

IBTracer 4X Version 2.30 Release Notes

- This version adds support for Rev 1.1 of the IB spec. Changes include updated decoding of MAD packets and Subnet administration (SADM) traffic as per the Rev 1.1 IB spec.
- Note this version will not decode Rev 1.0 MAD and SADM packets correctly.
- Version 2.20 and version 2.30 can both be installed on the host PC, but only one version should be running at a time.
- TDKTE Server is registered to operate with only one of the two possible installations of IBTracer which is the last one to be installed. To register the TDKTE server with a different IBTracer installation, run the #register.bat batch file in the installation directory of the desired version.
- No Firmware or bus engine changes in this release.
