Digital Portable Radios

Detailed Service Manual

**MOTOROLA**

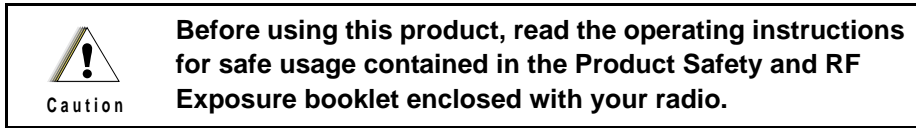

**ASTRO® XTS™ 5000**  
VHF/UHF Range 1/Range 2/700–800 MHz  
Digital Portable Radios  
**Detailed Service Manual**

# Foreword

The information contained in this manual relates to all ASTRO® XTS™ 5000 digital portable radios, unless otherwise specified. This manual provides sufficient information to enable qualified service shop technicians to troubleshoot and repair an ASTRO XTS 5000 digital portable radio to the component level.

For details on the operation of the radio or level 1 or 2 maintenance procedures, refer to the applicable manuals, which are available separately. A list of related publications is provided in the section, “[Related Publications](#),” on page xii.

## Product Safety and RF Exposure Compliance

### ATTENTION!

**This radio is restricted to occupational use only to satisfy FCC RF energy exposure requirements. Before using this product, read the RF energy awareness information and operating instructions in the Product Safety and RF Exposure booklet enclosed with your radio (Motorola Publication part number 6881095C98) to ensure compliance with RF energy exposure limits.**

**For a list of Motorola-approved antennas, batteries, and other accessories, visit the following web site which lists approved accessories: <<http://www.motorola.com/cgiss/index.shtml>>**

## Manual Revisions

Changes which occur after this manual is printed are described in FMRs (Florida Manual Revisions). These FMRs provide complete replacement pages for all added, changed, and deleted items, including pertinent parts list data, schematics, and component layout diagrams. To obtain FMRs, contact the Customer Care and Services Division (refer to “[Appendix A Replacement Parts Ordering](#)”).

## Computer Software Copyrights

The Motorola products described in this manual may include copyrighted Motorola computer programs stored in semiconductor memories or other media. Laws in the United States and other countries preserve for Motorola certain exclusive rights for copyrighted computer programs, including, but not limited to, the exclusive right to copy or reproduce in any form the copyrighted computer program. Accordingly, any copyrighted Motorola computer programs contained in the Motorola products described in this manual may not be copied, reproduced, modified, reverse-engineered, or distributed in any manner without the express written permission of Motorola. Furthermore, the purchase of Motorola products shall not be deemed to grant either directly or by implication, estoppel, or otherwise, any license under the copyrights, patents or patent applications of Motorola, except for the normal non-exclusive license to use that arises by operation of law in the sale of a product.

## Document Copyrights

No duplication or distribution of this document or any portion thereof shall take place without the express written permission of Motorola. No part of this manual may be reproduced, distributed, or transmitted in any form or by any means, electronic or mechanical, for any purpose without the express written permission of Motorola.

## Disclaimer

The information in this document is carefully examined, and is believed to be entirely reliable. However, no responsibility is assumed for inaccuracies. Furthermore, Motorola reserves the right to make changes to any products herein to improve readability, function, or design. Motorola does not assume any liability arising out of the applications or use of any product or circuit described herein; nor does it cover any license under its patent rights nor the rights of others.

## Trademarks

MOTOROLA, the Stylized M logo, and ASTRO are registered in the US Patent & Trademark Office. All other product or service names are the property of their respective owners.

# Commercial Warranty

## Limited Warranty

### MOTOROLA COMMUNICATION PRODUCTS

#### I. What This Warranty Covers And For How Long

MOTOROLA INC. ("MOTOROLA") warrants the MOTOROLA manufactured Communication Products listed below ("Product") against defects in material and workmanship under normal use and service for a period of time from the date of purchase as scheduled below:

ASTRO XTS 5000 Digital Portable Units	One (1) Year
Product Accessories	One (1) Year

Motorola, at its option, will at no charge either repair the Product (with new or reconditioned parts), replace it (with a new or reconditioned Product), or refund the purchase price of the Product during the warranty period provided it is returned in accordance with the terms of this warranty. Replaced parts or boards are warranted for the balance of the original applicable warranty period. All replaced parts of Product shall become the property of MOTOROLA.

This express limited warranty is extended by MOTOROLA to the original end user purchaser only and is not assignable or transferable to any other party. This is the complete warranty for the Product manufactured by MOTOROLA. MOTOROLA assumes no obligations or liability for additions or modifications to this warranty unless made in writing and signed by an officer of MOTOROLA. Unless made in a separate agreement between MOTOROLA and the original end user purchaser, MOTOROLA does not warrant the installation, maintenance or service of the Product.

MOTOROLA cannot be responsible in any way for any ancillary equipment not furnished by MOTOROLA which is attached to or used in connection with the Product, or for operation of the Product with any ancillary equipment, and all such equipment is expressly excluded from this warranty. Because each system which may use the Product is unique, MOTOROLA disclaims liability for range, coverage, or operation of the system as a whole under this warranty.

#### II. General Provisions

This warranty sets forth the full extent of MOTOROLA's responsibilities regarding the Product. Repair, replacement or refund of the purchase price, at MOTOROLA's option, is the exclusive remedy. THIS WARRANTY IS GIVEN IN LIEU OF ALL OTHER EXPRESS WARRANTIES. IMPLIED WARRANTIES, INCLUDING WITHOUT LIMITATION, IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ARE LIMITED TO THE DURATION OF THIS LIMITED WARRANTY. IN NO EVENT SHALL MOTOROLA BE LIABLE FOR DAMAGES IN EXCESS OF THE PURCHASE PRICE OF THE PRODUCT, FOR ANY LOSS OF USE, LOSS OF TIME, INCONVENIENCE, COMMERCIAL LOSS, LOST PROFITS OR SAVINGS OR OTHER INCIDENTAL, SPECIAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE SUCH PRODUCT, TO THE FULL EXTENT SUCH MAY BE DISCLAIMED BY LAW.

---

### III. State Law Rights

SOME STATES DO NOT ALLOW THE EXCLUSION OR LIMITATION OF INCIDENTAL OR CONSEQUENTIAL DAMAGES OR LIMITATION ON HOW LONG AN IMPLIED WARRANTY LASTS, SO THE ABOVE LIMITATION OR EXCLUSIONS MAY NOT APPLY.

This warranty gives specific legal rights, and there may be other rights which may vary from state to state.

### IV. How To Get Warranty Service

You must provide proof of purchase (bearing the date of purchase and Product item serial number) in order to receive warranty service and, also, deliver or send the Product item, transportation and insurance prepaid, to an authorized warranty service location. Warranty service will be provided by Motorola through one of its authorized warranty service locations. If you first contact the company which sold you the Product, it can facilitate your obtaining warranty service. You can also call Motorola at 1-888-567-7347 US/Canada.

### V. What This Warranty Does Not Cover

- A. Defects or damage resulting from use of the Product in other than its normal and customary manner.
- B. Defects or damage from misuse, accident, water, or neglect.
- C. Defects or damage from improper testing, operation, maintenance, installation, alteration, modification, or adjustment.
- D. Breakage or damage to antennas unless caused directly by defects in material workmanship.
- E. A Product subjected to unauthorized Product modifications, disassemblies or repairs (including, without limitation, the addition to the Product of non-Motorola supplied equipment) which adversely affect performance of the Product or interfere with Motorola's normal warranty inspection and testing of the Product to verify any warranty claim.
- F. Product which has had the serial number removed or made illegible.
- G. Rechargeable batteries if:
  - any of the seals on the battery enclosure of cells are broken or show evidence of tampering.
  - the damage or defect is caused by charging or using the battery in equipment or service other than the Product for which it is specified.
- H. Freight costs to the repair depot.
- I. A Product which, due to illegal or unauthorized alteration of the software/firmware in the Product, does not function in accordance with MOTOROLA's published specifications or the FCC type acceptance labeling in effect for the Product at the time the Product was initially distributed from MOTOROLA.
- J. Scratches or other cosmetic damage to Product surfaces that does not affect the operation of the Product.
- K. Normal and customary wear and tear.

## VI. Patent And Software Provisions

MOTOROLA will defend, at its own expense, any suit brought against the end user purchaser to the extent that it is based on a claim that the Product or parts infringe a United States patent, and MOTOROLA will pay those costs and damages finally awarded against the end user purchaser in any such suit which are attributable to any such claim, but such defense and payments are conditioned on the following:

- A. that MOTOROLA will be notified promptly in writing by such purchaser of any notice of such claim;
- B. that MOTOROLA will have sole control of the defense of such suit and all negotiations for its settlement or compromise; and
- C. should the Product or parts become, or in MOTOROLA's opinion be likely to become, the subject of a claim of infringement of a United States patent, that such purchaser will permit MOTOROLA, at its option and expense, either to procure for such purchaser the right to continue using the Product or parts or to replace or modify the same so that it becomes noninfringing or to grant such purchaser a credit for the Product or parts as depreciated and accept its return. The depreciation will be an equal amount per year over the lifetime of the Product or parts as established by MOTOROLA.

MOTOROLA will have no liability with respect to any claim of patent infringement which is based upon the combination of the Product or parts furnished hereunder with software, apparatus or devices not furnished by MOTOROLA, nor will MOTOROLA have any liability for the use of ancillary equipment or software not furnished by MOTOROLA which is attached to or used in connection with the Product. The foregoing states the entire liability of MOTOROLA with respect to infringement of patents by the Product or any parts thereof.

Laws in the United States and other countries preserve for MOTOROLA certain exclusive rights for copyrighted MOTOROLA software such as the exclusive rights to reproduce in copies and distribute copies of such Motorola software. MOTOROLA software may be used in only the Product in which the software was originally embodied and such software in such Product may not be replaced, copied, distributed, modified in any way, or used to produce any derivative thereof. No other use including, without limitation, alteration, modification, reproduction, distribution, or reverse engineering of such MOTOROLA software or exercise of rights in such MOTOROLA software is permitted. No license is granted by implication, estoppel or otherwise under MOTOROLA patent rights or copyrights.

## VII. Governing Law

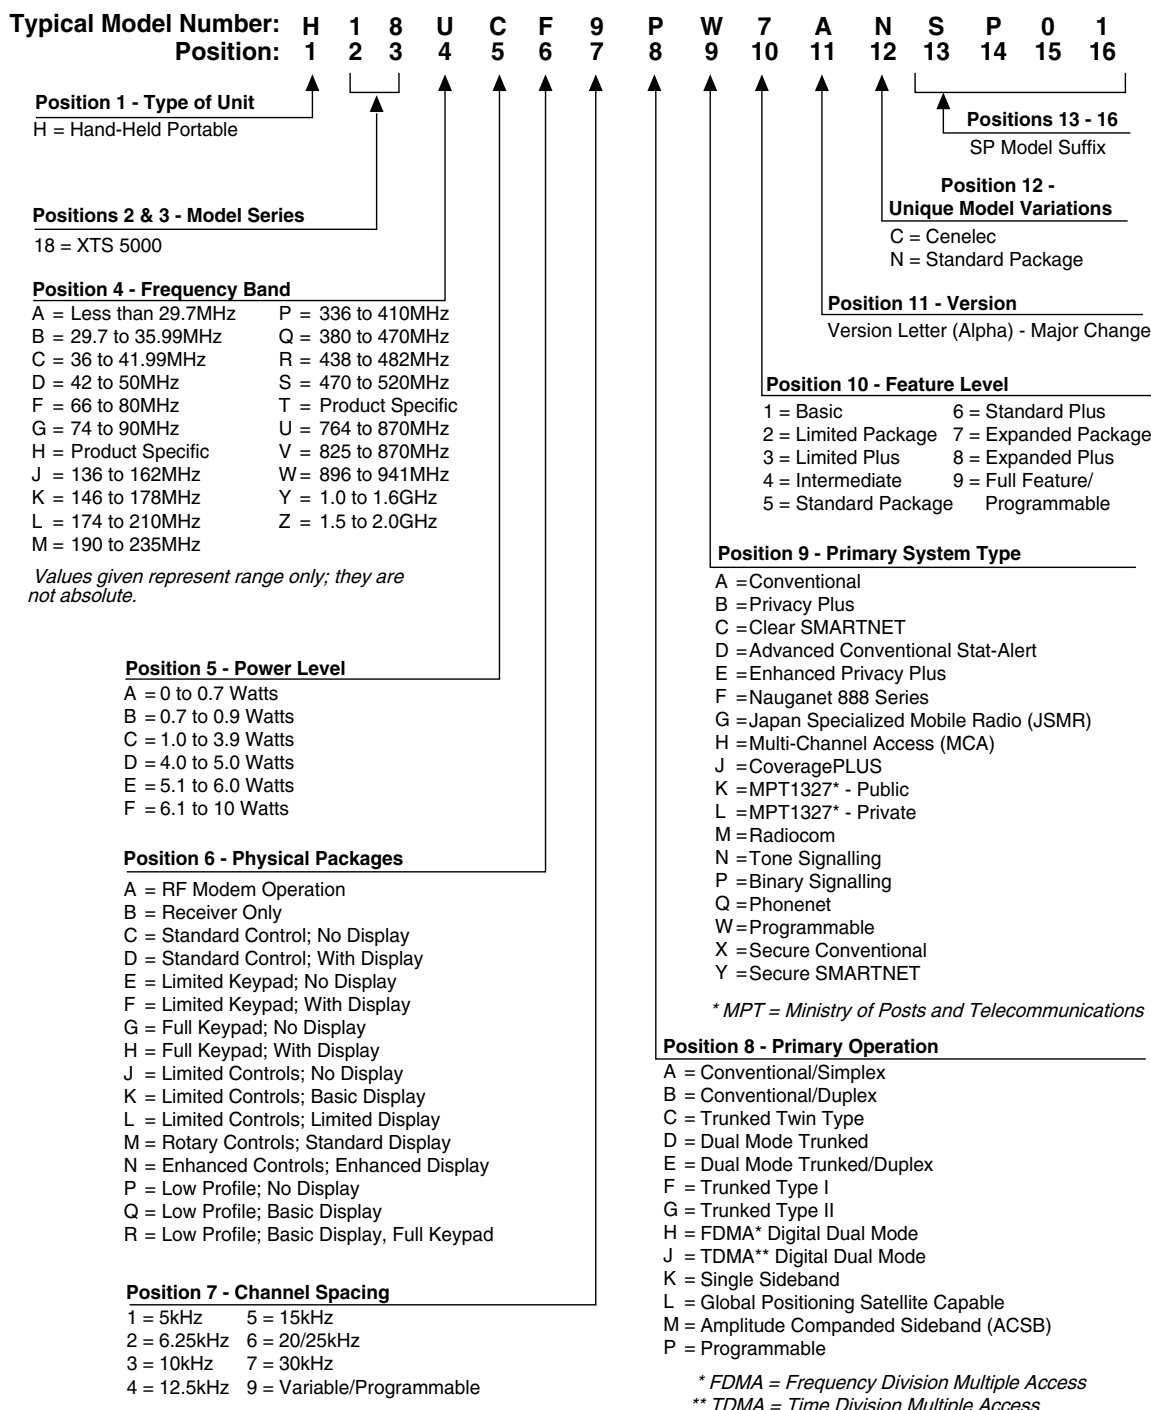

This Warranty is governed by the laws of the State of Illinois, USA.

**Notes:**

X =Item Included

\* =The radio's model number, FLASHcode, Host code, and DSP code are required when placing an order for the VOCON Board.

- The model number and (sometimes) the FLASHcode can be found on the FCC label on the back of the radio.
- The model number, Host code, DSP code, and (sometimes) the FLASHcode can be found by putting a Model II or III radio into the Test Mode.
- The model number, Host code, DSP code, and FLASHcode can be found by using the Programming Cable (RKN4105\_ or RKN4106\_) and the CPS to read a Model I, II, or III radio.

## Specifications for VHF Radios

All specifications are per Telecommunications Industries Association TIA-603 unless otherwise noted.

GENERAL	RECEIVER	TRANSMITTER
<b>FCC Designation:</b> AZ489FT3804	<b>Frequency Range:</b> 136-174 MHz	<b>Frequency Range:</b> 136-174 MHz
<b>Temperature Range:</b>		
<b>Operating:</b> -30 C to +60 C	<b>Bandwidth:</b> 38 MHz	<b>RF Power:</b> 136-174 MHz: 1-6 Watts
<b>Storage:</b> -40 C to +85 C	<b>Usable Sensitivity (typical) (12 dB SINAD):</b> 0.20 µV	<b>Frequency Stability (typical) (-30 to +60 C; 25 C ref.):</b> ±0.0002%
<b>Power Supply:</b> Nickel-Cadmium Battery (NiCd) or Nickel-Metal-Hydride Battery (NiMH) or Lithium-Ion Battery (Li-Ion)	<b>Intermodulation (typical):</b> -75 dB	<b>Emission (typical conducted):</b> -75 dBc
<b>Battery Voltage:</b>	<b>Selectivity (typical):</b>	<b>FM Hum and Noise (typical) (Companion Receiver):</b> 25 kHz -48 dB 12.5 kHz -42 dB
<b>Nominal:</b> 7.5 Vdc	<b>(25/30 kHz Channel):</b> -75 dB	
<b>Range:</b> 6 to 9 Vdc	<b>(12.5 kHz Channel):</b> -63 dB	<b>Distortion (typical):</b> 1.0% (typical)
<b>Transmit Current Drain (Typical):</b> 2100 mA	<b>Spurious Rejection (typical):</b> -75 dB	<b>Modulation Limiting:</b> 25 kHz chnls ±5.0 kHz 12.5 kHz chnls ±2.5 kHz
<b>Receive Current Drain (Rated Audio):</b> 240 mA	<b>Frequency Stability (-30+60 C; 25 C reference):</b> ±0.0002%	<b>ACPR (typical):</b> 25 kHz -73 dBc 12.5 kHz -63 dBc
<b>Standby Current Drain:</b> 80 mA	<b>Rated Audio:</b> 500 mW	<b>Emissions Designators:</b> 20K0F1E, 16K0F3E, 11K0F3E, 8K10F1D, and 8K10F1E
<b>Recommended Battery:</b>	<b>FM Hum and Noise (typical):</b> 25 kHz -55 dB 12.5 kHz -49 dB	
<b>Smart NiMH:</b> NNTN4435_	<b>Distortion (typical):</b> 1.5%	
<b>or Ultra-High-Capacity NiCd:</b> NTN8294_	<b>Channel Spacing:</b> 12.5/25 kHz	
<b>or Extended-Capacity NiMH:</b> NTN8293_		
<b>or Li-Ion:</b> NTN8610_		
<b>or Ultra-High-Capacity NiCd FM:</b> NTN8295_*		
<b>or Ultra-High-Capacity NiMH FM:</b> NTN8299_*		
<b>Optional FM (Factory Mutual) Battery:</b>		
* FM Intrinsically Safe: Class I, II, III, Division 1, Groups C, D, E, F, and G. FM Non-incendive: Class 1, Division 2, Groups A, B, C, and D.		
<b>Dimensions (H x W x D):</b>		
Note: 2.44" = width at PTT; 2.34" = width at bottom; 1.83" = depth at speaker; 0.97" = depth at keypad		
<b>Without Battery (Radio Only):</b>		
6.58" x 2.44" x 1.83"/6.58" x 2.34" x 0.97"		
(167.13 mm x 61.90 mm x 46.42 mm/ 167.13 mm x 59.49 mm x 24.56 mm)		
<b>With Battery:</b>		
6.58" x 2.44" x 1.83"/6.58" x 2.34" x 1.65"		
(167.13 mm x 61.90 mm x 46.42 mm/ 167.13 mm x 59.49 mm x 41.97 mm)		
<b>Weight: (w/ Antenna):</b>		
<b>Less Battery:</b> 14.10 oz (383 gm)		
<b>With Ultra-High Cap. NiCd:</b> 25.19 oz (693 gm)		
<b>With Li-Ion:</b> 20.41 oz (583 gm)		
<b>With Ultra-High Cap. NiMH:</b> 23.45 oz (644 gm)		
<b>With Extended- Cap. NiMH:</b> 24.04 oz (682 gm)		

Specifications subject to change without notice.

## Specifications for UHF Range 1 Radios

All specifications are per Telecommunications Industries Association TIA-603 unless otherwise noted.

## Notes

---

# Chapter 1 Introduction

## 1.1 General

This manual includes all the information needed to maintain peak product performance and maximum working time for the ASTRO XTS 5000 radio. This detailed level of service (component level) is typical of the service performed by some service centers, self-maintained customers, and distributors.

Use this manual in conjunction with the *ASTRO XTS 5000 VHF/UHF Range 1/700–800 MHz Digital Portable Radios Basic Service Manual* (Motorola part number 6881094C28), which can help in troubleshooting a problem to a particular printed circuit (PC) board.

Conduct the basic performance checks outlined in the basic service manual first to verify the need to analyze the radio and to help pinpoint the functional problem area. In addition, you will become familiar with the radio test mode of operation, which is a helpful tool. If any basic receive or transmit parameters fail to be met, the radio should be aligned according to the radio alignment procedure.

Included in other areas of this manual are functional block diagrams, detailed theory of operation, troubleshooting charts and waveforms, schematics, and parts lists. You should become familiar with these sections to aid in determining circuit problems. Also included are component location diagrams to aid in locating individual circuit components and some IC diagrams, which identify some convenient probe points.

[“Chapter 3, Theory of Operation,” on page 3-1](#), contains detailed descriptions of the operations of many circuits. Once you locate the problem area, review the troubleshooting flowchart for that circuit to fix the problem.

## 1.2 Notations Used in This Manual

Throughout the text in this publication, you will notice the use of warnings, cautions, and notes. These notations are used to emphasize that safety hazards exist, and care must be taken and observed.

**NOTE:** An operational procedure, practice, or condition that is essential to emphasize.

**Caution**

CAUTION indicates a potentially hazardous situation which, if not avoided, might result in equipment damage.

**WARNING**

**WARNING** indicates a potentially hazardous situation which, if not avoided, could result in death or injury.

**DANGER**

**DANGER** indicates an imminently hazardous situation which, if not avoided, will result in death or injury.

---

## Chapter 2 Radio Power

This chapter provides a detailed circuit description of the power distribution of an ASTRO XTS 5000 radio.

### 2.1 General

In the ASTRO XTS 5000 radio, power (B+) is distributed to two boards: the transceiver (RF) board and the VOCON board (see [Figure 2-1 on page 2-2](#) for UHF Range 1 (R1) and 700–800 MHz, and [Figure 2-2 on page 2-2](#) for VHF). For kit NNTN5567, the VOCON board supplies VSW1, regulated 3.6Vdc, from the MAKO switching regulator to the XCVR. In the case of a secure model radio, B+ is also supplied to the encryption module.

Power for the radio is provided through a battery supplying a nominal 7.5 Vdc directly to the transceiver. The following battery types and capacities are available:

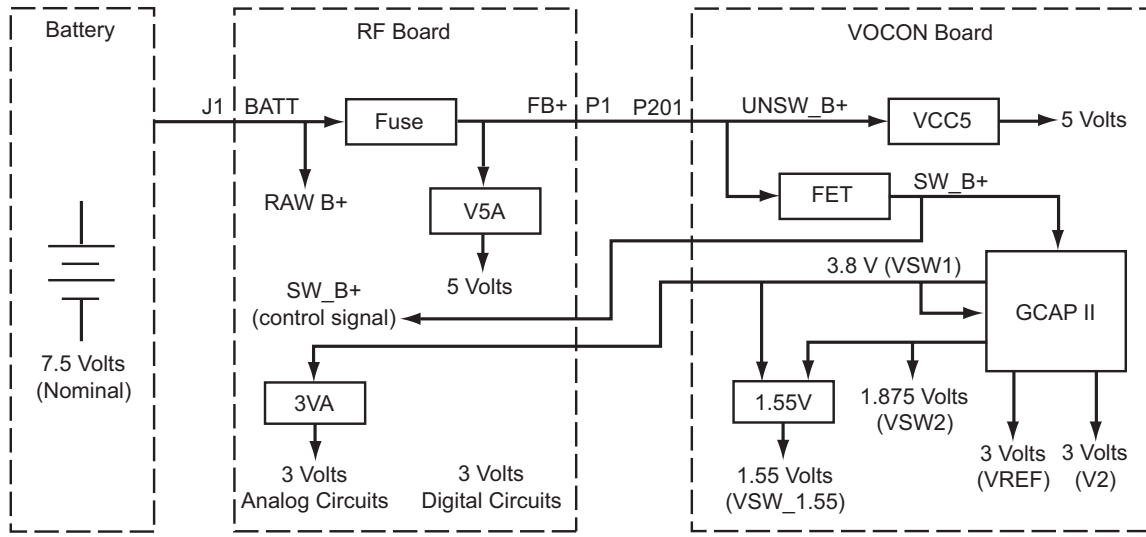

*Table 2-1. Conventional Batteries*

Part Number	Description
NTN8294	1525 NiCd, Ultra-High Capacity
NTN8295	1525 NiCd High-Capacity Factory Mutual (FM) Intrinsically Safe
NTN8297	1525 NiCd High-Capacity Factory Mutual (FM) Intrinsically Safe, Rugged
NTN8299	1750 NiMH Ultra-Capacity FM
NTN8610	1650 Lithium Ion
NTN8923	1800 NiMH Ultra-Capacity
NTN9177	Battery Holder, Clamshell, Black
NTN9183	Battery Holder, Clamshell, Orange
RNN4006	3000 NiMH
RNN4007	3000 NiMH FM

*Table 2-2. Smart Batteries*

Part Number	Description
HNN9031	1525 NiCd Smart
HNN9032	1525 NiCd Smart FM
NNTN4435_R	1800 mAh, NiMH Smart
NNTN4436	1750 NiMH Smart FM (VHF use only)

MAEPF-27419-A

Figure 2-1. DC Power Distribution—UHF Range 1 and 700–800 MHz Radios

MAEPF-27520-A

Figure 2-2. DC Power Distribution—VHF and Range 2 Radios

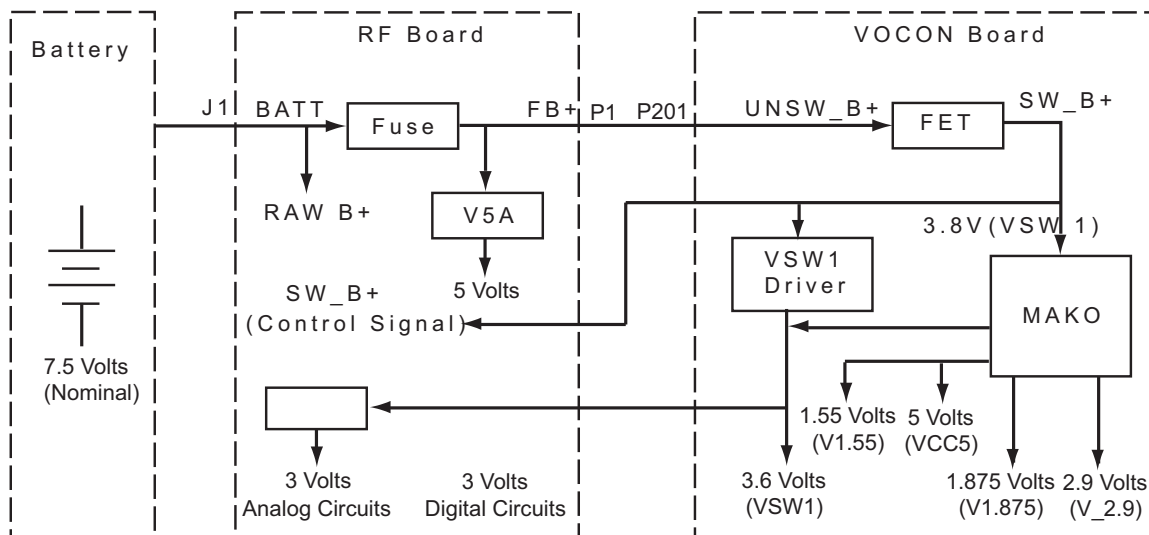

Figure 2-3. DC Power Distribution—UHF Range 1 and 700–800 MHz Radios (for NNTN5567)

Figure 2-4. DC Power Distribution—VHF and Range 2 Radios (for NNTN5567)

B+ from the battery is electrically switched to most of the radio, rather than routed through the On/Off/volume control knob, S1. The electrical switching of B+ supports a *keep-alive* mode. Under software control, even when the On/Off/volume control knob has been turned to the Off position, power remains on until the MCU completes its power-down, at which time the radio is physically powered down.

## 2.2 DC Power Routing—Transceiver Board

**NOTE:** Refer to [Table 8-1, “List of Transceiver Schematics and Board Overlays,”](#) on page 8-1 for a listing of schematics showing the transceiver board DC power routing components.

Connector J1, the B-plus assembly, connects the battery to the transceiver board. Capacitors C1, C2, and C3 provide protection against momentary breaks at the B-plus connector due to contact bounce when the radio is dropped.

**UHF R1 and 700–800 MHz:** Components C5, E4, C7, and E1 form a power-line filter for signal RAWB+, which supplies battery voltage to the transmitter PA.

**UHF R2 and VHF:** Component E1 forms a power-line filter for signal RAWB+, which supplies battery voltage to the transmitter PA.

Transistor Q1, controlled by signal SWB+ (SB+ for VHF) from the VOCON board, turns on XB+, which supplies to the 5-V linear regulator and TX\_ALC block.

Fuse F901 and filter C11, L1, C10 (C14, L1, C13 for VHF) supply fused B-plus to the VOCON board. In turn, the VOCON board supplies VSW1, regulated 3.8 Vdc, from the Global Control Audio and Power (GCAP) switching regulator to the XCVR. Switch Q99 (Q503 for VHF), controlled by SWB+, turns on V38 to the XCVR 3-V linear regulators. For kit NNTN5567, the Vocon board supplies VSW1, regulated 3.6Vdc, from the Mako switching regulator to the XCVR. The XCVR regulated power supplies are summarized in [Table 2-3](#).

Table 2-3. Transceiver Voltage Regulators

Ref. Desig.	IC Name	Output Signal Name	Description
U1	LP2989	V5A	Regulated 5.0 Vdc
U2	LP3985	V3D	Regulated 3.0 Vdc digital
U3	LP3985	V3A	UHF R1 and 700–800 MHz: Regulated 3.0 Vdc analog for the RX FE <b>UHF R2 and VHF:</b> Regulated 3.0 Vdc analog for synthesizer
U5	LP3985	V3B	<b>UHF R2 and VHF only:</b> Regulated 3.0 Vdc miscellaneous supply

## 2.3 DC Power Routing—VOCON Board

**NOTE:** Refer to [Table 8-2, “List of VOCON Schematics and Board Overlays,”](#) on page 8-1 for a listing of schematics showing the VOCON board DC power routing components.

Raw B+, or unswitched B+, (UNSW\_B+) is routed to connector P1 on the transceiver board, and then on to P201 on the VOCON board. Here the UNSW B+ is forwarded to the radio’s control top On/Off/volume knob through connector J101 and a flex circuit, as well as to regulator U505 (VCC5).

The On/Off/volume knob controls B+SENSE to Q502, which in turn controls Q501. Transistor Q501 is a solid-state power switch that provides SW B+ to the VOCON board, the audio PA, the GCAP II IC (via GCAP\_B+), and back to the transceiver board. In NNTN5567, the control signal, FET\_ENX, for the power MOSFET is generated by the MAKO IC upon applying B+ sense to the BJT switch. The MOSFET provides SW B+ to the VOCON board, MAKO IC, audio power amplifier, and transceiver board.

In the case of a secure radio model, SW B+ and UNSW B+ are also supplied to the encryption module through connector J701.

Transistor Q501 is also under the control of the microcontroller unit (MCU) via Vref from U501. This allows the MCU to follow an orderly power-down sequence when it senses that B+SENSE is off. This sense is provided through MECH\_SW\_BAR (inverted B+SENSE, see Q508). In NNTN5567, the MCU detects that B+SENSE is off when MECH\_SW (inverted B+SENSE) is asserted high. This is communicated to the MCU by the MAKO IC (U501) through the serial peripheral interface (SPI)

The digital circuits in the VOCON board are powered from regulators located in the GCAP II IC (U501), an external 5 Vdc regulator (VCC5, U505), and an external 1.55 Vdc regulator (VSW\_1.55V, on NNTN4717 VOCON kit only). The GCAP II IC provides three supplies: VSW1, VSW2, and V2. These regulators are software programmable. Table 2-4 lists the supply voltages and the circuits that use these voltages. In NNTN5567, the digital circuits in the VOCON board are powered from the regulators in the MAKO IC(U501). MAKO IC provides five supplies: VSW1, V\_2.9, VCC5, V1.55, and V1.875. VSW1 is controlled by the MAKO IC, but uses an external driver to source the current from SW B+. V\_2.9, V1.55 and V1.875 are software programmable.

Table 2-4. VOCON Board DC Power Distribution (for kits: NTN9564, NNTN4563, NNTN4819 & NNTN4717.)

Supply Name	Output Voltage	Supply Type	Unprogrammed Output Voltage	Circuits Supplied

## Chapter 3 Theory of Operation

This chapter provides a detailed circuit description of the ASTRO XTS 5000 transceiver and VOCON boards. When reading the theory of operation, refer to the appropriate schematic and component location diagrams located in the back of this manual. This detailed theory of operation can help isolate the problem to a particular component.

The ASTRO XTS 5000 radio is a dual-mode (digital/analog), microcontroller-based transceiver incorporating a digital signal processor (DSP). The microcontroller handles the general radio control, monitors status, and processes commands input from the keypad or other user controls. The DSP processes the typical analog signals, and generates the standard signaling digitally to provide compatibility with existing analog systems. In addition, the DSP provides digital modulation techniques, utilizing voice encoding techniques with error correction schemes. This provides the user with enhanced range and audio quality, all in a reduced bandwidth channel requirement. It allows embedded signaling, which can mix system information and data with digital voice to support a multitude of system features.

The three ASTRO XTS 5000 radio models (I, II, and III) are available in the VHF (136 to 174 MHz), UHF Range 1 (380 to 470 MHz), UHF Range 2 (450 to 520 MHz), and 700–800 MHz (764 to 870 MHz) frequency bands.

The ASTRO XTS 5000 radio (Figure 3-1) consists of the following:

- Band-dependent transceiver (RF) board
- Vocoder/controller (VOCON) board
- Universal flex assembly
- Display and keypad assemblies (Models II and III only)
- Encryption board (secure models only)

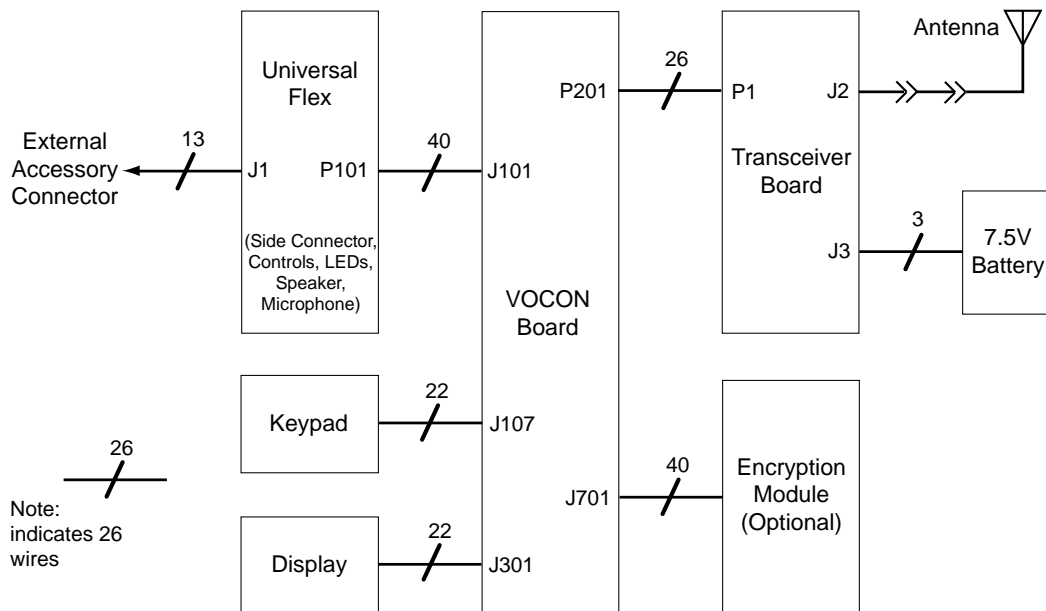

Figure 3-1. XTS 5000 Overall Block Diagram

### 3.1 Transceiver Board

The transceiver (XCVR) board performs the transmitter and receiver functions necessary to translate between voice and data from the VOCON board and the modulated radio-frequency (RF) carrier at the antenna. The transceiver board contains all the radio's RF circuits for the following major components:

- Receiver
- Transmitter
- Frequency Generation Unit (FGU)

Figure 3-2 illustrates the VHF transceiver board block diagram while Figure 3-3 on page 3-3 illustrates the transceiver UHF Range 1 and 700–800 MHz transceiver block diagrams.

Figure 3-2. Transceiver (VHF) Block Diagram (Power and Control Omitted)

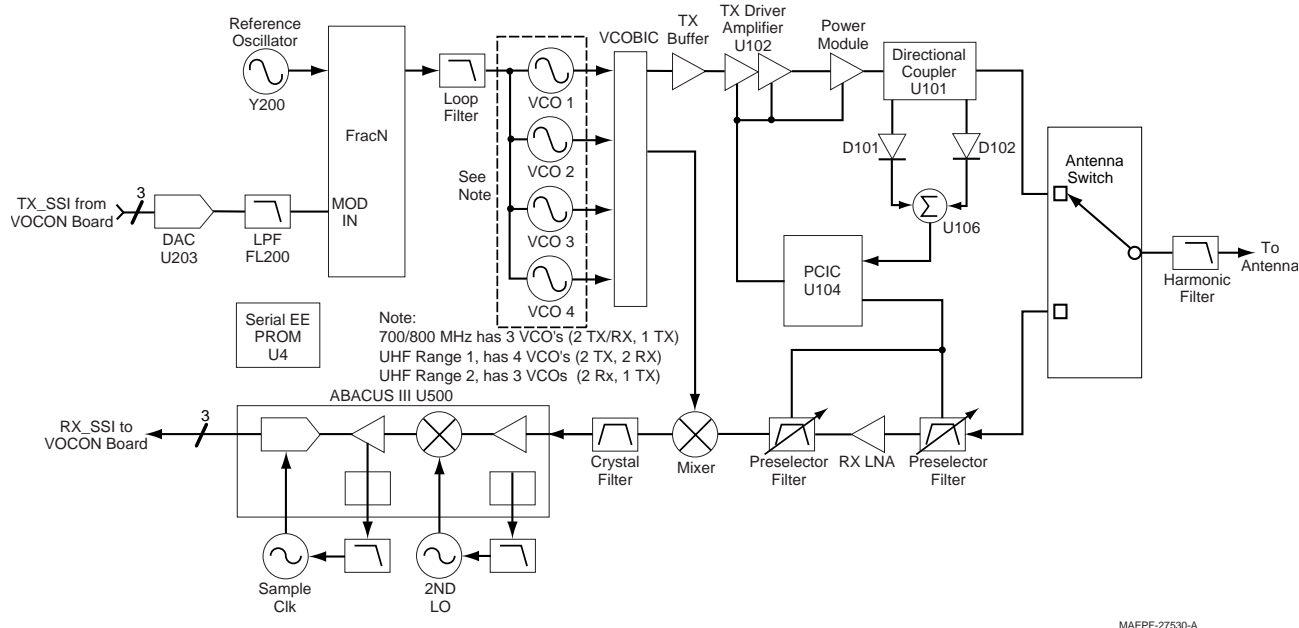

Figure 3-3. Transceiver (UHF Range 1, UHF Range 2 and 700–800 MHz) Block Diagram (Power and Control Omitted)

### 3.1.1 Interconnections

This section describes the various interconnections for the transceiver board.

#### 3.1.1.1 Battery Connector J3

Battery connector J3 consists of three gold-plated contacts on the printed circuit board that mate with a B-plus connector assembly. Signal descriptions are in [Table 3-1](#).

Table 3-1. Battery Connector J3

Pin No.	Signal	Description
1	BATT	Battery positive terminal, nominally 7.5 Vdc
2	BSTAT	Battery status, from battery to VOCON
3	BAT_RTN	Battery negative terminal, tied to PCB ground

#### 3.1.1.2 VOCON Connector P1

VOCON connector P1 (located on the XCVR board) consists of 26 gold-plated pads for the 26-pin compression connector, and one plated tool hole (pin 27) used for connector alignment. This is a digital interface carrying DC power, control, and data between the XCVR and VOCON boards. P1 connects through the compression connector to P201 on the VOCON board.

Table 3-2 lists the connector pins, their signals, and functions. SPI refers to serial peripheral interface, which is the control bus from the microprocessor. SSI is the serial synchronous interface bus for data to and from the DSP. There is a RX SSI bus for demodulated data from the receiver and a TX SSI bus for modulation data to the transmitter.

Table 3-2. VOCON Connector P1

Pin No.	VOCON Signal	XCVR Signal	XCVR I/O	Type	Description
1	UNSW_B+	FUB+	O	dc	Fused B+ to VOCON
2	UNSW_B+	FUB+	O	dc	Fused B+ to VOCON
3	LOCK_DET*	LOCK	O	status	FGU lock detect
4	TX_SSI_DATA	TXTD	O	ssi	TX SSI data
5	SSI_CLK	RXCK	O	ssi	RX SSI clock
6	SSI_FSYNC	SSFS	O	ssi	RX SSI frame sync
7	16.8MHz	F168	O	RF	16.8 MHz reference clock
8	SW_B+	SWB+	I	dc	Switch control
9	TX_SSI_FSYNC	TXFS	I	ssi	TX SSI frame sync
10	TX_SSI_CLK	TXCK	I	ssi	TX SSI clock
11	GND	GND			
12	RX_SSI_DATA	RXDO	O	ssi	RX SSI data
13	ABACUS3_CS	ABCS	I	ssi	SPI Abacus chip select
14	GND	GND			
15	VSW1	VSW1	I	dc	Regulated 3.8 V
16	SPI_CLK_A	SPCK	I	spi	SPI clock
17	SPI_MISO_A	MISO	O	spi	SPI data out
18	EEPROM_SEL*	EECS	I	spi	SPI EEPROM chip select
19	TX_INHIBIT	TXINH	I	control	TX inhibit control for secure
20	GND	GND			
21	BAT_STATUS	BSTAT	O	dc	Battery status
22	GND	GND			
23	SPI_MOSI_A	MOSI	I/O	spi	SPI data I/O
24	UNI_CS	USEL	I	spi	SPI universal chip select
25	AD_CS	ADCS	I	spi	SPI ADC chip select
26	POR*	RSTL	I/O	control	asynchronous reset, active low

### 3.1.1.3 Antenna Port J2

Antenna port J2 is a surface-mount, miniature coaxial connector for the antenna cable.

### 3.1.1.4 Serial EEPROM

The serial, electrostatically erasable, programmable, read-only memory (EEPROM), U907 in VHF and 700–800 MHz or U4 in UHF Range 1, holds all of the transceiver tuning data. This allows transceivers to be tuned in the factory and installed in the field without retuning.

### 3.1.1.5 Power Conditioning Components

DC power-conditioning components include zener diodes, capacitors, ferrite beads, a power inductor, and the fuse. Diodes VR1 and VR2 provide over-voltage protection. Ferrite beads (designated E1, etc.) and capacitors suppress electromagnetic interference from the transceiver. The power-line filter consisting of L1, C13, and C14 for VHF radios or L1, C10, and C11 for UHF Range 1 and 700–800 MHz radios, suppresses digital noise from the VOCON board switching power supplies that could degrade the transmitter spectral purity.

Pass transistor Q1 switches the battery voltage to the transceiver when control signal SWB+ or SB+ from the VOCON board is asserted high. This increases the transceiver's immunity to conducted interference that might be present on SWB+ or SB+, such as from switching voltage regulators on the VOCON board.

Ground clips G1 through G12 make contact between the transceiver board ground and the radio chassis. The chassis connection is a necessary electrical reference point to complete the antenna circuit path. Shields SH101 through SH700 and the tool hole appear on the schematic to show their connection to ground.

## 3.1.2 Receiver

The XTS 5000 transceiver has a dual-conversion superheterodyne receiver. [Figure 3-4](#) illustrates the major receiver components:

- Receiver Front End
- Receiver Back End

Figure 3-4. Receiver Block Diagram

### 3.1.2.1 Receiver Front End

**NOTE:** Refer to [Table 8-1, “List of Transceiver Schematics and Board Overlays,”](#) on page 8-1 for a listing of receiver front end schematics.

The receiver front end tunes to the desired channel and down converts the RF signal to the first intermediate frequency (IF). Channel selection is by way of a tunable local oscillator, RXLO, from the FGU.

The receiver front end consists of a preselector filter, an RF amplifier, a second preselector, mixer, and an IF crystal filter. VHF, UHF Range 1 and UHF Range 2 radios also contain a switchable attenuator between the antenna switch and the first preselector filter. The RF amplifier is a discrete RF transistor with associated circuitry. The mixer is a double-balanced, active mixer IC, coupled by transformers. The receiver (RX) local oscillator (LO) is provided by the FGU.

#### 3.1.2.1.1 Preselector Filters

**VHF, UHF Range 1, and UHF Range 2:** The receiver front end uses two discrete, tunable, bandpass filters to achieve its required out-of-band rejection. The first preselector filter precedes the RF amplifier, while the second preselector filter follows the RF amplifier. DAC2, from the PCIC, is used to simultaneously tune both preselector filters by applying voltage to the varactors.

**700–800 MHz:** The receiver front end uses two, multi-layer, ceramic, tunable, bandpass filters to achieve its required out-of-band rejection. The first preselector filter, FL401, precedes the discrete RF amplifier. To tune the center frequency of the first filter, voltage from port DAC1 is applied to pin 3 of FL401. Pin 3 connects to the surface-mounted varactor diodes placed on each filter. A second identical filter, FL402, follows the discrete RF amplifier. The second filter is tuned by applying voltage from port DAC2 to pin 3 of FL402. Capacitors C409 and C410 are RF bypasses. Capacitors C400 and C411 are used to filter out noise from the DAC1 and DAC2 control lines.

#### 3.1.2.1.2 LNA (Low-Noise Amplifier)

The XTS 5000 radio uses a discrete transistor for the low-noise amplifier (Q428 in VHF, Q430 in UHF Range 1, Q428 in UHF Range 2, and either Q401 or Q420 (NUF3577C or later) in 700–800 MHz). A feedback network between the collector and base improves stability and gain balance across the frequency band. Input and output LC networks match the LNA impedance to 50 ohms.

A diode limiter (D722 in VHF, D400 in UHF Range 1, D722 in UHF Range 2, and D401 in 700-800 MHz) protects the amplifier damage by strong input signals.

#### 3.1.2.1.3 Mixer

The mixer (U451 in VHF, U470 in UHF Range 1, U451 in UHF Range 2 and either U401 or U405 (NUF3577C or later) in 700–800 MHz) down-converts the received RF to the first intermediate frequency (IF). The IF is 44.85 MHz for VHF, 73.35 MHz for UHF Range 1 and UHF Range 2, and 109.65 MHz for 7/800 MHz. High-side LO injection is used for VHF and 700 MHz, low-side for the UHF bands and 800 MHz. Transformers are used as baluns to convert signals from single-ended to balanced at pins MI, MIX, LO, and LOX. An output transformer converts the balanced signal at pins MO and MOX to a single-ended output.

#### 3.1.2.1.4 IF Filter

The IF filter (FL451 in VHF, FL490 in UHF Range 1, FL451 in UHF Range 2, and FL403 in 700–800 MHz) is a leadless, surface-mount, 3-pole, quartz crystal filter. This narrow bandpass filter gives the radio its adjacent-channel and alternate-channel rejection performance.

Input and output LC networks match the filter impedance to 50 ohms. Exceptions are the VHF and UHF Range 2, where the output is matched to 50 ohms, but the input is not.

### 3.1.2.2 Receiver Back End

The receiver back end, which consists of the Abacus III (AD9874 IF digitizing subsystem) IC and its associated circuitry, processes the down-converted IF signal to produce digital data for final processing by the VOCON DSP.

**NOTE:** Refer to [Table 8-1, "List of Transceiver Schematics and Board Overlays,"](#) on page 8-1 for a listing of receiver back end schematics.

#### 3.1.2.2.1 Abacus III IC U500

The AD9874 ([Figure 3-5](#)) is a general-purpose, IF subsystem that digitizes a low-level 10–300 MHz IF input with a bandwidth up to 270 kHz. The output of the Abacus III IC is SSI data to the VOCON.

The signal chain of the AD9874 consists of a low-noise amplifier, a mixer, a bandpass sigma-delta A/D converter, and a decimation filter with programmable decimation factor. An automatic gain control (AGC) circuit provides the AD9874 with 12 dB of continuous gain adjustment. The high dynamic range and inherent anti-aliasing provided by the bandpass sigma-delta converter allow the AD9874 to cope with blocking signals 80 dB stronger than the desired signal.

Auxiliary blocks include frequency synthesizers for the second LO and sampling clock LO, as well as an SPI port. The second LO uses a discrete external loop filter and VCO. The clock oscillator has an external loop filter and resonator.

MAEPF-27412-0

Figure 3-5. Abacus III (AD9874) Functional Block Diagram (from data sheet)

**VHF:** Input signal RXIF is the 44.8 MHz IF from crystal filter FL451 in the receiver front end. Components C547 and L542 match the input impedance from 50 ohms at the RXIF to the Abacus input IFIN.

**UHF Range 1:** Input signal RXIF is 73.35 MHz. Components L547 and C547 match the input impedance to 50 ohms.

**UHF Range 2:** Input signal RXIF is 73.35 MHz. L542, C515, and C547 match the Abacus input to 50 Ohms.

**700–800 MHz:** Input signal RXIF is the 109.65 MHz IF from crystal filter FL403 in the receiver front end. Components L547 and C542 match the input impedance from 50 ohms at RXIF to approximately 420 ohms in parallel with a 1 pF capacitance at the Abacus input IFIN. Formatted SSI data is output to the VOCON board on ports FS, DOUTA, and CLKOUT.

### 3.1.2.2.2 Second Local Oscillator

The second LO is controlled by the Abacus LO synthesizer, which mixes with IFIN to produce a 2.25 MHz final IF. The external VCO consists of Q502 and its bias network and frequency-determining elements. Signal FREF is the 16.8 MHz reference from the FGU. Darlington transistor Q501 with C550 and R501 form an active power-line filter.

**VHF:** The second LO frequency is 42.6 MHz by default, or 47.1 MHz in special cases as needed to avoid radio self-quieters. The loop filter is composed of R507, C558, C559, and C503.

**UHF Range 1:** The second LO frequency is 71.1 MHz by default or 75.6 MHz in special cases as needed to avoid radio self-quieters. The loop filter is composed of R551, C558, C559, R552, and C512.

**UHF Range 2:** The 2nd LO frequency is 71.1 Mhz. C558, R507, and C559 form the loop filter.

**700–800 MHz:** The second LO frequency is 107.4 MHz by default or 111.9 MHz in special cases as needed to avoid radio self-quieters. The loop filter is composed of R507, C558, C559, R505, and C512.

### 3.1.2.2.3 Sampling Clock Oscillator

The Abacus sampling clock synthesizer operates at 18 MHz = 8 x 2.25 MHz. The VCO uses an internal transistor and external resonator. The resonator is composed of L503, C535, and D501.

**VHF:** The loop filter is composed of R514, C536, C570, and C571.

**UHF Range 1 and 700–800 MHz:** The loop filter is composed of R514, C570, and C571.

**UHF Range 2:** C503, C536, R415, C570, and C571 form the loop filter.

## 3.1.3 Transmitter

The transmitter takes modulated RF from the FGU and amplifies it to the radio's rated output power to produce the modulated transmitter carrier at the antenna.

**NOTE:** Refer to [Table 8-1, "List of Transceiver Schematics and Board Overlays,"](#) on page 8-1 for a listing of transmitter-related schematics that will aid in the following discussion.

The transmitter ([Figure 3-6 on page 3-9](#)) consists of an RF driver IC that receives its input signal from the voltage-controlled oscillator (VCO) and a high-power output transistor. Transmitter power is controlled by a power-control IC (PCIC) that senses the output of a directional coupler and adjusts PA control voltages to maintain a constant power level. The signal passes through an antenna switch and harmonic filter to the antenna.

Figure 3-6. Transmitter Block Diagram

### 3.1.3.1 Power Distribution

To minimize voltage drop to the power amplifiers, net RAWB+ connects to power module Q107 and the second stage of driver amplifier U102 through components having minimal series resistance—ferrite beads and chokes only. During receive, no RF or DC bias is applied, and leakage current through U102 and Q107 is less than 100 microamps. The first stage of U102 uses less than 50 mA and is supplied by TX7V, which is switched on during TX, and switched off during RX or whenever TXINH, the transmitter inhibit control line, is high.

**VHF:** At a transmitter power of 6 Watts, the radio consumes approximately 2000 mA. Bias TX7V is controlled by transistors Q101, Q102, Q103, and Q106.

**UHF Range 1 and Range 2:** At the rated transmitter power of 5 Watts, the radio consumes approximately 2000 mA. Bias TX7V is controlled by transistors Q101, Q102, Q103, and Q106.

**700–800 MHz:** At a transmitter power of 3 Watts, the radio consumes approximately 1200 mA. Bias TX7V is controlled by transistors Q101, Q102, Q103, and Q107.

### 3.1.3.2 Driver Amplifier

The driver amplifier IC (U102) contains two LDMOS FET amplifier stages and two internal resistor bias networks. Pin 16 is the RF input. Modulated RF from the FGU, at a level of +3 dBm  $\pm$ 2 dB, is coupled through a blocking capacitor to the gate of FET-1. An LC interstage matching network connects the first stage output VD1 to the second stage input G2. The RF output from the drain of FET-2 is pin 6 (RFOUT1). Gain control is provided by a voltage applied to pin 1 (VCNTRL). Typical output power is about +27 dBm (500 mW) with VCNTRL at 5.0 V.

**VHF:** L109 and C113 are the interstage matching network. Components C108–C111 and L106–L107 match the output impedance to maximize power transfer to Q107; capacitor C107 is a DC block.

**UHF Range 2:** L109 and C113 are the interstage matching network. Components C108–C111 and L105, L107, and L108 match the output impedance to maximize power transfer to Q107.

**UHF Range 1 and 700–800 MHz:** L109 and C116 are the interstage matching network. Components L105 and C110 match the output impedance to 50 ohms; capacitor C107 is a DC block.

### 3.1.3.3 Power Amplifier Transistor Q107

The power amplifier transistor, Q107, is an LDMOS FET housed in a high-power, surface-mount, ring package. To prevent thermal damage, it is essential that the heat sink of the power module be held in place against the radio chassis. The input impedance-matching network uses discrete inductors and capacitors. The low-pass output matching network uses both transmission lines and lumped LCs. Drain bias is applied through E101 and L101. Gain is dynamically controlled by adjusting the gate bias. The gate is insulated from the drain and source so that gate bias current is essentially zero.

**VHF:** The input and output impedance-matching networks consist of L112–L114 and C137–C140. Gate bias is applied through R105, R106, and L108.

**UHF Range 2:** The input and output impedance-matching networks consist of L113, L114 and C137, C139, C140, C149, and C151.

Gate bias is applied through R105, R106, and L720.

**UHF Range 1 and 700–800 MHz:** The input impedance-matching network is L106, L107, C108, and C109. A transmission-line structure and C137, C111, and C112 form the output-matching network. Gate bias applied through R106 and L110.

### 3.1.3.4 Directional Coupler

A directional coupler senses the transmitter forward and reverse power as control signals in the transmitter's automatic level control (ALC) loop. Isolated ports are terminated with external resistors.

**VHF and UHF Range 1:** The directional coupler consists of three embedded transmission lines.

**UHF Range 1 and 700–800 MHz:** The directional coupler is U101, a low-loss, bidirectional coupler.

### 3.1.3.5 Antenna Switch

**NOTE:** Refer to [Table 8-1, "List of Transceiver Schematics and Board Overlays,"](#) on page 8-1 for a listing of schematics that will aid in the following discussion.

The antenna switch is a single-pole, double-throw, positive-intrinsic-negative (PIN) diode, transmit/receive (T/R) antenna switch. Forward DC bias turn the diodes ON, reverse or zero bias turns them OFF.

**VHF and UHF Range 2:** PIN diodes D707 and D717 form a narrow-band, quarter-wave, T/R switch. In transmit mode, both diodes are forward-biased, and the signal goes from the transmitter to the antenna through the low resistance of the series PIN diode, while the low resistance of the shunt diode shorts the receiver. In receive mode, neither diode is biased and both behave as small-value capacitors, creating a high blocking impedance, in effect disconnecting the transmitter circuitry from the antenna.

**UHF Range 1:** Diodes D701 and D702 form a broadband switch. Inductors L706 and L707 resonate with the OFF diode parasitic capacitance to improve isolation.

**700–800 MHz:** PIN diodes D701 and D702 form a narrow-band, quarter-wave, T/R switch. When the PIN diodes are OFF, parallel inductors L706 and L707 resonate with the diode parasitic capacitance to increase isolation at the signal frequency.

The switch control circuit consists of transistors Q101, Q103, Q106, and associated resistors. The input signals are TXINH from the VOCON board and RXH (RX for VHF) from the PCIC. When TXINH is low and RXH (RX for VHF) is high, the switch is in the receive state. When TXINH and RXH (RX for VHF) are low, the switch is in its transmitter state. When TXINH is held high, the radio is inhibited from transmitting. This is a secure-module control feature.

### 3.1.3.6 Harmonic Filter

The harmonic filter is a high-power, low-loss, low-pass filter. Its purpose is to suppress transmitter harmonics. The filter also improves receiver out-of-band rejection. Shield SH700 must be in place to achieve the required stop band rejection.

**VHF:** The harmonic filter uses discrete components. The pass band is up to 190 MHz, and the stop band is above 260 MHz.

**UHF Range 1:** The harmonic filter is discrete, the pass band is up to 470 MHz, and the stop band is above 760 MHz.

**UHF Range 2:** The harmonic filter uses discrete components. The pass band is up to 595 MHz, and the stop band is above 900 MHz.

**700–800 MHz:** The harmonic filter uses both discrete components and transmission lines. The pass band is up to 870 MHz, and the stop band is above 1500 MHz.

### 3.1.3.7 RF Detectors D101 and D102

Two Schottky diodes, D101 and D102, are used as forward- and reverse-power detectors. Forward-coupled RF from the power amplifier, and reverse-coupled RF from the antenna are converted to DC voltages FWD and RVS. Detector output is a positive DC voltage, proportional to the amplitude of the RF signal at the input.

### 3.1.3.8 Summing Amplifier U106

This op-amp circuit is a non-inverting buffer. Signals FWD and RVS are summed and sent to the ALC input of the PCIC. When the antenna port is loaded with a low VSWR (voltage standing wave ratio), as in normal operation, RVS is far less than FWD, the amplifier output is a function of FWD, and the radio maintains a constant output power. Under high VSWR conditions, such as when the antenna is damaged or held near a large metal surface, the amplitude of RVS becomes a large fraction of FWD, the amplifier output increases proportionally, and the radio cuts back the transmitter power by up to 50%. This reduces high battery current into a large VSWR transmitter to extend battery life.

### 3.1.3.9 Power-Control IC (PCIC) U104

The PCIC, U104, contains all of the digital, and most of the analog, circuits needed to control the transmitter power amplifier. Host control is through a 3-wire, smart SPI interface. Pin descriptions are shown in [Table 3-3](#).

*Table 3-3. Power Control IC (U104) Pin Descriptions*

Pin	Name	Description
1	RFIN	Detector voltage input to ALC
2	T1	Test point
3	CI	External capacitor for integrator time constant
4	INT	Integrator output; control voltage to amplifiers
5	CJ	External capacitor for PA rise and fall times
6, 7	VL, CL	External capacitor for PA rise and fall times
8	GND1	Ground

Table 3-3. Power Control IC (U104) Pin Descriptions (Continued)

Pin	Name	Description
9	F168	Reference clock input, 2.1 MHz
10, 13	QX, CQX	External capacitor for voltage multiplier
11, 12	Q, CQ	External capacitor for voltage multiplier
14	V10	Voltage multiplier output
15	VG	Internal band-gap reference voltage
16	V45	Regulated 4.5 Vdc output
17	V5EXT	Power supply input for internal voltage regulator
18	VAR2	Buffered D/A output
19	VLIM	Test point for internal D/A No.2 voltage
20	VAR1	Buffered D/A output
21	RS	Asynchronous reset input
22	NA	Spare pin
23	RX	RX/TX mode control-bit output
24	VAR3	Buffered D/A output
25	GND2	Ground
26	CLK	SPI clock input
27	BPOS	Power supply input
28	DATA	SPI data input/output
29	CEX	SPI chip select input
30	TEMP	Temperature sensor input
31	RSET	External resistor; used to set the temperature cutback rate
32	ANO	Switched BPOS output

### 3.1.3.9.1 Power and Control

Since U104 is powered from switched B+, it makes its own regulated 4.5 Vdc to power the internal logic. The supply input is V5EXT at pin 17, and the output is V45 at pin 16. RX at pin 23 is the control signal to the antenna switch control circuit.

### 3.1.3.9.2 Voltage Multiplier

The PCIC contains an internal voltage multiplier. This multiplier produces signal V10 (pin 14), a 10-V supply for the PCIC D/A converters (DACs). This enables the DACs outputs to reach 8 V. The FREF signal is a 2.1 MHz clock used to switch the multiplier. The voltage multiplier is not used in either the VHF, UHF Range 1, UHF Range 2, or 700–800 MHz radio.

### 3.1.3.9.3 Automatic Level Control (ALC)

In TX mode, the PCIC disables the receiver, turns on the transmitter, and controls the TX power level. The automatic level control (ALC) circuit operates as follows:

The power level is set by programming an internal DAC to a calibrated reference voltage. D/A settings for the power set points were determined during radio tuning and stored in EEPROM. An internal op-amp compares the D/A reference voltage to the detector voltage at pin 1 (RFIN) (TP101) and produces an error signal output. This signal is buffered by another op-amp, configured as a low-pass filter, or integrator, to produce the INT output at pin 4 (TP104). This signal drives the base of voltage follower Q108.

Transistor Q108 supplies current to drive the gain control pins of amplifiers U102 and Q107. Resistors R105 and R106 determine the voltage ratio between U102 pin 2 (VCNTRL) and the Q107 gate. Transient response during key-up and key-down is controlled by the power amplifier rise and fall times. External capacitors at pins CI, CJ, and CL, along with internal programmable resistors, determine the ALC time constants.

#### 3.1.3.9.4 Temperature Cut Back

The PCIC contains a temperature cut-back circuit to protect the power amplifier (PA) from thermal damage that might result from incorrect assembly of the radio. External sensor U103 is a linear temperature-to-voltage transducer, placed near the hottest spot in the radio: power module Q107. The output is a DC voltage at pin 2 (VOUT) proportional to the temperature at pin 3 (GND). VOUT is 750 mV at 25°C and increases by 10 mV/°C. The PCIC temperature cut-back threshold is programmed to correspond to 85 or 90°C. Above this threshold, the ALC gradually cuts back the transmitter until it is fully turned off at 125°C. The slope of cut-back versus temperature is set by external resistor R111. Diode D104 clamps TEMP to a voltage not much less than VG (pin 15), about 1.3 V, to improve the transient response of the cut-back circuit.

#### 3.1.3.9.5 D/A Outputs

In RX mode, the PCIC shuts down the transmitter, turns on the receiver, and tunes the RX front-end pre-selector filters.

**VHF:** Signal VAR2 supplies the voltage used to tune both front-end preselector filters. The voltage range varies from 1.2 V to 2.4 V across the VHF band.

**UHF Range 1:** Signal VAR2 tunes both receiver preselector filters. Control voltage is in the 1 to 4 V range.

**UHF Range 2:** Signal VAR2 supplies the voltage used to tune both front-end preselector filters. The voltage

range varies from 1.2 V to 3.6 V.

**700–800 MHz:** Signals VAR1 and VAR2 are D/A outputs to the RX front-end preselector filters. Output voltage is in the range of about 1 to 4 V over the frequency band. In TX mode, VAR1 and VAR2 disconnect from the D/A and go to 0 Vdc, thus tuning the RX front-end filters out of band.

### 3.1.4 Frequency Generation Unit (FGU)

The frequency-generation function is performed by several ICs; multiple, discrete, voltage-controlled oscillators (VCOs); and associated circuitry. The reference oscillator provides a frequency standard to the fractional-N frequency synthesizer (FracN) IC, which controls the VCOs and VCO buffer IC (VCOBIC). The VCOBIC amplifies the VCO signal to the correct level for the next stage.

**VHF:** Two VCOs are employed—one to generate the first LO and the other to generate the transmit-injection signals.

**UHF Range 1:** Four VCOs are employed: two transmit and two receive.

**UHF Range 2:** Three VCOs are employed: one transmit and two receive.

**700–800 MHz:** Three VCOs generate the first LO and transmit-injection signals.

**NOTE:** Refer to [Table 8-1, “List of Transceiver Schematics and Board Overlays,”](#) on page 8-1 for a listing of FGU-related schematics that will aid in the following discussion.

#### 3.1.4.1 Reference Oscillator Y200

The radio's frequency stability and accuracy derive from the Voltage-Controlled Temperature-Compensated Crystal Oscillator (VCTCXO), Y200. This 16.8 MHz oscillator is controlled by the voltage from the WARP pin of the FracN (fractional-N frequency synthesizer) IC, U202, that can be programmed through a serial peripheral interface (SPI). The oscillator output at pin 3 is coupled through capacitor C234 to the FracN synthesizer reference oscillator input and through C236 (C237 for VHF and UHF Range 2) to the non-invertive input of the op-amp, U201.

Op-amp U201 buffers the 16.8 MHz output to the VOCON board. Components L205 and C214 (C213, L205, and C214 for VHF) form a low-pass filter to reduce harmonics of the 16.8 MHz.

The Digital-to-Analog Converter (DAC) IC, U203, and Switched Capacitors Filter (SCF) IC, FL200, form the interface between radio's DSP and the analog modulation input of the FracN IC.

#### 3.1.4.2 Fractional-N Frequency Synthesizer (FracN) IC U202

The FracN IC, U202, is a mixed-mode, Motorola-proprietary, CMOS, fractional-N frequency synthesizer with built-in dual-port modulation. The XTS 5000 radio uses a low-voltage version of the device, sometimes called LVFracN, for compatibility with the 3 V logic used throughout the radio.

The FracN IC incorporates frequency division and comparison circuitry to keep the VCO signals stable. The FracN IC is controlled by the MCU through a serial bus. All of the synthesizer circuitry is enclosed in rigid metal cans on the transceiver board to reduce interference effects.

Separate power supply inputs are used for the various functional blocks on the IC. Inductors L203 and L204 provide isolation between supply pins 20 (AVDD) and 36 (DVDD) connected to Vdd3. Host control is through a three-wire, smart SPI interface (pins 7, 8, and 9) with a bi-directional data pin. FracN functions include frequency synthesis, reference clock generation, modulation control, voltage multiplication and filtering, and auxiliary logic outputs.

##### 3.1.4.2.1 Synthesizer

Frequency synthesis functions include a dual-modulus prescaler, a phase detector, a programmable loop divider and its control logic, a charge pump, and a lock detector output. Fractional-N synthesizer IC principles of operation are covered in detail in the manufacturers' literature. No similar discussion will be attempted here.

##### 3.1.4.2.2 Clocks

U202, pin 23 (XTAL1), is the 16.8 MHz reference oscillator input from the VCTCXO (Y200).

##### 3.1.4.2.3 Modulation

To support many voice, data, and signaling protocols, XTS 5000 radios must modulate the transmitter carrier frequency over a wide audio frequency range, from less than 10 Hz up to more than 6 kHz. The FracN supports audio frequencies down to zero Hz by using dual-port modulation. The audio signal at pin 10 (MODIN) is internally divided into high- and low-frequency components, which modify both the synthesizer dividers and the external VCOs through signal MODOUT (pin 41). The IC is adjusted to achieve flat modulation frequency response during transmitter modulation balance calibration using a built-in modulation attenuator.

#### 3.1.4.2.4 Voltage Multiplier and Superfilter

Pins 12 (VMULT3) and 11 (VMULT4) together with diode arrays D201 and D202 and their associated capacitors form the voltage multiplier. The voltage multiplier generates 11.5 Vdc to supply the phase detector and charge-pump output stage at pin 47 (VCP).

The superfilter is an active filter that provides a low-noise supply for the VCOs and VCOBIC. The input is regulated 5 Vdc from Vdd5 at pin 30 (SFIN). The output is superfiltered voltage FSF at pin 28 (SFOUT).

The output from pin 15 (VMULT1) is used as a clock for the SCF IC, FL200.

#### 3.1.4.3 Loop Filter

The components connected to pins 43 (IOUT) and 45 (IADAPT) form a 3rd-order, RC low-pass filter. Current from the charge-pump output, IOUT, is transformed to voltage VCTRL, which modulates the VCOs. Extra current is supplied by IADAPT for rapid phase-lock acquisition during frequency changes. The lock detector output pin 4 (LOCK) goes to a logic “1” to indicate when the phased-lock loop is *in lock*.

#### 3.1.4.4 VCO Buffer IC (VCOBIC)

The VCOBIC (U302 for VHF radios or U300 for UHF Range 1 and 700–800 MHz radios) is an analog IC containing two NPN transistors for use as oscillators, an active-bias circuit, transmitter and receiver buffer amplifiers, and switching circuitry. The VCOBIC has three RF outputs:

- TX\_OUT (pin 10)—the modulated transmitter carrier
- RX\_OUT (pin 8)—the receiver first LO
- PRESC\_OUT (pin 12)—connected to FracN pin 32 (PREIN) through a matching circuit

Transmit/receive control is a single 5.0 Vdc logic input, TRB\_IN (pin 19). When TRB\_IN is low, the receiver buffer is active and the transmitter circuits are disabled. The converse is also true.

**VHF:** The VCOs in VHF radios use the VCOBIC internal transistors and implement the active bias via resistors R304 and R305. Bias to TX\_OUT is supplied through resistor R313. Components L309 and C316 form a matching circuit for the TX\_OUT impedance. C319 acts as a DC block, and resistors R314, R315, and R316 attenuate an output signal to an optimum level for the PA.

L312 and C320 form a low-pass bias supply filter for the RX\_OUT. L310 and C317 are the RX\_OUT impedance-matching circuit. C322 is a DC block, and resistors R317 and R318 attenuate an output signal to an optimum level for the mixer IC.

An NPN/PNP-packaged transistor, Q301, together with the supporting components R308, R309, and R310, form the 3.3 Vdc-to-5 Vdc logic-level shifter between the AUX3 pin of the FracN IC, U202, and VCOBIC, U302.

**UHF Range 1:** For these radios, four VCOs are used: two transmit and two receive. Control-logic translation is done by level shifter Q310 and Q311, and wired-OR D320.

**UHF Range 2:** Two VCOs are used for receive and one for Transmit. The fractional N synthesizer selects the appropriate VCO by toggling auxiliary lines 2,3, or 4. The selection of the TX VCO with auxiliary line 4 also sets TRB\_IN high.

**700–800 MHz:** These radios use three external, discrete, varactor-tuned, Colpitts VCOs based on transistors Q301, Q303, and Q308. Bias current to the VCOs is switched on and off by the transistors Q302, Q306, and Q309, which are controlled by FracN outputs AUX1, AUX2, and AUX4. Transistor Q304 is an additional transmit buffer amplifier reducing frequency pulling on the transmit VCO. An additional buffer is switched on and off by the transistor Q305. Bias to TX\_OUT is supplied through resistor R307. Components L307 and C208 form a low-pass bias supply filter. The RX\_OUT impedance is matched by a one-component match, coil L310.

Transistors Q307 and Q310 form a 3.3 Vdc-to-5 Vdc logic-level shifter for the signal from the FracN AUX3 pin to the VCOBIC.

## 3.2 VOCON Board

This section provides a detailed circuit description of the ASTRO XTS 5000 VOCON board.

The VOCON board (Figure 3-7 and Figure 3-8) is divided into the following sections:

- Controller and Memory
- Audio and Power
- Interface Support

### 3.2.1 Interconnections

The VOCON board interconnection diagram (see Figure 3-7 and Figure 3-8) contains three functional blocks and five connector symbols.

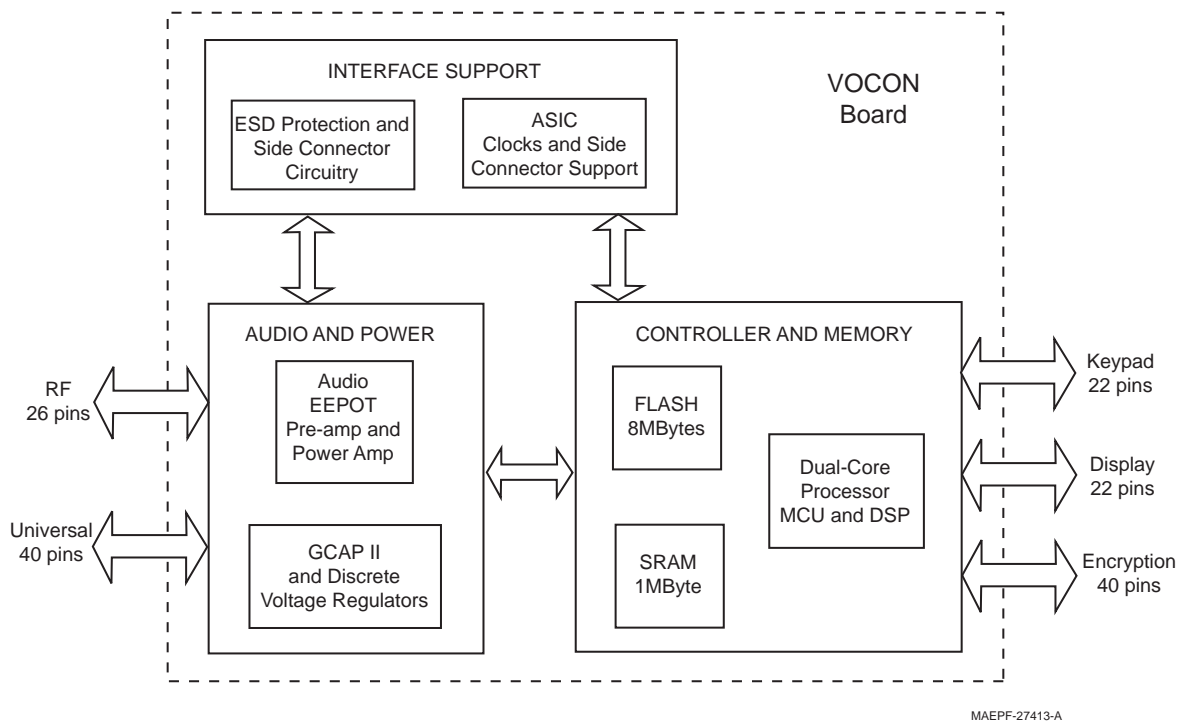

Figure 3-7. VOCON Board Interconnections

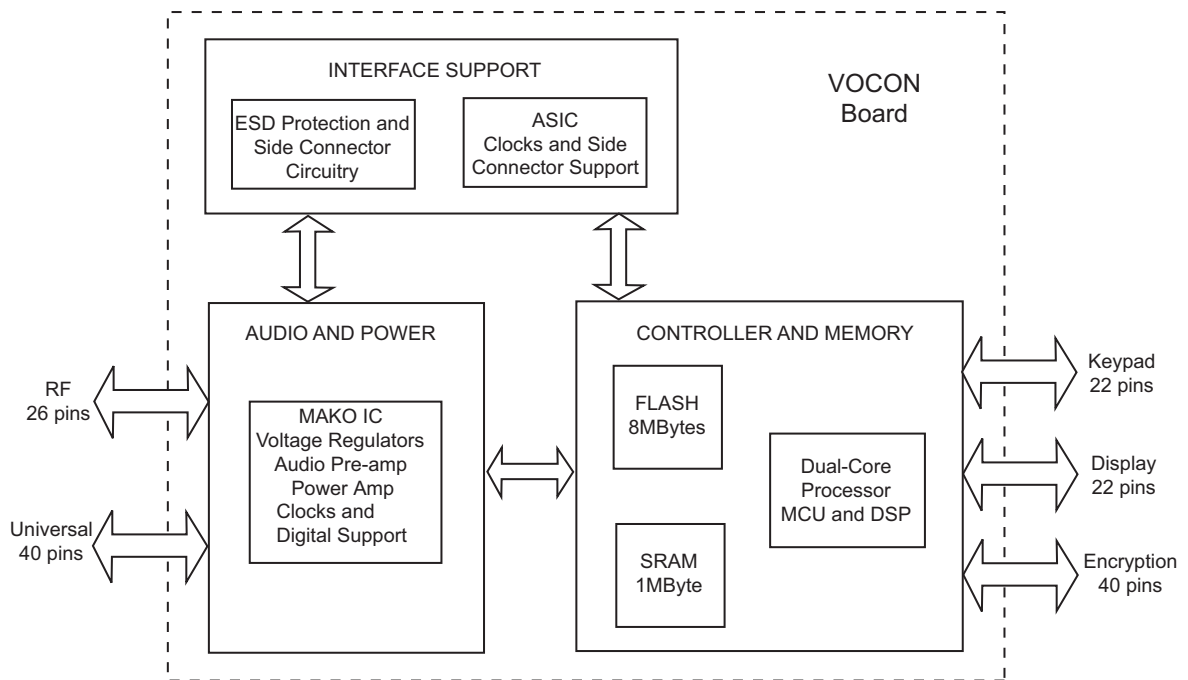

Figure 3-8. VOCON Board Interconnections (only for NNTN5567)

The functional blocks consist of the following:

- **Controller and Memory:** The Patriot (U401), the dual-core processor with the microcontroller unit (MCU) and a digital signal processor (DSP), the SRAM (U403) and Flash (U402) memory devices.
- **Audio and Power:** The GCAP II (U501), a 5 Vdc linear regulator (U505), a 1.55 Vdc linear regulator (NNTN4717 VOCON kit only), the audio pre-amplifier (U502), the audio power amplifier (U503), and the dual EEPOT (U509).

**NOTE:** In kit NNTN5567 (Figure 3-8): the audio, power, and digital support are all embedded into the MAKO IC (U501).

- **Interface Support:** The digital-support IC Flipper (U301), ESD protection circuitry, and side connector interface circuitry.

**NOTE:** Refer to [Table 8-2, “List of VOCON Schematics and Board Overlays,”](#) on page 8-1 for a listing of VOCON schematics that will aid in the following discussion.

### 3.2.1.1 Universal Connector J101

This is a 40-pin connector that mates with the universal flex on the housing. A majority of the lines on the connector are for user interface: emergency and side buttons (pin 14), monitor button (pin 17), secure/clear switch (pin 23), frequency switch (pins 24, 25, 26, and 27), volume knob (pin 31), and the three-position switch (pin 34). The LEDs on the universal flex are controlled through pins 20, 21, and 22. Connections to the external accessory connector, which include serial communication data lines, external audio, and option select lines for controlling audio modes, are present at pins 1 through 13. Switched battery voltage (B+SENSE) is provided on pin 32. Most of the pins at this connector have ESD protection devices and components.

### 3.2.1.2 Encryption Connector J701

This 40-pin connector provides the interface between the VOCON board and the encryption module. Two voltages are provided to the encryption board: UNSWB+ and SWB+. The SAP SSI lines, serial communication data lines, and general-purpose I/O lines from the Patriot IC are included in the interface to the encryption board. A number of jumpers are present on some of the lines so that the VOCON board configuration to the encryption board can be changed depending on the encryption type present.

### 3.2.1.3 Keypad Module Connector P107

This 22-pin connector mates the VOCON board to the keypad module flex used on Model II and III radios. The keypad module is provided with 5 volts (pins 7 and 8) for the LEDs. The LEDs are activated by the signal at pin 6, BL\_EN. The row signal lines (pins 13, 14, 15, 16, 17, 18, and 19) and column signal lines (pins 1, 2, and 3) are all at the dual-core processor's GPIO voltage.

### 3.2.1.4 RF Interface Connector P201

This is a 26-pin compression connector that interfaces between the VOCON board and the transceiver board. See Section 3.1.1.2 "VOCON Connector P1," on page 3-3 for a detailed description of the interface between the VOCON and transceiver boards through P201. Ground clip M202 is used on the bottom side of the VOCON board to contact the transceiver shield. This additional connection provides a consistent, common ground with the VOCON board and the radio chassis.

### 3.2.1.5 Display Module Connector P301

This 22-pin connector mates the VOCON board to the display module flex used on Model II and III radios. The NTN9564 VOCON kit has a parallel data interface to the display module. In this design, two voltages are provided to the display module: 1.8 V and 3 V. The display's parallel data lines (pins 9, 10, 11, 12, 13, 14, 15, and 16), chip select line (pin 5), read/write line (pin 8), register select line (pin 7), and parallel/serial configuration line (pin 4) are at 1.8-V logic levels.

The NNTN4563 and NNTN4819 VOCON kits have a serial data interface to the display module. In this design, only 3 V is provided to the display module on pins 17 and 18. The display's serial data line (pin 16), serial clock line (pin 15), chip select line (pin 5), and register select line (pin 7) are at 3 V logic levels. The NNTN4717 and NNTN5567 VOCON board has a serial data interface to the display module, and all the lines are at 2.9 V logic levels.

## 3.2.2 Controller and Memory

The controller and memory section contains the following components:

- Patriot IC (U401)
- Static RAM (SRAM) IC (U403)
- Flash memory IC (U402)

The Patriot IC acts as both the microcontroller unit (MCU) and the digital signal processor (DSP) for the radio. The MCU controls receive/transmit frequencies, power levels, display programming, user interface (PTT, keypad, channel select, etc.), and programming of ICs, as well as other functions. The DSP performs voice encoding and decoding, audio filtering, volume control, PL/DPL encode and alert-tone generation, squelch control, and receiver/transmitter filtering, as well as other functions.

The Patriot IC executes a stored program located in the Flash memory device. The SRAM, a volatile device, is used as working memory and shares the address and data bus with the Flash memory device.

**NOTE:** Refer to [Table 8-2, “List of VOCON Schematics and Board Overlays,”](#) on page 8-1 for a listing of VOCON schematics that will aid in the following discussion.

### 3.2.2.1 Patriot IC U401

The Patriot IC U401 is a dual-core processor that contains both a 32-bit microcontroller unit (MCU) and a 16-bit digital signal processor (DSP) in one IC package. It comes in a 256-pin, ball-grid array (BGA) package with 1mm pitch solder balls. On the NTN9564, NNTN4563, and NNTN4819 VOCON boards, the dual-core processor is supplied with two voltages: 1.8 V (E401) and 3 V (E402). The 1.8 V supply is used as the core voltage, as well as the interface voltage, to the memory devices and display (1.8 V display interface only for the NTN9564 VOCON board). Most of the pins on the Patriot IC operate from the 3 V supply.

The NNTN4717 kit uses a new dual-core processor which requires some different operating voltages. The 1.8 V supply is used as the interface to the memory devices, unchanged from the original processor. A 1.55 V supply is used for the core voltage and the clock amplifier module. The remaining pins of the processor use a 2.9 V supply.

**NOTE:** GPIO voltage for the NTN9564, NNTN4563, and NNTN4819 VOCON boards is 3.0 V.

**NOTE:** GPIO voltage for the NNTN4717 and NNTN5567 VOCON board is 2.9 V.

Two main clocks are provided to the Patriot IC. The CKIH pin (C452) is provided a 16.8 MHz sine wave. This is the most important clock since it is internally used to generate the clocks for both the MCU and DSP cores, as well as most of the peripherals. A 3 V peak-to-peak 32 kHz square wave (32 kHz test point) is generated by the Flipper IC U301 and supplied to the CKIL pin on the Patriot IC. While not as widely used as the 16.8 MHz clock, the 32 kHz clock is needed by some components in the Patriot including the reset circuitry.

#### 3.2.2.1.1 Microcontroller Unit (MCU)

The MCU portion of the Patriot IC has 22.5k x 32 bits of internal RAM and 1k x 32 bits of internal ROM, which is used for the bootstrapping code. The MCU has several peripherals including an External Interface Module (EIM), the Multiple Queue Serial Peripheral Interface (MQSPI), two Universal Asynchronous Receiver/Transmitter (UART) modules, and the One-Wire Interface module. The MCU communicates internally to the DSP through the MCU/DSP Interface (MDI).

##### **External Interface Module (EIM)**

The External Interface Module (EIM) is the MCU interface to the SRAM U403 and Flash Memory U402, as well as the display (only for the NTN9564 VOCON kit). The EIM lines include 24 external address lines, 16 external bi-directional data lines, 6 chip selects lines, read/write line, and output enable line among others. All of the EIM lines operate at 1.8-V logic levels, and the EIM operates at the MCU clock speed.

##### **Multiple Queue Serial Peripheral Interface (MQSPI)**

The Multiple Queue Serial Peripheral Interface (MQSPI) is the MCUs programming interface to other ICs. The Patriot IC has two independent SPI busses, and each has its own clock line (test points SCKA and SCKB), data-out line (test points MOSIA and MOSIB), and data-in line (test points MISOA and MISOB). There are 10 SPI chip selects (SPICS) that are programmable to either SPI A, the transceiver board SPI bus, or to SPI B, the dedicated VOCON SPI bus.

The devices on the SPI A bus include the PCIC and FracN IC on the SPICS4 (R131), the Abacus III IC on SPICS5 (R126), an analog-to-digital converter (ADC) on SPICS6 (R133), and the serial EEPROM on SPICS7 (R132). The two SPI B chip selects are for the GCAP II IC U501 on SPICS2 (R539) and the Flipper IC U301 on SPICS3. On the NNTN4563, NNTN4819, and NNTN4717 VOCON boards, two additional SPI chip select lines are used for the display: SPICS0 (R442) and SPICS1 (U407 pin 14). On NNTN5567, one SPI B chip select is used for the MAKO IC U501 on SPICS2 (TP\_MAKO\_CE). See Section 3.2.3.7 “MAKO IC U501 (for NNTN5567),” on page 3-27 for more information on MAKO IC U501. All of the SPI module lines operate at GPIO voltage logic levels.

There are several devices on the transceiver board that only have one bi-directional SPI data line. Components U404, U405, and U406 are configurable by MCU GPIO pin TOUT13 (MISOA\_SEL) to route the data line to the appropriate pin on the Patriot IC depending on which SPI device is being accessed.

### Universal Asynchronous Receiver/Transmitter (UART)

The Patriot IC has two Universal Asynchronous Receiver/Transmitter (UART) modules. UART1 handles the RS232 lines while UART 2 is connected to the SB9600 lines. Each UART has a receive data line (URXD), a transmit data line (UTXD), and hardware flow control signals (RTS—request to send) and (CTS—clear to send). All UART lines operate at GPIO voltage logic levels. The translation to 5 V logic levels for the accessory side connector is discussed in the Flipper section.

### One-Wire Interface

The MCU has a One-Wire Interface module that is used to communicate to a One-Wire device like a USB cable or a smart battery using the Dallas Semiconductor protocol. This module has one external pin, OWIRE\_DAT (Q504 pin 2), and it uses a GPIO voltage logic level.

#### 3.2.2.1.2 Digital Signal Processor (DSP)

The DSP portion of the Patriot IC has 84k x 24 bits of program RAM and 62k x 16 bits of data RAM. The DSP has its own set of peripherals including the Baseband Interface Port (BBP), the DSP Timer module, and the Serial Audio CODEC Port (SAP). Additionally, the DSP shares some peripherals with the MCU, including the USB interface and the General Purpose Input/Output module (GPIO).

### Baseband Interface Port (BBP)

The Baseband Interface Port (BBP) module is the DSP's serial synchronous interface (SSI) to the transceiver board. The BBP has independent sections for the receiver and the transmitter. The receiver BBP pins include the receive data pin SRDB (R121), the receive clock signal pin SC0B (R124), and the receive frame synchronization (sync) signal pin SC1B (R123). The transmitter's BBP pins include the transmit data pin STDB (R127), the transmit clock signal pin either SCKB (R125) or SCKB (TP\_SCKB) in NNTN5567, and the transmit frame sync signal pin either SC2B (R119) or SC2B in NNTN5567. All BBP lines use GPIO voltage logic levels.

### DSP Timer Module

While the BBP receive clock and frame sync signals are supplied by the Abacus III IC from the transceiver board, the BBP transmit clock and frame sync signals are generated by the DSP Timer. The BBP receive clock, connected to the DSP Timer input pin T10, is reference used to generate the BBP transmit clock and frame sync signals. These two signals, along with the BBP transmit data signal, are connected to the DAC on the transceiver board. For NNTN5567, the BBP transmit clock and frame sync signals are generated by the MAKO IC using the 16.8MHz clock (connected to the TCXO\_IN M1 pin).

### Serial Audio CODEC Port (SAP)

The Serial Audio CODEC Port (SAP) module is the DSP's serial synchronous interface (SSI) to the audio CODEC on the GCAP II IC. However, In NNTN5567, the audio CODEC is on the MAKO IC. The SAP also interfaces with the encryption module.

The SAP interface consists of four signals including the SAP clock line pin SCKA (component R405 or R572 (for NNTN5567) ), the SAP frame sync line pin SC2A (component R406 or R573 (for NNTN5567) ), the SAP receive data line pin SRDA (component R402), and the transmit data line pin STDA (component R403). On the NTN9564, NNTN4563, and NNTN4819 VOCON boards, the SAP clock is generated by the Flipper IC U301, and is a 520 kHz, 3 V peak-to-peak square wave. The SAP frame sync signal is also generated by the Flipper IC, and is an 8 kHz, 3 V peak-to-peak square wave.

On NNTN5567 Vocon board, the SAP clock is generated by the MAKO IC (U501) and is a 512 kHz, 2.9V peak-to-peak wave. The SAP frame sync signal is generated by the MAKO IC U501, and is an 8kHz, 2.9V peak-to-peak square wave.

On the NNTN4717 VOCON board, the SAP clock is generated by the dual-core processor U401, and is a 256 kHz, 2.9 V peak-to-peak square wave. The SAP frame sync signal is generated by the dual-core processor U401, and is an 8 kHz, 2.9 V peak-to-peak square wave.

### Universal Serial Bus (USB)

The Patriot IC USB peripheral, shared by the MCU and the DSP, provides the required buffering and protocol to communicate on the Universal Serial Bus. The Patriot IC supports USB slave functionality.

For receive data, the USB differentially decoded data comes from the Flipper IC URXD\_RTS pin into the Patriot URTS1 pin, while the single-ended USB data positive signal goes to pin PA2\_USB\_VPIN, and the single-ended USB data minus signal goes to pin URXD1. The two data lines are used to detect the single-ended zero state.

On the NNTN5567 VOCON board, the receive data path is routed from the MAKO ICs (U501) integrated USB transceiver. Single ended positive data is generated at U501 pin B9 and is sent to the Patriot PA2\_USB\_VPIN pin. USB data minus comes from U501 pin C9 and is sent to URXD1 of the Patriot.

For transmit data, the USB data comes out of the Patriot IC UTXD1 pin and goes to either the Flipper IC or MAKO IC (NNTN5567) TXD\_USB\_VPO pin. The USB transmit single-ended zero signal is generated from the Patriot IC PC0\_USB\_VMOOUT pin.

### General-Purpose Input/Output (GPIO) Module

The General-Purpose Input/Output (GPIO) module is shared by the MCU and the DSP. This module consists of four 16-pin bi-directional ports and a 15 pin bi-directional port. While some of the pins on these ports are being used for other functions (UART, SPI, SAP, BBP, and Interrupt pins), the remaining pins can be programmed to become GPIOs that can be used by either the DSP or the MCU. Each GPIO pin has up to 8 alternate output functions and up to 4 alternate input functions. This allows for the GPIO pins to be routed internally to pertinent Patriot IC modules. Additionally, the GPIO module adds selectable edge-triggered or level-sensitive interrupt functionality to the GPIO pins. Some examples of GPIO pins include the Audio PA control signals (EXT\_SPKR\_SEL, AUDIO\_PA\_EN, and AUDIO\_MODE\_SEL), the EEPROM control signals (EEPOT\_INC\*, EEPOT\_U\_D\*, EEPOT\_CS\*, and EEPOT\_CS\_EXT\*), and the LED control signals (RED\_LED and GREEN\_LED).

### 3.2.2.2 Static RAM (SRAM) U403

The static RAM (SRAM) IC U403 is an asynchronous, 1 MB, CMOS device that is capable of 70 ns access speed. It is supplied with 1.8 volts. The SRAM has its 19 address lines and 16 data lines connected to the EIM of the Patriot IC through the Address(23:0) and Data(15:0) busses.

The SRAM has an active-high chip select CS2 that is tied directly to the 1.8 V supply and an active-low chip select CS1 that is connected to the EIM CS2\_N pin (test point CS2). When the SRAM CS1 pin is not asserted, the SRAM is in standby mode, which reduces current consumption.

Two other control signals from the EIM that change the mode of the SRAM are the read/write signal, R/W, and the output enable signal, OE. The R/W of the EIM is connected to the SRAM EN\_WE pin (test point R\_W), while the OE signal from the EIM is connected to the SRAM EN\_OE pin. The SRAM is in read mode when the EN\_WE pin is not asserted and the EN\_OE pin is asserted. The SRAM is in write mode when the EN\_WE pin is asserted, regardless of the state of the EN\_OE pin.

The other SRAM pins are the lower-byte enable pin LB and the upper-byte enable pin UB. These pins are used to determine which byte (LB controls data lines 0-7 and UB controls data lines 8-15) is being used when there is a read or a write request from the Patriot IC. The LB pin is controlled by the EIM EB1\_N signal, while the UB pin is controlled by the EB0\_N signal.

### 3.2.2.3 FLASH Memory U402

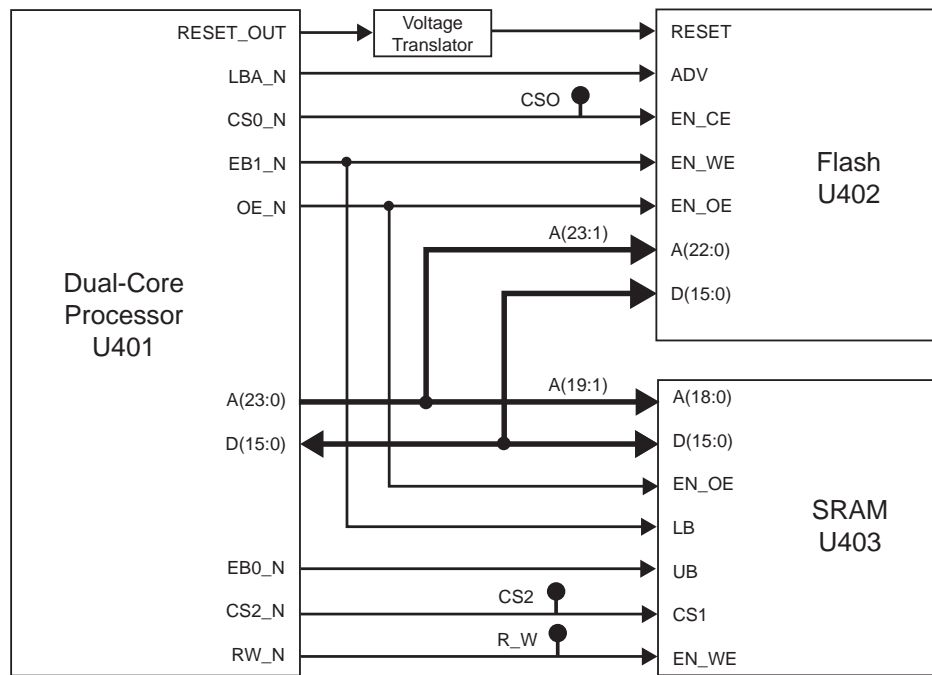

The Flash memory IC is an 8 MB CMOS device with simultaneous read/write or simultaneous read/erase operation capabilities with 70 ns access speed. It is supplied with 1.8 volts. The Flash memory has its 22 address lines and 16 data lines connected to the EIM of the Patriot IC through the Address(23:0) and Data(15:0) busses. The Flash memory contains host firmware, DSP firmware, and codeplug data with the exception of the tuning values that reside on the transceiver board's serial EEPROM. The Flash memory IC is not field repairable.

The RESET\_OUT of the Patriot IC is at a GPIO voltage logic level. Components D401 and R401 are used to convert the voltage down to a 1.8 V logic level, and this 1.8 V reset signal is fed to the Flash RESET pin. When this pin is asserted (active low logic), the Flash is in reset mode. In this mode, the internal circuitry powers down, and the outputs become high-impedance connections.

The Flash active-low chip select pin, EN\_CE, is connected to the active-low CS0\_N pin (CS0 test point) of the EIM. When the EN\_CE is not asserted, the Flash is in standby mode, which reduces current consumption.

Several other active-low control pins determine what mode the Flash memory is in: the address valid pin ADV (ADV test point) that is connected to the EIM LBA\_N signal, the output enable pin EN\_OE that is connected to the EIM OE\_N signal, and the write enable pin EN\_WE that is connected to the EIM EB1\_N signal. For read mode, the ADV and EN\_OE pins are asserted while the EN\_WE pin is not asserted. When the EN\_WE is asserted and the EN\_OE pin is unasserted, the Flash operates in the write mode.

[Figure 3-9](#) illustrates the EIM and memory ICs block diagram.

MAEPF-27414-A

Figure 3-9. Patriot EIM and Memory Block Diagram

### 3.2.3 Audio and Power

The audio and power section contains the following components:

- GCAP II IC U501
- 5 V regulator U505
- 1.55 V regulator (NNTN4717 VOCON board only)
- Audio pre-amplifier U502
- Audio power amplifier U503
- EEPOT U509
- MAKO IC U501 (for kit NNTN5567A)
- VSW1 Driver IC Q502 (for kit NNTN5567A)

The GCAP II IC contains a CODEC, amplification, filtering and multiplexing capability for receive and transmit audio, voltage regulators, an analog-to-digital converter (ADC), and a real-time clock (RTC). The GCAP II IC is programmed by the Patriot IC.

On NNTN5567, the audio and power supply functionality is carried out by the MAKO IC U501. It supplies all of the voltages used on the VOCON board with its voltage regulators. It also has microphone audio amplifiers, multiplexing capability for receive and transmit audio, switching between internal and accessory microphones, switching between internal and external speaker, filtering, and the audio CODEC. The MAKO IC also has an analog/digital converter (ADC). The MAKO IC is programmed by the Patriot IC.

The audio pre-amplifier and the audio power amplifier condition the received audio signal before being routed to the speaker. The dual EEPOT sets the gain of the microphone signal. These devices are programmed by the Patriot IC.

On NNTN5567, the audio pre-amplifier and audio PA are integrated into the MAKO IC. The pre-amplifier and PA condition the received signal from the analog output of the MAKO IC CODEC before the audio is routed to the internal/external speaker. The microphone gain stages are also integrated into the MAKO IC. The microphone gain stages, audio pre-amplifier, and PA are programmed by the dual-core processor.

**NOTE:** Refer to [Table 8-2, “List of VOCON Schematics and Board Overlays,”](#) on page 8-1 for a listing of audio and power-related schematics that will aid in the following discussion.

#### 3.2.3.1 GCAP II IC U501

The GCAP II IC is a mixed-signal (analog and digital) IC that provides control, audio, and voltage regulation functionality. It comes in a 100-pin, ball-grid array (BGA) package with 0.8 mm pitch solder balls. The GCAP II IC is supplied with switched battery voltage GCAP\_B+ (R581).

##### 3.2.3.1.1 Voltage Regulation

The GCAP II IC contains several voltage regulators that are used in the design of the VOCON board: VSW1, VSW2, and V2. The VSW1 regulator is a programmable switching regulator that uses the switched battery voltage as its input on pin PSRC1. The output voltage of VSW1 (R502) is programmable by the Patriot IC U401 through the SPI bus. The initial output of VSW1 is 3.2 volts, which is then programmed to 3.8 volts. The VSW1 voltage is supplied to the RF Interface connector P201 pin 15 and to the input pins of the VSW2 and V2 regulators.

The VSW2 regulator is a SPI programmable switching regulator that uses VSW1 as its input on pin PSRC2. The initial output of VSW2 (R501) is 2.2 volts, which is then programmed to 1.875 volts (referred to as 1.8 volts throughout this document). The VSW2 voltage is supplied to the Patriot IC (core voltage and the EIM voltage), the SRAM U403, the Flash memory U402, and the display module connector J301 (1.8 V display interface only for the NTN9564 VOCON kit).

The V2 regulator is a SPI programmable linear regulator that uses VSW1 as its input on pin VIN2. The initial output of V2 (R560) is 2.775 volts, which is then programmed to 3 volts for the NTN9564, NNTN4563, and NNTN4819 VOCON boards, and 2.9 volts for the NNTN4717 VOCON board. The V2 voltage is supplied to the Patriot IC (I/O ring - SPI, BBP, SAP, UART, GPIO, etc.), the Flipper IC U301, the EEPOT U509, the display module connector J301, and the many discrete components that interface with the Patriot IC and the Flipper IC.

### 3.2.3.1.2 MCU Interface

The GCAP II IC has a four-wire, SPI connection to the Patriot IC (SPI B). The SPI B clock is connected to the SPI\_CLK pin (test point SCKB). The SPI B MOSI line is connected to the SPI\_DW pin (test point MOSIB). The SPI B MISO line is connected to the SPI\_DR pin (test point MISOB). The GCAP SPI B chip-select signal is connected to the CE pin (R539). Through this interface, the Patriot IC can program the voltage regulators, the CODEC, the transmit and receive audio filters and amplifiers, as well as read information from the ADC and the real-time clock.

The GCAP II IC has an 8-bit ADC with general-purpose six channels and four voltage-monitoring channels. The six general-purpose analog-to-digital (A/D) channels are assigned to monitor volume (AD5); the three-position toggle switch from the universal connector J101 (AD1); the emergency, monitor, and side buttons (AD0); the battery status line (AD2); the board type indicator (AD3); and the board identification voltage (AD4). Battery voltage is also monitored by the ADC. The Patriot IC activates and reads the A/D values through the SPI bus.

The real-time clock (RTC) module of the GCAP II IC consists of several counters to determine elapsed time. The Patriot IC reads the RTC registers through the SPI bus. The RTC is supplied with voltage from a backup lithium rechargeable battery (LI\_CELL) and a 32.768 kHz clock signal from the Flipper IC to the GCAP II IC XTAL1 pin.

### 3.2.3.1.3 Audio Circuitry

A 13-bit CODEC, internal to the GCAP II IC and programmable by the Patriot IC through the SPI bus, converts microphone audio into a digital bit stream for processing by the DSP. The CODEC also converts receive audio data that was processed by the DSP into an analog audio signal for amplification to a speaker. The CODEC interfaces to the DSP through the 4-wire SAP bus. The CODEC clock, which is 520 kHz (for the NTN9564, NNTN4563, and NNTN4819 VOCON boards) or 256 kHz (for the NNTN4717 VOCON board) is supplied to the DCLK pin. The CODEC 8 kHz CODEC frame synchronization signal is supplied to the FSYNC pin. The CODEC transmit data signal is on the TX pin, while the CODEC receive data signal is on the RX pin. For the CODEC to operate with those clock and frame sync signals, a 13 MHz clock (R302), generated by the Flipper IC, is supplied to the GCAP CLK\_IN pin.

The GCAP II IC contains internal amplification, filtering, and multiplexing functionality for both receive and transmit audio. These functions are Patriot IC-programmable through the SPI bus. The input for the internal microphone audio (R540) is the MICIN\_NEG pin, while the input for the external microphone audio (R566) is the AUX\_MIC\_NEG pin. The output for the speaker audio is the EXTOUT pin (C533).

### 3.2.3.2 5 V Regulator U505

The 5 V regulator uses UNSW\_B+ as its input voltage. The Flipper IC WDI line controls the regulator's SHUTDOWN pin. The 5 V supply (R503) is used by the Flipper IC U301, audio pre-amplifier U502, microphone bias circuitry (R531 and R563), Flipper IC protection diodes, bi-directional voltage translators, battery data-line isolation circuitry, and ESD protection circuitry.

### 3.2.3.3 1.55 V Regulator

The 1.55 V regulator is made up of the following components: U508, Q503, R598, R507, R508, R509, R512, R599, C576, C565, C512, C580, and C567 (check the NNTN4717 VOCON board BOM for part values and placement). This circuit uses VSW1 to bias the regulator while VSW2 sources the current. This voltage is used by the dual-core processor U401 for its core voltage and clock amplifier. The 1.55 V regulator is only instantiated on the NNTN4717 VOCON board.

### 3.2.3.4 Audio Pre-Amplifier U502

The audio pre-amplifier U502 is a single-package, 5-pin, op-amp supplied with 5 volts. This pre-amp stage provides a fixed gain, which is selected by the components R551 and R537. The input (U502 pin 4) of stage is the EXTOUT pin from the GCAP II IC, while the output (U502 pin 1) of this stage goes to the audio PA.

### 3.2.3.5 Audio Power Amplifier U503

The audio power amplifier (PA) U503 consists of two BTL amplifiers, complementary outputs, and control logic. Each of the amplifiers has a fixed gain—the external audio PA gain is set by components R553 and R554, while the internal audio PA gain is set by components R549 and R550. The MODE pin (U503 pin 4) voltage determines the operation of the amplifier. That voltage is controlled by the Patriot IC GPIO lines AUDIO\_PA\_EN (to Q505) and AUDIO\_MODE\_SEL (to Q506). [Table 3-4](#) describes how the Patriot IC GPIO lines configure the audio PA.

Table 3-4. Audio PA Status

AUDIO_PA_EN	AUDIO_MODE_SEL	Audio PA Status	MODE Voltage
0	0	Standby	$V_{\text{Mode}} > 7 \text{ V}$
0	1	Mute	$1.5 \text{ V} < V_{\text{Mode}} < 6 \text{ V}$
1	0	On	$V_{\text{Mode}} < 0.5 \text{ V}$
1	1	On	$V_{\text{Mode}} < 0.5 \text{ V}$

The SELECT pin (U503 pin 6) is used to switch the audio path between internal and external speaker. The voltage on that pin is determined by the EXT\_SPKR\_SEL line from the Patriot IC and the Q505 transistor. When the voltage at the SELECT pin is high (B+), the audio is routed to the internal speaker lines. When the voltage at the SELECT pin is low ( $V_{\text{select}} < 0.5\text{V}$ ), the audio is routed to the external speaker lines.

### 3.2.3.6 EEPOT U509

The EEPOT is a digitally programmable potentiometer with 256 taps and a total resistance of 50 kohms. This 10-pin package contains two independent potentiometers, one for each microphone line. The EEPOT resistance values are programmed by the Patriot IC GPIOs EEPOT\_INC\* (U509 pin 9) and EEPOT\_U\_D\* (U509 pin 2). The EEPOT\_INC\* signal increments the resistance value up or down, which depends on the EEPOT\_U\_D\* signal. The EEPOT\_CS\* line (U509 pin 10) is asserted when the internal microphone gain is being changed. Similarly, the EEPOT\_CS\_XST\* (U509 pin 1) is asserted for external microphone gain changes. The EEPOT is supplied with voltage from the GCAP II V2 regulator.

### 3.2.3.7 MAKO IC U501 (for NNTN5567)

The MAKO IC is a mixed-signal IC that provides control, clock generation, digital support, audio, and voltage regulation functionality. It comes in a 176-pin, ball-grid array (BGA) package with 0.8mm pitch solder balls. The MAKO IC is supplied with switched battery voltage SW\_B+.

#### 3.2.3.7.1 Voltage Regulation

The MAKO IC contains all of the regulators that are used in the design of the VOCON board: VSW1, VSW2, V\_2.9, V1.55, V1.875, and VCC5. VSW1 is a programmable switching regulator controlled by the MAKO IC on pin SW1\_SUMCOMP\_DL, while the current is sourced by a driver Q501 using the switched battery voltage (SW\_B+). The switching frequency of VSW1 (R511) is programmable by the dual-core processor through the SPI bus. The VSW1 voltage is supplied to the to the input pin of MAKO's VSW2 regulator (pin SW2\_VCCS).

The VSW2 regulator is a SPI programmable switching regulator. The initial and programmed output of VSW2 (C515) is 2.3 volts. The VSW2 voltage is used internal to the MAKO IC to supply the 1.875 volt (V1.875) and 1.55 volt (V1.55) linear voltage regulators. The V1.875 voltage is supplied to the dual-core processor U401 (EIM voltage), SRAM U403, and Flash memory U402. The V1.55 voltage (R518) is supplied to the dual-core processor U401 (core voltage).

The V\_2.9 volt regulator is a linear regulator within the MAKO IC that used VSW1 as its input. The initial output of V\_2.9 is 2.775 volts, which is then programmed to 2.9 volts by the dual-core processor via the SPI bus. The V\_2.9 voltage is supplied to the dual-core processor (I/O ring - SPI, BBP, SAP, UART, GPIO, etc.), the display module connector P301, and the many discrete components that interface with the dual-core processor and the MAKO IC.

#### 3.2.3.7.2 MCU Interface

The MAKO IC has a four-wire, SPI connection to the dual-core processor (SPI B). The SPI B clock is connected to the SPI\_CLK pin (TP\_SCKB). The SPI B MOSI line is connected to the SPI\_DI pin (TP\_MOSIB). The SPI B MISO line is connected to the SPI\_DO pin (TP\_MISOB). The MAKO SPI B chip-select signal is connected to the SPI\_CS pin (TP\_MAKO\_CE). Through this interface, the dual-core processor can program the voltage regulators, the CODEC, the transmit and receive audio filters and amplifiers, digital support multiplexing, and read information from the ADC.

The MAKO IC has a 10-bit ADC with eight general-purpose channels and two voltage-monitoring channels. Five out of the eight general-purpose channels are assigned to the display backlight button on the control head (ATOD\_2), the monitor volume (ATOD\_1), the two-position toggle switch (ATOD\_3), the OPT\_SEL\_IN (ATOD\_8), and board type ID (ATOD\_5). The other three general purpose channels are unused. Battery voltage is also monitored by the ADC. The dual-core processor reads the ADC values through the SPI bus.

### 3.2.3.7.3 Audio Circuitry

A16-bit CODEC is integrated into the MAKO IC and programmable by the dual-core processor through the SPI bus. The CODEC converts microphone audio data into a digital bit stream for processor by the DSP and converts receive audio data that was processed by the DSP into an analog audio signal for amplification to a speaker. The CODEC interfaces to the DSP through the 4-wire SAP bus. The CODEC clock, which is 512kHz, is generated by the MAKO IC and supplied on the VC\_DCLK pin (R572). The CODEC 8 kHz frame synchronization signal is generated by the MAKO IC and supplied on the VC\_FSYNC pin (R573). The CODEC transmit data signal is on the VC\_TX3V pin and the CODEC receive data signal is on the VC\_RX pin. For the MAKO IC to generate the clock and frame sync signals, a 24.576 MHz crystal Y502 is supplied to the XOUT and XIN pins.

The MAKO IC contains internal amplification (digital and analog), filtering, and multiplexing functionality for both receive and transmit audio. These functions are programmable by the dual-core processor through the SPI bus. The input for the internal microphone audio (C555) is the INT\_MIC\_P pin, while the input for the external microphone audio (C554) is the EXT\_MIC\_P pin.

The differential output for the internal speaker is the INT\_SPKR\_P pin and INT\_SPKR\_M pin. The differential output for the external speaker is the EXT\_SPKR\_P pin (C205) and EXT\_SPKR\_M pin (C206).

### 3.2.3.7.4 Regulator

The 5 V regulator is internal to the MAKO IC and uses SW\_B+ as its input voltage at pin V08\_I (R517). The 5 V supply (C519) is used by the bi-directional voltage translators integrated into the MAKO IC, the MAKO IC protection diodes, and the ESD protection circuitry.

The 1.55 V regulator (programmable through the SPI bus) is integrated into the MAKO IC. This regulator uses VSW2 to source the current. The 1.55 V supply (R518) is used by the dual-core processor U401 for its core voltage and clock amplifier.

### 3.2.3.7.5 Audio Pre-Amplifier

The audio pre-amplifier is integrated into the MAKO IC. The pre-amplifier's supply voltage and gain are programmable and controlled by the dual-core processor through the SPI bus. The input to the pre-amplifier is routed from the internal gain stages within the MAKO IC. The differential output of the pre-amplifier is the VC\_OUT\_P pin (R597) and VC\_OUT\_M pin (R598).

### 3.2.3.7.6 Audio Power Amplifier

The audio power amplifier, supplied by SW\_B+, is integrated into the MAKO IC U501. The audio PA is a programmable BTL type and is controlled by the dual-core processor through the SPI bus. The operational state of the PA, as well as selecting between the internal and external audio path, is controlled by the dual-core processor via the SPI bus.

The differential input to the audio PA comes from a low-pass filter (R597, R598, C590, C565, and C564) at the output of the audio pre-amplifier.

## 3.2.4 Interface Support

The interface support section consists of the following:

- Flipper IC U301
- ESD protection circuitry
- MAKO IC U501 (for NNTN5567)
- Universal connector interface circuitry

The Flipper IC contains a USB transceiver, switching logic between RS232 and boot data path, One-Wire side connector support, and several clock generators. The Flipper IC is programmed by the Patriot IC.

ESD protection devices include zener diodes and low-capacitance ESD suppressors.

Side connector interface circuitry includes current-limiting resistors and noise-suppressing shunt capacitors.

### 3.2.4.1 Flipper IC U301

See [Figure 8-64, "NTN9564B VOCON Flipper Circuit," on page 8-98](#) for schematic details of the following discussion.

The Flipper IC U301 is an application-specific, integrated circuit (ASIC) device designed for the XTS-radio product line. The Flipper IC is contained in a 64-pin  $\mu$ BGA package with 0.8 mm pitch solder balls. The Flipper IC is supplied with 5 volts and the processor's GPIO voltage, and it uses the 16.8 MHz clock (C307) as its master clock. The Flipper IC is programmable by the Patriot IC through the SPI bus.

The Flipper IC supports many functions including the radio side connector interface, bi-directional logic level translation, boot data path control, USB transceiver, One-Wire option detect support, watchdog timer, 32 kHz oscillator with CMOS output, 13 MHz reference generation for the GCAP II IC, and SSI clock and frame sync generator.

#### 3.2.4.1.1 Side Connector Interface, Logic Level Translation, and Boot Data Path Control

The Flipper IC facilitates the interface to the radio's side connector. Some of the side connector lines are at 5 V logic levels, so the Flipper IC converts those lines to GPIO voltage logic levels to interface to the Patriot IC, as well as the encryption module. These lines include the SB9600 bus busy line LH\_BUSY (TP207), the RS 232 CTS (TP208) and RTS (TP209) lines, the RS232 data-out line (TP210), and the RS232 data-in line (TP211). The SB9600 data line uses an external, bi-directional, voltage translation circuit that includes Q303, D301, R325, R326, and R327.

Another function that the Flipper IC provides with these lines is boot data path control. The boot data path is as follows: boot data-in is multiplexed onto the RS232 data-out line while the boot data-out is multiplexed with the SB9600 data line. This alternate data path is used only to Flash code into a radio for the first time. The Patriot IC, through the SPI bus, controls this feature.

#### 3.2.4.1.2 USB Transceiver

The USB transceiver, internal to the Flipper IC, is capable of transmitting and receiving serial data at a rate of 12 megabits per second. The differential USB data comes from the side connector, through the 22-ohm resistors R252 and R253 and the isolation switch Q301, and then to the USB\_DPLUS and USB\_DMINUS pins on the Flipper IC. The USB receive interface from the Flipper IC to the Patriot IC is as follows: USB\_DPLUS routed to USB\_VPI, USB\_DMINUS routed to USB\_VMI\_RXD, and the differential decoded data is output at the URXD\_RTS pin and goes to the Patriot IC URTS1 pin.

The USB transmitter is enabled when the USB\_SUSP and USB\_TXENAB signals are both driven low by the Patriot IC. The single-ended data is output from the Patriot IC on the UTXD1 pin and goes to the Flipper TXD\_USB\_VPO pin. The data is driven out differentially on the USB\_DPLUS and USB\_DMINUS pins, which go to the side connector. The Patriot IC sends the single-ended zero signal from pin PC0\_USB\_VMOOUT to the Flipper IC USB\_FSEZ pin.

When a USB cable is detected, the USB\_DIS pin (Q302 pin 2) goes high. This controls the isolation switch Q301 so that the data that is on those lines are routed to the USB transceiver. If a USB cable is not detected, the USB\_DIS pin is low and the USB transceiver on the Flipper IC is isolated from the side connector. This isolation is done primarily because the RS232 data lines are 5 V lines, so the switch protects the transceiver since it operates at a lower voltage, and the USB data lines to the side connector also act as the RS232 lines.

On the NNTN4717 VOCON board, the USB transceiver on the Flipper IC is not used. Instead, a discrete USB transceiver U310 is used. This transceiver is provided with 5 V and 2.9 V. The 5 V powers an internal 3.3 V voltage regulator on the transceiver, which is used as the voltage for the USB data pins D+ and D- as well as the VPU pin. The 2.9 V is used by the remaining pins as they interface to the dual-core processor U401.

#### 3.2.4.1.3 One-Wire Support

New options and accessories that attach to the side connector are identified by the Patriot IC using the One-Wire protocol. The Option Select 2 pin on the side connector also serves as the One-Wire data pin (R218). This signal is connected to the ONE\_WIRE\_OPT pin. This pin is connected to the Patriot IC One-Wire bus ONE\_WIRE\_UP through an internal isolation switch controlled by a Patriot IC GPIO line to the Flipper IC ONE\_WIRE\_EN\_X pin. This isolation is needed to prevent possible contention on the One-Wire bus when a smart battery is attached to the radio.

These new accessories are to ground pin 10, CTS (TP208), of the side connector. When this occurs, the Flipper IC pin KVL\_USB\_DET\_X is asserted and the Patriot IC detects the change. The Patriot IC then asserts the ONE\_WIRE\_EN\_X pin on the Flipper IC to connect the side connector One-Wire line to the Patriot IC One-Wire bus. In the case of the USB cable, the Patriot IC reads the One-Wire data from the cable and, upon determining that a USB cable is attached, programs the Flipper IC for USB mode.

#### 3.2.4.1.4 Watchdog Timer

The Flipper IC monitors the position of the radio's On/Off switch on the BP\_SEN\_X pin, and that signal is located on Q508 pin 3. If the voltage on pin 3 is ground, then the radio is turned on. If the voltage on pin 3 is 3 volts, then the radio is off. When the radio is turned off, a counter inside the Flipper IC begins incrementing. That counter can be refreshed by the Patriot IC through the SPI bus. This is done so that the software has enough time to complete its tasks before the power is taken away from the Patriot IC. If the counter is not refreshed by the time the count is complete, the Flipper IC pin WD\_OUT goes low, which shuts down the GCAP II voltage regulators. During normal radio operation, WD\_OUT should be high (V2 regulated voltage).

#### 3.2.4.1.5 32 kHz Oscillator and CMOS output

The 32 kHz oscillator circuitry uses a separate voltage supply pin (VDD3\_XTL) than the other 3-V portions of the Flipper IC. This 32 kHz clock is used by the GCAP II RTC module to keep track of time. The VDD3\_XTS pin is supplied with the backup lithium (Li) rechargeable battery voltage LI\_CELL. The oscillator circuitry is internal to the Flipper IC, and the 32.768 kHz crystal Y301 and additional load capacitors C308 and C309 are located next to the IC.

The output of the 32 kHz oscillator is an LI\_CELL voltage (approximately 3 volts peak-to-peak), 32.768 kHz square wave on pin REF32\_OUT. This clock goes to two destinations: the Patriot IC CKIL pin (32 kHz test point) as a square wave and the GCAP II IC XTAL1 pin (C306) as a sine wave. Components C306 and C313 are used to filter the square wave into a sine wave before the signal goes to the GCAP II IC.

#### 3.2.4.1.6 13 MHz Reference Generation for GCAP II

The 13 MHz reference is required by the GCAP II IC for the CODEC time base and the SSI clock generator module internal to the Flipper IC. A phase locked loop (PLL) is used to generate the 13 MHz using the 16.8 MHz clock, which is provided to the Flipper IC REF\_16\_IN pin (C307). An external RC loop filter network, consisting of R301, C301, and C302, is connected to the PLL\_LFT pin.

The 13 MHz reference output pin, REF\_13\_OUT, is conditioned by the RC network of R302 and C303. The signal at REF\_13\_OUT is a 3-V peak-to-peak square wave, and the RC filter produces a lower-level triangle wave that is suitable for the GCAP II IC.

The 13 MHz reference is disabled as the Flipper IC powers up. The 13 MHz reference is enabled by the Patriot IC through the SPI bus, and, during normal radio operation, this signal should be present.

#### 3.2.4.1.7 SSI Clock and Frame Sync Generator

The Flipper IC generates the SSI clock and frame sync signals for the SAP bus used by the Patriot IC, GCAP II IC, and encryption module. These signals are generated from the 13 MHz reference. The SSI clock output pin is labeled SSI\_CLK, and the frequency is 520 kHz. The SSI frame sync output pin is FRSYNC, and the frequency is 8 kHz. These signals are not active when the Flipper IC comes out of reset, so they are programmed by the Patriot IC through the SPI bus.

The Flipper IC provides four 16-bit TDM slots per frame on the SAP bus. The first slot (slot 0) begins immediately after the frame sync pulse, and this slot is used by the GCAP II IC. The SEC\_SS\_X pin is active for the first 8 bits of the second slot (slot 1). This signal is used by the encryption module to synchronize its input and output to the SSI frame. The other two slots are reserved for possible design additions in the future.

On the NNTN4717 VOCON board, the Flipper IC is not programmed to generate the SSI clock, SSI frame sync signal, or the secure slave select signal (SEC\_SS\_X); the dual-core processor U401 generates these signals.

#### 3.2.4.2 MAKO IC U501 (for NNTN5567)

The digital-support functions are performed by the MAKO IC. The MAKO IC is contained in a 176-pin BGA with 0.8mm pitch solder balls. The MAKO IC is supplied with three clocks. It is supplied with a 16.8 MHz clock from the transceiver board. It uses a 32.768 kHz crystal to boot up the dualcore processor and for the real-time clock. It also uses a 24.576 MHz crystal to generate the SAP clock and frame synchronization signals.

The MAKO IC includes that one-wire option detect support, watchdog timer, and the radio's universal (accessory) side connector interface. It also monitors the position of the on/off switch in order to control the power-up/power-down sequence.

##### 3.2.4.2.1 Side Connector Interface, Logic Level Translation, and Boot Data Path Control

For kit NNTN5567A the LH Data bidirectional translation is performed internal to the Mako IC and 3V logic level is on Mako pin SB96D\_BDO\_KF\_3V.

##### 3.2.4.2.2 USB Transceiver

In kit NNTN5567A, the USB transceiver is internal to MAKO IC U501, and is capable of transmitting and receiving serial data at a rate of 12 megabits per second. The differential USB data comes from the side connector, through the 27-ohm resistors R252 and R253 and then to the USB1\_DP and USB1\_DM pins on U501. The data will then go through some interfacing and multiplexing internal to the transceiver for 6-wire USB operation and onto the output pins. The USB receive interface through the transceiver to the dual core processor is as follows: DP routed to USB\_VPI, DM routed to URXD1\_USB\_VMI, and the differentially decoded data is output on URTS1\_XRXD pin.

The USB transmitter is enabled when the RS232\_USB\* and USB\_TXENAB signals are both driven low by the dual-core processor. The single-ended data is output from the dual-core processor on the UTXD1\_USB\_VPO pin and goes to USB1\_DAT\_TXD on U501. The data is driven out differentially on the USB1\_DP and USB1\_DM pins, which go to the side connector. The dual-core processor sends the single-ended zero signal from pin USB\_VMO to the USB1\_SE0 pin on U501.

When a USB cable is attached, pin CTS\_CABLE\_DET\_5V is driven low and goes through level translation in U501 and the output of CABLE\_DET\_3V is pulsed low and sent to the dual-core processor. This line controls the USB and RS232 modes so that the data that is on those lines are routed to the USB transceiver when a cable is detected. If a USB cable is not detected, CABLE\_DET\_3V is high, the transceiver is put in suspend mode and the DP and DM pins can now handle 5V tolerance for RS232 mode.

#### 3.2.4.2.3 One-Wire Support

New options and accessories that attach to the side connector are identified by the dual-core processor using the One-Wire protocol. The One-Wire pin on the side connector serves as the One-Wire data pin. This signal is connected to the ONE\_WIRE\_OPT pin. This pin is connected to the dual-core processor One-wire bus ONE\_WIRE\_UP through the Mako IC, U501, internal isolation switch controlled by the SPI commands sent from the dual-core processor. This isolation is needed to prevent possible contention on the One-Wire bus when a smart battery is attached to the radio.

These new accessories are to ground, designator R245, of the side connector. When this occurs, the digital-support IC pin KVL\_USB\_DET\_X is asserted and the dual-core processor detects the change. The dual-core processor then sends a command through the SPI lines to the U501 Mako IC to connect the side connector One-Wire line to the dual-core processor One-Wire bus. In the case of the USB cable, the dual-core processor reads the One-Wire data from the cable and, upon determining that a USB cable is attached, programs the digital-support IC for USB mode.

#### 3.2.4.2.4 Watchdog Timer

In kit NNTN5567A, the watchdog timer is a 125ms counter that is integrated into the MAKO IC U501 and used during the power down sequence. The MAKO IC will begin the power down sequence when a low-to-high transition occurs on MECH\_SW pin (MAKO pin E4). Once this transition occurs, the MAKO IC begins the watchdog timer. Upon expiration, RESETX (MAKO pin C5) is asserted and all of the MAKO regulators are shutdown. The dual-core processor can refresh the watchdog timer so that the software has enough time to complete its tasks before the power is taken away.

#### 3.2.4.2.5 32 kHz Oscillator and CMOS Output

There is an internal 32kHz oscillator circuitry to the MAKO IC U501 that is based off of a 32.768 kHz crystal Y501 and additional load capacitors C501 and C502. The output of the 32 kHz oscillator is a logic\_vdd voltage (approximately 2.9 volts peak-to-peak), 32kHz +/- 20% square wave on pin GATED\_32K\_CLK. This 32 kHz signal is routed through an analog switch U512 and sent to the dual-core processor CKIL pin. This signal is only used to boot up the dual-core processor.

After the dual-core processor boots up, the select input (R599) of the analog switch is asserted high allowing for the processor to receive an accurate 32.768 kHz, 2.9 V peak-to-peak square wave. This signal is generated by tapping the output of the 32.768 crystal and buffering the signal with the following components: U513, R545, R546, C543, C592, R542, and R541. The 32.768 kHz clock signal allows for the completion of real-time applications.

#### 3.2.4.3 ESD Protection Circuitry

See Figure 8-63, "NTN9564B VOCON Universal Connector Circuit," on page 8-97 for schematic details of the following discussion.

---

Several components on the VOCON board protect the circuitry from ESD. The side connector signal lines have ESD protection components on them since they are exposed. These protection components include:

- 5.6-V zeners VR205, VR206, VR220, and VR221 on the SB9600 lines, RS232 lines, microphone lines, and option-select lines
- 12-V zeners VR201, VR203, and VR209 on the internal and external speaker audio lines
- 13-V zener VR204 on the OPTB+ line
- Low-capacitance ESD suppressors D203, D204, D205, and D206 on audio lines, USB data lines, and option-select lines

There were also several protection diodes on lines connected to the Flipper IC. These include D302, D303, D304, D305, D306, D307, and D308. ESD protection for the battery status line is provided by a 5.6-V zener VR501.

### 3.2.4.4 Universal Connector Interface Circuitry

See Figure 8-63, “NTN9564B VOCON Universal Connector Circuit,” on page 8-97 for schematic details of the following discussion.

Some important components on the universal connector interface are two op-amps. The first op-amp, U201, is used as a comparator for the option-select 1 line. The comparator threshold is determined by the voltage-divider network of R257 and R258. Similarly, the other op-amp, U202, is used as a comparator for the option-select 2 line. The comparator threshold is determined by the voltage-divider network of R240 and R243. The remaining components consist of current-limiting serial resistors and noise-suppressing shunt capacitors.

#### 3.2.4.4.1 Universal Connector and Option Selects

The universal connector is located on the side of the radio. It is the external port or interface to the outside and is used for programming and interfacing to external accessories. The universal connector connects to the VOCON board at connector J101 via a flex circuit that is routed inside the external housing. Connections to the universal connector and J101 on the VOCON board are shown in Figure 3-10 on page 3-34 and Figure 3-11 on page 3-34.

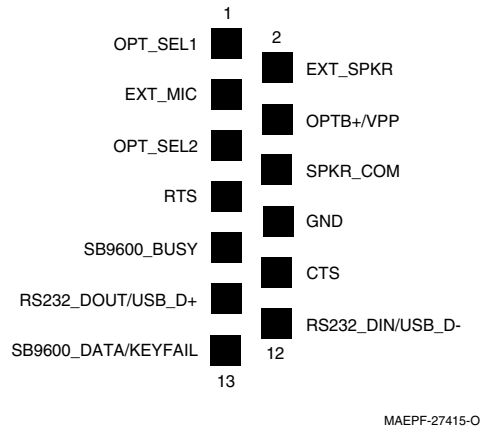

Figure 3-10. Universal (Side) Connector

Figure 3-11. VOCON Board Connector—J101

Most of the signals are extensions of circuits described in other areas of this manual. However, there are two option select pins (see [Table 3-5](#)) used to configure special modes: Option Select 1 and Option Select 2. These pins are controlled by accessories connected to the universal connector. [Table 3-5](#) outlines their functions as defined at the universal connector. In the case of the XTS Vehicular Adapter (XTVA), Option Select 1 pin is connected to Option Select 2 pin by a diode internal to the XTVA.

Table 3-5. Option-Select Functions

Function	Option Select 1	Option Select 2
External PTT	0	0
No Function (Normal)	1	1
Man Down	1	0
External Speaker	0	1
XTVA	Diode cathode	Diode anode

### 3.2.4.5 Display Module

An optional, integral, 96 pixels by 64 pixels, bit-mapped, liquid-crystal display (LCD) module is available with either a 3 x 2 keypad with a navigational button (Model II radios) or 3 x 6 keypad with a navigational button (Model III radios). The display module is connected to the VOCON board through flex connector J301. The display module uses chip-on-film technology and is not field repairable.

#### 3.2.4.5.1 7285726C01 Display Module

**NOTE:** The NTN9564 VOCON kit is only compatible with the 7285726C01 display module.

The 7285726C01 display module is controlled by the Patriot IC MCU core, which programs the display through the EIM data lines D0 - D7 (pins 9 through 16, respectively), the display chip select line (pin 5), the EIM read/write line (pin 8), and the EIM address 0 line (pin 7) that is used to select the register to be programmed. The Patriot IC can reset the display module through pin 6. The display is supplied with 1.8 V (B102) to pin 17 and 3.0 V (B101) to pin 18. Display backlighting is controlled by the Patriot IC GPIO line BL\_EN signal through components R140 and Q101. The LEDs on the display module are powered by 5 V going through resistors R101, R102, R103, and R104.

#### 3.2.4.5.2 7285726C02 and 7285726C03 Display Modules

**NOTE:** The NNTN4563 VOCON kit is compatible only with the 7285726C02 display module, while the NNTN4819 VOCON kit is compatible only with the 7285726C03 display module. Check the model charts for display part number compatibility with the NNTN4717 VOCON board.

The 7285726C02 and 7285726C03 display modules are controlled by the Patriot IC SPI bus, which programs the display through the serial data line (pin 16), the serial clock line (pin 15), chip select line (pin 5), and register select line (pin 7) that is used to select the register to be programmed. The Patriot IC can reset the display module through pin 6. The display is supplied with GCAP II V2 regulated voltage (B101) to pins 17 and 18 or 2.9V MAKO IC regulated voltage (NNTN5567 VOCON kit) to pins 11 and 14. Display backlighting is controlled by the Patriot IC GPIO line BL\_EN signal through components R140 and Q101. The LEDs on the display module are powered by 5 V going through resistors R103 and R104.

### 3.2.4.6 Keypad Module

The keypad module is either a 6- x 3-button (Model III) or a 2- x 3-button (Model II) module with backlighting.

The keypad module is connected to the VOCON board through flex connector J107. The keypad is read through a row-and-column matrix made up of ROW1, ROW2, ROW3, ROW4, ROW5, ROW6, and COL1, COL2, and COL3. When a key is pressed, a row and a column are connected to each other. The Patriot IC determines a key press by a scanning algorithm. Each column line is configured as an open drain output and pulled low. The Patriot IC then scans the row pins (each row pin has an internal pull-up resistor). If a row signal is read low, then the Patriot IC determines that a key was pressed. If none of the row signal lines are low, then another column line is pulled low and the row scanning routine occurs.

The keypad backlighting is controlled by the Patriot IC GPIO BL\_EN, and that signal goes to pin 6 of the J107 connector. Pins 7 and 8 are supplied with 5 volts, which is used to power the LEDs on the keypad module.

### 3.2.4.7 Controls and Control Top Flex

The universal flex assembly contains an On/Off switch/volume control knob, frequency selector switch, push-to-talk (PTT) switch, monitor button, several function-selectable switches, universal connector, speaker, and microphone.

The housing assembly top controls include the On/Off switch/volume control (S1), a 16-position mode-select switch with programmable two-position concentric switch (U1), a programmable three-position (A,B,C) toggle switch (S2), and a programmable top (orange) button (SW3). The side controls include three programmable, momentary, pushbutton switches (side button 1 [SB2], side button 2 [SB3], top side button [SB1]) and a PTT switch (SW2). These components are connected through a flex circuit to the controller at J101 (see [Table 3-12, "Control Top Flex," on page 3-37](#)). The assembly also contains the radio's internal speaker and internal microphone.

UNSW\_B+ is routed through switch S1 to provide the B+SENSE signal, which is used to activate the SW\_B+ and GCAP\_B+ voltages that, in turn, power up the radio. Volume control is also provided by S1, which contains a potentiometer biased between V2 regulated voltage and ground. The VOL signal is a voltage level between V2 regulated voltage and ground, depending on the position of the rotary knob. The VOL signal is fed to buffer U507 pin 3, and then the output of the buffer is voltage-divided down to 2.5 volts before the signal goes to the GCAP II IC AD5 pin. The Patriot IC reads the GCAP II IC A/D value through the SPI bus, and from this reading, the Patriot IC DSP adjusts the speaker volume. In NNTN5567 VOCON kit, the VOL signal is fed directly to the MAKO IC U501 AD1 pin. There is no buffer or voltage division since the MAKO IC's AD pin is high impedance and tolerant to 3 V. The dual-core processor reads the MAKO IC A/D value through the SPI bus, and from this reading, the dual-core processor DSP adjusts the speaker volume.

Switch S2 is the three-position, programmable, toggle switch typically used for expanded zone/channel selection. The switch can output the following voltages: 0 volts, half of the V2 regulated voltage, or V2 regulated voltage (measurable at R231). The switch is connected to the GCAP II IC AD1 input pin through the voltage divider network of R519 and R523. But for NNTN5567, the switch is connected to MAKO IC AD3 input pin through R224. The Patriot IC reads the A/D value through the SPI bus, and it uses that reading to determine the position of the toggle switch.

The programmable top (orange) button SW3 is typically used for emergency. This button, along with programmable side buttons SB1 through SB3, is connected to a resistor divider network, biased between V2 regulated voltage and ground. This network, made up of R1, R2, and R3, provides a voltage level, controlled by whichever button is pressed, to pin 3 of buffer U504. The output of the buffer is voltage- divided down to 2.5 volts before the signal goes to the GCAP II IC AD0 pin. The Patriot IC reads the GCAP II IC A/D value through the SPI bus, and it uses that data to determine which button was pressed.

LED D1 is the TX/RX indicator. LEDs D2 through D6 are used for backlighting the frequency knob.

U1 is a binary-coded switch. The output pins from U1, which are connected to GPIO pins on the Patriot IC, provide a four-bit binary word (signals RTA0, RTA1, RTA2, and RTA3) to the MCU, indicating to which of the 16 positions the rotary is set. This switch provides an additional output, TG2, which is typically used for coded or clear mode selection. It is an input to the Patriot IC TOUT8\_PD4 GPIO pin. Selecting clear mode pulls this signal to a logic low, and it can be monitored from R234.

Figure 3-12. Control Top Flex

### 3.2.4.8 System Clocks

The Patriot IC is supplied with two clocks. The first clock, a 16.8 MHz sine wave, comes from the RF interface connector P201 pin 7. It is conditioned by the clock buffer circuit, which includes Q450, Q451, L450, C450, C452, C452, R450, R451, R452, R453, R454, and R455. The output of this buffer (C452) goes to the Patriot IC CKIH pin as well as the Flipper IC REF\_16\_IN (C307).

The other clock supplied to the Patriot IC is a 32.768 kHz square wave. This clock is generated by the Flipper IC internal oscillator and an external 32.768 kHz crystal Y301 and is connected to the Patriot IC CKIL pin.

### 3.2.5 VOCON Audio Paths

This section describes the VOCON transmit and receive audio paths. See Figure 8-67, "NTN9564B VOCON Audio and DC Circuits," on page 8-101 for schematic details of the following discussion.

#### 3.2.5.1 Transmit Audio Path

Refer to Figure 3-13. The internal microphone audio enters the VOCON board through the universal connector J101 pin 36, and the internal microphone bias is set by circuitry that includes R531, R533, C519 and C521. The internal microphone signal is connected to the MICIN\_NEG pin, which is the input terminal on the GCAP II IC internal op-amp A3. The gain of the A3 op-amp is set by the values of R540, R555, and the resistance of EEPOT U509 (digital potentiometer), which is programmed by Patriot IC GPIO lines.

The external microphone audio enters the VOCON board through the universal connector J101 pin 13, and the external microphone bias is set by circuitry that includes R563, R565, C547, and C548. The external microphone signal is connected to the AUX\_MIC\_NEG pin, which is an input terminal on the GCAP II IC internal op-amp A5. The gain of the A5 op-amp is set by the values of R566, R561, and the resistance of the EEPOT U509.

The Patriot IC, through the SPI bus, programs a multiplexer to select one of the microphone signals. Then, the selected amplified microphone signal goes through a programmable gain amplifier before it goes to the CODEC for A/D conversion. The resulting digital data is filtered and sent to the DSP on the SAP CODEC\_TX line from the GCAP II IC TX pin. After additional filtering and processing, the DSP sends the data-out from the STDB pin to the RF interface connector P201 pin 4 (TX\_DATA), which is connected to the DAC U203 on the transceiver board.

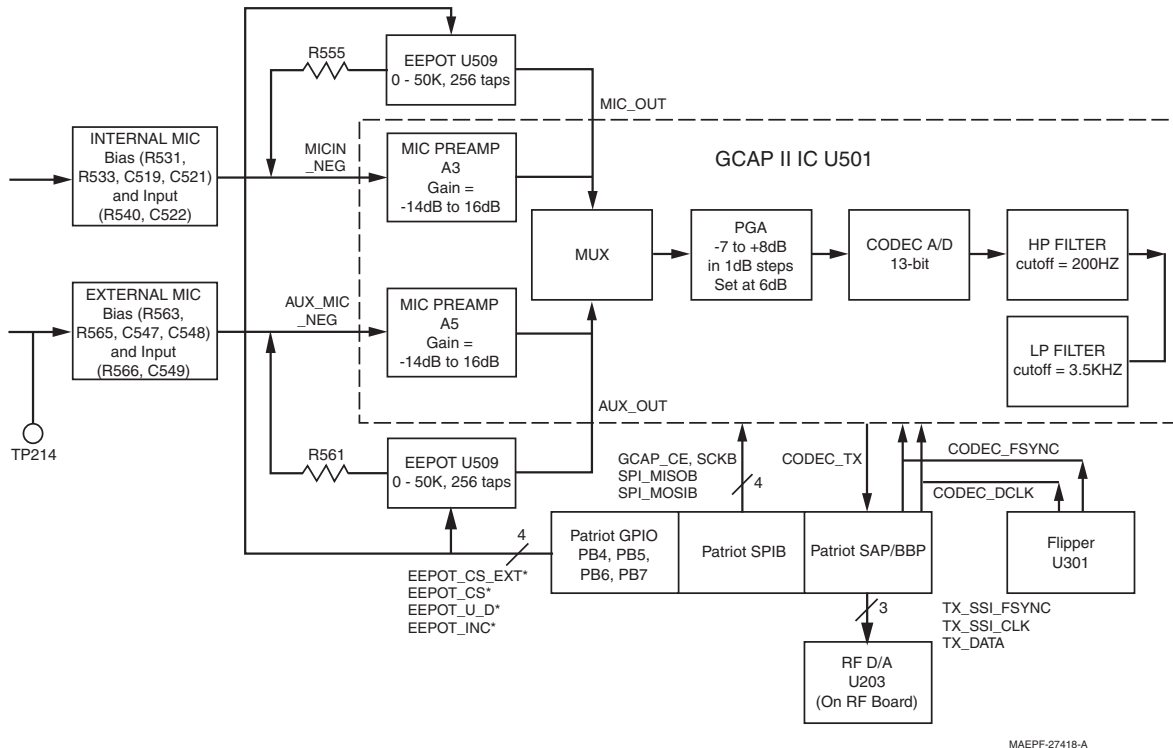

Figure 3-13. VOCON Transmit Audio Path

### 3.2.5.2 Transmit Audio Path (for kit NNTN5567A)

Refer to [Figure 3-14](#). The single-ended internal microphone audio enters the VOCON board through pin 8 of the M102 contact, and the internal microphone bias is set by circuitry that includes C550, R550 and R552. The internal microphone signal is connected to the INT\_MIC\_P pin, which is the input terminal on the Mako IC internal op-amp G1 after the signal is multiplexed. The gain of the G1 pre-amp is set to +15 dB, which is programmed by dual-core processor SPI lines.

The external microphone audio enters the VOCON board through the remote connector J102, pin13, and the external microphone bias is set by circuitry that includes C551, R551 and R553. The external microphone signal is connected to the EXT\_MIC\_P pin, which is an input terminal on the Mako IC internal op-amp G1 after the signal is multiplexed. The gain of the G1 pre-amp is set to +15 dB, which is programmed by dual-core processor SPI lines.

The dual-core processor, through the SPI bus, programs a multiplexer internal to the Mako IC to select one of the microphone signals. Then, the selected microphone signal goes through the G1 pre-amplifier stage and on to a programmable gain amplifier (G2) before it goes to the CODEC for A/D conversion. The resulting digital data is filtered and sent to the DSP on the CODEC\_TX line from the Mako IC VC\_TX3V pin. After additional filtering and processing, the DSP sends the data-out from the STDB pin, labeled TX\_SSI\_DATA to the RF interface connector P201 pin 4 (TX\_DATA), which is connected to the DAC U203 on the transceiver board.

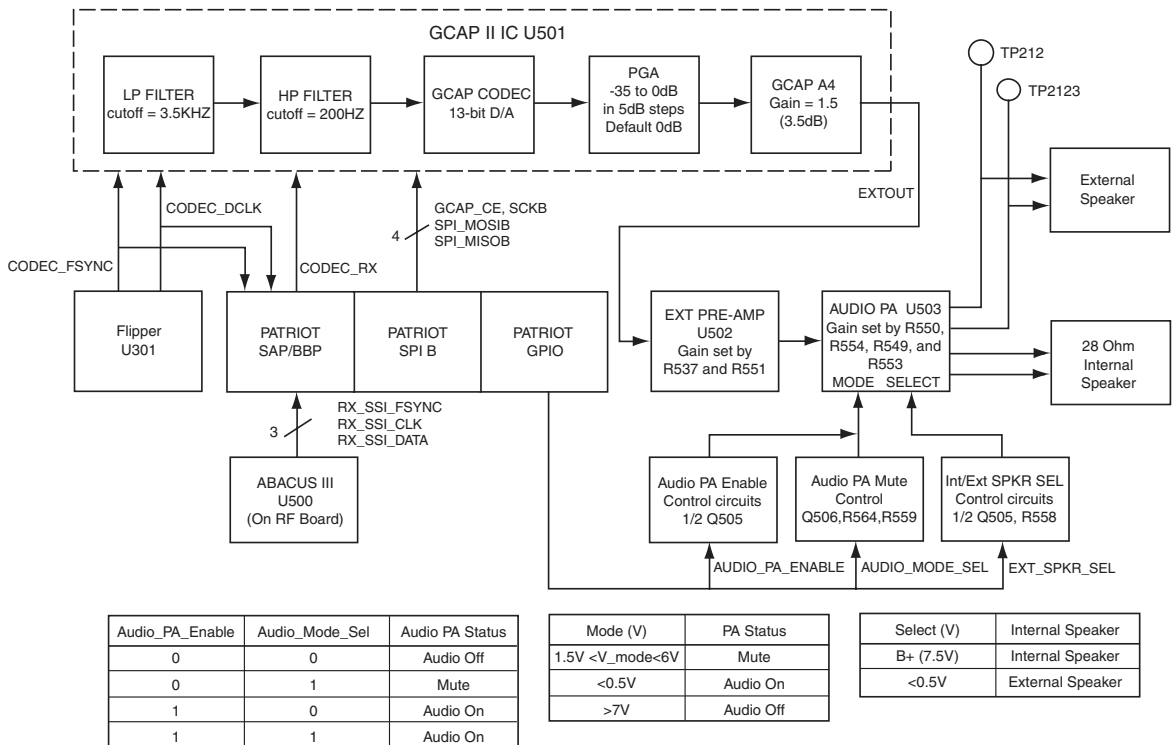

Figure 3-14. VOCON Transmit Audio Path

### 3.2.5.3 Receive Audio Path

Refer to Figure 3-15. The receive audio data comes from the Abacus III IC U500 through the RF interface connector P201 pin 12 (RX\_DATA) to the Patriot IC SRDB pin. The DSP decodes the data and sends it out through the CODEC\_RX line to the GCAP II IC RX pin. The CODEC filters and converts the digital data into an analog audio signal, which, in turn, is sent to a programmable gain amplifier. The Patriot IC programs a multiplexer to route the audio signal to the A4 amplifier, which has a fixed gain of 3.5 dB. The output of the A4 amplifier is pin EXTOUT.

From the EXTOUT pin, the audio signal goes through the pre-amplifier U502 and then to the audio power amplifier U503, which together provide approximately 30 dB of gain. The Patriot IC selects whether the amplified audio is routed to the internal speaker or the external speaker.

MAEPF-27417-A

Figure 3-15. VOCON Receive Audio Path

### 3.2.5.4 Receive Audio Path (for NNTN5567A)

Refer to Figure 3-13a. The receive audio data comes from the Abacus III IC U500 through the RF interface connector P201 pin 12 (RX\_DATA) to the Patriot IC SRDB pin. The DSP decodes the data and sends it out through the CODEC\_RX line to the Mako IC VC\_RX3V pin. The CODEC filters, adds digital programmable gain G1, then converts the digital data into an analog audio signal, which in turn is sent to programmable attenuator G3. The signal is then sent through an internal programmable differential preamplifier (G4) to add gain and outputs the signal on pins VC\_OUT\_P and VC\_OUT\_M of the Mako IC.

This output from the preamp is then filtered through circuitry R597, R598, C590, C565, C564, and then sent back to 2 independent internal BTL differential power amplifiers, G5 & G6, of the Mako IC. The power amplifiers are programmed to a fixed gain of 26 dB through the dual-core processor SPI lines and PA control registers.

The dual-core processor selects whether the amplified audio is routed to the internal speaker or the external speaker through the SPI lines based upon which amplifier is turned on as shown in the PA control block. The output audio is routed on Mako IC pins INT\_SPKR\_P and INT\_SPKR\_M for internal and EXT\_SPKR\_P and EXT\_SPKR\_M for external speaker lines.

Figure 3-16. VOCON Receive Audio Path (for kit NNTN5567)

### 3.2.6 Radio Power-Up/Power-Down Sequence

The radio power-up sequence begins when the user closes the radio On/Off switch on the control top, placing 7.5 Vdc on the B+SENSE line. This voltage enables the pass element Q501 and Q502, enabling SW\_B+ and GCAP\_B+. In NNTN5567 VOCON kit, the B+SENSE line enables the pass elements Q500, Q501, and Q503 enabling SW\_B+ and RFSW\_B+.

When the GCAP II IC U501 detects a low-to-high voltage transition on GCAP\_B+, it turns on and enables voltage supplies VSW1, VSW2, V2 and Vref. As soon as these voltages come up, the 1.55 V regulator ramps up (only on the NNTN4717 VOCON board), and the Flipper IC U301 drives the WDI line high to enable VCC5 from regulator U505 and to maintain the GCAP II IC in the ON state. If WDI remains low, the GCAP II IC turns off 50 ms after turning on. For NNTN5567 VOCON board, when the MAKO IC U501 detects a high-to-low transition on the MECH\_SW pin, the MAKO IC grounds the FET\_ENX pin driving the gate of an external P-MOSFET low. This turns on the transistor (Q500) and applies SW\_B+ to the MAKO IC and the rest of the board (RF and VoCon). After applying power to SW\_B+, the regulators VSW1, VSW2, V1.875, V1.55, V\_2.9, and VCC5 are sequenced on. After the regulators are stable, the RESETX pin is asserted low for an additional 16ms and then de-asserted allowing the dual-core processor to start.

The radio power-down sequence begins by opening the radio On/Off switch, which removes the B+SENSE signal from the VOCON board. This does not immediately remove power because the GCAP II IC has control of Q502 through Vref, and U301 through WDI maintains the GCAP II IC in an active state. Both the MCU and Flipper IC monitor B+SENSE. After B+SENSE is removed, the Flipper IC waits 125 ms. before releasing WDI to allow for software cleanup; however, the software has the ability to prolong this time if it was necessary to complete its operations. When WDI is released, the GCAP II IC shuts down its supplies and the rest of the radio through Q501. In NNTN5567 VOCON board, the radio power-down sequence begins by opening the radio On/Off switch, causing the MECH\_SW pin to transition high. This causes the MAKO IC to start an internal 125ms watchdog timer and drive the INT\_X interrupt output pin low. The dual-core processor then determines (through communication on the SPI bus) that it must initiate the power-down sequence. At this point, the watchdog timer can be kept alive by the dual-core processor (via the SPI bus) allowing for software cleanup. Upon expiration of the watchdog timer, the MAKO IC asserts the RESETX pin and turns off all DC regulators including SW\_B+ (Q500 turns off when the MAKO IC drives the FET\_ENX pin high).

### 3.3 Encryption Module

The encryption module (secure models only) connects directly to the VOCON board and interfaces directly with the vocoder digital circuitry. It contains an independent microcontroller and two custom ICs to perform digital, numerical, encryption algorithms.

The encryption modules are designed to digitally encrypt and decrypt voice and ASTRO data in ASTRO XTS 5000 radios. This section covers the encryption modules, hardware kits **NTN9738** and **NNTN5032**.

**NOTE:** The encryption modules are NOT serviceable. The information contained in this section is only intended to help determine whether a problem is due to a encryption module or the radio itself.

The encryption module uses a custom encryption IC and an encryption key variable to perform its encode/decode function. The encryption key variable is loaded into the encryption module, via the radio's universal (side) connector, from a hand-held, key variable loader (KVL). The encryption IC corresponds to the particular encryption algorithm purchased. [Table 3-6](#) lists the encryption algorithms and their corresponding kit numbers.

Table 3-6. Encryption Module Software Kits and Algorithms

Software Kit Number	Algorithm
NNTN4006	DES, DES-XL, DES-OFB
NTN9837	DES, DES-XL, DES-OFB WITH DVP-XL
NTN9838	DVI-XL
NTN9839	DVP-XL
NNTN4197	AES
NNTN4198	AES with DES, DES-XL, DES-OFB

The encryption module operates from two power supplies (UNSW\_B+ and SW\_B+). The SW\_B+ is turned on and off by the radio's On/Off switch. The UNSW\_B+ provides power to the encryption module as long as the radio battery is in place.

Key variables are loaded into the encryption module through connector J701, pin 1. Depending on the type of encryption module, up to 16 keys can be stored in the module at a time. The key can be infinite key retention or 30-seconds key retention, depending on how the codeplug is set up.

The radio's host processor communicates with the encryption module on the Synchronous Serial Interface (SSI) bus. The SSI bus consists of five signal lines. A communications failure between the host processor and the secure module will be indicated as an *ERROR 09/10* message on the display.

To troubleshoot the encryption module, refer to the flowcharts in [Chapter 5 "Troubleshooting Charts."](#)

---

## Chapter 4 Troubleshooting Procedures

The purpose of this chapter is to aid in troubleshooting problems with the ASTRO XTS 5000 radio. It is intended to be detailed enough to localize the malfunctioning circuit and isolate the defective component. It also contains a listing of service tools recommended for PC board repair at the component level.

**Caution**

Most of the ICs are static sensitive devices. Do not attempt to disassemble the radio or troubleshoot a board without first referring to the following Handling Precautions section.

### 4.1 Handling Precautions

Complementary metal-oxide semiconductor (CMOS) devices, and other high-technology devices, are used in this family of radios. While the attributes of these devices are many, their characteristics make them susceptible to damage by electrostatic discharge (ESD) or high-voltage charges. Damage can be latent, resulting in failures occurring weeks or months later. Therefore, special precautions must be taken to prevent device damage during disassembly, troubleshooting, and repair. Handling precautions are mandatory for this radio, and are especially important in low-humidity conditions. DO NOT attempt to disassemble the radio without observing the following handling precautions.

1. Eliminate static generators (plastics, Styrofoam, etc.) in the work area.
  2. Remove nylon or double-knit polyester jackets, roll up long sleeves, and remove or tie back loose-hanging neckties.
  3. Store and transport all static-sensitive devices in ESD-protective containers.
  4. Disconnect all power from the unit before ESD-sensitive components are removed or inserted unless otherwise noted.
  5. Use a static-safeguarded workstation, which can be accomplished through the use of an anti-static kit (Motorola part number 01-80386A82). This kit includes a wrist strap, two ground cords, a static-control table mat and a static-control floor mat.
-

## 4.2 Recommended Service Tools

Table 4-1 lists recommended service tools that can be used for PC board repairs at the component level. For listings of additional service tools, service aids, and test equipment that are recommended for all levels of service, refer to the XTS 5000 basic service manual (see “[Related Publications](#)” on page xii).

Table 4-1. Recommended Service Tools

Motorola Part Number	Description	Application
R1453	Digital-readout solder station	Digitally controlled soldering iron
RLN4062	Hot-air workstation, 120V	Tool for hot-air soldering/desoldering of surface-mounted integrated circuits
0180386A78	Illuminated magnifying glass with lens attachment	Illumination and magnification of components
0180302E51	Master lens system	
0180386A82	Anti-static grounding kit	Used during all radio assembly and disassembly procedures
6684253C72	Straight prober	
6680384A98	Brush	
1010041A86	Solder (RMA type), 63/67, 0.5 mm diameter, 1 lb. spool	
0180303E45	SMD tool kit (included with R1319A)	
R1319	ChipMaster (110V)	Surface-mount removal and assembly of surface-mounted integrated circuits and/or rework station shields. Includes 5 nozzles.
R1321	ChipMaster (220V)	
R1364	Digital heated tweezer system	Chip component removal
R1427	Board preheater	Reduces heatsink on multi-level boards
6680309B53	Rework equipment catalog	Contains application notes, procedures, and technical references used to rework equipment
<b>ChipMaster Options:</b>		
6680370B54	0.710" x 0.710"	Heat-focus heads for R1319 workstation
6680370B57	0.245" x 0.245"	
6680370B58	0.340" x 0.340"	
6680371B15	0.460" x 0.560"	

Table 4-1. Recommended Service Tools (Continued)

Motorola Part Number	Description	Application
<b>ChipMaster Nozzles:</b>		
6680333E28	PA nozzle	Soldering and unsoldering ICs
6680332E83	PLCC-28* nozzle	
6680332E93	PLCC-32 nozzle	
6680332E82	PLCC-44* nozzle	
6680332E94	PLCC-52 nozzle	
6680332E95	PLCC-68* nozzle	
6680332E96	PLCC-84 nozzle	
6680332E89	QFP-80 nozzle	
6680332E90	QFP-100* nozzle	
6680332E91	QFP-132* nozzle	
6680334E67	QFP-160 nozzle	
6680332E86	SOIC-14/SOL-16J nozzle	
6680333E46	SOL-18 nozzle	
6680332E84	SOIC-20 nozzle	
6680332E87	SOL-20J nozzle	
6680333E45	SOL-24 nozzle	
6680332E88	SOL-28J nozzle	
6680333E54	TSOP-32 nozzle	
6680333E55	TSOP-64 nozzle	

\* Included with ChipMaster packages

### 4.3 Voltage Measurement and Signal Tracing

It is always a good idea to check the battery voltage under load. This can be done by checking the OPT\_B+\_VPP pin at the side connector (pin 4). The battery voltage should remain at or above 7.0 Vdc. If the battery voltage is less than 7.0 Vdc, then it should be recharged or replaced as necessary prior to analyzing the radio.

In most instances, the problem circuit may be identified using a multimeter, an RF millivoltmeter, oscilloscope (preferably with 100 MHz bandwidth or more), and a spectrum analyzer.

 <p><b>Caution</b></p>	<p>When checking a transistor or module, either in or out of circuit, do not use an ohmmeter having more than 1.5 Vdc appearing across test leads or use an ohms scale of less than x100.</p>
---	---

## 4.4 Standard Bias Table

Table 4-2 outlines some standard supply voltages and system clocks which should be present under normal operation. These should be checked as a first step to any troubleshooting procedure.

Table 4-2. Standard Operating Bias

Signal Name	Nominal Value	Tolerance	VOCON Board Source
13 MHz	13 MHz	±1000 ppm	C303 (NTN9564) C339 (NNTN4563, NNTN4819 & NNTN4717)
FLIP_32K	32.768 kHz	±400 ppm	U302, pin2 (under shield SH102 on NNTN4563, NNTN4819 & NNTN4717)
SINE32K	32.768 kHz	±400 ppm	C313 (NTN9564) C306 (NNTN4563, NNTN4819 & NNTN4717)
CKIH	16.8 MHz		R452 (under shield SH101 on NNTN4563, NNTN4819 & NNTN4717 or test fixture pin 7 on the board-to-board connector)
16_8MHz	16.8 MHz		C452 (under shield SH101 on NNTN4563, NNTN4819 & NNTN4717)
POR	3.0 Vdc	±5%	POR test point
RESET_OUT	3.0 Vdc	±5%	RESET_OUT test point (NTN9564) D401, pin 3 (NNTN4563, NNTN4819 & NNTN4717)
VSW1	3.85 Vdc	±5%	R502
VSW2	1.85 Vdc	±5%	R501
FILT_B+	7.5 Vdc	6.0-9.0 Vdc	C523
V2	3.0 Vdc* 2.9 Vdc**	±5%	R560
GCAP_B+	7.5 Vdc	6.0-9.0 Vdc	R581
UNSW_B+	7.5 Vdc	6.0-9.0 Vdc	B104
SW_B+	7.5 Vdc	6.0-9.0 Vdc	R587
VCC5	5.0 Vdc	±5%	R503
VSW_1_55 V	1.55 Vdc	±5%	R407 (NNTN4717 VOCON kit only)

\* = NTN9564, NNTN4563, & NNTN4819 VOCON kits

\*\* = NNTN4717 VOCON kit

Table 4-3. Standard Operating Bias (only for kit NNTN5567\_)

Signal Name	Nominal Value	Tolerance	VOCON Board Source
Gated_32_CLK	32.768KHz	± 400ppm	R543
CKIH	16.8MHz		R457
16.8_MHz	16.8MHz		C450
POR	2.9Vdc	±5%	R725
MAKO_RESET	2.9Vdc	±5%	TP_MAKO_RESET
VSW1	3.6Vdc	±5%	R511
VSW2	2.3Vdc	±5%	C515
V_2.9	2.9Vdc	±5%	C523
UNSW_B+	7.5Vdc	6.0-9.0Vdc	R525
SW_B+	7.5Vdc	6.0-9.0Vdc	R517
VCC5	5.0Vdc	±5%	L505
VSAVE	2.5Vdc	±5%	C504
RF_SW_B+	7.5Vdc	6.0-9.0Vdc	C530

## 4.5 Power-Up Self-Check Errors

Each time the radio is turned on, the MCU and DSP perform a series of internal diagnostics. These diagnostics consist of checking such programmable devices as the FLASH ROMs, the EEPROM, and SRAM devices.

Problems detected during the power-up self-check routines are presented as error codes on the radio's display. For non-display radios, the problem is presented at power up by a single, low-frequency tone. Table 4-4 lists possible error codes, a description of each error code, and a recommended corrective action.

Table 4-4. Power-Up Self-Check Error Codes

Error Code	Description	Corrective Action
01/02	FLASH ROM codeplug Checksum Non-Fatal Error	Reprogram the codeplug
01/12	Security Partition Checksum Non-Fatal Error	Send radio to depot
01/20	ABACUS Tune Failure Non-Fatal Error	Turn radio off, then on
01/22	Tuning Codeplug Checksum Non-Fatal Error	Send radio to depot
01/81	Host ROM Checksum Fatal Error	Send radio to depot
01/82	FLASH ROM Codeplug Checksum Fatal Error	Reprogram the codeplug

Table 4-4. Power-Up Self-Check Error Codes (Continued)

Error Code	Description	Corrective Action
01/88	External RAM Fatal Error — Note: Not a checksum error	Send radio to depot
01/90	General Hardware Failure Fatal Error	Turn radio off, then on
01/92	Security Partition Checksum Fatal Error	Send radio to depot
01/93	FLASHport Authentication Code Failure	Send radio to depot
01/98	Internal RAM Fail Fatal Error	Send radio to depot
01/A2	Tuning Codeplug Checksum Fatal Error	Send radio to depot
02/81	DSP ROM Checksum Fatal Error	Send radio to depot
02/88	DSP RAM Fatal Error — Note: Not a checksum error	Turn radio off, then on
02/90	General DSP Hardware Failure (DSP startup message not received correctly)	Turn radio off, then on
09/10	Secure Hardware Failure	Turn radio off, then on
09/90	Secure Hardware Fatal Error	Turn radio off, then on

## 4.6 Power-Up Self-Check Diagnostics and Repair (Not for Field Use)

Table 4-5 lists additional action items that can be used for the diagnosis and resolution of the error codes listed in Table 4-4 on page 4-5.

Table 4-5. Power-Up Self-Check Diagnostic Actions

Error Code	Diagnostic Actions
01/02	This non-fatal error will likely recover if the radio's power is cycled. In the event that this does not resolve the issue, the radio should be reflashed. As a last resort, the FLASH ROM U402 should be replaced.
01/12	The radio should be sent to the depot for reflashing of the security codeplug.
01/20	Cycling radio power should resolve this issue.
01/22	The radio should be sent to the depot for reflash of the tuning codeplug followed by retuning of the radio.
01/81	The radio should be sent to the depot for reflashing of the host code.
01/82	The radio should be sent to the depot for reflashing of the radio codeplug.
01/88	Reflashing of the radio should first be performed. If this fails to resolve the issue, then replacement of the SRAM U403 is necessary.
01/90	Cycle power to radio. Continued failure indicates a likely IC failure (GCAP, PCIC, FLIPPER, ABACUS). In this event, radio should be sent to the depot for isolation and repair of the problem IC.

Table 4-5. Power-Up Self-Check Diagnostic Actions (Continued)

Error Code	Diagnostic Actions
01/92	The radio should be sent to the depot for reprogramming of the security codeplug.
01/93	The radio should be sent to the depot for reflashing of the host code.
01/98	Send radio to the depot for replacement of the SRAM U403.
01/A2	The radio should be sent to the depot for reflashing of the tuning codeplug followed by re-tuning of the radio.
02/81	The radio should be sent to the depot for examination and/or replacement of either the FLASH U402, or the PATRIOT MCU/DSP U401.
02/88	Cycle power to the radio. If this does not fix the problem, then the radio should be sent to the depot for reflashing of the DSP code. Continued failure requires examination and/or replacement of the SRAM U403.
02/90	Cycle power to the radio. If this fails to fix the problem, then the radio should be sent to the depot for reflashing of the DSP code. Continued failure may require replacement of U401, the PATRIOT MCU/DSP.
09/10	Cycle power to the radio. If this fails then follow instructions in the secure hardware failure troubleshooting flowchart.
09/90	Cycle power to the radio. If this fails then follow instructions in the secure hardware failure troubleshooting flowchart.

## **Notes**

---

## Chapter 5 Troubleshooting Charts

This section contains detailed troubleshooting flowcharts. These charts should be used as a guide in determining the problem areas. They are not a substitute for knowledge of circuit operation and astute troubleshooting techniques. It is advisable to refer to the related detailed circuit descriptions in the theory of operation sections prior to troubleshooting a radio.

### 5.1 List of Troubleshooting Charts

Most troubleshooting charts (see [Table 5-1](#)) end up by pointing to an IC to replace. **It is not always noted, but it is good practice to verify supplies and grounds to the affected IC and to trace continuity to the malfunctioning signal and related circuitry before replacing any IC.** For instance, if a clock signal is not available at a destination, continuity from the source IC should be checked before replacing the source IC.

MAEPF-27390-A

# Power-Up Failure (for kit NNTN5567)—Page 1

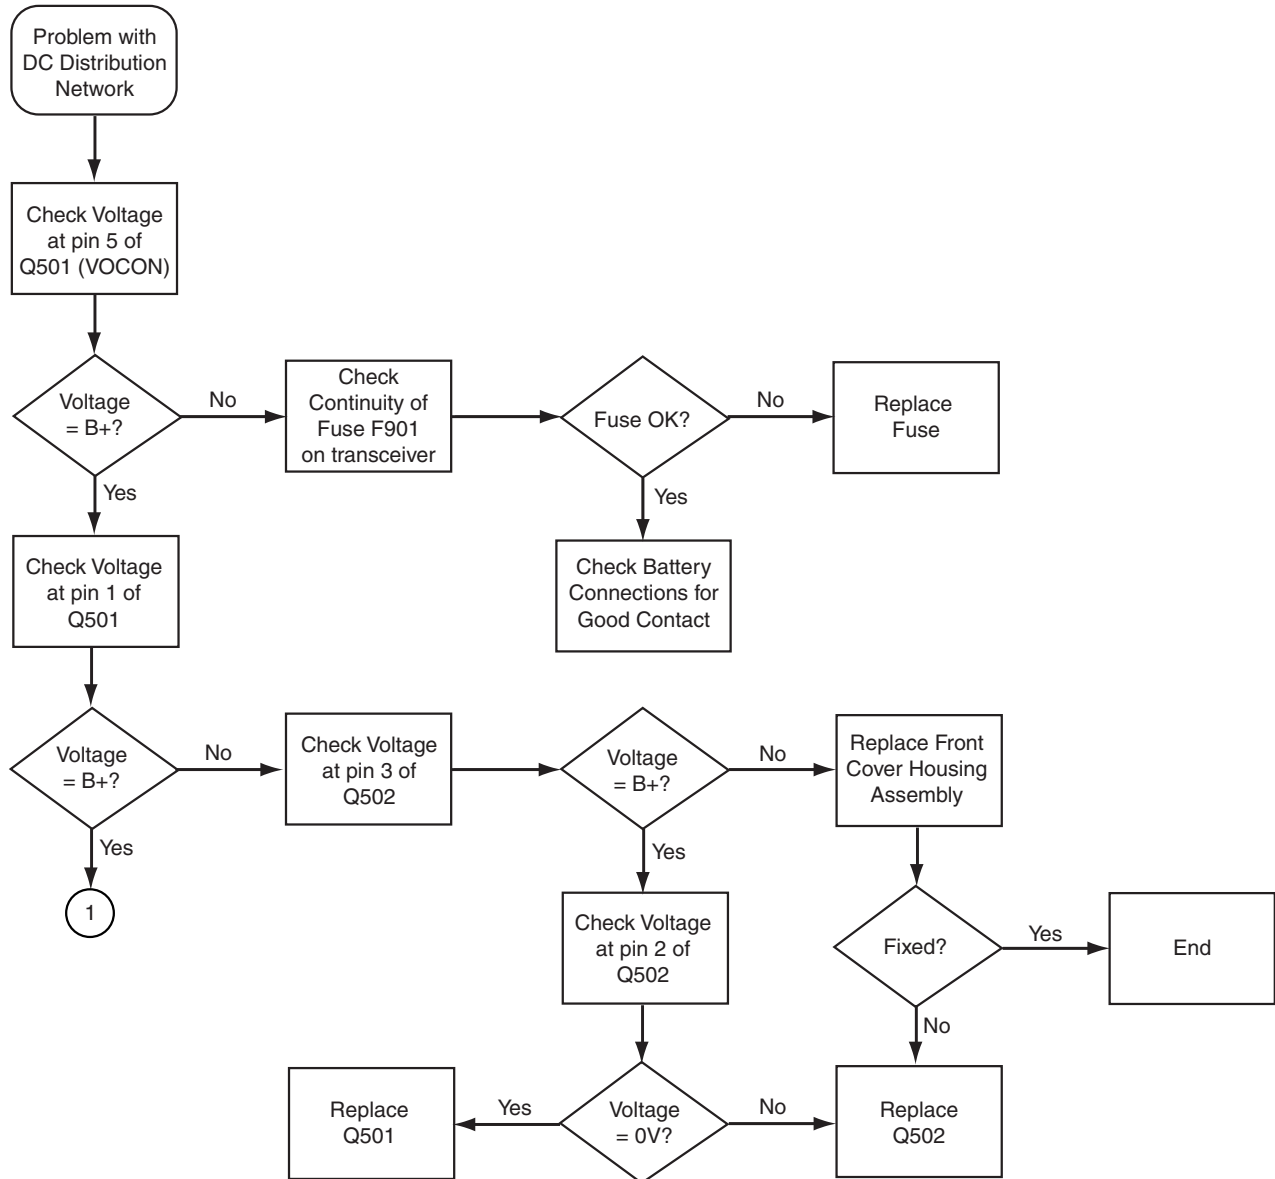

# Power-Up Failure (for kit NNTN5567)—Page 2

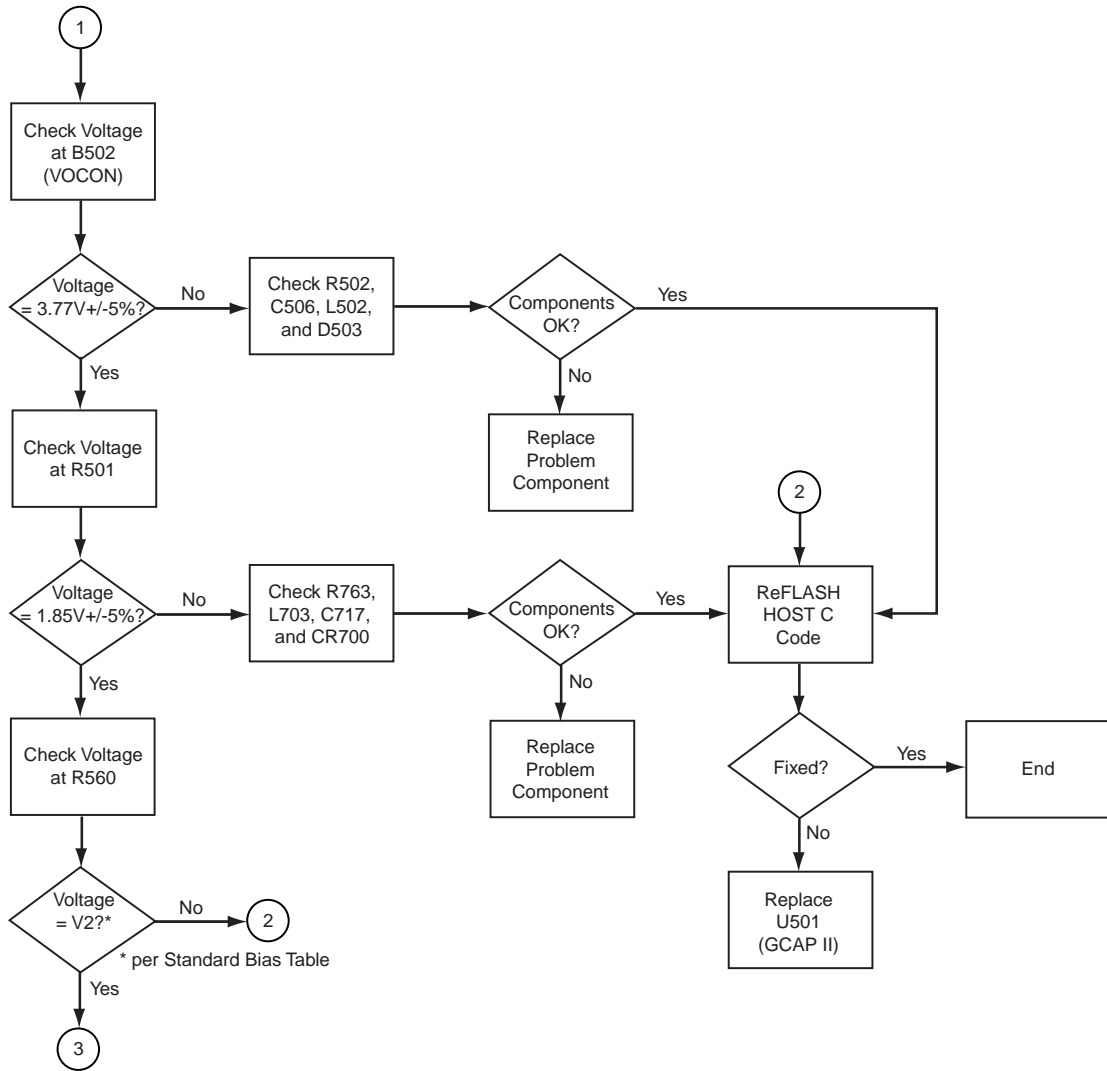

### 5.4 DC Supply Failure—Page 1

**NOTE:** Since the failure of a critical voltage supply might cause the radio to automatically power down, supply voltages should first be probed with a multimeter. If all the board voltages are absent, then the voltage test point should be retested using a rising-edge-triggered oscilloscope. If the voltage is still absent, then another voltage should be tested using the oscilloscope. If that voltage is present, then the original voltage supply in question is defective and requires investigation of associated circuitry.

## 5.9 Button Test

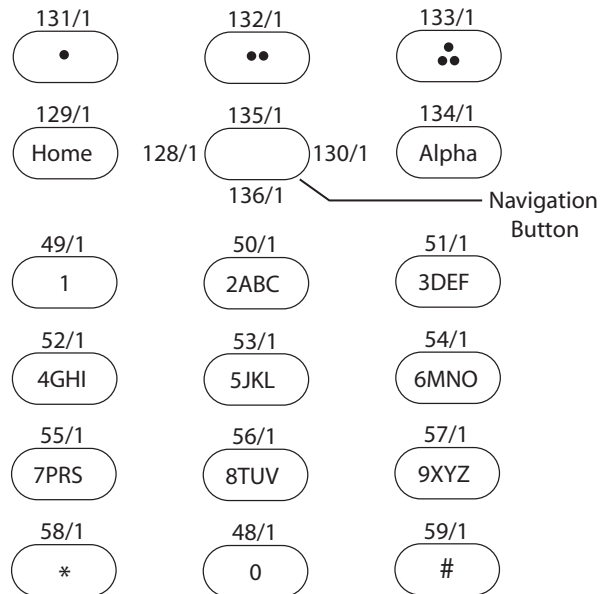

**Synopsis**

This chart relates to a failure in the button functions  
 Basic Failure modes are as follows:

- 1) Failure in control top/PTT or keypad flex assembly
- 2) Bad Connection
- 3) Defective Switches or pads
- 4) Defective A/D port in GCAP II
- 5) Defective MAKO A/D ports (for kit NNTN5567)

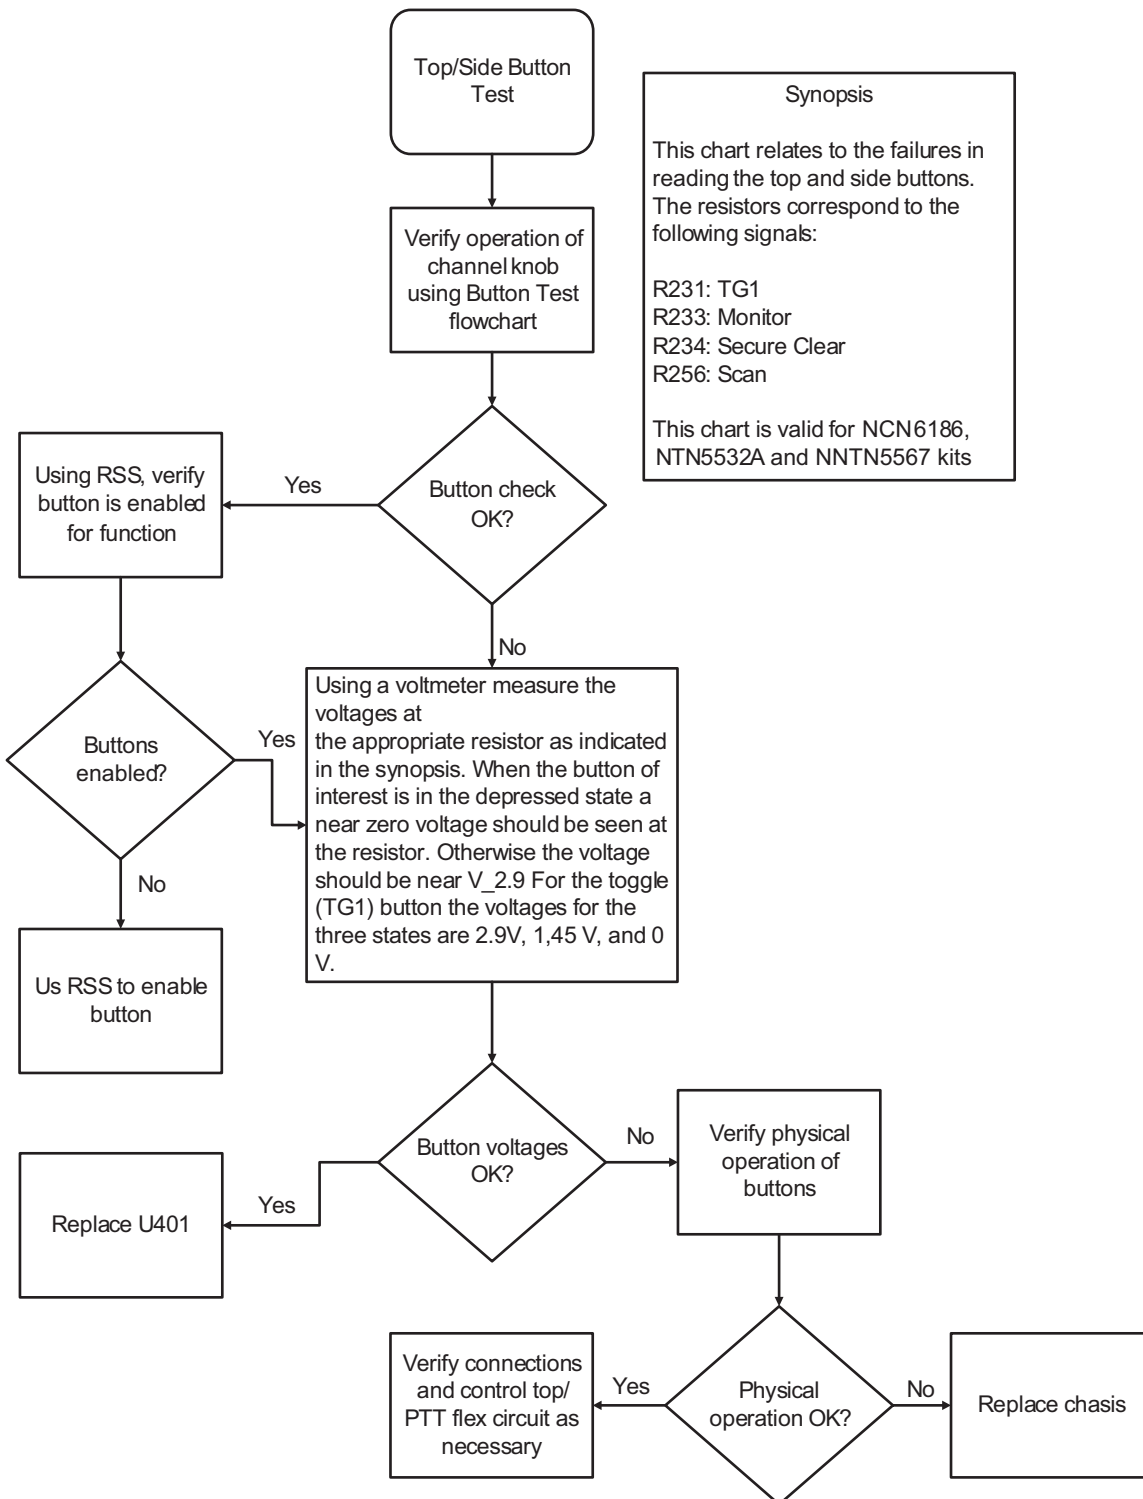

**Button Table**

Button	Code
PTT	1/ 0-1
Top Button (Emergency)	3/ 0-1
Side Button 1 (Monitor)	96/ 0-1
Side Button 2	97/ 0-1
Side Button 3	98/ 0-1
Channel Select (Frequency)	4/ 0-15
Volume Control Knob	0/ 0-244
Zone Select	65/ 0-2

### 5.10 Top/Side Button Test

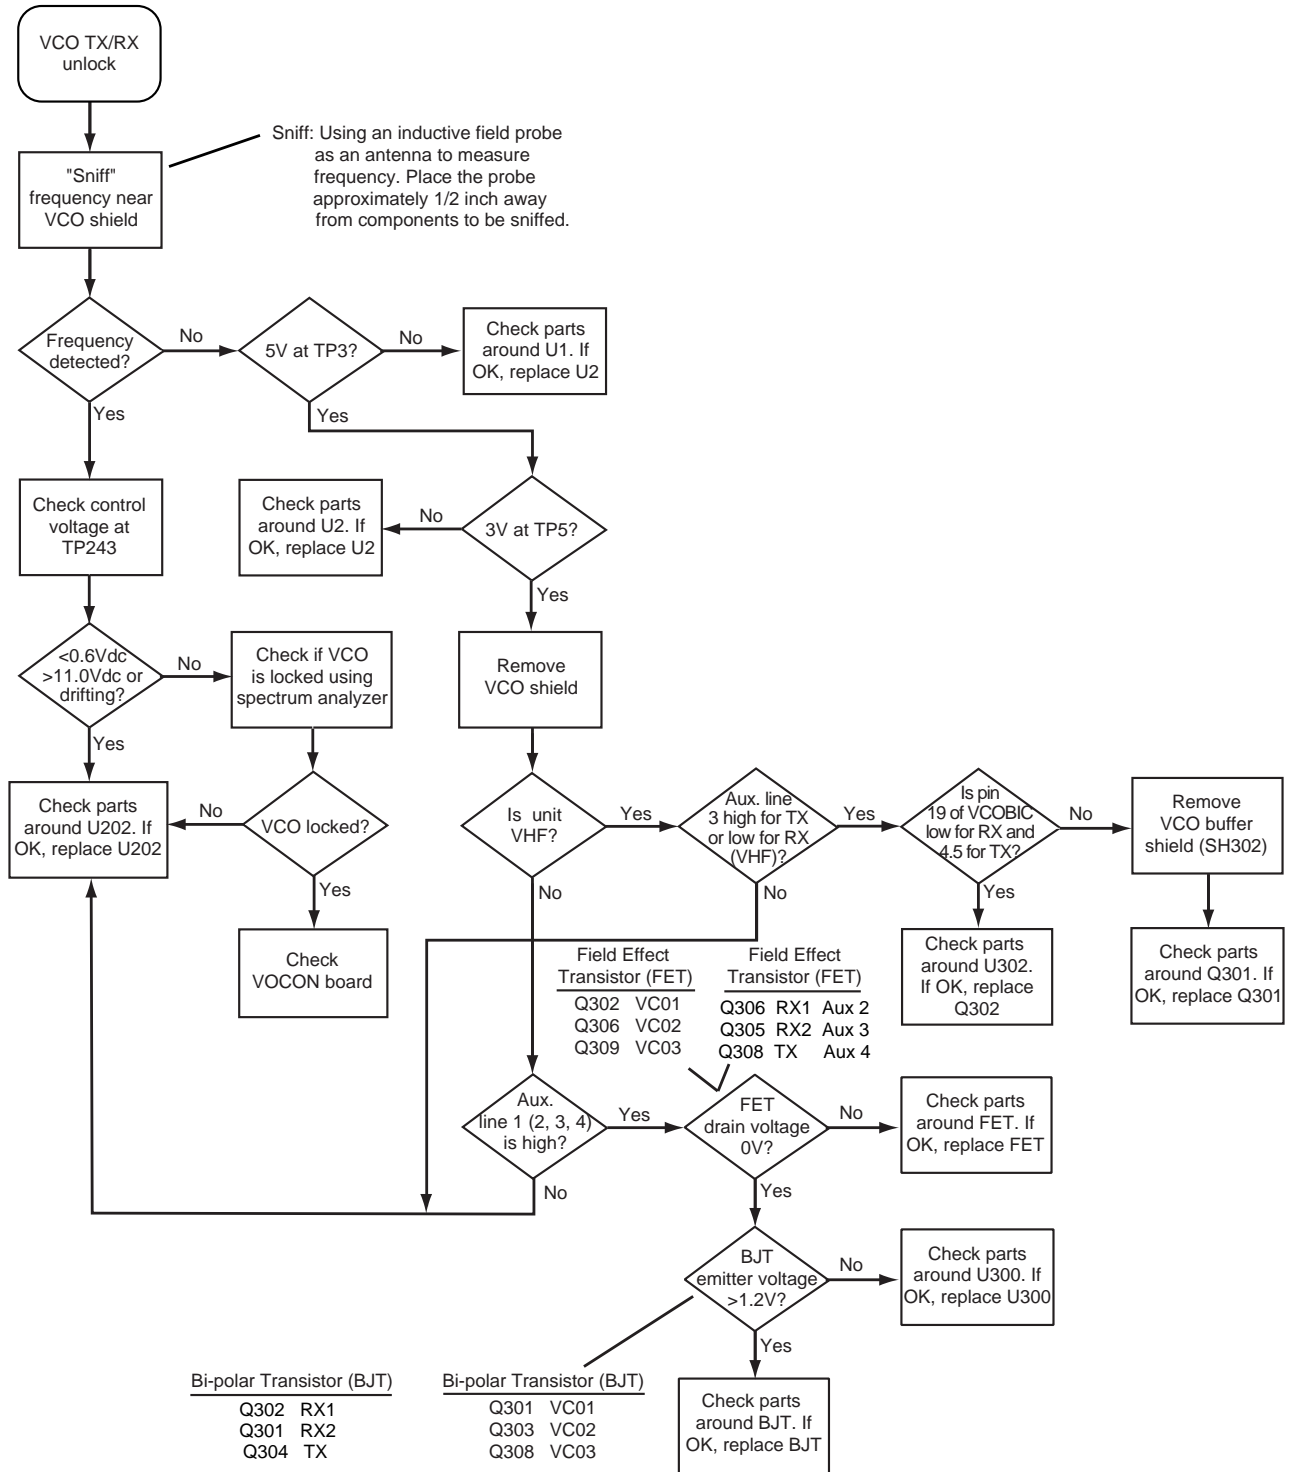

**Synopsis**

This chart relates to the failures in reading the top and side buttons. The resistors correspond to the following signals:

- R231: TG1
- R233: Monitor
- R234: Secure Clear
- R256: Scan

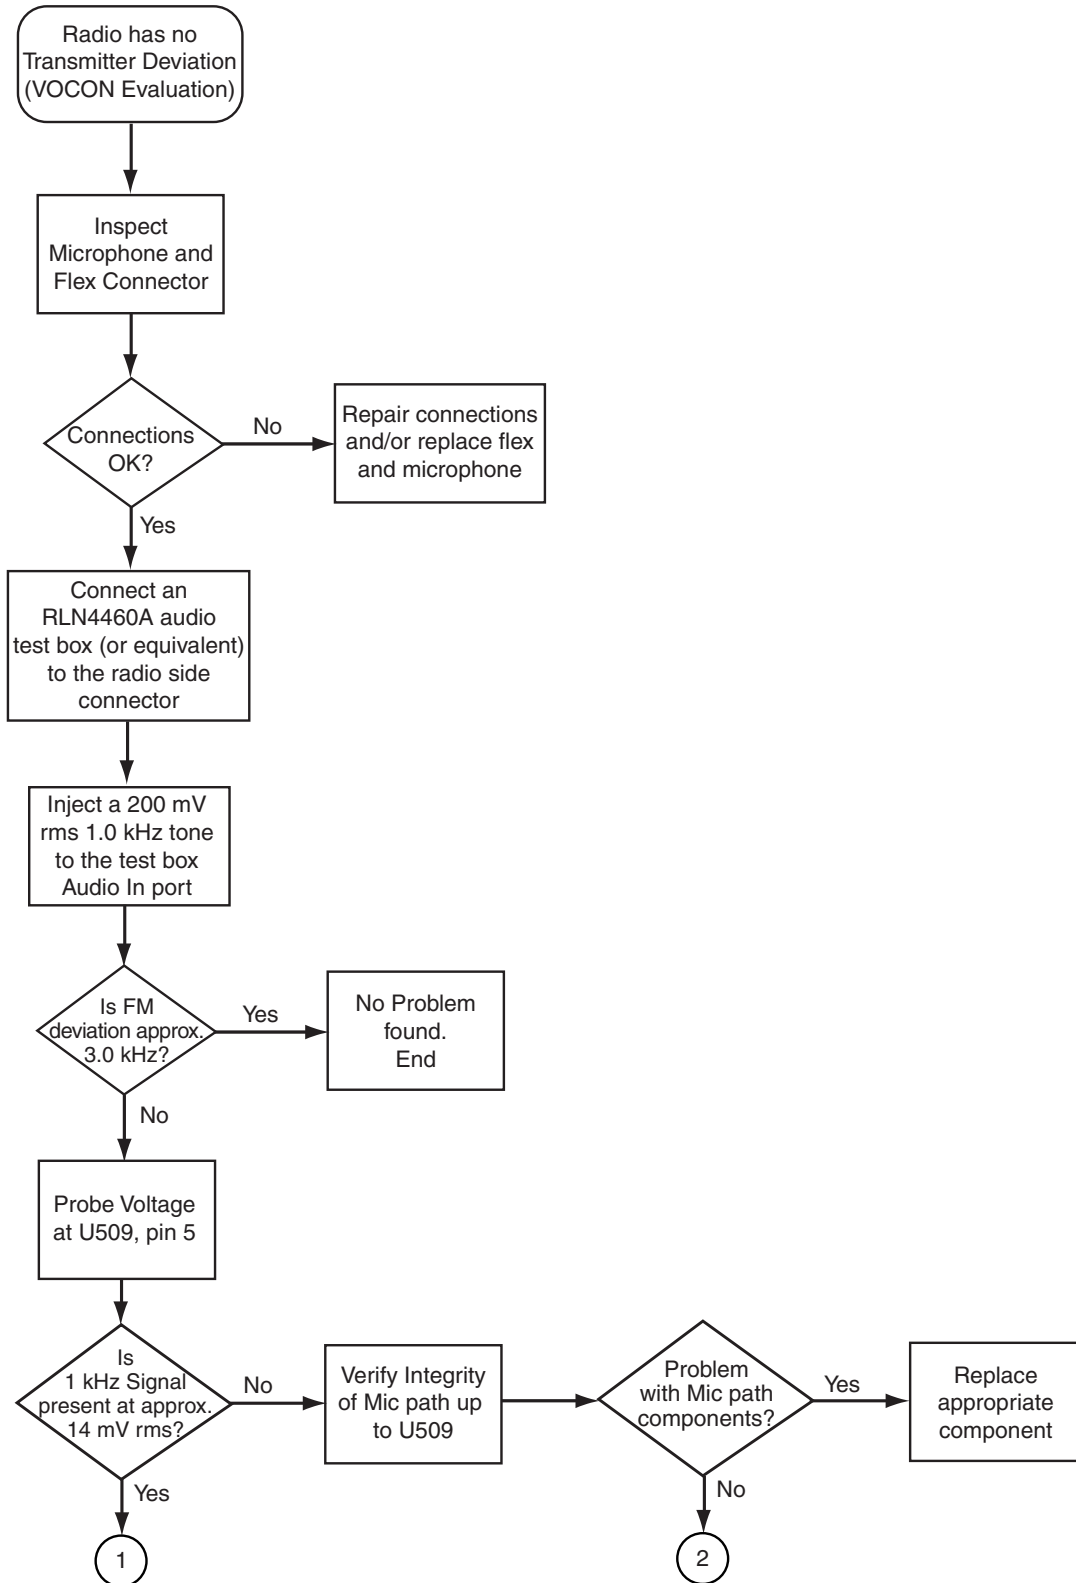

This chart is valid for NCN6186, NTN5532A and NNTN5567 kits

### 5.17 Keyload Failure

**Synopsis**  
 This failure relates only to secure-equipped radios and indicates a failure to load key with the KVL indicated by the message "KEYFAIL" and key-fail tone.  
 Typical failure modes would be:  
 1) Open between universal connector uC which places radio in Keyload mode.  
 2) Use of wrong KVL or KVL cable for XTS 5000 radio.  
 3) Failure of secure module.

MAEPF-27388-B

### 5.18 Secure Hardware Failure

MAEPF-27387-O

## Notes

---

## Chapter 6 Troubleshooting Waveforms

This chapter contains images of waveforms that might be useful in verifying operation of certain parts of the circuitry. These waveforms are for reference only; the actual data depicted will vary depending on operating conditions.

### 6.1 List of Waveforms

[Table 6-1](#) lists each waveform and the page on which the waveform can be found.

*Table 6-1. List of Waveforms*

# Chapter 7 Troubleshooting Tables

## 7.1 List of Board and IC Signals

Due to the nature of the schematic-generating program, signal names might be different when they are not directly connected to the same point. The tables in this chapter provide a cross reference to the various pinouts for these signals. [Table 7-1](#) lists and provides links to each of the tables in this chapter.

*Table 7-1. List of Tables of Board and IC Signals*

\* = Component located under a shield on NNTN4563, NNTN4819, & NNTN4717

Table 7-10. U501 MAKO IC Pinouts (for kit NNTN5567)

U301 Pin No.	Description	To/From	Comment	Accessible on Vococn
A2	PGLDO3	R593	2.5Vdc, sets V3 Level	Yes
A3	TEST	GND		Yes
A4	VREF	C571	Internal Voltage	Yes
A5	BBP_CLK	R436	1.68MHZ Clock at Logic Level	Yes
A6	LOGIC_VDD	U406 pin 5	2.9Vdc	Yes
A7	VC_RX	R403	Voice Rx Codec operates at Logic Level	Yes
A8	RS232_USB_X	R581	Selects Either RS232 or USB mode, Operates at Logic Level	Yes
A9	USB2_OE_RCV_RTS	TP_URTS1_XRXD	Output Enable, Active Low Input	Yes
A10	UART2_RXD_OD	TP_RXD2	UART Rx Digital Output at Logic Level	Yes
A11	TX_RX	NC		No
A12	XOUT	Y502 pin 3	24.576MHZ	Yes
A13	XIN	Y502 pin 1	24.576MHZ	Yes
B1	XTAL32_OUT	Y501 pin 1	32.768KHZ RC Out	Yes
B2	BAT_TYPE	GND		Yes
B3	SW_TYPE	GND		Yes

Table 7-10. U501 MAKO IC Pinouts (for kit NNTN5567)

U301 Pin No.	Description	To/From	Comment	Accessible on Vococn
B4	IGN_X	NC		No
B5	BBP_SYNC	R437	48KHz at Logic Level	Yes
B6	SPI_DI	U701 pin 3	SPI Data In	Yes
B7	VC_TX	NC		No
B8	USB1_OE	TP_USB_TX ENAB	Output Enable used for USB Mode, Active Low Input	Yes
B9	USB2_DAT_VP	TP_USB_VP 1	Rx Vplus Output at 3.3V Logic Level	Yes
B10	CTS_X	TP_UCTS1_ USB_SPEED *	Active Low Signal Operates at Logic Level	Yes
B11	AD_TRIG	U401 pin F13	Active High Trigger to Start A/D, Logic Level	No
B12	OPTION_INTX	NC		No
B13	VBUS_SUPPLY	NC		No
C1	XTAL32_IN	Y501 pin 2	32.768KHz Oscillator	Yes
C2	VSAVE	R593	2.5Vdc	Yes
C3	PGLDO2	GND		Yes
C4	SCAN_EN	GND		Yes
C5	RESETX	TP_MAKO_R ESET	Active Low Asserted Reset, Operates at Logic Level	Yes
C6	SPI_DO	TP_SPI_MO SIB	Digital Output of SPI data to Microprocessor, Operates at Logic Level	Yes
C7	BOOT_NORM_X	R583	Selects Bootstrap Mode or Normal, Operates at Logic Level	Yes
C8	USB1_DAT_TXD	TP_UTXD1_ USB_VPO	Digital Input for USB or RS232 Operates at Logic Level	Yes
C9	USB2_SE0_VM_RXD	TP_URXD1_ USB_VMI	Output for Vminus or Output for RS232 Data	Yes
C10	USB_INTX	NC		No

C11	OPT_GPIO1	NC		No
C12	BUSY_IN	TP_BSY_IN_RTS	Level Translated SB96_BUS_BUSY, Operates at Logic Level	Yes
C13	VBUS2_CMD	NC		No
C14	VBUS1_CMD	NC		No
D1	BAT_7V5	R525	7.5Vdc	Yes
D2	BAT_3V6	C505	3.6Vdc	Yes
D3	REG_3V6	R505	3.6Vdc	Yes
D4	TCXO_SEL_16_24	GND		Yes
D5	INT_X	TP_MAKO_INT	Digital Output Assert Active Low Interrupt, Operates at Logic Level	Yes
D6	SPI_CS	R567	Marko SPI Chip Select, Operates at Logic Level	Yes
D7	VC_FSYNC	R573		Yes
D8	USB1_SE0	TP_USB_VMO	Tx SE0 Input, Operates at Logic Level	Yes
D9	GND9	GND		Yes
D10	CABLE_DET_3V	TP_KVL_USB_DET	Level Translated CTS_CABLE_DET_5V	Yes
D11	OPT_GPIO3	NC		No
D12	VBUS2	NC		No
D13	SW5_VDD	NC		No
D14	GND7	GND		Yes
E1	PA_BPLUS	R524	7.5Vdc PA Supply	Yes
E2	FET_ENX	R502	Enable to Switch B+ PMOS, Max 11V	Yes
E3	BPLUS	R525	Connects to Battery +, 7.5V	Yes

Table 7-10. U501 MAKO IC Pinouts (for kit NNTN5567)

U301 Pin No.	Description	To/From	Comment	Accessible on Vococn
E4	MECH_SW	Q501 pin 3	Radio On/Off Switch, Pulls to GND if switch is close, 2.5Vdc Otherwise	Yes
E6	SPI_CLK	SCKB		Yes
E7	VC_DCLK	R572	SSI serial clock. (Freq = 8 KHz * 16bits/slot * #slots)	Yes
E8	VFUSE	GND		Yes
E9	UART2_TXD	TP_UTXD2		Yes
E11	BUSY_OUT	TP_BSY_OUT	Controls SB9600, Active Low	Yes
E12	VBUS1_SENS	NC		No
E13	SW5_SUMCOMP	NC	5 Pulse Output that Operates at 5V	No
E14	SW5_VSENSE	NC		No
F1	INT_SPKR_P	J101 pin 40	Analog Output, Positive Internal Speaker PA Pin	Yes
F2	INT_SPKR_M	J101 pin 37	Analog Output, Negative Internal Speaker PA Pin	Yes
F3	BAT_RTC	C500	Analog I/O for RTC	Yes
F4	EMERG_PB	NC		No
F5	GATED_32K_CLK	U512 pin 3	36.25KHz Nominal Signal	Yes
F10	OPT_GPIO0	NC		Yes
F11	VBUS32_SENS	NC		Yes
F12	SW5_VOUT	NC		Yes
F13	SW5_VDDHV	NC		Yes
F14	SW1_PHASE	Q502 pin 16	Input Used to Detect if Output has Switched	Yes
G1	EXT_SPKR_M	J101 pin 9	Analog Output, Negative External Speaker PA Pin	Yes
G2	PA_IN_P	C564	Analog Input, Plus PA pin	Yes
G3	PA_IN_M	C565	Analog Input, Minus PA pin	Yes

Table 7-10. U501 MAKO IC Pinouts (for kit NNTN5567)

U301 Pin No.	Description	To/From	Comment	Accessible on Vococn
G4	HV_BG	C506	Bandgap Output at 1.231V	Yes
G5	GND4	GND		Yes
G10	OPT_GPIO2	NC		No
G11	SW5_PHASE	NC		No
G12	SW1_VDDHV	R569 or C510	Switcher 1 Supply Input from SW_B+	Yes
G13	SW1_VDD	C511	5Vdc Output	Yes
G14	SW1_SUMCOMP_DL	Q502 pin 4	Pulse Width Modulated Output at 5V	Yes
H1	EXT_SPKR_P	J101 pin 9	Analog Output, Positive External Speaker PA Pin	Yes
H2	VC_OUT_M	R598	Voice Codec Analog Output	Yes
H3	VC_OUT_P	R597	Voice Codec Analog Output	Yes
H4	VCM2	C570		Yes
H5	GND8	GND		Yes
H10	VBUS1	NC		No
H11	SW1_VSEN_BUK	Q502 pin 1		Yes
H12	SW1_VOUT	C513		Yes
H13	SW1_DH	NC		No
H14	SW1_GND	GND		Yes
J1	EXT_MIC_M	C559	Analog Input, External Mic Negative Input	Yes
J2	EXT_MIC_P	C554	Analog Input, External Mic Positive Input	Yes
J3	VCM1	C562	Analog I/O	Yes
J4	GND3	GND		Yes
J5	TXDO_BDI_UP_3V	U301 pin K6		No

K1	INT_MIC_M	C558	Analog Input, Internal Mic Negative Input	Yes
K2	INT_MIC_P	C555	Analog Input, Internal Mic Positive Input	Yes
K3	V08_I	J701 pin 7	Nominal 7.5Vdc Input	Yes
K4	V08_O	L505	5.0Vdc	Yes
K6	TXDO_BDI_ENC_3V	U301 pin J5		No
K7	OPTA_SEL1	NC		No
K8	OPTB_SEL1	NC		No
K9	GND5	GND		Yes
K11	ATOD6	GND		Yes
K12	ATOD7	GND		Yes
K13	ATOD8	R207	Analog Input for A to D Channel 8	Yes
K14	SW2_VCCS	R514	3.6Vdc	Yes
L1	V09_O	C522	3.3Vdc	Yes
L2	MIC_BIAS	R551	5Vdc When Mic Bias is Switched On	Yes
L3	FE_TUNE1	NC		No
L4	GND6	GND		Yes
L5	APCO	NC		No
L6	USB_CONNECT	NC		No
L7	ONE_WIRE_UP	R595	Digital I/O at 1.8V or 3V	Yes

Table 7-10. U501 MAKO IC Pinouts (for kit NNTN5567)

U301 Pin No.	Description	To/From	Comment	Accessible on Vococn
L8	ONE_WIRE_BATT	R580	Digital I/O at 5V Level	Yes
L9	V10_GND	GND		Yes
L10	VMES	C560	Analog I/O	Yes
L11	ATOD2	C234	Analog Input for A to D Channel 2	Yes
L12	ATOD4	NC		No
L13	ATOD5	R557	Analog Input for A to D Channel 5	Yes
L14	SW2_GND	GND		Yes
M1	TCXO_IN	R459	Analog 16.8MHz Input	Yes
M2	FE_TUNE2	NC		No
M3	RTS_FILLSEN_3V	NC		No
M4	VC_TX3V	R402	Digital Output for Tx Codec Operates at 2.9V Level	Yes
M6	V10_O	C524	3.3Vdc Output	Yes
M7	GND2	GND		Yes
M8	ONE_WIRE2	NC		No
M9	OPTA_SEL2	NC		No
M10	TXDO_BDI_5V	VR221 pin 1	Digital I/O pin for RS232 and Boot Data, Operates at 5V Level	Yes
M11	RTS_FILLSEN_5V	R578	Digital Input, Request to Send or Fill Sense, Operates at 5V Level	Yes
M12	ADC_VREF	C557		Yes
M13	ATOD1	R232	Analog Input for A to D Channel 1	Yes
M14	ATOD3	R231	Analog Input for A to D Channel 3	Yes
N1	PWR_CTRL	NC		No
N2	RXDIN_ENC_3V	U301 pin P2		No
N3	UCM_SS	R102	Digital Output UCM Slave Select, Active Low	Yes
N4	V02_O	C516	1.875Vdc	Yes

Table 7-10. U501 MAKO IC Pinouts (for kit NNTN5567)

U301 Pin No.	Description	To/From	Comment	Accessible on Vococn
N5	V04_O	C521	2.775Vdc	Yes
N6	USB1_DP	VR221 pin 1	D+ Cable connection for USB1	Yes
N7	USB2_DP	NC		No
N8	SB96D_BDO_KF_3V	R588	Digital I/O, Operates at 2.9V Level	Yes
N9	SB96D_BDO_KF_5V	R577	Digital I/O, Operates at 5V Level	Yes
N10	OPTA_SEL3	N10	Digital I/O, As Output Operates at 5V Level	Yes
N11	OPTB_SEL3	N11	Digital I/O, As Output Operates at 5V Level	Yes
N12	RXDIN_5V	VR220 pin 1	Digital RS232 Input from Radio Connector, Operates at 5V Level	Yes
N13	SB96_BUS_BUSY	R576	Digital I/O, Operates at 5V Level	Yes
N14	ATOD0	U407 pin 5	Analog Input for A to D Channel 0	Yes
P2	RXDIN_3V	U301 pin N2		No
P3	V06_O	C523	2.9Vdc	Yes
P4	V03_O	C518	1.55Vdc	Yes
P5	GND1	GND		Yes
P6	V07_O	C517	2.775Vdc Used Internally	Yes
P7	USB1_DM	VR220 pin 1	D- Cable Connection for USB1	Yes
P8	USB2_DM	NC		No
P9	ONE_WIRE_1	R215	Digital I/O, Operates at 2.9V Level	Yes
P10	OPTA_SEL0	NC		No
P11	OPTB_SEL0	NC		No
P12	OPTB_SEL3	NC		No
P13	CTS_CABLE_DET_5V	R579	Digital I/O, Operates at 5V Level	Yes

## Notes

## Chapter 8 Schematics, Board Overlays, and Parts Lists

This chapter contains the schematics, board overlays, and parts lists for the XTS 5000 radio. Use them in conjunction with the theory of operation and the troubleshooting procedures, charts, and waveforms to isolate a problem to the component level.

When schematics are viewed on line or as a PDF file, colors can be seen that denote power and signal paths. The red color denotes voltage paths, blue denotes the receive path, and green denotes the transmit path.

The following tables list the pages where the schematics and board overlays for the XTS 5000 radio are found.

### 8.1 List of Transceiver Schematics and Board Overlays

Table 8-1. List of Transceiver Schematics and Board Overlays

## Notes

---

## Appendix A Replacement Parts Ordering

### A.1 Basic Ordering Information

When ordering replacement parts or equipment information, the complete identification number should be included. This applies to all components, kits, and chassis. If the component part number is not known, the order should include the number of the chassis or kit of which it is a part, and sufficient description of the desired component to identify it.

Crystal orders should specify the crystal type number, crystal and carrier frequency, and the model number in which the part is used.

### A.2 Transceiver Board and VOCON Board Ordering Information

When ordering a replacement Transceiver Board or VOCON Board, refer to the applicable Model Chart in the front of this manual, read the Transceiver Board or VOCON Board note, and include the proper information with your order.

### A.3 Motorola Online

Motorola Online users can access our online catalog at

<https://www.motorola.com/businessonline>

To register for online access, please call 800-814-0601 (for U.S. and Canada Service Centers only). International customers can obtain assistance at <https://businessonline.motorola.com>.

### A.4 Telephone Orders

Radio Products Services Division\*  
(United States and Canada)  
7:00 AM to 7:00 PM (Central Standard Time)  
Monday through Friday (Chicago, U.S.A.)  
1-800-422-4210  
(International Orders)  
1-847-538-8023

U.S. Federal Government Markets Division (USFGMD)  
1-800-826-1913 Federal Government Parts - Credit Cards Only  
8:30 AM to 5:00 PM (Eastern Standard Time)

### A.5 Fax Orders

Radio Products Services Division\*  
(United States and Canada)  
1-800-622-6210  
(International)  
1-847-576-3023

USFGMD  
(Federal Government Orders)  
1-800-526-8641 (For Parts and Equipment Purchase Orders)

---

## **A.6 Parts Identification**

Radio Products Services Division\*  
(United States and Canada)  
1-800-422-4210, menu 3

## **A.7 Product Customer Service**

Customer Response Center  
(Non-technical Issues)  
1-800-247-2346  
FAX:1-800-247-2347

\* The Radio Products Services Division (RPSD) was formerly known as the Customer Care and Services Division (CCSD) and/or the Accessories and Aftermarket Division (AAD).

# Glossary

This glossary contains an alphabetical listing of terms and their definitions that are applicable to ASTRO portable and mobile subscriber radio products. All terms do not necessarily apply to all radios, and some terms are merely generic in nature.

Term	Definition
<b>A/D</b>	<i>See analog-to-digital conversion.</i>
<b>Abacus IC</b>	A custom integrated circuit providing a digital receiver intermediate frequency (IF) backend.
<b>ADC</b>	<i>See analog-to-digital converter.</i>
<b>ADDAG</b>	<i>See Analog-to-Digital, Digital-to-Analog and Glue.</i>
<b>ALC</b>	<i>See automatic level control.</i>
<b>analog</b>	Refers to a continuously variable signal or a circuit or device designed to handle such signals. <i>See also digital.</i>
<b>Analog-to-Digital, Digital-to-Analog and Glue</b>	An integrated circuit designed to be an interface between the radio's DSP, which is digital, and the analog transmitter and receiver ICs.
<b>analog-to-digital conversion</b>	Conversion of an instantaneous dc voltage level to a corresponding digital value. <i>See also D/A.</i>
<b>analog-to-digital converter</b>	A device that converts analog signals into digital data. <i>See also DAC.</i>
<b>automatic level control</b>	A circuit in the transmit RF path that controls RF power amplifier output, provides leveling over frequency and voltage, and protects against high VSWR.
<b>band</b>	Frequencies allowed for a specific purpose.
<b>BBP</b>	<i>See baseband interface port.</i>
<b>baseband interface port</b>	Synchronous serial interface to the transceiver board used to transfer transmit and receive audio data.
<b>BGA</b>	<i>See ball grid array.</i>
<b>ball grid array</b>	A type of IC package characterized by solder balls arranged in a grid that are located on the underside of the package.
<b>CODEC</b>	<i>See coder/decoder.</i>

---

Term	Definition
<b>codeplug</b>	Firmware that contains the unique personality for a system or device. A codeplug is programmable and allows changes to system and unit parameters. <i>See also firmware.</i>
<b>coder/decoder</b>	A device that encodes or decodes a signal.
<b>CPS</b>	<i>See Customer Programming Software.</i>
<b>Customer Programming Software</b>	Software with a graphical user interface containing the feature set of an ASTRO radio. <i>See also RSS.</i>
<b>D/A</b>	<i>See digital-to-analog conversion.</i>
<b>DAC</b>	<i>See digital-to-analog converter.</i>
<b>Data communication equipment</b>	Definition for device (such as radio) data communications using the RS232 protocol. The correct data communication wiring requires the device's TX pins (output) to connect to the RX pins (input) and the RTS pins (output) to connect to the CTS pins (input). It is incorrect to attach device pins having the same name to to each other.
<b>Data terminal equipment</b>	Data terminal equipment; for example, a computer.
<b>DCE</b>	<i>See Data communication equipment.</i>
<b>default</b>	A pre-defined set of parameters.
<b>digital</b>	Refers to data that is stored or transmitted as a sequence of discrete symbols from a finite set; most commonly this means binary data represented using electronic or electromagnetic signals. <i>See also analog.</i>
<b>digital-to-analog conversion</b>	Conversion of a digital signal to a voltage that is proportional to the input value. <i>See also A/D.</i>
<b>digital-to-analog converter</b>	A device that converts digital data into analog signals. <i>See also ADC.</i>
<b>Digital Private-Line</b>	A type of digital communication that utilizes privacy call, as well as memory channel and busy channel lock-out to enhance communication efficiency.
<b>digital signal processor</b>	A microcontroller specifically designed for performing the mathematics involved in manipulating analog information, such as sound, that has been converted into a digital form. DSP also implies the use of a data compression technique.
<b>digital signal processor code</b>	Object code executed by the Digital Signal Processor in an ASTRO subscriber radio. The DSP is responsible for computation-intensive tasks, such as decoding ASTRO signaling.

Term	Definition
<b>DPL</b>	<i>See Digital Private-Line. See also PL.</i>
<b>DSP</b>	<i>See digital signal processor.</i>
<b>DSP code</b>	<i>See digital signal processor code.</i>
<b>DTE</b>	<i>See Data terminal equipment.</i>
<b>DTMF</b>	<i>See dual tone multi-frequency.</i>
<b>dual tone multi-frequency</b>	The system used by touch-tone telephones. DTMF assigns a specific frequency, or tone, to each key so that it can easily be identified by a microprocessor.
<b>EEPOT</b>	Electrically Programmable Digital Potentiometer.
<b>EEPROM</b>	<i>See Electrically Erasable Programmable Read-Only Memory.</i>
<b>Electrically Erasable Programmable Read-Only Memory</b>	A special type of PROM that can be erased by exposing it to an electrical charge. An EEPROM retains its contents even when the power is turned off.
<b>FCC</b>	Federal Communications Commission.
<b>firmware</b>	Code executed by an embedded processor such as the Host or DSP in a subscriber radio. This type of code is typically resident in non-volatile memory and as such is more difficult to change than code executed from RAM.
<b>FGU</b>	<i>See frequency generation unit.</i>
<b>flash</b>	A non-volatile memory device similar to an EEPROM. Flash memory can be erased and reprogrammed in blocks instead of one byte at a time.
<b>FLASHcode</b>	A 13-digit code which uniquely identifies the System Software Package and Software Revenue Options that are enabled in a particular subscriber radio. FLASHcodes are only applicable for radios which are upgradeable through the FLASHport process.
<b>FLASHport</b>	A Motorola term that describes the ability of a radio to change memory. Every FLASHport radio contains a FLASHport EEPROM memory chip that can be software written and rewritten to, again and again.
<b>FMR</b>	<i>See Florida Manual Revision.</i>
<b>Florida Manual Revision</b>	A document that provides interim updates to a publication until the entire publication can be updated and reissued.
<b>frequency</b>	Number of times a complete electromagnetic-wave cycle occurs in a fixed unit of time (usually one second).

Term	Definition
<b>frequency generation unit</b>	This unit generates ultra-stable, low-phase noise master clock and other derived synchronization clocks that are distributed throughout the communication network.
<b>General-Purpose Input/Output</b>	Pins whose function is programmable.
<b>GPIO</b>	<i>See General-Purpose Input/Output.</i>
<b>host code</b>	Object code executed by the host processor in an ASTRO subscriber radio. The host is responsible for control-oriented tasks such as decoding and responding to user inputs.
<b>IC</b>	<i>See integrated circuit.</i>
<b>IF</b>	Intermediate Frequency.
<b>IMBE</b>	A sub-band, voice-encoding algorithm used in ASTRO digital voice.
<b>inbound signaling word</b>	Data transmitted on the control channel from a subscriber unit to the central control unit.
<b>integrated circuit</b>	An assembly of interconnected components on a small semiconductor chip, usually made of silicon. One chip can contain millions of microscopic components and perform many functions.
<b>ISW</b>	<i>See inbound signaling word.</i>
<b>keep-alive mode</b>	A software-controlled operational mode in which power for the radio remains on after the On/Off/volume control knob is turned off to allow the microcontroller unit to complete its power-down sequence. Then, the radio completely powers off.
<b>key-variable loader</b>	A device used to load encryption keys into a radio.
<b>kHz</b>	<i>See kilohertz.</i>
<b>kilohertz</b>	One thousand cycles per second. Used especially as a radio-frequency unit.
<b>KVL</b>	<i>See key-variable loader.</i>
<b>LCD</b>	<i>See liquid-crystal display.</i>
<b>LED</b>	<i>See light emitting diode.</i>
<b>light emitting diode</b>	An electronic device that lights up when electricity is passed through it.
<b>liquid-crystal display</b>	An LCD uses two sheets of polarizing material with a liquid-crystal solution between them. An electric current passed through the liquid causes the crystals to align so that light cannot pass through them.
<b>LO</b>	Local oscillator.

Term	Definition
<b>low-speed handshake</b>	150-baud digital data sent to the radio during trunked operation while receiving audio.
<b>LSH</b>	<i>See low-speed handshake.</i>
<b>Master In Slave Out</b>	SPI data line from a peripheral to the MCU.
<b>Master Out Slave In</b>	SPI data line from the MCU to a peripheral.
<b>MCU</b>	<i>See microcontroller unit.</i>
<b>MDC</b>	Motorola Digital Communications.
<b>MDI</b>	MCU/DSP Interface internal to the Patriot IC.
<b>MHz</b>	<i>See Megahertz.</i>
<b>Megahertz</b>	One million cycles per second. Used especially as a radio-frequency unit.
<b>microcontroller unit</b>	Also written as $\mu\text{C}$ . A microprocessor that contains RAM and ROM components, as well as communications and programming components and peripherals.
<b>MISO</b>	<i>See Master In Slave Out.</i>
<b>MOSI</b>	<i>See Master Out Slave In.</i>
<b>multiplexer</b>	An electronic device that combines several signals for transmission on some shared medium (e.g., a telephone wire).
<b>MUX</b>	<i>See multiplexer.</i>
<b>NiCd</b>	Nickel-cadmium.
<b>NiMH</b>	Nickel-metal-hydride.
<b>OMPAC</b>	<i>See over-molded pad-array carrier.</i>
<b>open architecture</b>	A controller configuration that utilizes a microprocessor with extended ROM, RAM, and EEPROM.
<b>oscillator</b>	An electronic device that produces alternating electric current and commonly employs tuned circuits and amplifying components.
<b>OSW</b>	<i>See outbound signaling word.</i>
<b>OTAR</b>	<i>See over-the-air rekeying.</i>
<b>outbound signaling word</b>	Data transmitted on the control channel from the central controller to the subscriber unit.
<b>over-molded pad-array carrier</b>	A Motorola custom IC package, distinguished by the presence of solder balls on the bottom pads.

Term	Definition
<b>over-the-air rekeying</b>	Allows the dispatcher to remotely reprogram the encryption keys in the radio.
<b>PA</b>	Power amplifier.
<b>paging</b>	One-way communication that alerts the receiver to retrieve a message.
<b>Patriot IC</b>	A dual-core processor that contains an MCU and a DSP in one IC package.
<b>PC Board</b>	Printed Circuit Board. Also referred to as a PCB.
<b>phase-locked loop</b>	A circuit in which an oscillator is kept in phase with a reference, usually after passing through a frequency divider.
<b>PL</b>	<i>See private-line tone squelch.</i>
<b>PLL</b>	<i>See phase-locked loop.</i>
<b>private-line tone squelch</b>	A continuous sub-audible tone that is transmitted along with the carrier. <i>See also DPL.</i>
<b>Programmable Read-Only Memory</b>	A memory chip on which data can be written only once. Once data has been written onto a PROM, it remains there forever.
<b>PROM</b>	<i>See Programmable Read-Only Memory.</i>
<b>PTT</b>	<i>See Push-to-Talk.</i>
<b>Push-to-Talk</b>	The switch or button usually located on the left side of the radio which, when pressed, causes the radio to transmit. When the PTT is released, the unit returns to receive operation.
<b>radio frequency</b>	The portion of the electromagnetic spectrum between audio sound and infrared light (approximately 10 kHz to 10 GHz).
<b>radio frequency power amplifier</b>	Amplifier having one or more active devices to amplify radio signals.
<b>Radio Interface Box</b>	A service aid used to enable communications between a radio and the programming software.
<b>Radio Service Software</b>	DOS-based software containing the feature set of an ASTRO radio. <i>See also CPS.</i>
<b>RAM</b>	<i>See random access memory.</i>
<b>random access memory</b>	A type of computer memory that can be accessed randomly; that is, any byte of memory can be accessed without touching the preceding bytes.
<b>read-only memory</b>	A type of computer memory on which data has been prerecorded. Once data has been written onto a ROM chip, it cannot be removed and can only be read.

Term	Definition
<b>real-time clock</b>	A module that keeps track of elapsed time even when a computer is turned off.
<b>receiver</b>	Electronic device that amplifies RF signals. A receiver separates the audio signal from the RF carrier, amplifies it, and converts it back to the original sound waves.
<b>registers</b>	Short-term data-storage circuits within the microcontroller unit or programmable logic IC.
<b>repeater</b>	Remote transmit/receive facility that re-transmits received signals in order to improve communications range and coverage (conventional operation).
<b>repeater/talkaround</b>	A conventional radio feature that permits communication through a receive/transmit facility, which re-transmits received signals in order to improve communication range and coverage.
<b>RESET</b>	Reset line: an input to the microcontroller that restarts execution.
<b>RF</b>	<i>See radio frequency.</i>
<b>RF PA</b>	<i>See radio frequency power amplifier.</i>
<b>RIB</b>	<i>See Radio Interface Box.</i>
<b>ROM</b>	<i>See read-only memory.</i>
<b>RPCIC</b>	Regulator/power control IC.
<b>RSS</b>	<i>See Radio Service Software.</i>
<b>RTC</b>	<i>See real-time clock.</i>
<b>RX</b>	Receive.
<b>RX DATA</b>	Recovered digital data line.
<b>SAP</b>	<i>See Serial Audio CODEC Port.</i>
<b>SCI IN</b>	<i>See Serial Communication Interface Input Line.</i>
<b>Serial Audio CODEC Port</b>	SSI to and from the GCAP II IC CODEC used to transfer transmit and receive audio data.
<b>Serial Communication Interface Input Line</b>	A full-duplex (receiver/transmitter) asynchronous serial interface.
<b>Serial Input/Output IC</b>	An integrated circuit that provides SB9600 serial and power-control functions.
<b>Serial Peripheral Interface</b>	How the microcontroller communicates to modules and ICs through the CLOCK and DATA lines.

Term	Definition
<b>signal</b>	An electrically transmitted electromagnetic wave.
<b>Signal Qualifier mode</b>	An operating mode in which the radio is muted, but still continues to analyze receive data to determine RX signal type.
<b>SIO IC</b>	<i>See Serial Input/Output IC.</i>
<b>Smart Radio Interface Box</b>	A service aid containing microcontroller buffered RAM that enhances the speed and capability of programming a radio with programming software.
<b>softpot</b>	<i>See software potentiometer.</i>
<b>software</b>	Computer programs, procedures, rules, documentation, and data pertaining to the operation of a system.
<b>software potentiometer</b>	A computer-adjustable electronic attenuator.
<b>spectrum</b>	Frequency range within which radiation has specific characteristics.
<b>SPI</b>	<i>See Serial Peripheral Interface.</i>
<b>squelch</b>	Muting of audio circuits when received signal levels fall below a pre-determined value. With carrier squelch, all channel activity that exceeds the radio's preset squelch level can be heard.
<b>SRAM</b>	<i>See static RAM.</i>
<b>SRIB</b>	<i>See Smart Radio Interface Box.</i>
<b>SSI</b>	<i>See Synchronous Serial Interface.</i>
<b>Standby mode</b>	An operating mode in which the radio is muted but still continues to monitor data.
<b>static RAM</b>	A type of memory used for volatile, program/data memory that does not need to be refreshed.
<b>Synchronous Serial Interface</b>	DSP interface to peripherals that consists of a clock signal line, a frame synchronization signal line, and a data line.
<b>system central controllers</b>	Main control unit of the trunked dispatch system; handles ISW and OSW messages to and from subscriber units ( <i>See ISW and OSW</i> ).
<b>system select</b>	The act of selecting the desired operating system with the system-select switch (also, the name given to this switch).
<b>talkaround</b>	A conventional radio feature that lets you bypass the repeater and connect directly to another radio. The transmit and receive frequencies are the same.
<b>thin small-outline package</b>	A type of dynamic random-access memory (DRAM) package that is commonly used in memory applications.

Term	Definition
<b>time-out timer</b>	A timer that limits the length of a transmission.
<b>TOT</b>	<i>See time-out timer.</i>
<b>transceiver</b>	Transmitter-receiver. A device that both transmits and receives analog or digital signals. Also abbreviated as XCVR.
<b>transmitter</b>	Electronic equipment that generates and amplifies an RF carrier signal, modulates the signal, and then radiates it into space.
<b>TSOP</b>	<i>See thin small-outline package.</i>
<b>TX</b>	Transmit.
<b>UART</b>	<i>See also Universal Asynchronous Receiver Transmitter.</i>
<b>UHF</b>	Ultra-High Frequency.
<b>Universal Asynchronous Receiver Transmitter</b>	A microchip with programming that controls a computer's interface to its attached serial devices.
<b>Universal Serial Bus</b>	An external bus standard that supports data transfer rates of 12 Mbps.
<b>USB</b>	<i>See Universal Serial Bus.</i>
<b>VCO</b>	<i>See voltage-controlled oscillator.</i>
<b>vector sum excited linear predictive coding</b>	A voice-encoding technique used in ASTRO digital voice.
<b>VHF</b>	Very-High Frequency.
<b>VIP</b>	Vehicle Interface Port.
<b>VOCON</b>	<i>See vocoder/controller.</i>
<b>vocoder</b>	An electronic device for synthesizing speech by implementing a compression algorithm particular to voice. <i>See also voice encoder.</i>
<b>vocoder/controller</b>	A PC board that contains an ASTRO radio's microcontroller, DSP, memory, audio and power functions, and interface support circuitry.
<b>voice encoder</b>	The DSP-based system for digitally processing analog signals, and includes the capabilities of performing voice compression algorithms or voice encoding. <i>See also vocoder.</i>
<b>voltage-controlled oscillator</b>	An oscillator in which the frequency of oscillation can be varied by changing a control voltage.
<b>VSELP</b>	<i>See vector sum excited linear predictive coding.</i>
