detailed below refer to the views of figures shown in section 8.

### 6.2.1 Disassembly Procedure

Please study the figures in section 8 before attempting disassembly. Before removing any parts from the LeCroy LC564DL, be sure to read carefully the instructions referring to those parts, noting any precautions needed to avoid problems.

Extreme caution should be taken in protecting the LCD face from damage (e.g. scratch marks, fingerprints, dust etc.) when handling, in particular when inserting or removing from the instrument.

#### a. Removal of the Front Bezel

The front bezel disassembly procedure refers to the view of figure 8-1.

The display is very easily damaged by fingerprints and dust once the front bezel is removed. Extra care must be exercised to protect the LCD face from getting dust or fingerprints. It may be impossible to clean completely if it is touched.

- Before removing front bezel make sure work area is as dust free as possible.
- Cover hands with powder free vinyl gloves.
- Remove three M3X6 screws underneath the plastic bezel.
- Pivot up the plastic bezel and remove it from the front frame by disengaging the hooks on the top of the bezel from the corresponding front frame lugs.
- Place bezel in plastic bag to protect glass from dust and fingerprints.
- Immediately cover LCD face with fresh piece of plastic wrap - secure to frame of unit if necessary with tape.

#### b. Removal of the Upper Cover Assembly

The upper cover disassembly procedure refers to the view of figure 8-1.

- Remove the front bezel (6.2.1.a)
- Remove the seven M3X6 screws (three M3X6 on top, two M3X6 on left and two M3X6 on right).
- Remove the two upper feet rubber (see 11 on figure 8-3).
- Remove the two M5 screws that secure the two upper feet to the upper cover and rear panel.
- Carefully slide the upper cover off the unit ( disconnect optional Internal printer cables from power supply and processor board ).

---

### **c. Removal of the Front Frame Assembly with Color LCD Display**

The front frame disassembly procedure refers to the view of figure 8-2 and 8-12.

- Remove the front bezel (6.2.1.a)
- Remove the upper cover assembly (6.2.1.b)
- Remove two M3X6 screws that secure the front frame on both side of the lower cover.
- With a long hex screwdriver unlock four M3X6 screws that secure the front frame on the main board upper shield.
- Disconnect the monitor cable from the F9615-21 card connector J1
- Disconnect the floppy cable from the processor board connector J1.
- Disconnect the front panel cable from the processor board connector J2

The front frame assembly with LCD display, front panel and floppy disk drive can with care be removed forward from the unit.

### **d. Removal of the Processor Board**

The processor board disassembly procedure refers to the view of figure 8-1 & 8-18.

- Remove the front bezel (6.2.1.a)
- Remove the upper cover assembly (6.2.1.b)
- Remove the front frame assembly (6.2.1.c)
- Disconnect the processor cable J10 from the F9601-2 card connector J4.
- Disconnect the processor cable J9 from the F9301-4 RS232 & GPIB interface. and optional F9300-8 hard disk interface.

The processor can now be removed vertically from the main board connector J1.

### **e. Removal of the Power Supply Assembly**

The power supply disassembly procedure refers to the view of figure 8-3.

- Remove the front bezel (6.2.1.a)
- Remove the upper cover assembly (6.2.1.b)
- Remove the front frame assembly (6.2.1.c)
- Remove the processor board (6.2.1.d)

If the instrument is equipped with hard disk option, remove the F9300-8 interface from the rear panel, by removing two M3X6 screws that secure it to the rear panel.

- Remove two M3x6 screws that secure the fan shroud to the rear panel.
- Remove one M3x6 screw which secures the fan shroud to the top of the power supply.

- Remove two M3X6 screws that secure the power supply on the main board upper shield.
- Remove two M3X6 screws that secure the power supply on the rear panel.
- Disconnect the power supply cable from the F9601-8 board connector J2
- Disconnect the fan power cable from the power supply connector J6

The power supply can now be removed vertically from the oscilloscope.

#### **f. Removal of the Upper Shield Assembly**

The upper shield disassembly procedure refers to the view of figure 8-2, 8-3 & 8-4.

- Remove the front bezel (6.2.1.a)
- Remove the upper cover assembly (6.2.1.b)
- Remove the front frame assembly (6.2.1.c)
- Remove the processor board (6.2.1.d)
- Remove the power supply assembly (6.2.1.e)
- Remove the two M3x5 that secure the fan shroud to the rear panel.
- Remove twelve M3x20 screws that secure the shield to the lower cover.
- Remove six M3X5 screws on both side of the lower cover.
- Remove six M2.5x6 screws that secure the upper shield to the main board front panel.
- Remove three M3X6 screws that secure the upper shield to the rear panel.
- Disconnect the power cable from the F9601-8 board connector J1.

The upper shield can now be removed from the oscilloscope.

#### **g. Removal of the Rear Panel Assembly**

The rear panel disassembly procedure refers to the view of figure 8-3 & 8-8.

- Remove the front bezel (6.2.1.a)
- Remove the upper cover assembly (6.2.1.b)
- Remove the front frame assembly (6.2.1.c)
- Remove the processor board (6.2.1.d)
- Remove the power supply (6.2.1.e)
- Remove the upper shield (6.2.1.f)
- Remove the two lower feet rubber (see 5 on figure 8-4)
- Remove two M5 screws that secure the two lower feet to the rear panel and lower cover.

The rear panel assembly can now be removed from the oscilloscope.

---

## h. Removal of the Main Board Assembly

The main board disassembly procedure refers to the view of figure 8-5 & 8-10.

- Remove the front bezel (6.2.1.a)
- Remove the upper cover assembly (6.2.1.b)
- Remove the front frame assembly (6.2.1.c)
- Remove the processor board (6.2.1.d)
- Remove the power supply (6.2.1.e)
- Remove the upper shield (6.2.1.f)
- Remove three M3x6 screws that secure the main board to the lower cover.
- Remove twelve M3X6 screws that secure the main board to the lower cover

The main board can now be removed from the oscilloscope.

### 6.2.2 Assembly Procedure

Reassemble the unit in the reverse order, check that all screws shown on the drawings in section 8 are used and properly torqued.

Verify that all cables are correctly connected.

#### Assembly Note :

- **Bezel** : The plastic bezel should be in contact with the CRT all around the screen area. The bezel should not be deformed. When reassembling unit, if glass on inside of bezel must be cleaned use lint free wipes and while again wearing a lab coat and gloves try to polish off any marks, as a last resort use glass cleaner. If any fingerprints are present on LCD display, it may be possible to clean with alcohol and a lint free wipe, however sometimes it is impossible to clean it completely. If dust is present it may be possible to blow it off using particle free compressed air however this may cause more dust to be drawn to the LCD face.
- **LCD Display**: Being careful not to damage the LCD face. Fingerprints may be impossible to clean off.
- **Fan** : Check the fan cable direction. Note the air flow, the fan extracts air from the unit and expels it.
- **Feet** : Check that the lower feet and rear feet are aligned and properly tightened before re-assembly.
- **Filter** : Check that the earth wire is correctly installed and tightened.
- **Floppy** : Adjust the floppy position to obtain the front face tangential to face of the front panel. Check that the door is moving freely and shuts correctly. Insert a floppy and eject it to check the mechanism.

- **Front Panel** : Check that knobs rotate freely, are the right size and in the right place.
- **Main Board** :The main card must be parallel and tacked against the bend of the lower cover. Being careful not to bend the board or damage components underneath.
- **Rear Panel** : Check the CD9610 trimming adjustments align with holes in the rear panel.
- **Processor** : Check that the memory card insertion guide is correctly inserted in the front panel.
- **Printer** : If the graphic printer is used, before closing don't forget to plug input cable to the option and the driver cable to the processor card.

## 6.3 Software Update Procedure

**6.3.1** Firmware upgrades are available from the Internet via <http://www.lecroy.com> or CDROM using the LeCroy software utility Scope Explorer.

The following methods are available for upgrading scope firmware:

- 1) GPIB
- 2) RS-232
- 3) Floppy disk (No connection)

Each method is described below.

### **a) GPIB:**

#### **Scope requirements:**

- IEEE 488.2 GPIB cable connected to the PC.
- From the utilities menu; select the GPIB/RS232 menu.
- Now select a GPIB address and ignore the rest of the menu.
- Put the scope in stop mode by depressing STOP on the front panel.

#### **PC requirements:**

- National Instruments TNT type GPIB card.
- Windows 95, 98, or NT operating system.
- LeCroy Scope Explorer utility.

#### **Connecting to PC**

- 1) Open Scope Explorer, then select Scope-finder from the scope pull-down menu. (see fig. #1)
- 2) From the Scope-finder window select find.
- 3) If more than one device appears in the window, select the correct device.
- 4) Using the scope pull-down menu select upgrade DSO from internet/CD and follow the upgrade wizard. (see fig. #2)
- 5) After following the instructions, the firmware will be automatically upgraded via the Internet.

- 6) Cycle the power when prompted.

**b) RS232:**

**Scope requirements:**

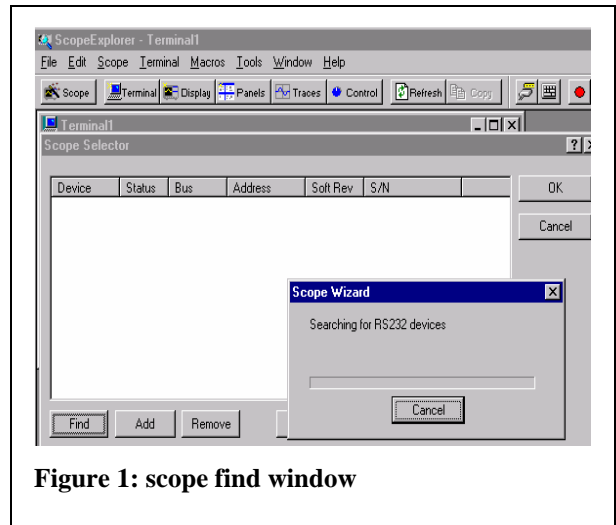

- 9-pin serial null modem cable connected to the PC.
- From the scope utilities menu; select the GPIB/RS232 menu.
- Select RS232; 8 bits; parity none; stop bits 1; max baud rate 19.2K; and ignore the GPIB address.
- Place scope in stop mode by depressing STOP on the front panel.

**PC requirements:**

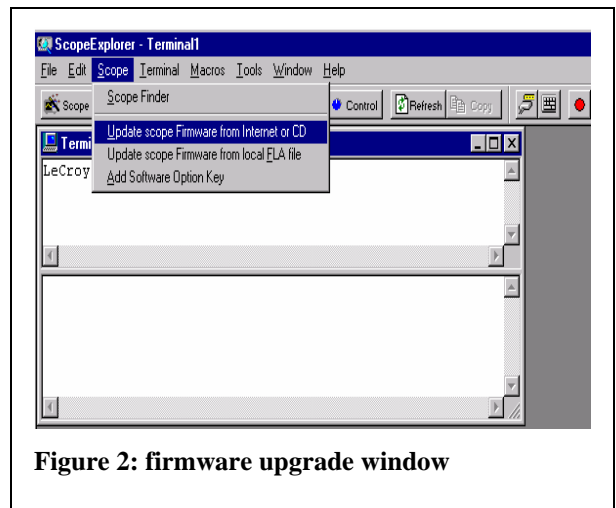

- Windows 95, 98, or NT operating system
- LeCroy Scope Explorer utility.
- Two 1.44 M byte formatted floppy disks

**Connecting to PC**

- 1) Open Scope Explorer, then select Scope-finder from the scope pull-down menu (see fig. #1)
- 2) From the Scope-finder window select find.
- 3) If more than one device appears in the window, select the correct device.
- 4) Using the scope pull-down menu select upgrade DSO from internet/CD and follow the upgrade wizard (see fig. #2)
- 5) The scope cannot be upgraded directly through RS232, but will download the firmware to 1.44 Mbyte floppy disks.
- 6) After the software is loaded to the floppy disks, put floppy # 1 into the scope drive.
- 7) Push the utilities button and select special modes from the on screen menu.
- 8) Now select firmware update, and update from floppy.
- 9) From the on screen menu choose update flash.
- 10) Remove floppy # 1 and insert floppy # 2 into scope when prompted on scope display.
- 11) Cycle the power when prompted.

**Figure 1: scope find window**

**Figure 2: firmware upgrade window**

### **c) No Connection (floppy disk)**

#### **Scope requirements:**

- Put the scope in stop mode by depressing STOP on the front panel.

#### **PC requirements:**

- Windows 95, 98, or NT operating system.
- LeCroy Scope Explorer utility.
- Two 1.44 Mbytes formatted floppy disks.

#### **Without a connection:**

- 1) Open Scope Explorer
- 2) Using the scope pull-down menu select upgrade DSO from internet/CD and follow the upgrade wizard
- 3) You must have the scope model number, the firmware version, and the scope serial number.
- 4) To find the scope information, push the show status button on the scope.
- 5) In the status box, highlight system by pressing the second on screen menu button and the text screen will contain the necessary information.
- 6) Because the scope cannot upgrade directly Scope Explorer will download the firmware to 1.44 Mbytes floppy disks.
- 7) Now follow the same directions as RS232 connection step # 6

## **6.3.2 Software Options**

The following software options are available:

- WP01      Advanced Math Firmware
- WP02      Basic FFT Firmware
- WP03      Parameter Distribution Analysis Firmware
- DDM        Disk Drive Measurements
- PRML      Partial Response Maximum Likelihood
- ORM        Optical Recording Measurement
- DDFA      Disk Drive Failure Analysis
- MC01      PCMCIA Memory Card
- JTA        Jitter and Timing Analysis
- PMT        Power Measurement Tools
- MT01/02   Automatic Mask Tester
- MT03      OC3/OC12 Optical Signal Test Solution
- PMSK      Polymask Mask Testing Software
- JPRO        JitterPro
- CCTM      Clock Certification and Test Module

---

### 6.3.2.1 Changing Software Option Key

#### a. Scope ID, Scope Serial Number

The scope ID and scope s/n: are used to request a Software Option Key

- Enter the scope's Software Options menu (located under the **STATUS, SYSTEM** menu ).
- Note the **SCOPEID**, i.e: 59258A-31 and **Scope s/n**: LC564DL30104 that are found on that menu.

#### b. Entering Option Key in the DSO

- Enter the scope's Software Options menu ( **STATUS, SYSTEM** menu ).
- Enter the **ADD OPTION KEY** menu on the DSO
- Enter the new option key using the dymo-editor, i.e: **C4B5-F4A9-4464-E7ED**
- Click on **ENTER THIS OPTION KEY** to add the key
- Reboot the scope and verify that the options added correctly.

### 6.3.3 Processor Board Exchange Procedure

The serial number of the LC564DL oscilloscope is loaded in the real time clock memory which is battery backed up. If it becomes necessary to replace the processor board, the serial number must be loaded in the memory of the new board by using LeCroy program " LeCalsoft " under GPIB remote control. To run " LeCalsoft " type SKP.exe, in the main menu type S, and follow the instructions, use five digits to enter the serial number ( i.e. 30104). Then check in the system summary, by using the show status button on the front panel, the scope serial number.

## 6.4 Equipment and Spare Parts Recommended for Service

### 6.4.1 Test Equipment Required

See Table 5-1 in section 5.2.

### 6.4.2 LC564DL Spare Parts

LeCroy P/N	Assembly	Adjustments	Performance Tests
F9601-11-16	Power PC, 2X8MB DRAM	None	None
F9601-2	Internal + External VGA Centronics Interface	None	None
900079	Acquisition Card 4 GS/s	None	See Chapter 5
F9301-4	GPIB Interface RS232 Interface	None	None
F9615-5	Keyboard Assy	None	None
S9615-21	Buffer Board	None	None
F9601-6	Floppy Disk Drive Assy	None	None
F9300-7	Printer Interface	None	None
F9300-8	Hard Disk Interface	None	None
F9601-9	NMB Variofan	None	None
S9601-9	NMB Speed Control	None	None
258104001	TFT Color LCD Module, 10.4 inch	None	None
PS9611	Power Supply	6.5.1	None

The other parts are not on the above list because the probability of failure is very low. See chapter 7, 8 & 9 for mechanical and electrical replaceable parts.

## 6.5 Calibration Procedures

The following section includes the manual adjustments of the power, but does not contain any instructions or descriptions about the acquisition board calibration. The acquisition board adjustments required complex test set-up and calibration Software. For information on the availability of the tester and software, contact your nearest LeCroy service center.

---

## 6.5.1 Power Supply Calibration Procedure

- Remove the front bezel (see 6.2.1.a)
- Remove the upper cover assembly (see 6.2.1.b)
- To ensure adequate main board cooling, it is necessary to control the air flow by installing a **temporary closure plate** which fully encloses the air space behind the monitor.
- Turn on the power, set the scope to **Auto Trigger**, and perform the adjustments to get on processor board connector J11:

Vcc : **+ 5.00V** ( Min = + 4.9 V, Max = + 5.10 V )  
Vee : **- 5.1 V** ( Min = - 5.05 V, Max = - 5.15 V )  
+15 : **+14.95 V** ( Min = +14.90 V, Max = +15.05V )  
- 15 : **- 14.95 V** ( Min = -14.90 V, Max = -15.05 V )

- The four potentiometers are accessible from the top through holes in the PS9611 power supply chassis.
- Turn the potentiometer clockwise to increase the voltage or counterclockwise to decrease the voltage.
- When the adjustment is done, stop the acquisition by depressing the stop trigger push button, and verify that there is no large difference on the + 5.00 V, typically less than 80 mV.

## 6.6 Troubleshooting and Flow Charts

### 6.6.1 Introduction

The troubleshooting information contained in this section is intended for use by qualified personnel having a basic understanding of electronics (analog and digital). In order to simplify servicing and minimize downtime, the following list of possible symptoms, likely causes, and troubleshooting steps have been prepared. The first step in troubleshooting is to check for obvious items like blown fuses. The power supply is the next item to check before proceeding to more detailed troubleshooting, since noise or low power supply voltages can cause a variety of digital and analog problems.

### 6.6.2 Line Fuses Replacement

The power supply of the oscilloscope is protected against short circuits and overload by means of two T6.3A / 250 V fuses located above the main plugs.

Turn off the power and disconnect the line cord from the instrument. Disconnect the instrument from other equipment.

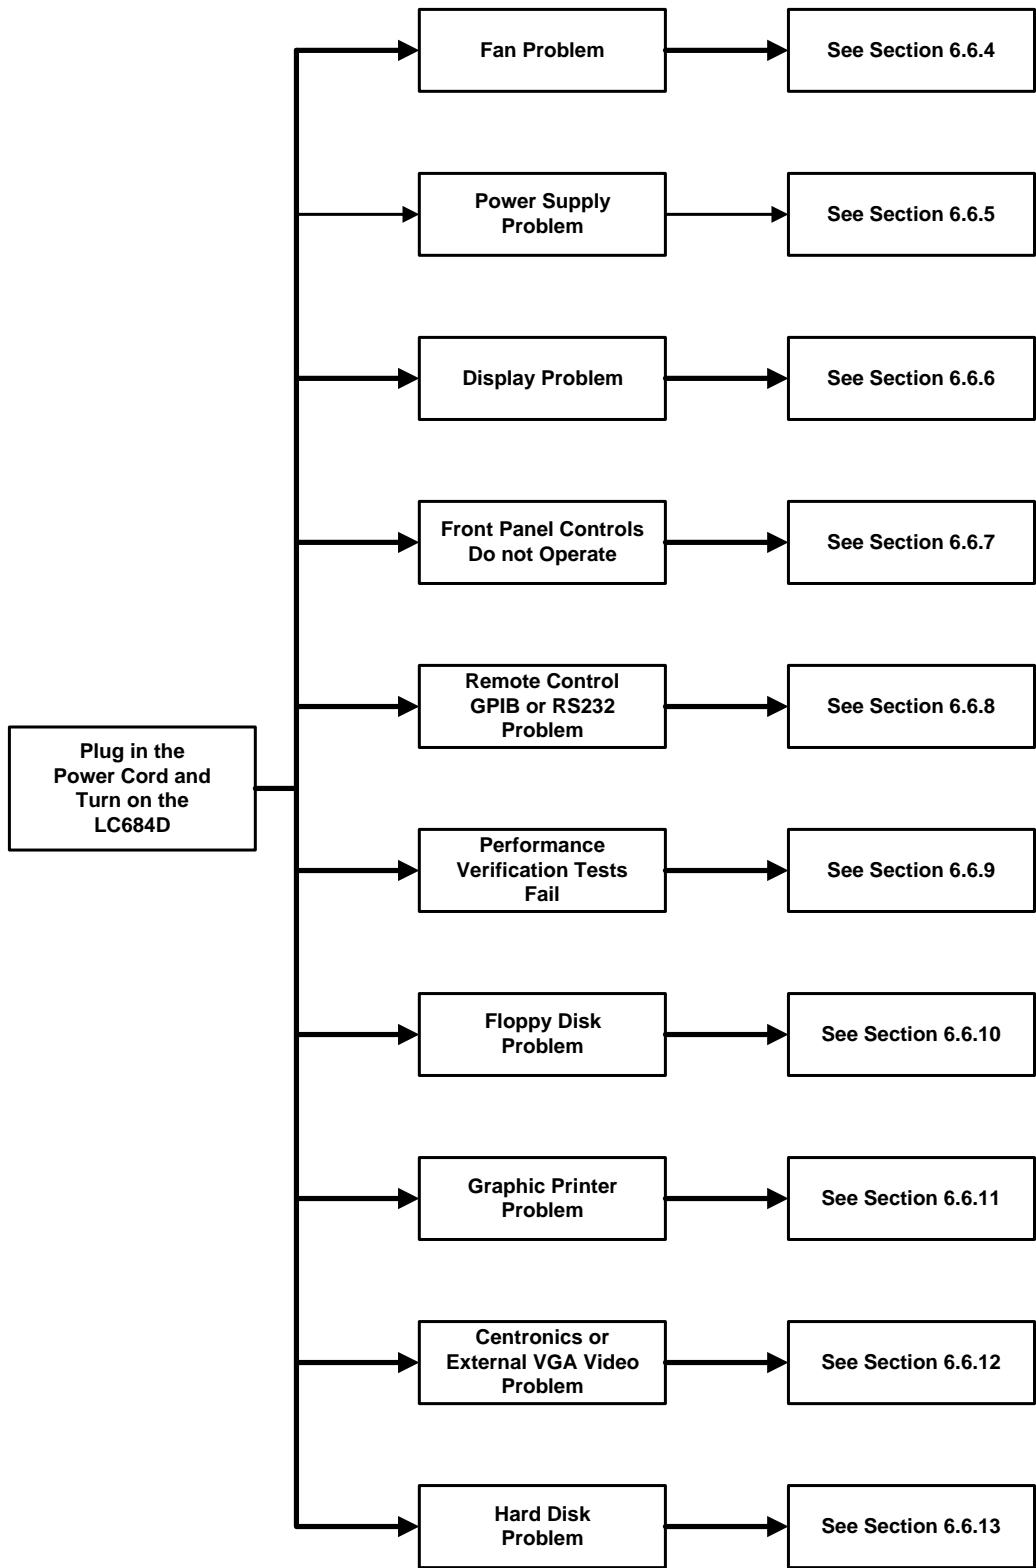

To replace line fuses, proceed as follow:

- Open the fuse box by inserting a small flat screwdriver under the plastic cover and remove the fuse carrier from the holder
- Remove the fuse and replace it with the proper type: T6.3 A / 250 V, LeCroy part number: **433 162 630**

### 6.6.3 Initial Troubleshooting Chart

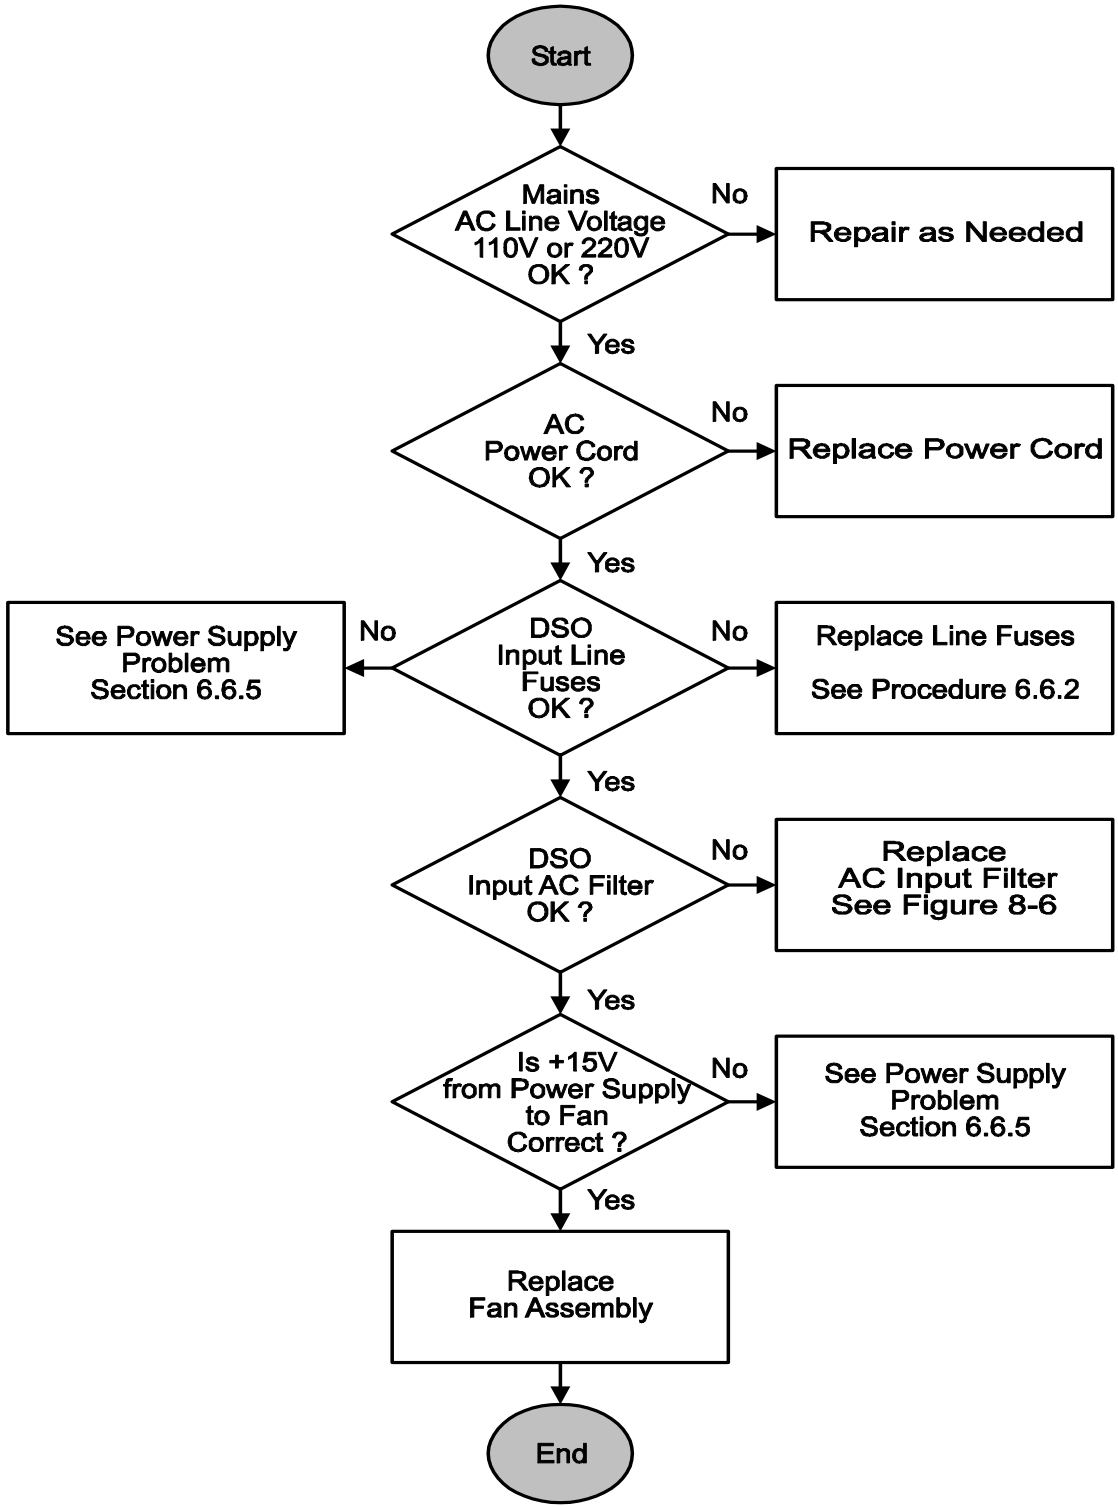

Most procedures in this section will allow troubleshooting down to the **BOARD LEVEL.**

Defective circuit boards will be repaired or exchanged by the regional LeCroy service office or the local representative (see section 2.2).

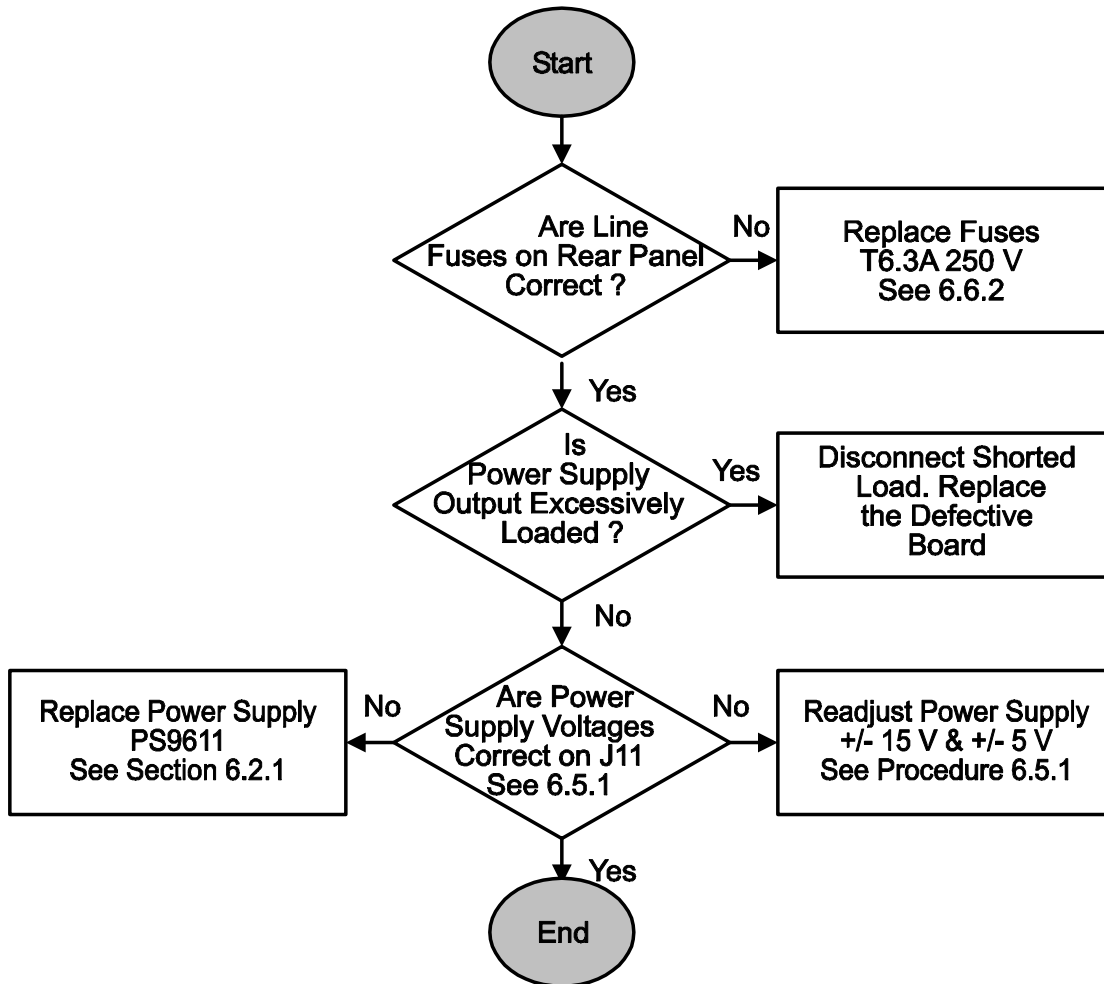

### 6.6.4 Fan Problem

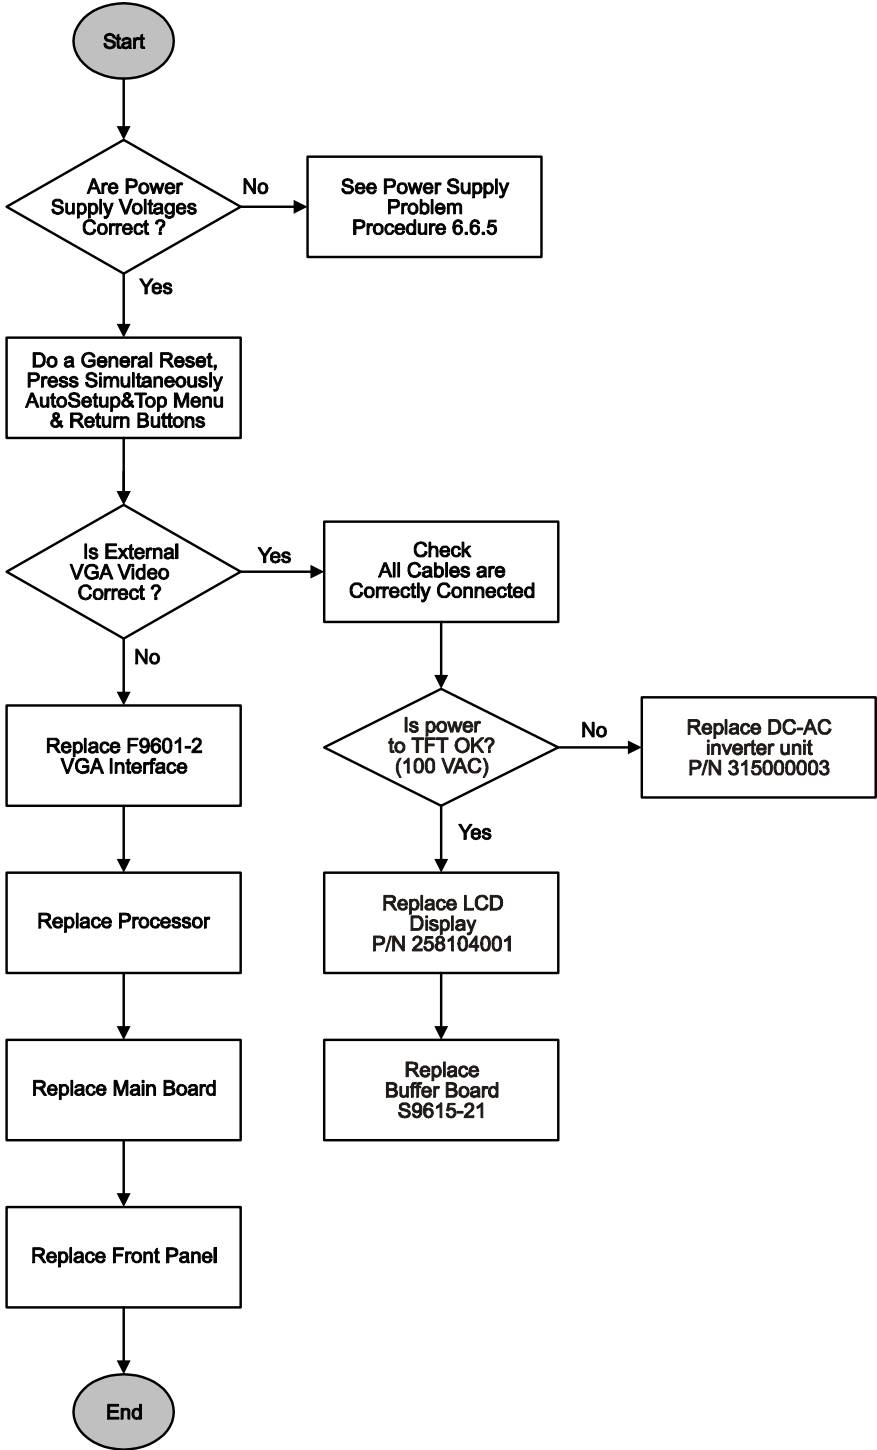

---

### 6.6.5 Power Supply Voltages Problem

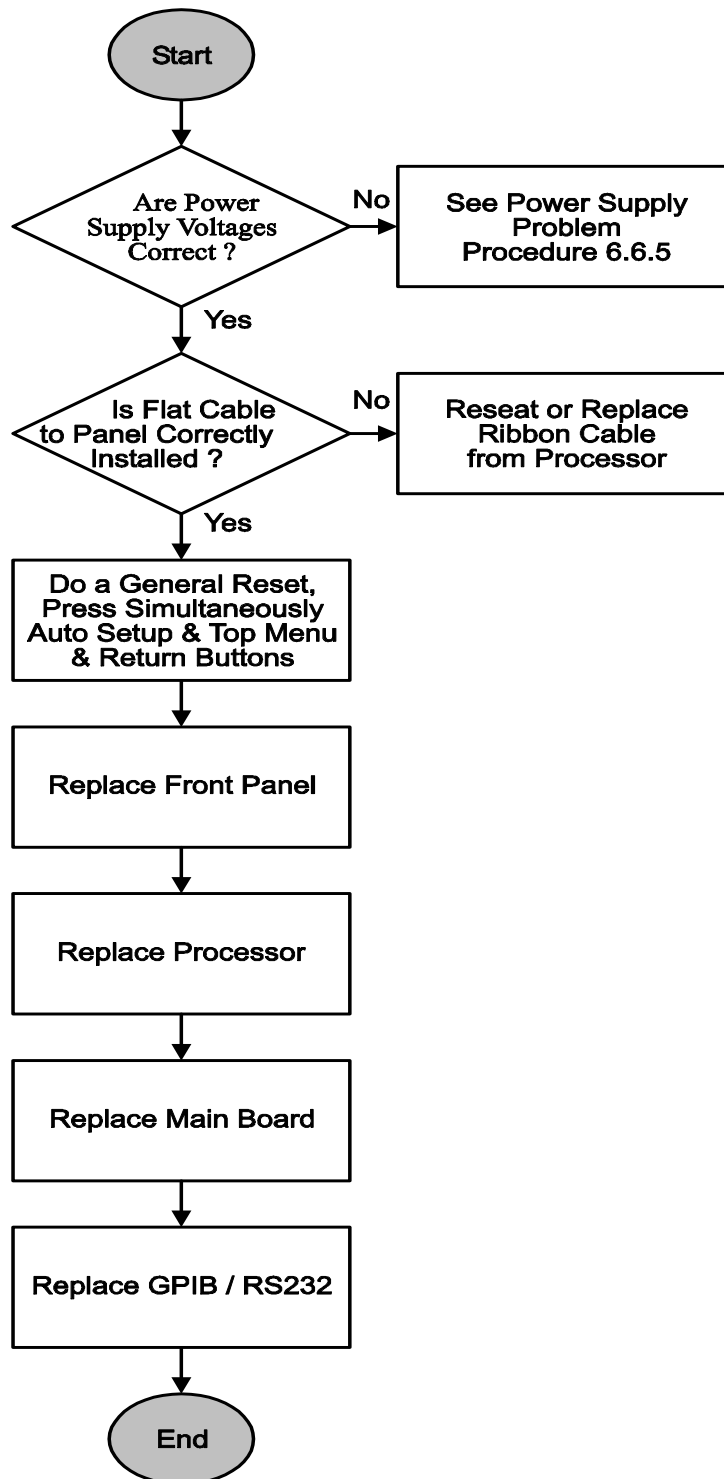

### 6.6.6 Display Problem

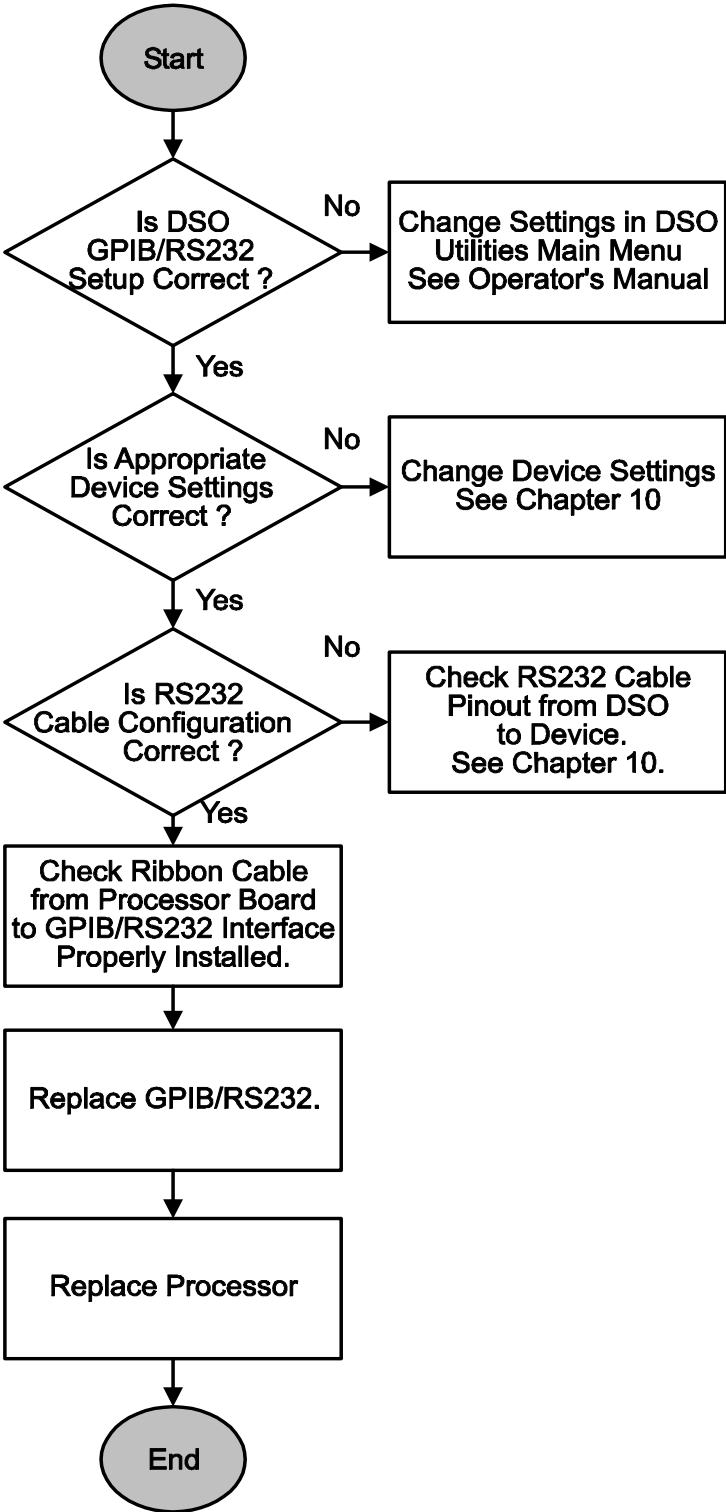

---

### 6.6.7 Front Panel Controls Do not Operate

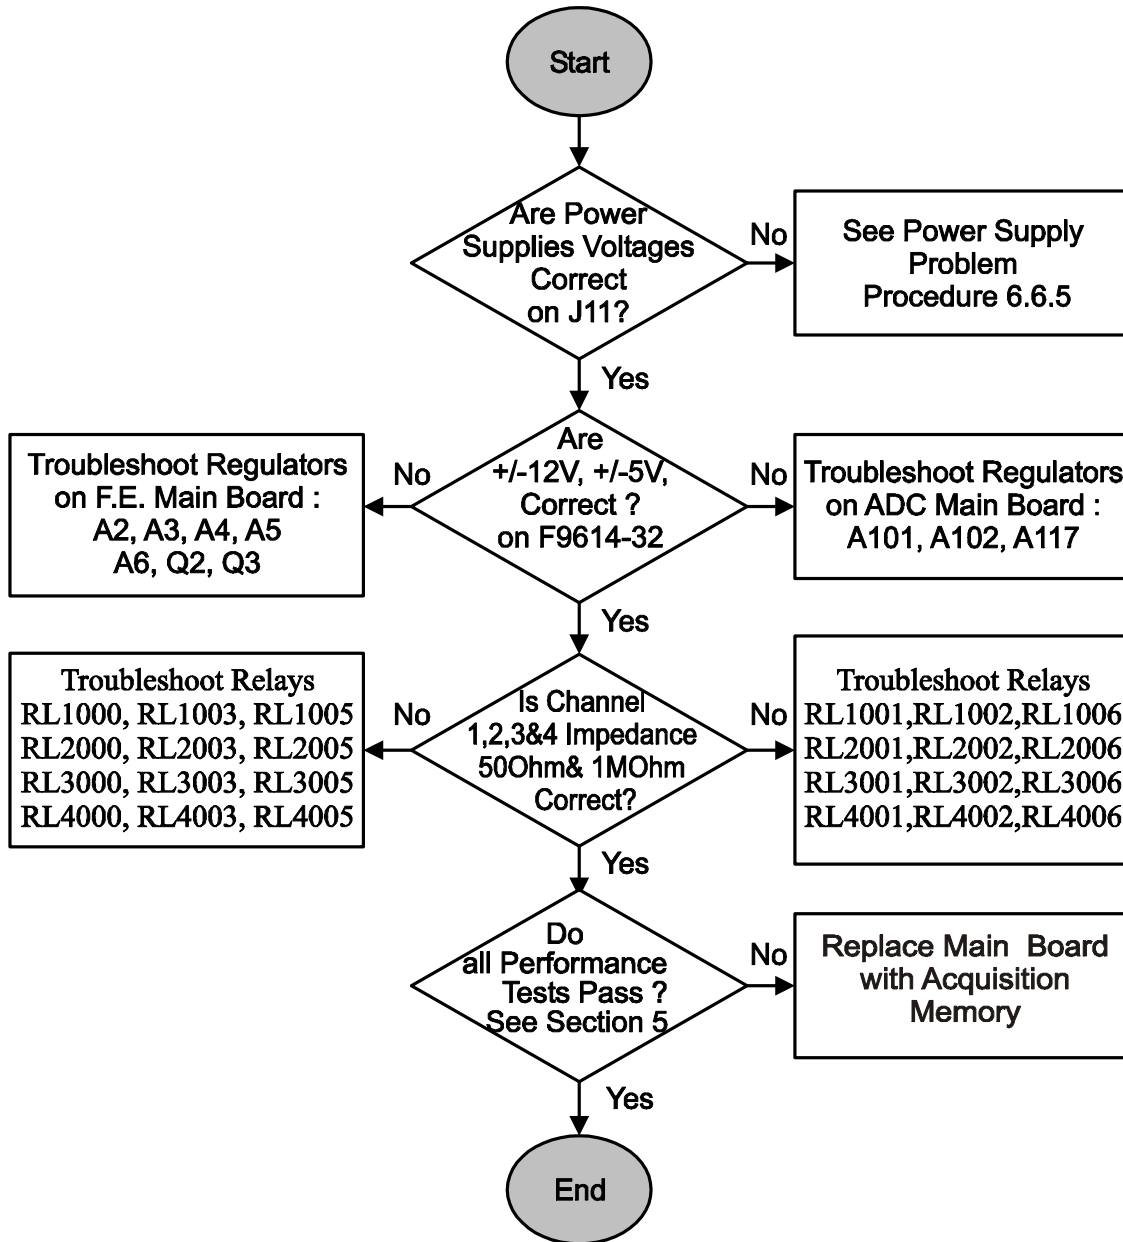

### 6.6.8 Remote Control GPIB or RS232 Problem

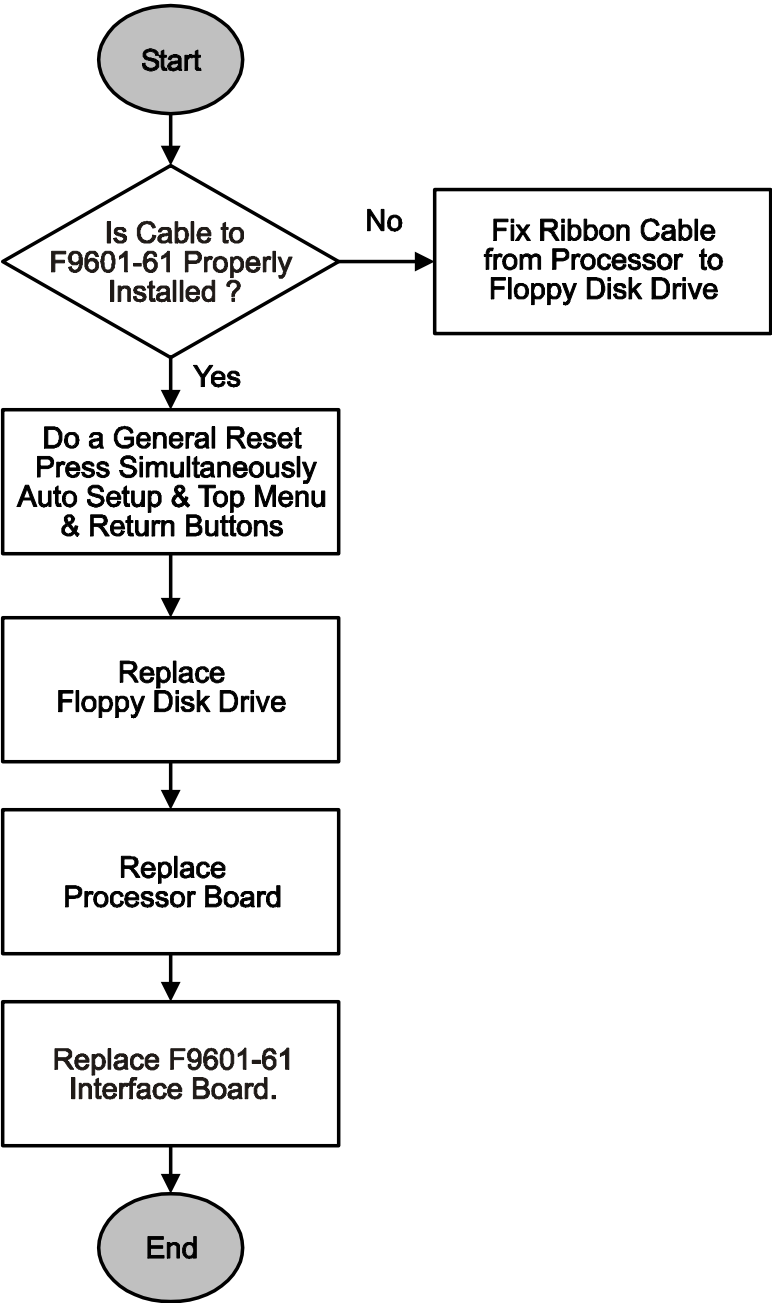

### 6.6.9 Performance Verification Fails

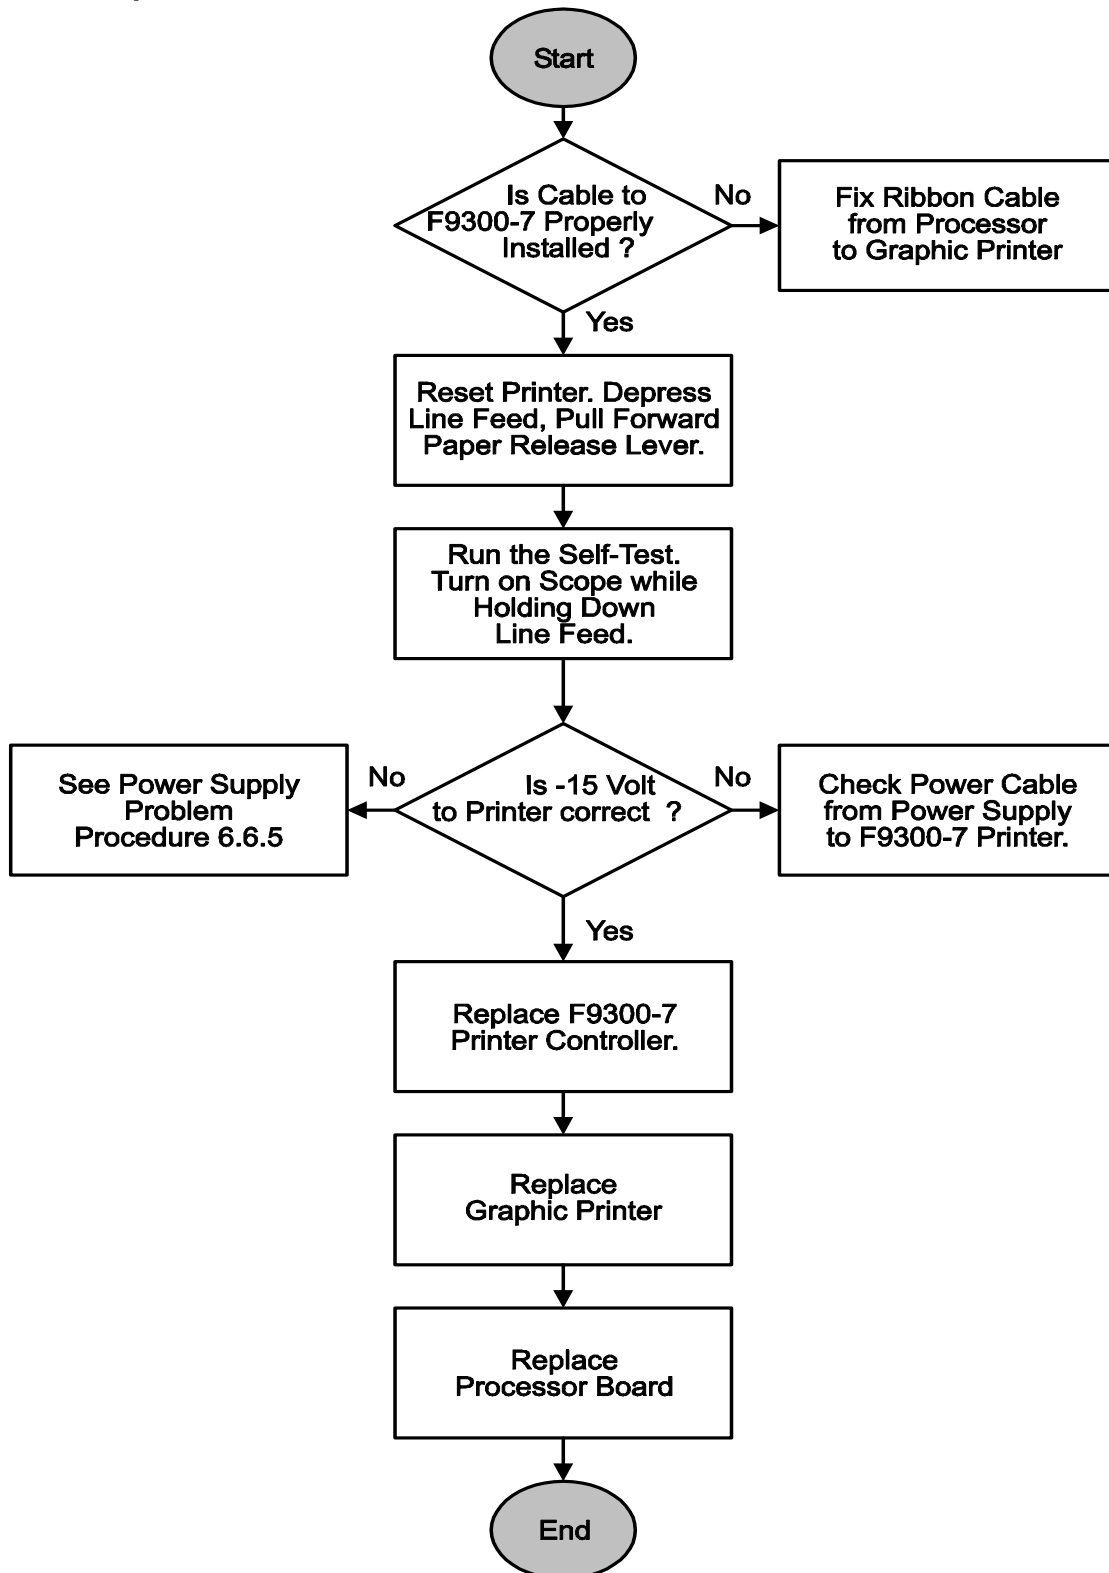

### 6.6.10 Floppy Disk Drive Problem

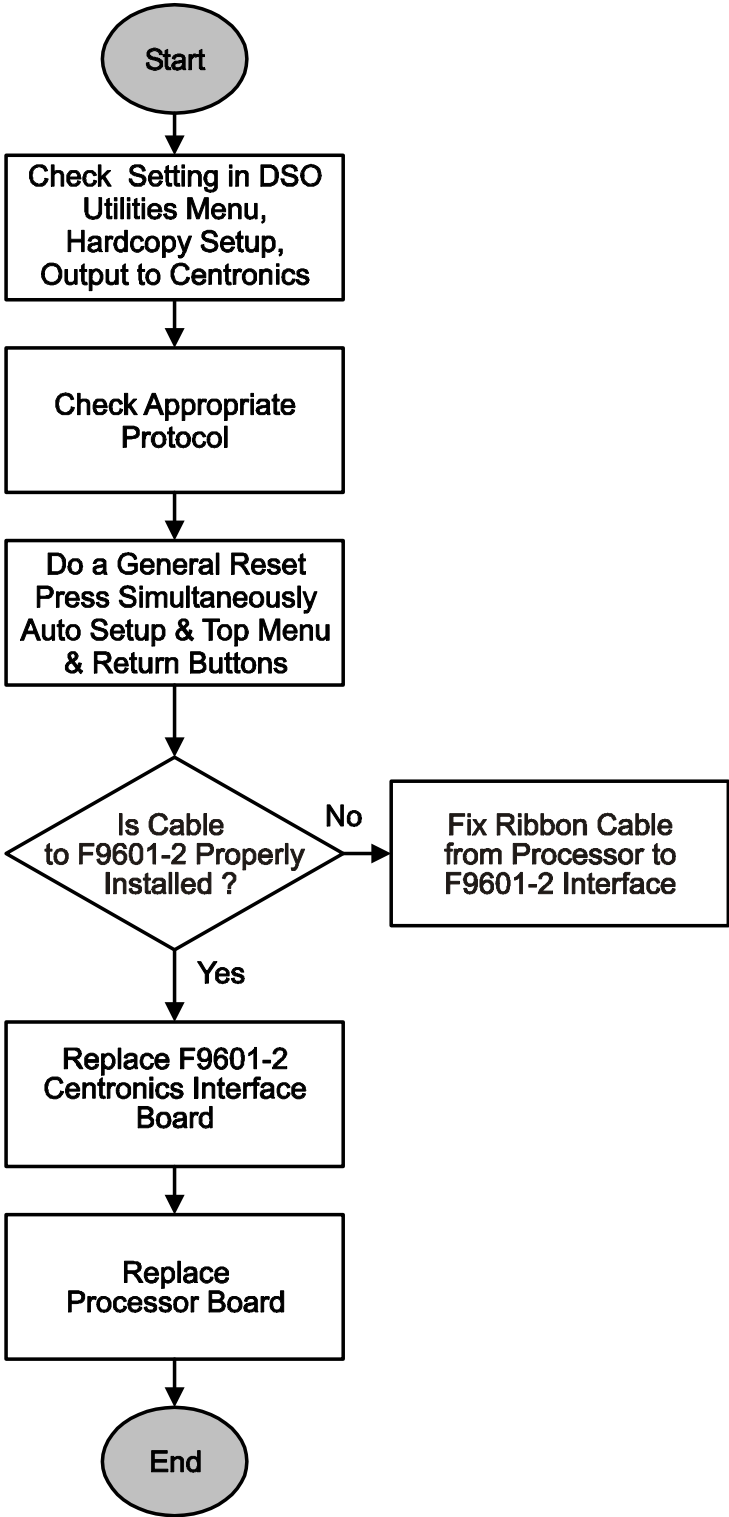

### 6.6.11 Graphic Printer Problem

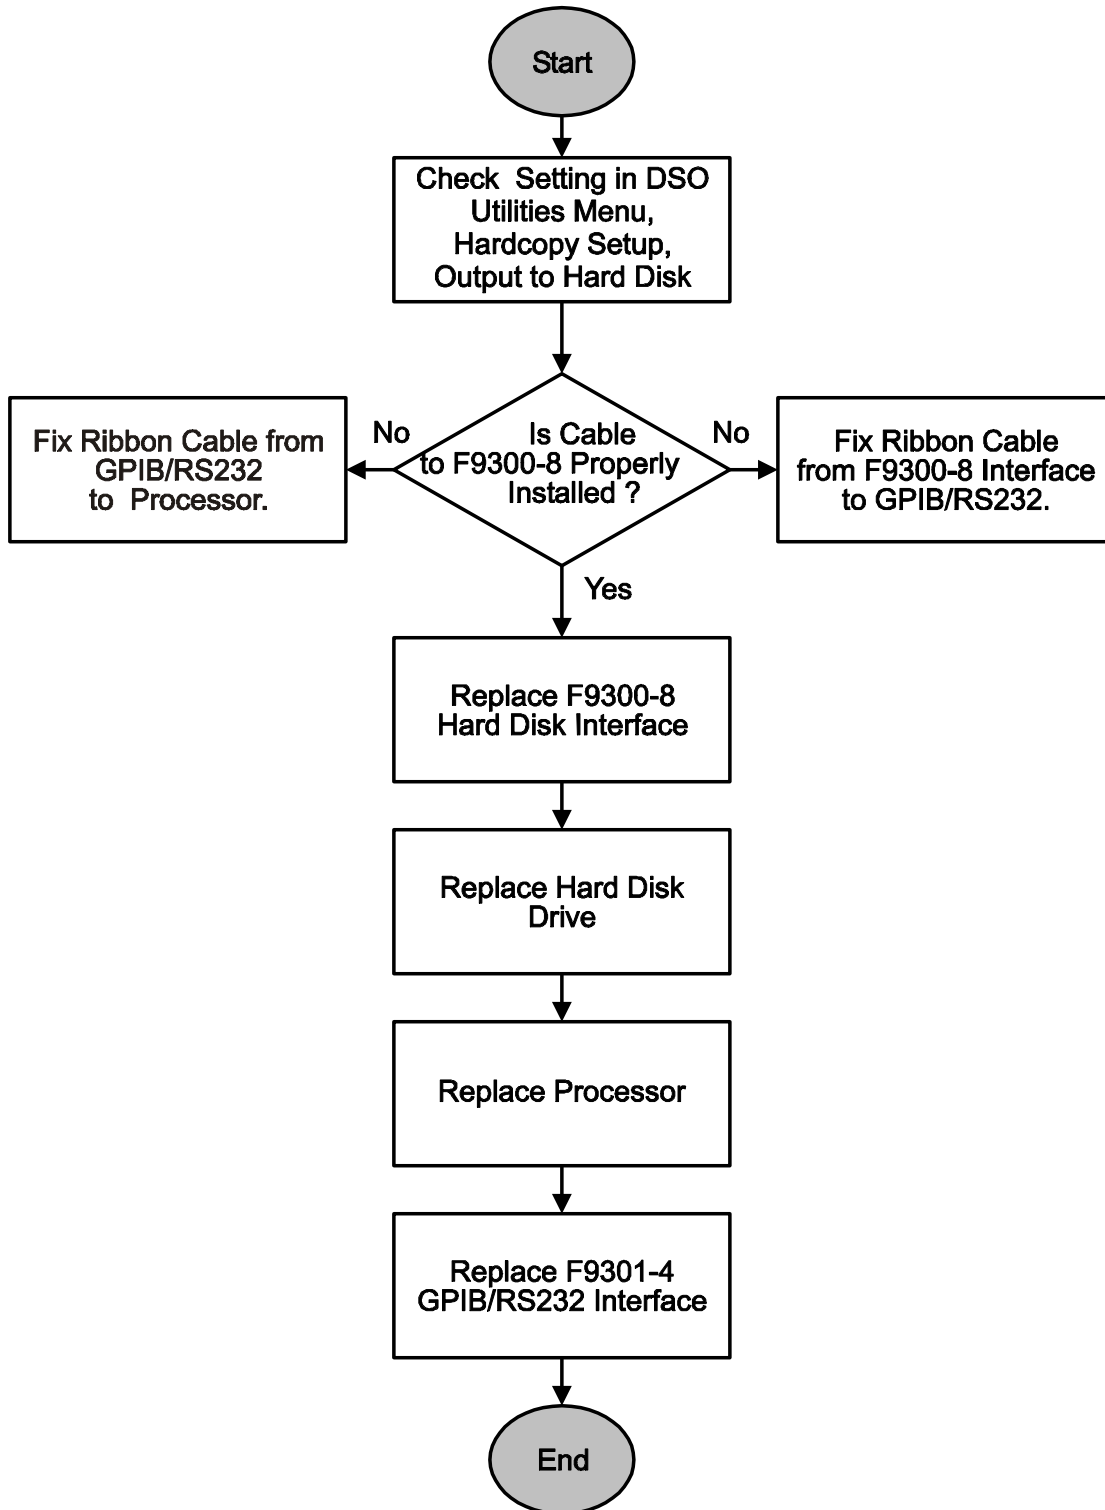

### 6.6.12 Centronics Problem

---

### 6.6.13 Hard Disk Drive Problem

### 7. Replaceable Parts

To order parts, contact your local LeCroy service office. A list of the service centers is given in section 2 of this manual. For boards, you can either order a new board or an exchange board. Exchange assemblies are factory repaired, inspected, tested and calibrated. If you order an exchange board, you must return the defective board.

This section applies to the following model :

#### LC564DL

LeCroy Part Number	Description	Qty
