## UIF Module

### Introduction

The UI module UE4 is connected to the system/RF PCB with a 28-pin spring connector.

## Display

Display LCD84x48 is full dot matrix display, with COG driver. Display size is 84 columns and 48 rows. With the display graphic images can be presented.

## Functional Description

### Power Distribution Diagram

### Display Circuit

The display circuit comprises a LCD module (GD40) and two capacitors. The LCD module employs the COG (Chip on Glass) technology. The LCD module is connected to the UI board with gold wired elastomer. The capacitors are placed on the UI PCB.

The display driver includes a hw-reset, voltage tripler or quadrupler which depends on temperature, temperature compensating circuit and a low power control. The driver includes 84x48 RAM memory which is used when elements are create on the LCD. The elements are created with software. The driver doesn't include CG-ROM. One bit in the RAM is same as one pixel on display.

# Keyboard

1	NC	Soft left	Up	Down	Soft Right
2	NC	1	4	7	*
3	NC	2	5	8	0
4	PWR switch	3	6	9	#

NC = Not Connected

## Power Key

A micro switch is used as a power key on UI module. Circuitry includes micro switch and two diodes which are needed for the MAD interface. The power key is connected to the CCONT. The power switch is active in LOW state. The power key circuit can be seen on the Display Circuit diagram. The power key is connected to ROW4.

# Backlighting

Typical value for node is marked with black when circuit is not active  
Typical value for node is marked with gray when circuit is active

### Display backlight

Backlighting is provided by LEDs, three LED on right and three on left side of the display. The LEDs are compatible with CL270–YG and are side illuminating. The light is on when LIGHT–signal is in HIGH state.

Pin	Line Symbol	Parameter	Minimum	Typical / Nominal	Maximum	Unit	Notes
14	VBAT	Battery voltage	3.0		5.1	V	Same supply for Buzzer & Keyboard
			43.4	51.4	59.6	mA	LEDs

### Keyboard backlight

The keyboard backlighting comprises 6 LEDs. The LEDs are compatible with CL190–YG. Backlighting is on when LIGHT–signal is on HIGH state.

Color of LED is for

- Keyboard : yellow–green,  $\lambda = 570\text{nm}$

Pin	Line Symbol	Parameter	Minimum	Typical / Nominal	Maximum	Unit	Notes
14	VBAT	Battery voltage	3.0		5.1	V	Same supply for Buzzer & Display
			55.3	62.4	69.9	mA	LEDs

### Buzzer

Buzzer is of SMD type.

Typical value for node is marked with black when circuit is not active  
 Typical value for node is marked with gray when circuit is active

## Speaker

The speaker is sealed to the A-cover and the UI PCB with a silicon gasket for more constant frequency response. The speaker needs 6pcs of 1.2mm holes under component for leaking sound pressure into the RF-section through the UI module and 7pcs of 0.9mm holes in the left-hand corner of the UIM to leak from RF-section back to up cavity of phone. The RF-section between the UI module and the engine acts like a sound cage. This gives better sound quality.

The silicon gasket and the speaker itself act as water proofing elements in that area. Water may come into the speaker space between the speaker and the A-cover but not further into the phone from there. On the A-cover there are 3 pcs leaking holes which are not located top of the speaker. These holes make a better sound quality and less sensitivity for how tightly the user presses the phone against his/her ear.
