## SERVICE PROCEDURES

### 1. Safety-check out

After correcting the original service problem, perform the following safety check before releasing the set to the customer:

Connect the insulating-resistance tester between the plug of power supply cord and chassis.

Specifications : More than 10 Mohm at 500V.

### 2. Replacing the fuses

For continued protection against fire hazard, replace only with same type and same rating fuse.

NOTE: <D> 120V model only  
<M> Asian model only

### 3. Voltage Selector (Rear Panel)

Asian model are equipped with a voltage selector to conform to local power supplied.

Be sure to set this switch to match the voltage of the power supply in your area before plugging in the unit. Models without a voltage selector can only be used in area where the power supply is the same as that of the unit.

#### Setting the voltage selector

- Determine the proper for voltage for your area : 230-240V or 220V.
- If the preset voltage is not proper for your area, insert a screwdriver into the groove in the switch. Slide the switch all the way to the right (230-240V) or to the left (220V), which-ever is proper.

## 1. Preparations

- 1) Place the unit on the workbench. (There should be about 15 mm of space between the base plate of the unit and the work surface.)
- 2) Set up the unit as follows.
  - (1) No load
  - (2) No signal
  - (3) Volume turned all the way down
  - (4) Speaker switch OFF
  - (5) Power switch OFF

Note) Check the following points before making adjustments

  - (1) The power switch should be OFF.
  - (2) The interior of the unit should not be warm.

## 2. Idling current adjustment

- 1) Turn the power switch ON and allow the unit to warm up for about 10 minutes.
  - (1) Adjust VR370(VR470) so that the voltage at test point R383 (R483) on the power amp transistor pc circuit board is  $13\text{mV} \pm 2\text{mV}$ .

NOTE) Semi-fixed resistors enclosed in parentheses ( ) are for the right channel.
