

### TXP / TXC Mask

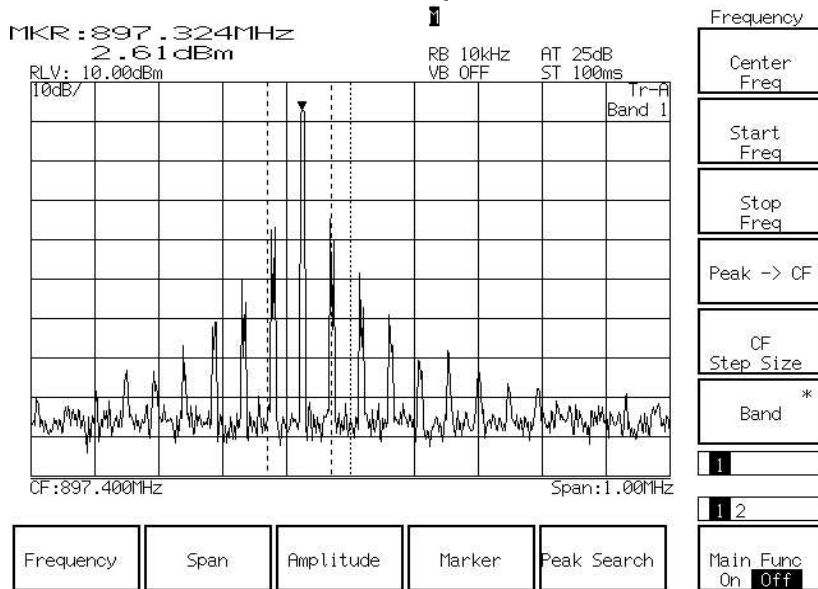

### EGSM TX Can Test Points

### VTXB\_900 (EGSM V802 Pre-Amp Biasing Waveform)

### EGSM Transmit Waveform (Burst, Power Level 19)

Phone drew 140mA during Burst operation

### EGSM Transmit Waveform (Continuous, Power Level 19)

**\*\*Was drawing over 600mA during continuous operation\*\***

### TX Path of the transmitted EGSM900 signal

For easy error tracing it is important to know the signal path of the EGSM900 transmitter. The components can be grouped into blocks and drawn as shown below. Note that the following picture shows both EGSM900 transmitter (bottom) and GSM1800/GSM1900 transmitter (top).

**Antenna Switch (TX/RX switch)**

The antenna Switch works as a diplexer for the RX and TX signals. Moreover, it suppresses the TX harmonics generated by the PA. The antenna switch is controlled by the Mjoelner RF ASIC using the control signals CONT1, CONT2 and CONT3. The following table shows the possible different states.

CONT1 [Volt]	CONT2 [Volt]	CONT3 [Volt]	EGSM Rx	DCS Rx	PCS Rx	EGSM Tx	DCS/PCS Tx
0	0	0	X				
0	0	0		X			
0	0	2.7				X	
0	2.7	0			X		
2.7	0	0					X

**Antenna Switch Test Points**

## Antenna Switch Control Line During EGSM Transmission

## Transmit Timing

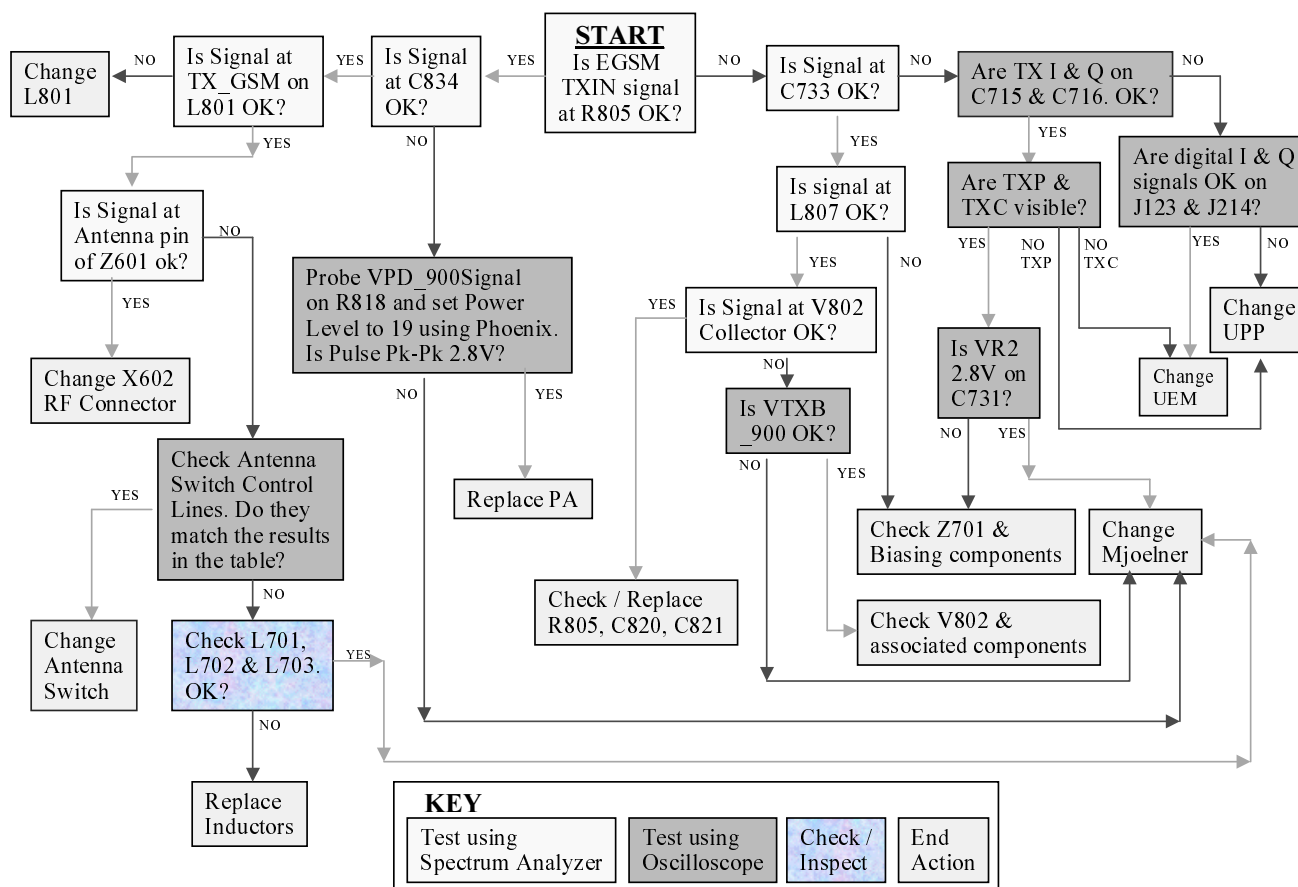

### EGSM Tx fault finding flow chart

The first flow diagram assumes the following:

- Phoenix has been set up as shown in the following screen (the Tx power level may be increased using Phoenix if it makes the Tx pulse easier to see).
- Relevant components have been visually inspected for orientation, placement, etc.
- The transmit signal has been checked with a spectrum analyzer at RF connector, X602 and was found to be too low or non-existent.
- The VCO is running correctly.

- The power amplifier is getting a correct VBATRF supply via L805 & L808.
- Mjoelner's supply voltages VR1A, VR2, VR3, VR4, VR5 & VR7 are all working correctly.

## GSM1800/1900 Transmitter

### General instructions for GSM1800/1900 TX troubleshooting

Apply an RF-cable to the RF-connector to allow the transmitted signal to act as normal. RF-cable should be connected to measurement equipment (GSM Test equipment, Powermeter, Spectrum Analyzer, or similar).

### DCS 1800/PCS 1900 Tx fault finding flow chart

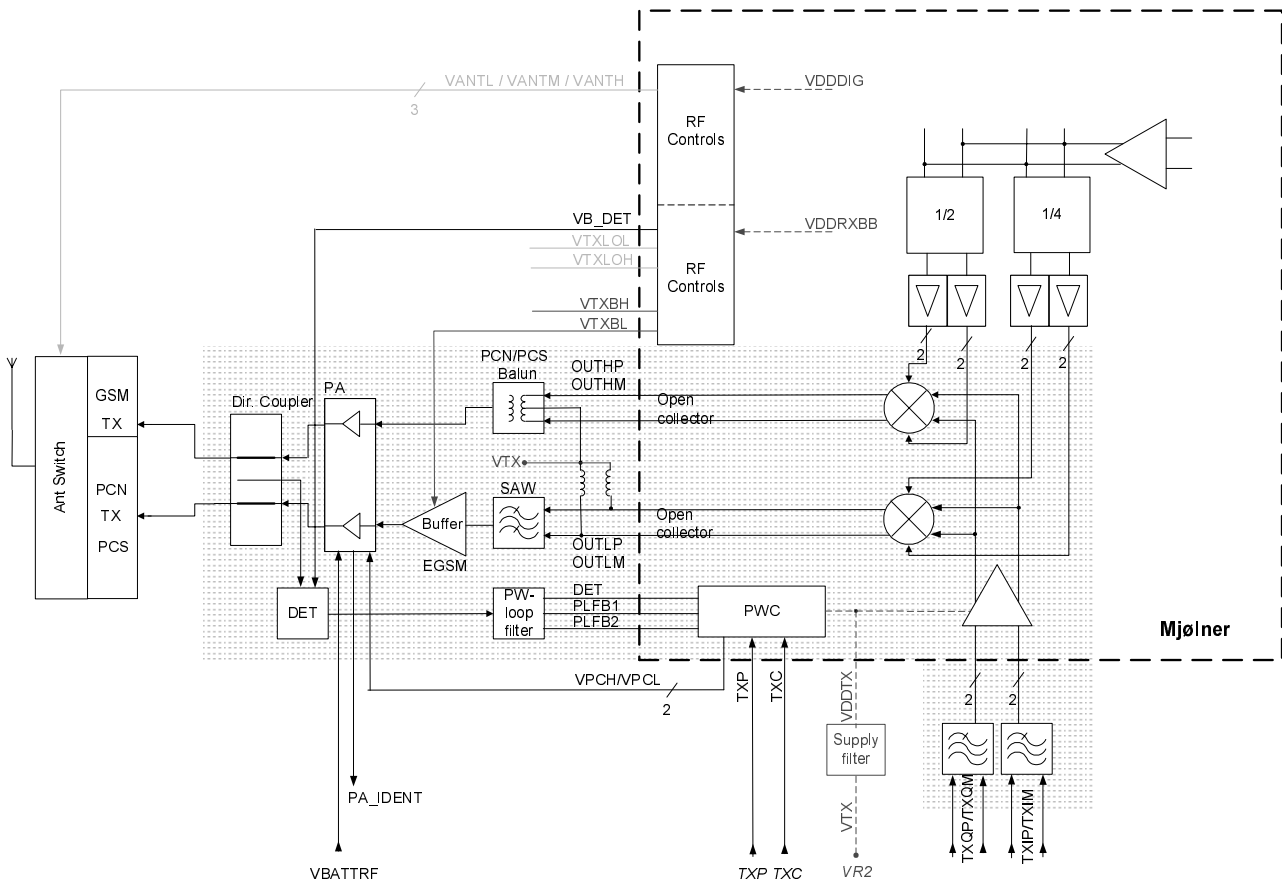

The following diagram assumes the following:

- Phoenix has been set up as shown previously (selecting DCS 1800 in the RF control box).
- Relevant components have been visually inspected for orientation, placement etc.
- The Transmit Signal has been checked with a Spectrum Analyzer at the RF connector, X602 and was found to be low or non-existent.
- The VCO is running correctly.

- The Power Amplifier is getting a correct VBATRF supply via L805 & L808.
- Mjoelner's supply voltages VR1A, VR2, VR3, VR4, VR5 & VR7 are all working correctly.

### Path of the transmitted GSM1800/1900 signal

For easy error tracking it is important to know the signal path of the GSM1800/ GSM1900 transmitter. The components can be grouped into blocks and drawn as shown below. Note that the picture shows both EGSM transmitter (bottom) and GSM1800/ GSM1900 transmitter (top).

### The path of Mjoelner RF ASIC

The balanced TX signal from base band is coming to Mjoelner RF ASIC. The GSM1900 path includes an common RF modulator for GSM1800 and GSM1900. The BB signal is up-converted with the LO signal corresponding to the wanted TX channel. The GSM1800/ GSM1900 TX output of Mjoelner is a balanced signal.

From the output of Mjoelner the signal is fed through the Balun T701 (Balanced to single ended) and an 3 dB pad to the PA GSM1800/1900 input.

**The path of the PA**

The GSM1800/GSM1900 part of the PA has a maximum output of app. 33dBm. The supply is coming directly from the Battery connectors.

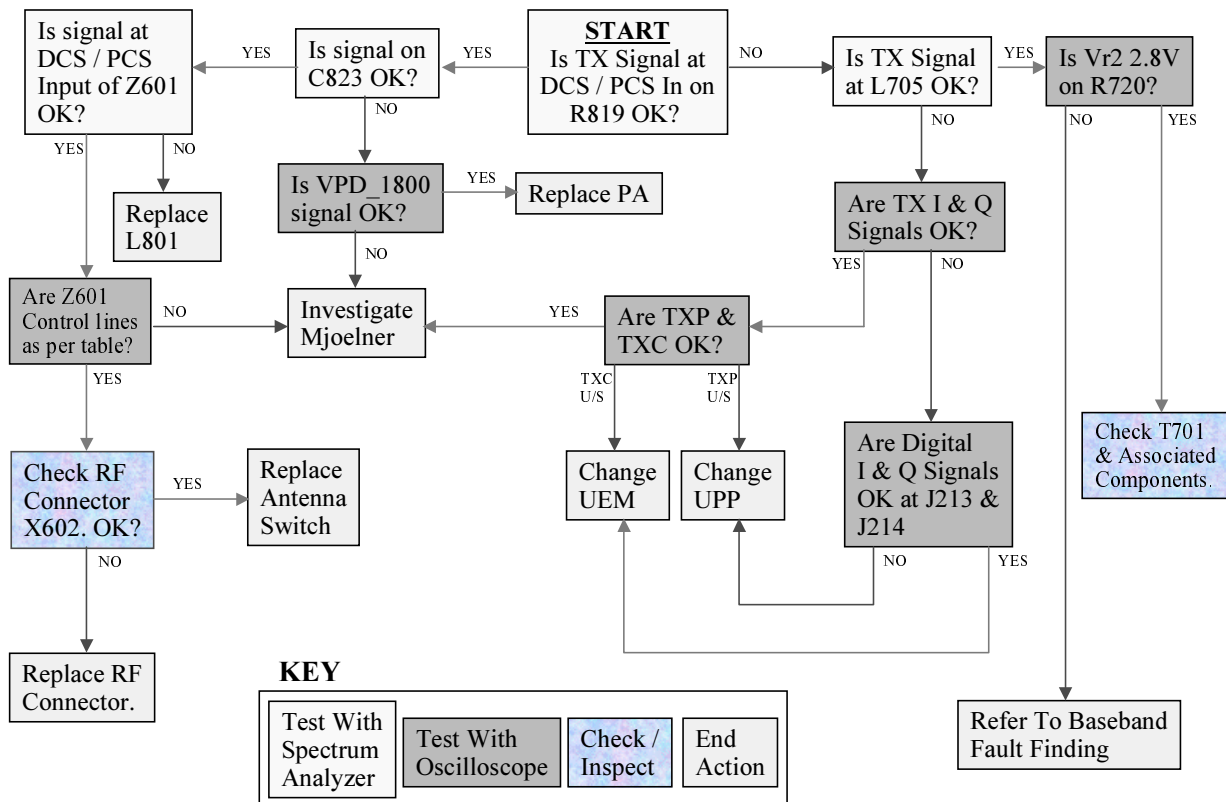

The output is controlled by the power control loop. From the output of the PA the signal goes through the directional coupler (one of the power control loop components) to the Antenna Switch.

**Antenna Switch**

The Antenna Switch works as a diplexer between RX and TX Bands. Moreover, it partly suppresses the harmonics generated by the PA. Mjoelner RF ASIC controls the antenna switch by three voltages CONT1, CONT2 and CONT3. The following table shows the different states.

CONT1 [Volt]	CONT2 [Volt]	CONT3 [Volt]	EGSM Rx	DCS Rx	PCS Rx	EGSM Tx	DCS/PCS Tx
0	0	0	X				
0	0	0		X			
0	0	2.7				X	
0	2.7	0			X		
2.7	0	0					X

**Fault finding chart for GSM1900 transmitter**

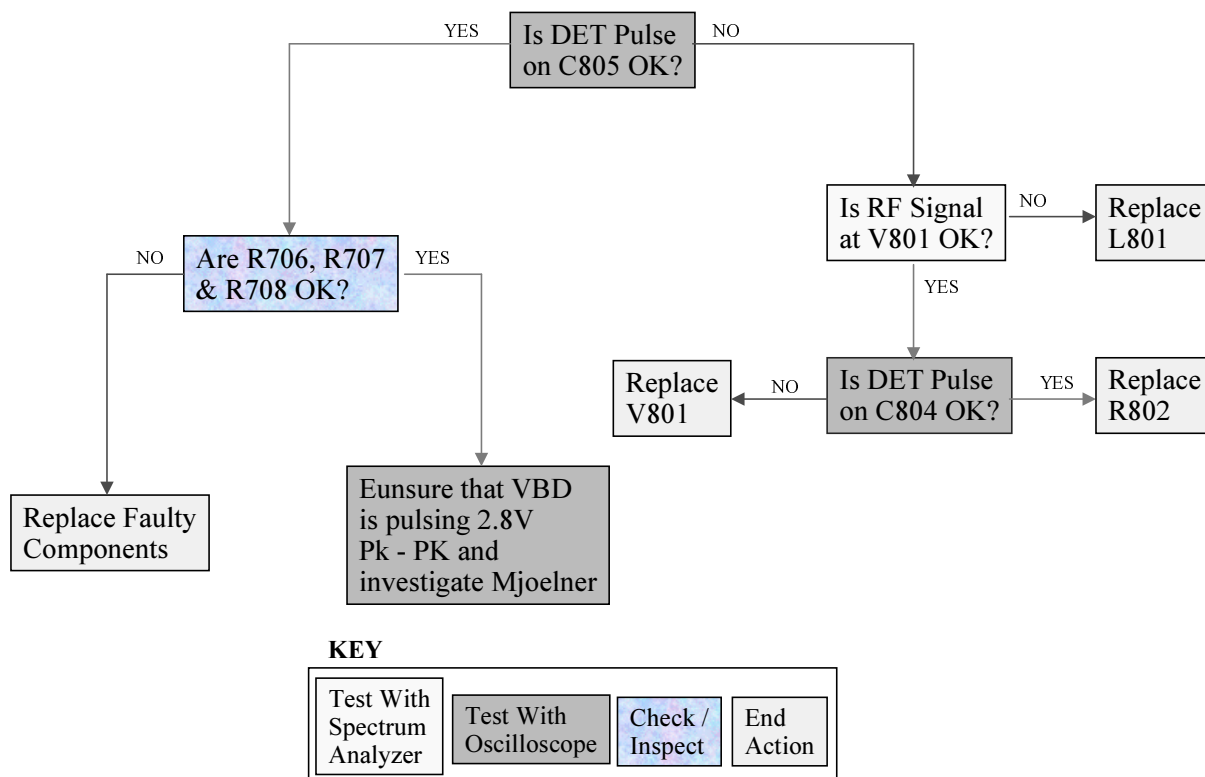

If the Tx output is too high, then it is most likely that there is a problem within the Power Control loop.

Mjoelner is receiving the Reference TXC from Baseband and not getting any feedback from DET to compare with TXC. The result is that Mjoelner drives VDP\_900/VPD\_1800 high to try and increase the power output so that the DET signal is matching TXC. With a break in the Power Control loop, the DET signal never reaches Mjoelner so it assumes that the PA is not outputting enough power so it tries to compensate by increasing the gain.

When checking the Power Control loop, make sure that VBD is pulsing at 2.8V Peak to Peak. Check the DET pulse at Mjoelner input on R706.

This case is the same for EGSM, DCS1800 & DCS1900.

## NHL-8 Synthesiser

There is only one PLL synthesiser generating frequencies for both Rx and Tx for all three bands (EGSM900, GSM1800 and GSM1900). VCO frequency is divided by 2 or by 4 in Mjoelner depending on which band is active.

### General instructions for Synthesiser troubleshooting

Connect the the phone to a PC with DAU-9P cable and dongle and follow these instructions:

#### Start Phoenix Service Software (dongle needed):

Select	Scan Product	Ctrl-R
or	File	Alt-F
	Scan Product	P

Wait until phone information shows in the lower right corner of the screen.

Set operating mode to local mode.

Start RF Control window:

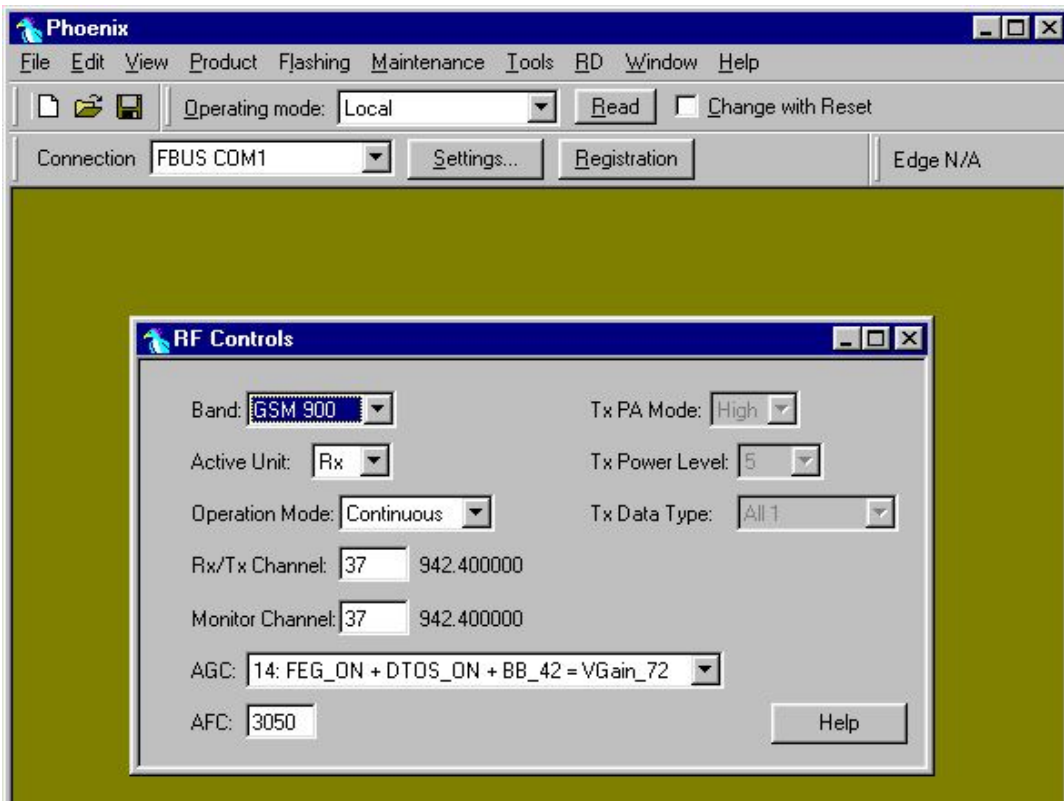

Select	RF	Alt-M
	Tuning	T
	RF Controls	F

Wait until the RF Controls window pops up

Set the synthesiser to the following mode:

Select	Band	GSM 900
	Active unit	RX
	Operation mode	Continuous
	RX/TX Channel	37

The setup should now look like this:

Since VCO chamber is completely shielded, it is not easy to measure frequency of 3769.6MHz at the output of the VCO (G701) using a resistive probe and a spectrum analyzer. It is possible to measure tuning voltage at charge pump output (C710) easily. For  $f_{VCO} = 3769.6\text{MHz}$  the tuning voltage should be  $2.3V_{DC} \dots 2.8V_{DC}$  (Tuning sensitivity of VCO is 240MHz/V typ.).

### PLL Synthesizer Test Points

If this is not the case, then go to Fault finding chart in this document for troubleshooting.

### Mjoelner Can Test Points

### 26 MHz reference oscillator ( VCXO )

The 26 MHz reference oscillator (VCXO) is part of Mjoelner RF-ASIC (N601). It needs only an external 26 MHz Xtal (B601) as external circuitry.

The reference oscillator has three functions:

- Reference frequency for the PLL synthesiser.
- System clock for BB (RFCIk\_I = 26 MHz).

- 26 MHz Reference clock (LPRFCIk\_I) for Bluetooth Module (N430) via buffer V601.

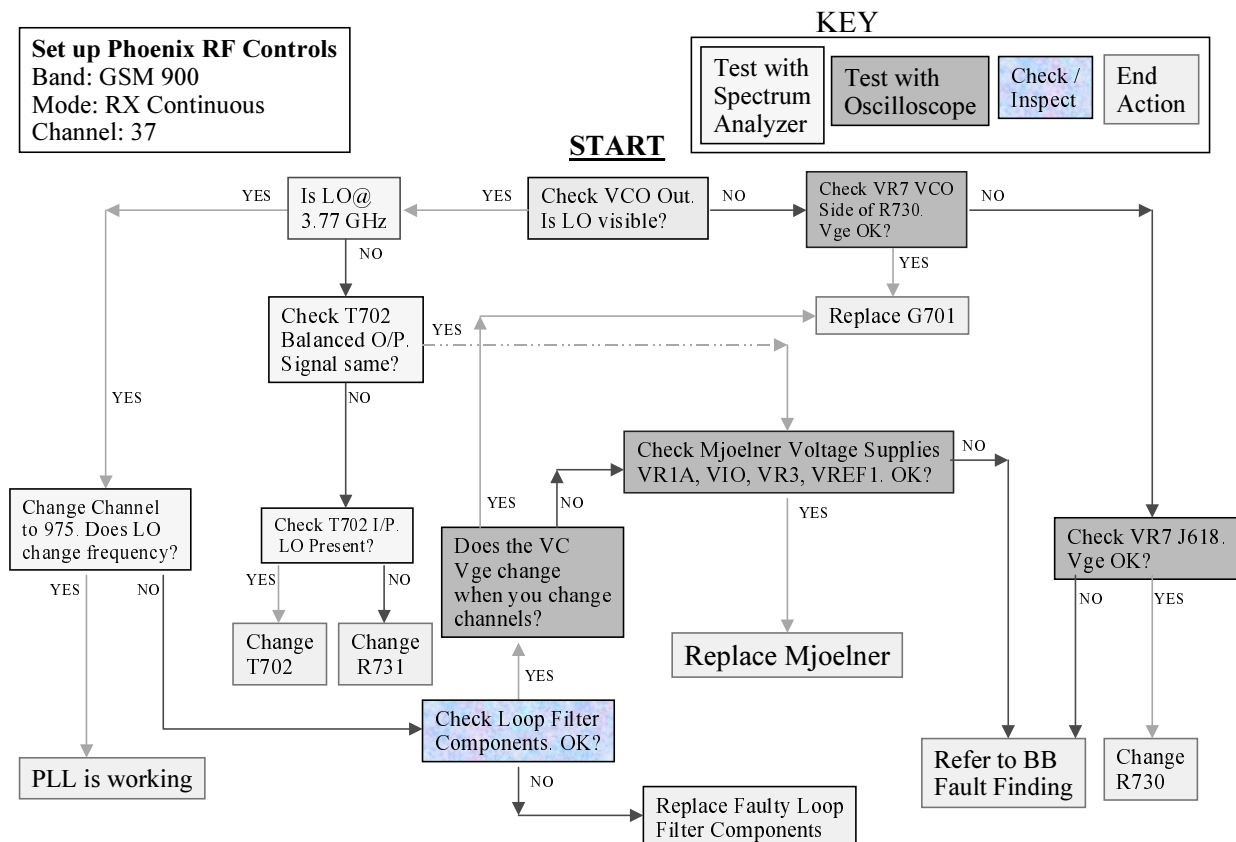

For an error free initial synchronization, the 26MHz frequency of the VCXO must be accurate enough. Therefore, a **VCXO-calibration (cal)** value is written via the serial Bus into the RefOSCCAL register of Mjoelner and an additional bit in the RefOSCCntl register of the Mjoelner. That is necessary for the rough calibration of the VCXO.

The VCXO is fine tuned by programming the AFC value via the serial bus of Mjoelner. The necessary AFC value is written into the RefOSCAFC register in Mjoelner.

## VCO

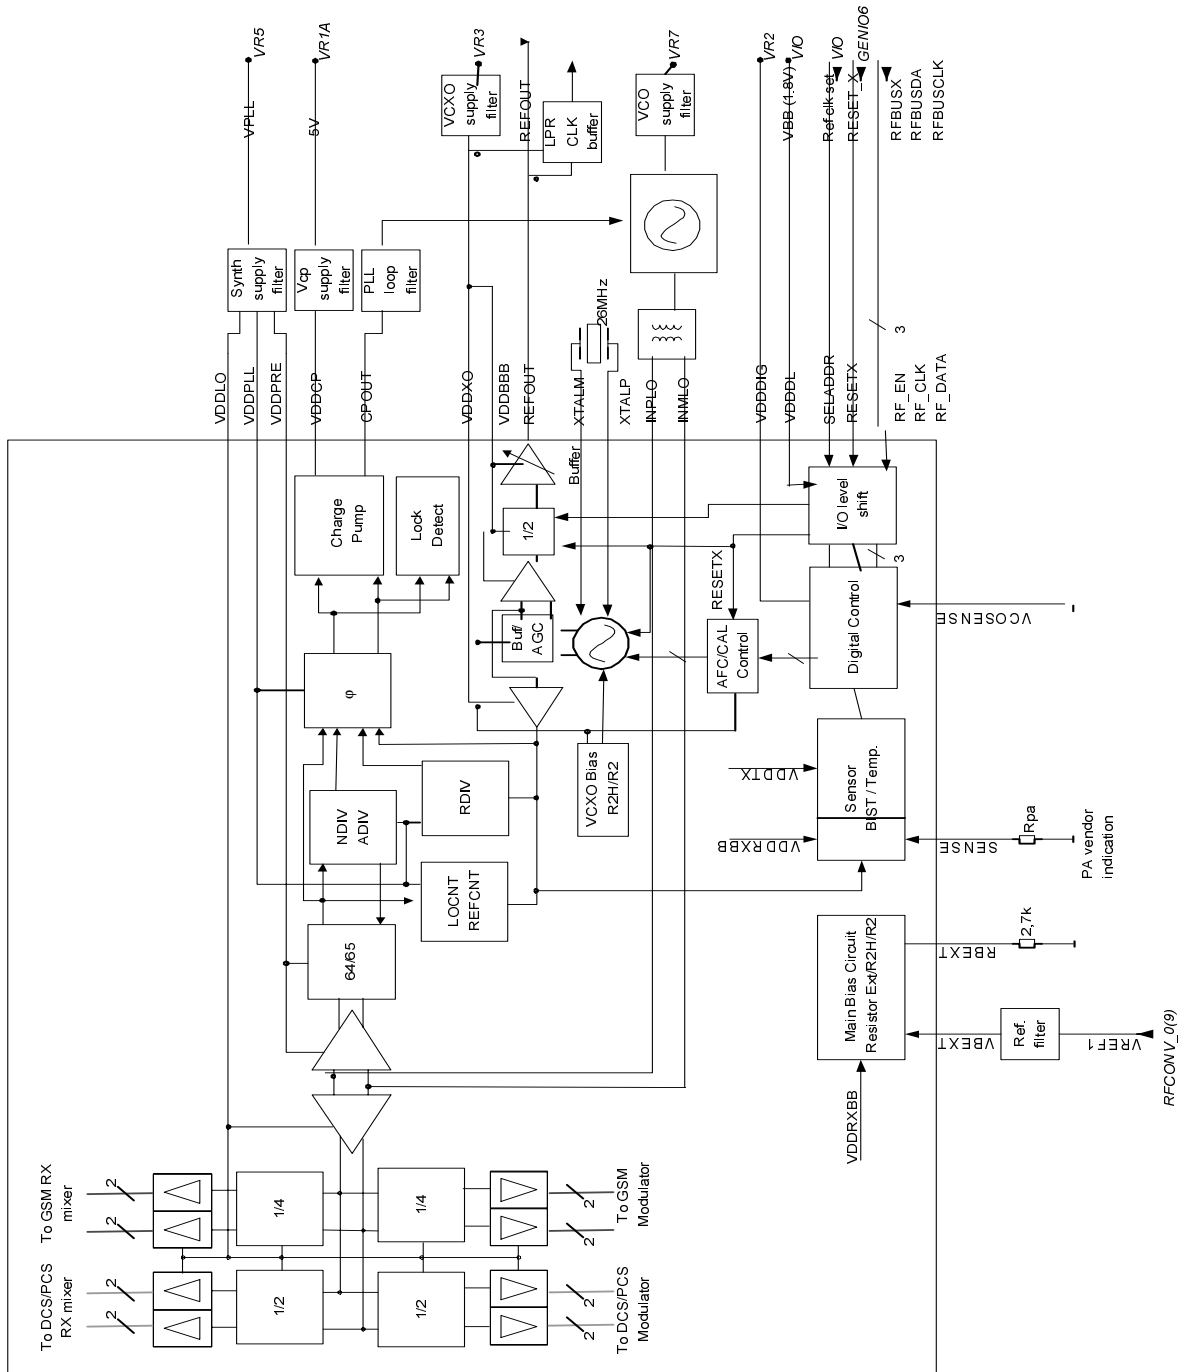

The VCO is able to generate frequencies in the range from 3420MHz to 3980MHz when PLL is in function. The frequency of the VCO signal is divided by 2 or by 4 in Mjoelner RF-ASIC. So it is possible to generate the frequency of all channels in EGSM900, GSM1800 and GSM1900 (both RX and TX). Frequency of the VCO is controlled by DC voltage (Vc) coming from the PLL loop filter. Range of Vc when PLL is in function is 0.7V– 3.8V. Typical tuning sensitivity of the VCO is 240MHz/V. Even if PLL is not working (Vc out of range) there is a frequency at the output of the VCO, which is between 3 and 4 GHz (if the VCO itself is ok).

## Fault finding chart for PLL Synthesiser

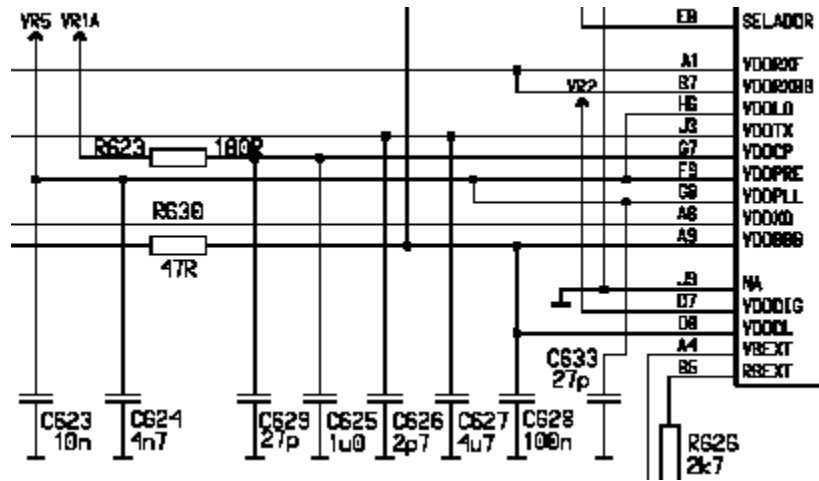

It is important to say that power supply for VCXO ( VR3) is only switched 'OFF' in the so-called 'Deep Sleep Mode' and power supply for VCO (G701 VR7) is switched 'OFF' in so-called 'Sleep Mode'.

## Phoenix tuning

Before any tuning the phone should be synchronised with the PC.

Connect the phone to a PC with DAU-9P cable and dongle and follow the following instructions:

Provide the phone with power supply

Start Phoenix Service Software and open FBUS connection

Select            File    Scan Product

Wait until phone information is shown in the lower right corner of the screen.

## RF tuning after repairs

Different repairs require different tuning. In general it is necessary to determine in which section the repair was done to select which tunings to perform. To determine if RF tuning is necessary after repair it is important that the functionality of the repaired circuit is understood well.

- In general repairs in the TX part will require "TX Power Level Tuning" and "TX IQ Tuning".
- In general repairs in the RX part or PLL part always require "RX Calibration", "Rx Band Filter Response Calibration".
- If Mjoelner is changed all calibrations have to be done.

Other parts interfacing to TX, RX or PLL might require tuning, but common sense should be used, e.g. if a component that has no influence on RF performance has been changed, e.g. the microphone, on/off key, mechanical parts or similar, there is no need to do any RF tuning.

## RX Calibration (incl. VCXO Calibration)

The "RX calibration" is used to determine gain at different gain-settings for front-end and Mjoelner and needs to be done in all three bands.

RX-calibration requires an external signal generator.

RX-calibration in EGSM900 combines two tunings, VCXO-calibration and AGC-calibration:

Calibration of GSM1800 and GSM1900 band only determines AGC values.

The **VCXO-calibration** finds out a calibration value for VCXO control, an AFC initial value and 3 AFC-slope coefficients.

A value (RF\_TEMP), which represents the RF hardware temperature, is determined during RX Calibration. This temperature value is used by DSP to RSSI reporting in Normal mode of the phone. It is not visible in the calibration process.

**AGC-calibration:**

The AGC-calibration finds the gain values of the RX-gain system. The AGC consists of RF LNA, which can be either on or off (gain difference between on and off state is nominally 30dB) and BB gain which can be controlled in 6dB steps. This gives 15 gain steps RSSI0 to RSSI14. LNA is off for steps RSSI0 to RSSI4. AGC-calibration measures the gain at gain step RSSI4 and RSSI7. The other gain values are calculated.

**VCXO-calibration:**

The VCXO-calibration ensures the function of an **initial** synchronization (before location update is done) when the mobile station is in Normal mode. For an error free initial synchronization, the 26MHz frequency of the VCXO must be accurate enough. Therefore, a **VCXO cal** value is written into the RefOSCCAL register of the Mjoelner.

During VCXO-calibration, the **VCXO cal** value is changed by a DSP-algorithm until a synchronization is possible. This means the VCXO oscillates at 26 MHz with a sufficient minimum frequency error.

To further minimize the frequency error, an initial **AFC value** is determined by the DSP and written into RefOSCAFC register of the Mjoelner.

Also the DSP algorithm determines 3 AFC slope coefficients **Slope C1...3** during VCXO calibration. One AFC slope value is not sufficient for Mjoelner **F3**, because the AFC slope is non-linear in this chip.

**EGSM**

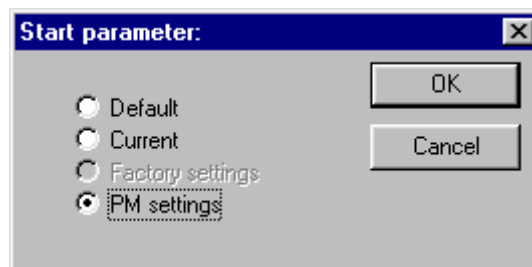

Set operating mode to local mode

Select	RF	Alt-M
	Tuning	T
	RX Calibration	C
Wait until the RX Calibration window pops up.		
Select	Band	GSM 900
	Autom.-	60

The setup should now look like this:

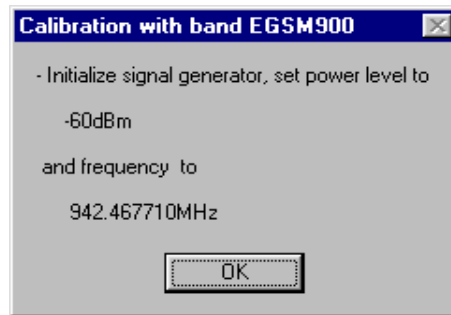

Select Automatic, press Start and a new window pops up:

Select PM settings, press OK and the window closes.

Now it is possible to press the calibrate button in the RX Calibration window.

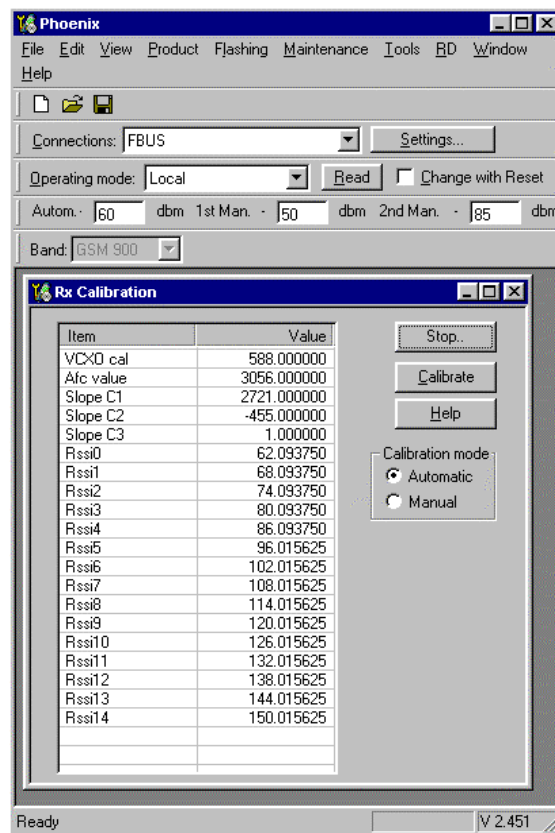

Press Calibrate and a window pops up:

Connect an external signal generator to the RF connector of the phone and set the generator as told in the window, taking care for external cable losses.

Press ok and the window closes.

A typical result will look like this:

Press Stop in the RX Calibration window and a new window pops up:

Press Yes and the EGSM RX Calibration is finished.

### GSM1800 (DCS/PCN)

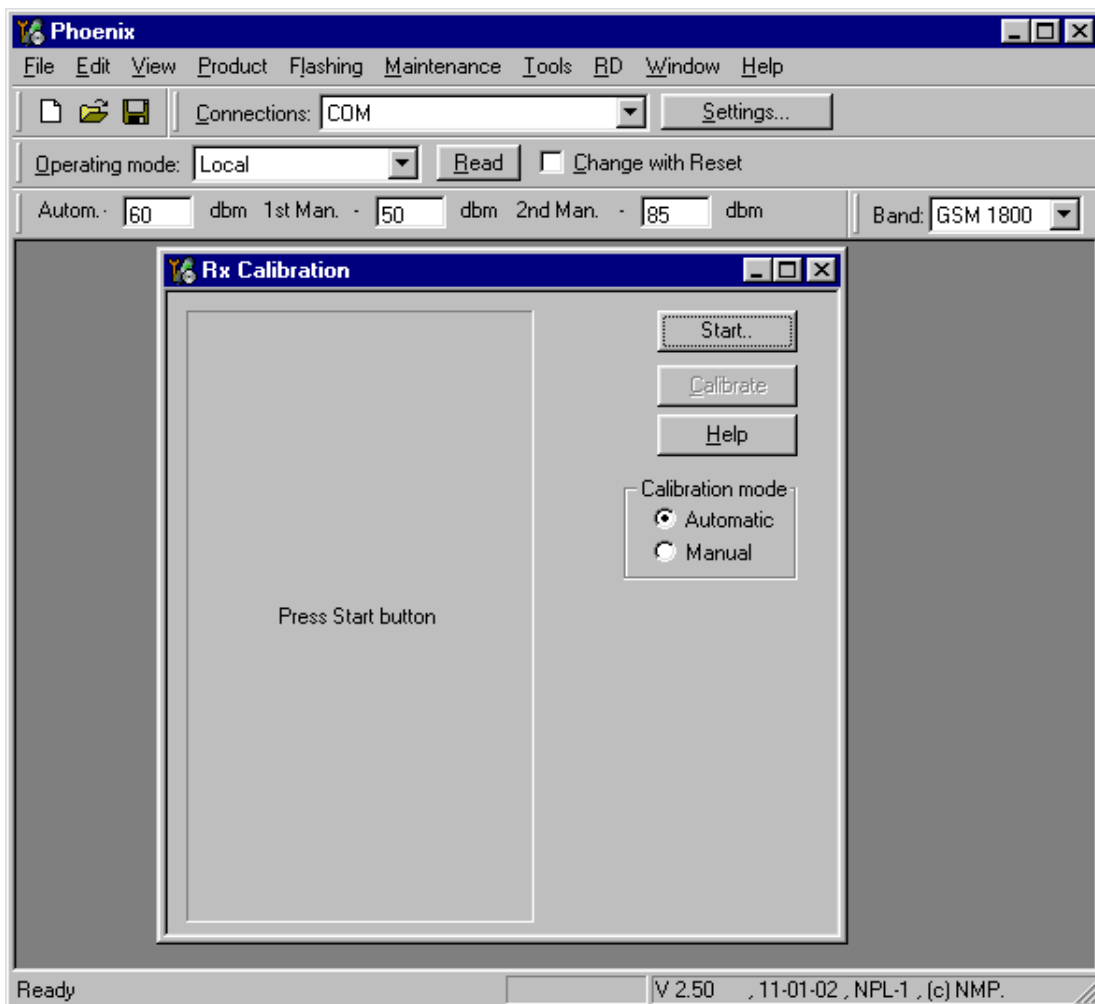

Set operating mode to local mode

- |        |                |       |
|--------|----------------|-------|
| Select | RF             | Alt-M |
|        | Tuning         | T     |
|        | RX Calibration | C     |

Wait until the RX Calibration window pops up.

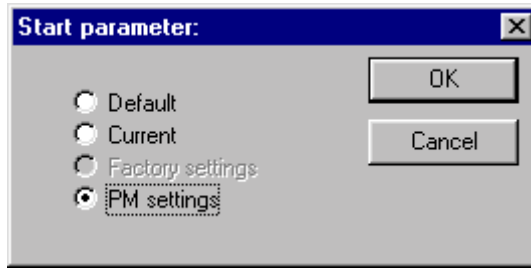

- |        |                      |          |
|--------|----------------------|----------|
| Select | Band                 | GSM 1800 |
|        | Autom.               | -60      |
|        | 1 <sup>st</sup> Man. | -50      |
|        | 2 <sup>nd</sup> Man. | -85      |

The setup should now look like this:

Select Automatic, press Start and a new window pops up:

Select PM settings, press OK and the window closes.

Now it is possible to press the calibrate button in the RX Calibration window.

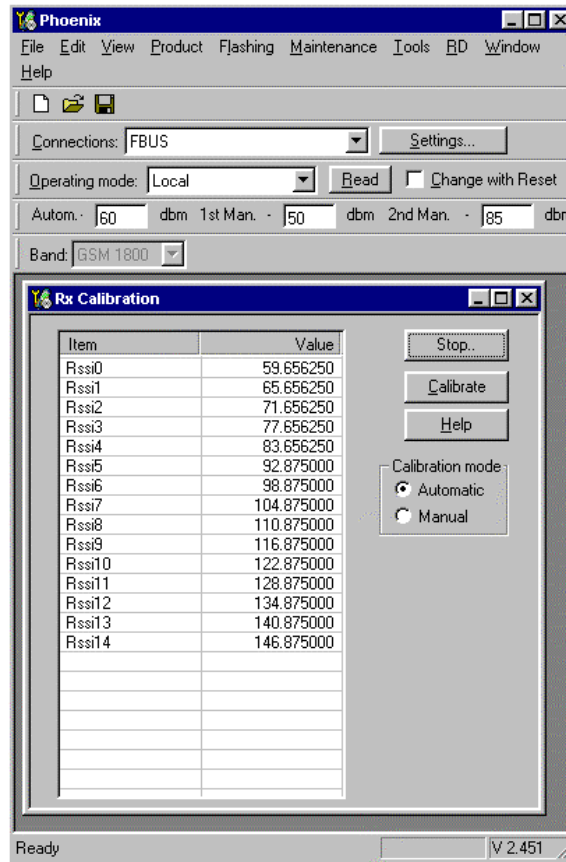

Press Calibrate and a window pops up:

Connect an external signal generator to the RF connector of the phone and set the generator as told in the window, taking care for external cable losses.

Press ok and the window closes.

A typical result will look like this:

Press Stop in the RX Calibration window and a new window pops up:

Press Yes and the GSM1800 RX Calibration is finished.

### GSM1900 (PCS)

Set operating mode to local mode

Select	RF	Alt-M
	Tuning	T
	RX Calibration	C

Wait until the RX Calibration window pops up.

Select	Band	GSM 1900
	Autom.	-60
	1 <sup>st</sup> Man.	-50
	2 <sup>nd</sup> Man.	-85

The setup should now look like this:

Select Automatic, press Start and a new window pops up:

Select PM settings, press OK and the window closes.

Now it is possible to press the calibrate button in the RX Calibration window.

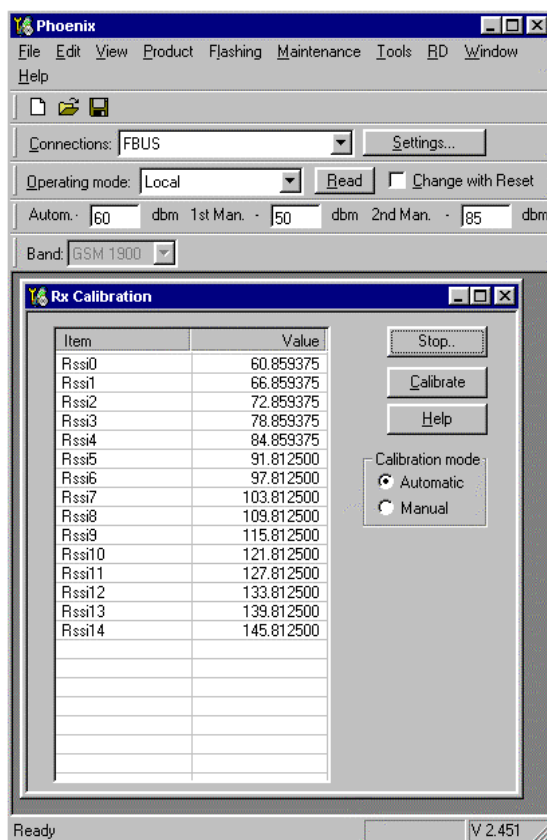

Press Calibrate and a window pops up:

Connect an external signal generator to the RF connector of the phone and set the generator as told in the window, taking care for external cable losses.

Press OK and the window closes.

A typical result will look like this:

Press Stop in the RX Calibration window and a new window pops up:

Press Yes and the GSM1900 RX Calibration is finished.

### RX AGC limits

The Rx calibration is only valid if it is within certain limits.

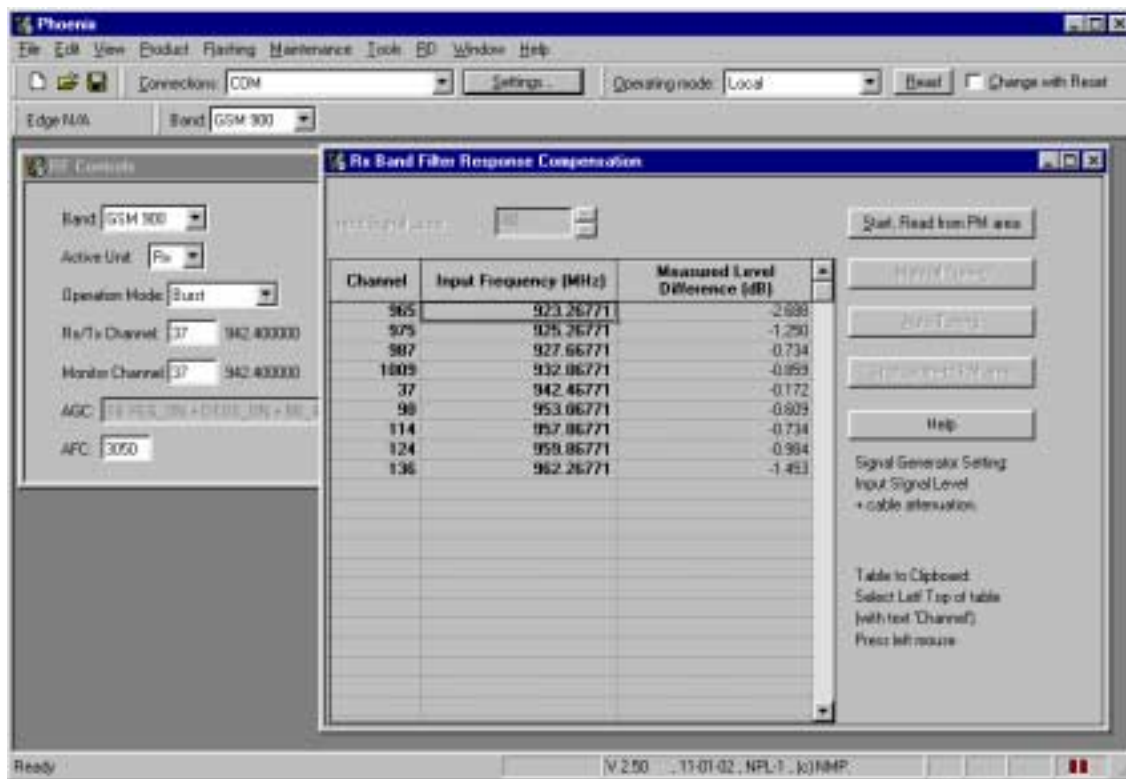

For the most recent limits see NHL-8 Production Testing Requirements,

If calibration is not within limits, there is a fault in the RX chain.

Below the values for RSSI4 and RSSI7 are given:

The setup should now look like this:

Select Input Signal Level -60dBm

### Manual Tuning

Press Manual tuning and a window pops up:

Connect an external signal generator to the RF connector of the phone and set the generator as told in the window.

Press OK and a new window pops up:

Set the generator as told in the window.

Press OK and a new window pops up. Repeat this sequence **9 times** until all channels are done.

Press Stop, Write to PM Area (In the RX Band Filter Response Compensation window) and a window pops up:

Press Yes and the EGSM RX Band Filter Response Compensation is finished.

### Auto Tuning

A faster and more convenient method for Band Filter Calibration can be performed by clicking on "Auto Tuning". This requires a signal Generator that can be programmed to see a user defined list of frequencies.

Program the signal generator to the list of frequencies that are visible in the column "Input Frequency (MHz)" .

Press Auto tuning and a window pops up:

Connect an external signal generator to the RF connector of the phone and let the signal generator step sweep through the programmed frequency list.

Press OK.

Press Stop, Write to PM Area (In the RX Band Filter Response Compensation window) and a window pops up:

Press Yes and the EGSM RX Band Filter Response Compensation is finished.

**GSM1800 (DCS/PCN)**

Set operating mode to local mode

- Select RF Alt-M
- Tuning T
- RF Controls F

Wait until the RF Controls window pops up

- Select Band GSM 1800

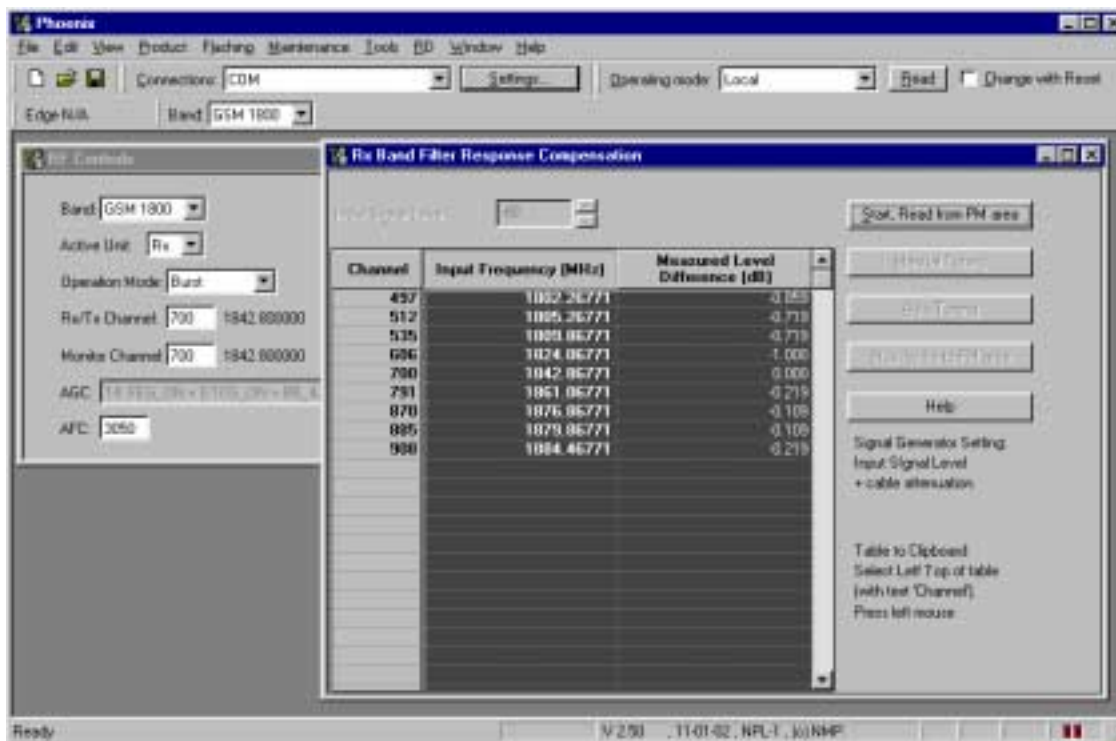

- Select Maintenance Alt-M
- Tuning T
- RX Band Filter Response Compensation B

Following window pops up:

Select Yes and the RX Band Filter Response Compensation window pops up.

The setup should now look like this:

- Select Input Signal Level -60dBm

## Manual Tuning

Press Manual tuning and a window pops up:

Connect an external signal generator to the RF connector of the phone and set the generator as told in the window.

Press OK and a new window pops up:

Set the generator as told in the window.

Press OK and a new window pops up. Repeat this sequence **9 times** until all channels are done.

Press Stop, Write to PM Area (In the RX Band Filter Response Compensation window) and a window pops up:

Press Yes and the EGSM RX Band Filter Response Compensation is finished.

## Auto Tuning

A faster and more convenient method for Band Filter Calibration can be performed by clicking on "Auto Tuning". This requires a signal Generator that can be programmed to seep a user defined list of frequencies.

Program the signal generator to the list of frequencies that are visible in the column "Input Frequency (MHz)".

Press Auto tuning and a window pops up:

Connect an external signal generator to the RF connector of the phone and let the signal generator step sweep through the programmed frequency list.

Press OK.

Press Stop, Write to PM Area (In the RX Band Filter Response Compensation window) and a window pops up:

Press Yes and the EGSM RX Band Filter Response Compensation is finished.

**GSM1900 (PCS)**

Set operating mode to local mode

Select	RF		Alt-M
		Tuning	T
		RF Controls	F

Wait until the RF Controls window pops up

Select	Band	GSM 1900
--------	------	----------

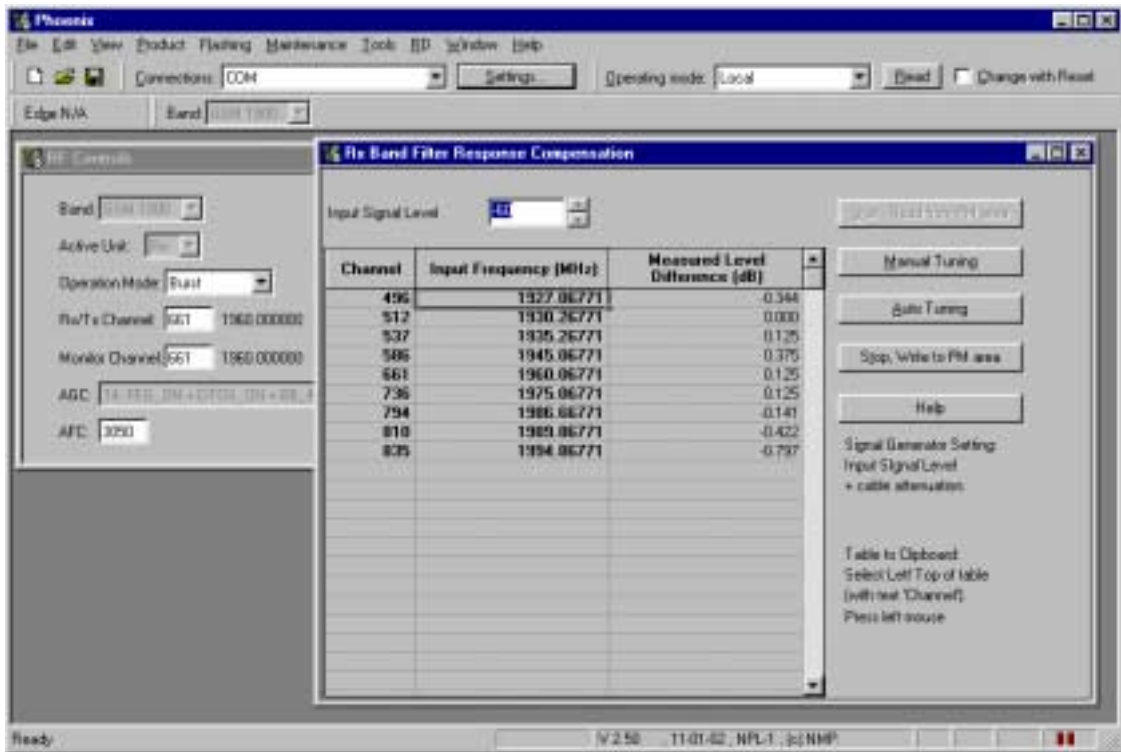

Select	RF		Alt-M
		Tuning	T
		RX Band Filter Response Compensation	B

A window pops up:

Select Yes and the RX Band Filter Response Compensation window pops up.

The setup should now look like this:

Select  -60dBm

### Manual Tuning

Press Manual tuning and a window pops up:

Connect an external signal generator to the RF connector of the phone and set the generator as told in the window.

Press OK and a new window pops up:

Set the generator as told in the window.

Press OK and a new window pops up. Repeat this sequence **9 times** until all channels are done.

Press Stop, Write to PM Area (In the RX Band Filter Response Compensation window) and a window pops up:

Press Yes and the EGSM RX Band Filter Response Compensation is finished.

### Auto Tuning

A faster and more convenient method for Band Filter Calibration can be performed by clicking on "Auto Tuning". This requires a signal Generator that can be programmed to see a user defined list of frequencies.

Program the signal generator to the list of frequencies that are visible in the column "Input Frequency (MHz)" .

Press Auto tuning and a window pops up:

Connect an external signal generator to the RF connector of the phone and let the signal generator step sweep through the programmed frequency list.

Press OK.

Press Stop, Write to PM Area (In the RX Band Filter Response Compensation window) and a window pops up:

Press Yes and the EGSM RX Band Filter Response Compensation is finished.

### RX Channel Select Filter Calibration

This calibration is calibrating the Base band filter inside Mjoelner. It is done by internally

Press Stop and a new window pops up:

Press Yes and the RX Channel Select Filter Calibration is finished.

### TX Power tuning

This tuning must be done in all three bands.

Note: TX Power tuning must be done with a peak power meter, e.g. Anritsu model ML2408A with Anritsu Peak Power Sensor MA2442A and a suitable attenuator.

The use of power meter in GSM testers is likely to cause larger error than the use of a dedicated power meter and might cause the phone to be non-compliant with GSM specifications.

### EGSM (EGSM900)

Set operating mode to local mode

Select      RF                      Tuning                      TX Power Level Tuning

Wait until the TX Power Level Tuning window pops up.

Connect a **calibrated** powermeter to the RF connector of the phone.

Select      Band                      GSM 900  
   Active Unit                      TX

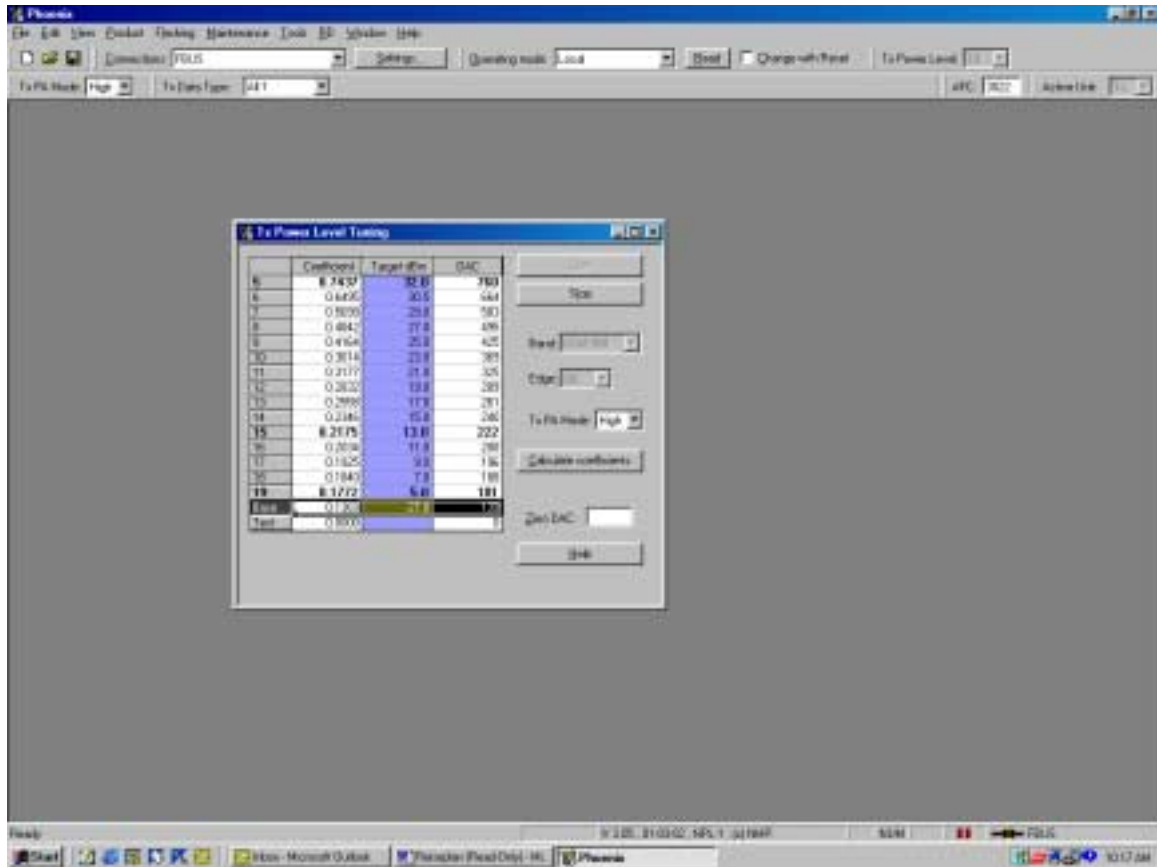

Press Start and a window pops up:

Select Permanent memory, press OK and the window closes.

Select                                      TX Data Type      Random

The setup should now look like this:

Select TX PA Mode High

Tune Base level to -27 dBm.

Adjust DAC Values for Power Level 5 (32.5 dBm), 15 (13 dBm) and 19 (5 dBm) according to Target values. The Power levels may differ from Phoenix mentioned target power levels.

Press calculate, check if all levels match the target values, correct if necessary.

Select TX PA Mode Low

Adjust DAC Values for Power Level 7, 15 and 19 according to Target values.

Press calculate, check if all levels match the target values, correct if necessary.

Press Stop and a window pops up:

Select 'Save values to Phone Permanent Memory'

Press Yes and the EGSM TX Power Level Tuning is finished.

### GSM1800 (DCS/PCN)

Set operating mode to local mode

Select RF Tuning TX Power Level Tuning

Wait until the TX Power Level Tuning window pops up.

Connect a **calibrated** powermeter to the RF connector of the phone.

Select Band GSM 1800  
Active Unit TX

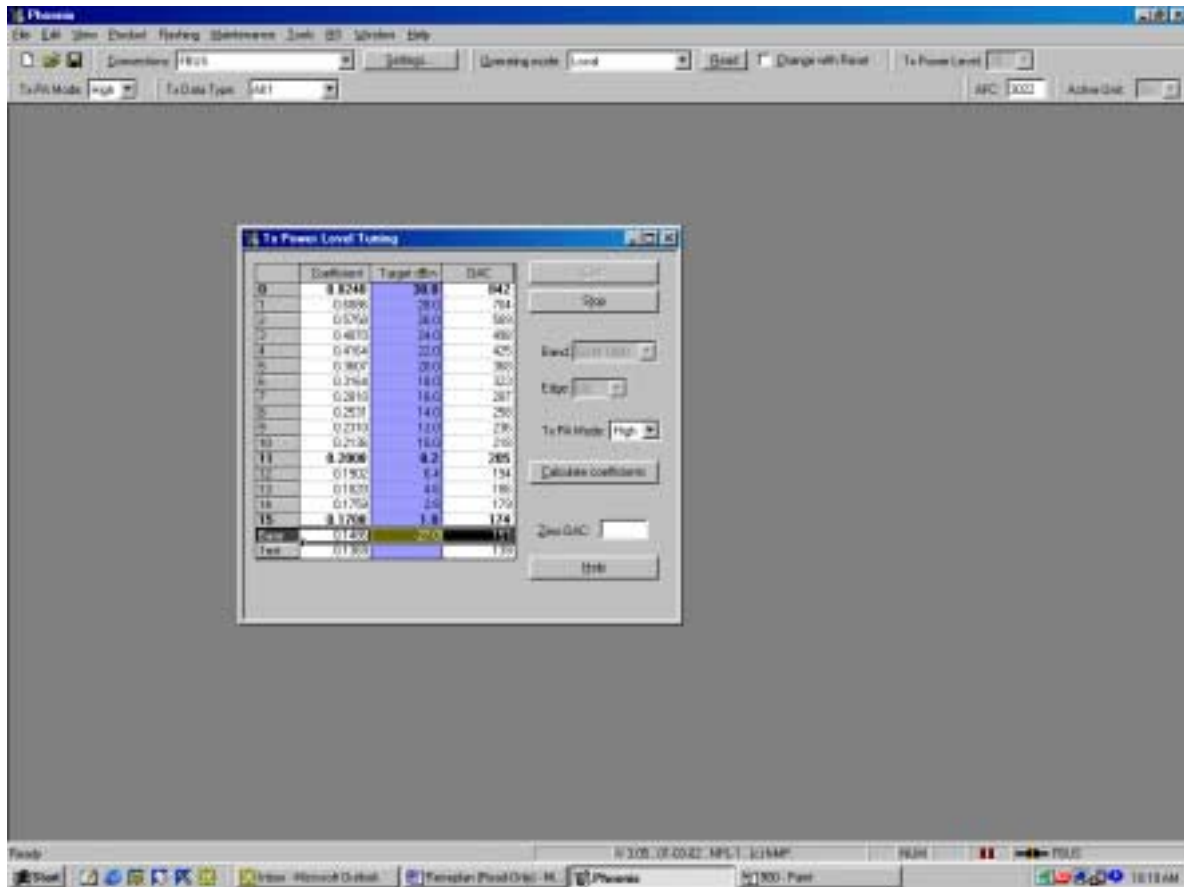

Press Start and a window pops up:

Select Permanent memory, press OK and the window closes.

Select TX Data Type Random

The setup should now look like this:

Select TX PA Mode High

Tune Base level to -27 dBm.

Adjust DAC Values for Power Level 0 (30 dBm), 11 (8.2 dBm) and 15 (1 dBm). The Power levels may differ from Phoenix mentioned target power levels.

Press calculate, check if all levels match the target values, correct if necessary.

Press Stop and a window pops up:

Select 'Save values to Phone Permanent Memory'

Press Yes and the GSM1800 TX Power Level Tuning is finished.

### GSM1900 (PCS)

Set operating mode to local mode

Select RF Tuning TX Power Level Tuning

Wait until the TX Power Level Tuning window pops up.

Connect a **calibrated** powermeter to the RF connector of the phone.

Select Band GSM 1900  
Active Unit TX

Press Start and a window pops up:

Select Permanent memory, press OK and the window closes.

Select TX Data Type Random

The setup should now look like this:

Select TX PA Mode High

Tune Base level to -27 dBm.

Adjust DAC Values for Power Level 0 (30 dBm), 11 (8.2 dBm) and 15 (1 dBm). The Power levels may differ from in Phoenix mentioned target power levels.

Press calculate, check if all levels match the target values, correct if necessary.

Press Stop and a window pops up:

Select 'Save values to Phone Permanent Memory'

Press Yes and the GSM1900 TX Power Level Tuning is finished.

## TX I/Q Tuning

This tuning must be done in all three bands.

### EGSM (EGSM900)

**Caution:** In case you use a spectrum analyser make sure that the external attenuation (20 - 30dB) between phone and spectrum analyser is high enough that the input of the analyser can't be destroyed. Adjust the reference level offset according to the insertion loss from the phone to the spectrum analyser .

PC/Phone operation:

Set operating mode to local mode

Select	RF		Alt-M
		Tuning	T
		TX IQ Tuning	I

Wait until the TX IQ Tuning window pops up.

Select	RF		Alt-M
		Tuning	T
		RF Controls	F

Wait until the RF Controls window pops up.

Connect a Spectrum Analyzer or GSM tester with the option \*Narrow Spectrum' to the RF connector of the phone.

If a spectrum analyzer is used then use the following settings.

	<b>EGSM/EGSM900</b>
Center Frequency	897.4 MHz
Frequency Span	300 kHz
Resolution Bandwidth	3kHz
Video Bandwidth	3kHz
Sweep Time	3 sec.
Sweep Type	Clear/Write
Detector Type	Max Peak
Reference level	35 dBm
	EGSM/EGSM900
Marker 1	897.33229 MHz
Marker 2	897.4 MHz
Marker 3	897.46771 MHz

Select in the RF Controls Window:

```
Select      Band      GSM 900
Active Unit  TX
            Operation Mode  Burst
            RX/TX Channel   37
            TX PA Mode Free
            TX Data Type  All1
```

Select in the TX IQ Tuning Window:

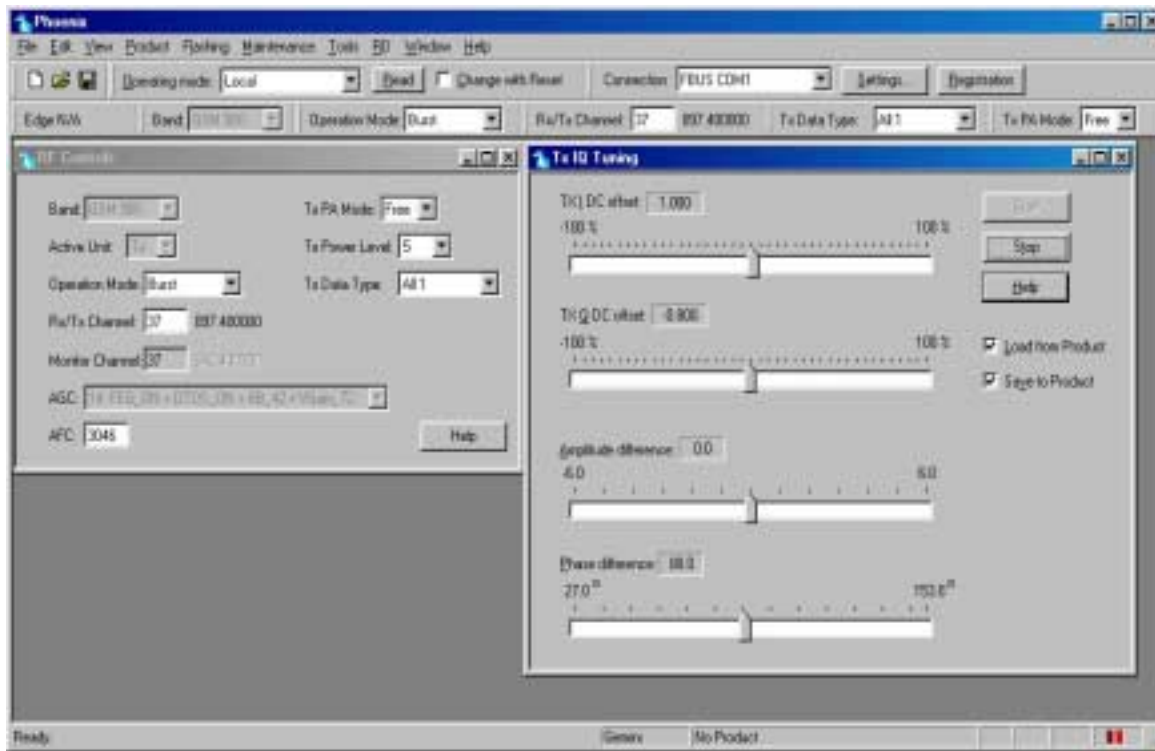

```
Select      "Load from Product"
            "Save to Product"
```

Press Start

Select again in the RF Controls Window:

```
Select      TX Power Level  5
```

The setup should now look like this:

The Spectrum Analyzer now shows a plot like this:

Date: 14.JAN.2002 13:11:55

The purpose of this tuning is to tune the carrier signal and the +67kHz signal to a minimum level (Marker 2 and 3).

Use the variables 'TX I DC offset' and 'TX Q DC offset' to adjust the carrier signal to a minimum level (Marker 2).

After tuning to the minimum the level difference between the peak levels at marker 1 and 2 must exceed 40dB.

Tuning is possible by using arrow keys on the keyboard. Pushing the sliders by using the mouse is less sensitive but even possible.

The Spectrum Analyzer now shows a plot like this:

Date: 14.JAN.2002 13:20:36

Use the variables 'Amplitude difference' and 'Phase difference' to adjust the +67kHz signal to a minimum level (Marker 3). After tuning to the minimum the level difference between the peak levels at marker 1 and 3 must exceed 40dB. Tuning is possible by using arrow keys on the keyboard. Pushing the sliders by using the mouse is less sensitive but even possible.

The Spectrum Analyzer now shows a plot like this:

Date: 14.JAN.2002 13:23:02

Select again in the RF Controls Window:

Select "Save to Product"

Press Stop and the values are stored in the phone.

The EGSM TX IQ Tuning is now finished.

**Note:** The optimal values for "TX I and Q Offset" and "Amplitude and Phase Difference" vary from phone to phone.

**GSM1800 (DCS/PCN)**

**Caution:** In the case you use a spectrum analyser make sure that the external attenuation (20 - 30dB) between phone and spectrum analyser is high enough that the input of the analyser can't be destroyed. Adjust the reference level offset according to the insertion loss from the phone to the spectrum analyser .

**PC/Phone operation:**

Set operating mode to local mode

Select	RF	Alt-M
	Tuning	T
	TX IQ Tuning	I

Wait until the TX IQ Tuning window pops up.

Select	RF	Alt-M
	Tuning	T
	RF Controls	F

Wait until the RF Controls window pops up.

Connect a Spectrum Analyzer or GSM tester with the option \*Narrow Spectrum' to the RF connector of the phone.

If a spectrum analyzer is used then use the following settings.

	<b>GSM1800</b>
Center Frequency	1747.8MHz
Frequency Span	300 kHz
Resolution Bandwidth	3 kHz
Video Bandwidth	3 kHz
Sweep Time	3 sec.
Sweep Type	Clear/Write
Detector Type	Max Peak
Reference level	35 dBm
Marker 1	1747.73229 MHz
Marker 2	1747.8 MHz
Marker 3	1747.86771 MHz

Select in the RF Controls Window:

Select	Band	GSM 1800
	Active Unit	TX
	Operation Mode	Burst
	RX/TX Channel	700
	TX PA Mode	Free
	TX Data Type	All1

Select in the TX IQ Tuning Window:

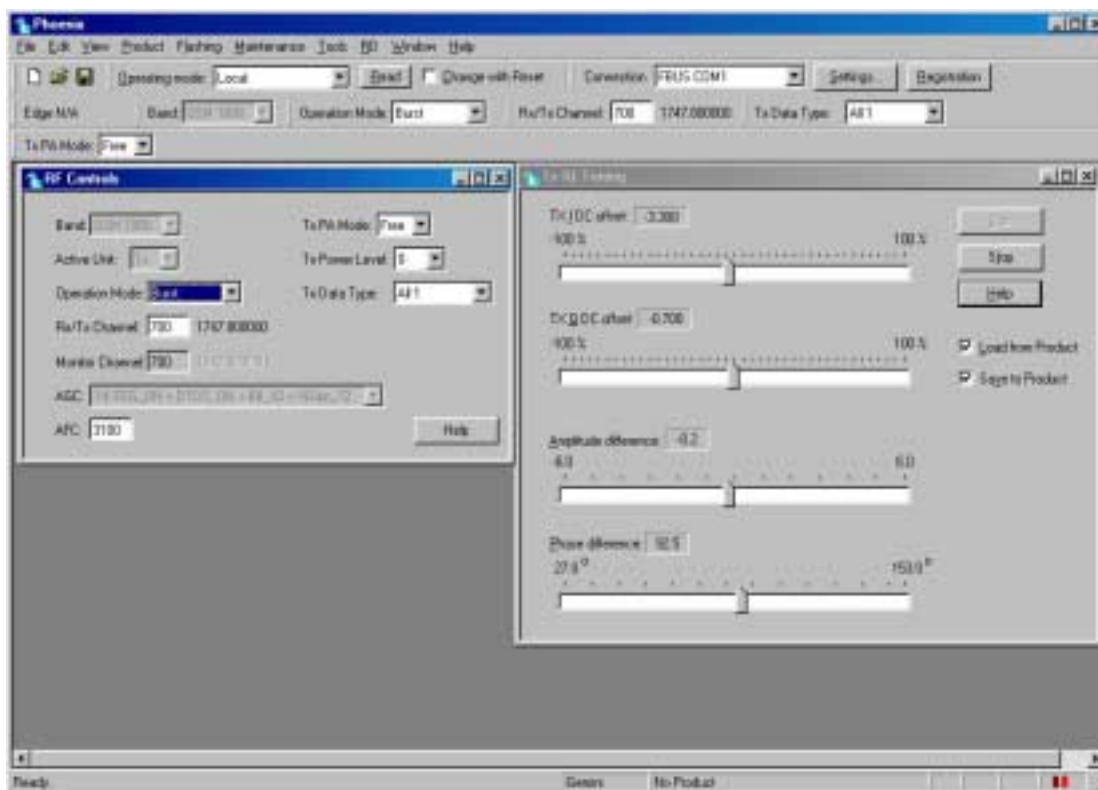

Select "Load from Product"  
"Save to Product"

Press Start

Select again in the RF Controls Window:

Select TX Power Level 0

The setup should now look like this:

The Spectrum Analyzer now shows a plot like this:

Date: 15.JAN.2002 10:18:02

The purpose of this tuning is to tune the carrier signal and the +67kHz signal to a minimum level (Marker 2 and 3).

Use the variables 'TX I DC offset' and 'TX Q DC offset' to adjust the carrier signal to a minimum level (Marker 2). After tuning to the minimum the level difference between the peak levels at marker 1 and 2 must exceed 40dB.

Tuning is possible by using arrow keys on the keyboard. Pushing the sliders by using the mouse is less sensitive but even possible.

The Spectrum Analyzer now shows a plot like this:

Date: 15.JAN.2002 10:20:39

Use the variables 'Amplitude difference' and 'Phase difference' to adjust the +67kHz signal to a minimum level (Marker 3)..After tuning to the minimum the level difference between the peak levels at marker 1 and 3 must exceed 40dB. Tuning is possible by using arrow keys on the keyboard. Pushing the sliders by using the mouse is less sensitive but even possible.

The Spectrum Analyzer now shows a plot like this:

Date: 15.JAN.2002 10:22:02

Select 'Save to Product'

Press Stop in the TX IQ Tuning Window and the values are stored in the phone.

The GSM1800 TX IQ Tuning is now finished.

Note: The optimal values for "TX I and Q Offset" and "Amplitude and Phase Difference" vary from phone to phone.

### GSM1900 (PCS)

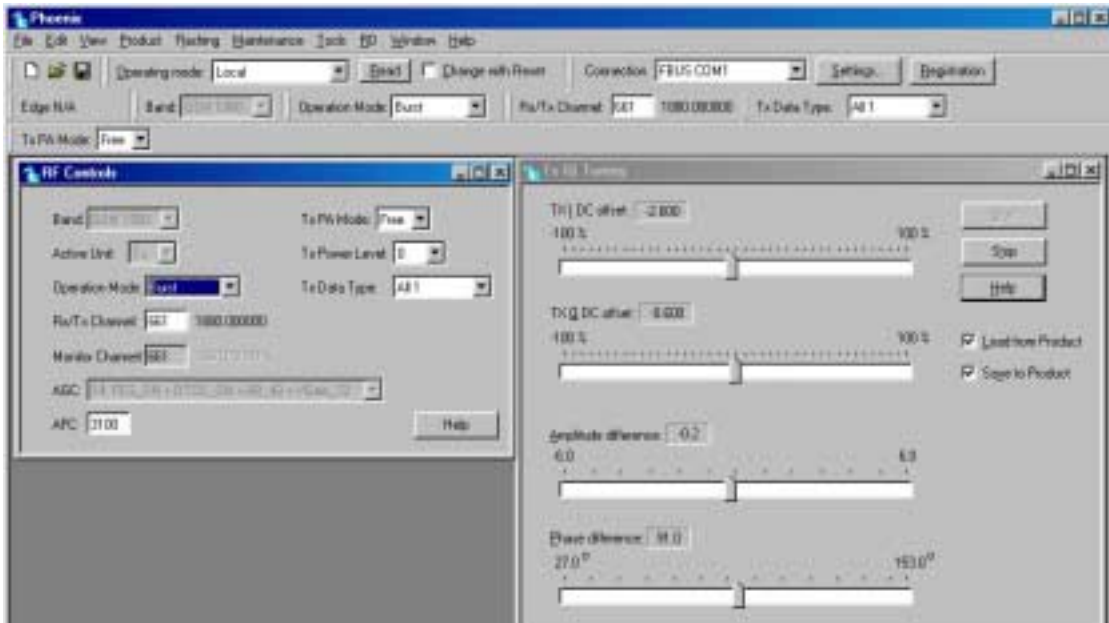

**Caution:** In case you use a spectrum analyser make sure that the external attenuation (20 - 30dB) between phone and spectrum analyser is high enough that the input of the analyser can't be destroyed. Adjust the reference level offset according to the insertion loss from the phone to the spectrum analyser .

PC/Phone operation:

Set operating mode to local mode

The setup should now look like this:

The Spectrum Analyzer now shows a plot like this:

Date: 15.JAN.2002 10:53:47

The purpose of this tuning is to tune the carrier signal and the +67kHz signal to a minimum level (Marker 2 and 3).

Use the variables 'TX I DC offset' and 'TX Q DC offset' to adjust the carrier signal to a minimum level (Marker 2).

After tuning to the minimum the level difference between the peak levels at marker 1 and 2 must exceed 40dB.

Tuning is possible by using arrow keys on the keyboard. Pushing the sliders by using the mouse is less sensitive but even possible.

The Spectrum Analyzer now shows a plot like this:

Date: 15.JAN.2002 10:57:06

Use the variables 'Amplitude difference' and Phase difference' to adjust the +67KHz signal to a minimum level (Marker 3). After tuning to the minimum the level difference between the peak levels at marker 1 and 3 must exceed 40dB, Tuning is possible by using arrow keys on the keyboard. Pushing the sliders by using the mouse is less sensitive but even possible'

The Spectrum Analyzer now shows a plot like this:

Date: 15.JAN.2002 10:58:09

Select 'Save to Product'

Press Stop in the TX IQ Tuning Window and the values are stored in the phone.

The GSM1900 TX IQ Tuning is now finished.

**Note:** The optimal values for "TX I and Q Offset" and "Amplitude and Phase Difference" vary from phone to phone.
