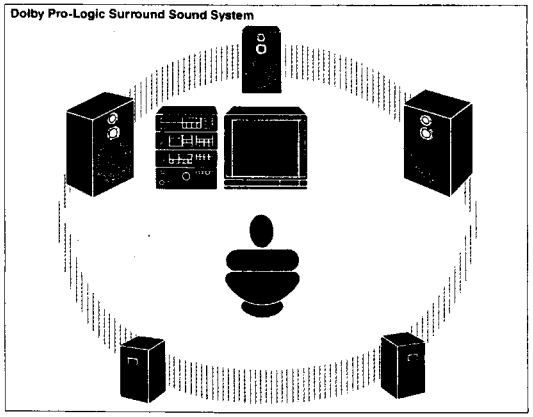
Dolby Pro-Logic Surround Sound System*

Dolby Pro-Logic Surround Sound employs circuitry based on that found in the professional Dolby surround decoders used in movie theaters. This "active decoder" configuration is more sophisticated than the "passive decoder" circuitry found in conventional receivers. Dolby Pro-Logic Surround's biggest feature is its "directional emphasis circuit." It adds a new, independently controlled "center channel" to the existing stereo L/R front channels and monaural L/R rear channel. The result is the same sonic composition you hear in a theater. Rather than just a combination of left and right channel information, the center channel benefits from logic steering circuitry that increases separation from around 3 dB to between 26 and 40 dB. This results in pinpoint directionality, image stability and enhanced overall sound quality. For example, the voices of on-screen characters always seem to come directly from the TV and never from a side speaker, even if you are sitting far to one side of the TV screen. A built-in noise sequencer generates test tones, making it easy to set the optimum channel balance. Simply listen to the test tone as it sequences automatically between the left, center, right and rear channels and set the channel levels so that they match. It's that easy to bring a theater ambience into your home.

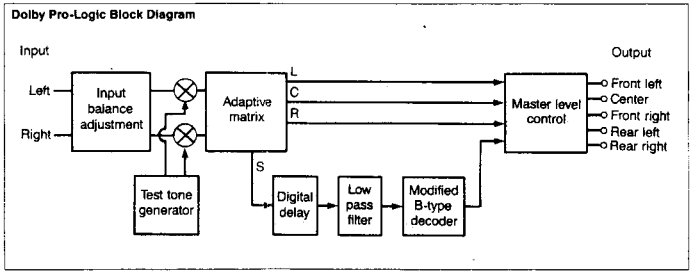


Adjustable Digital Time Delay

The TX-SV90 PRO includes adjustable digital time delay for the rear speaker channels to let you acoustically tailor the perceived room size to match the characteristics of the program material. This feature works with both the Dolby Pro-Logic and Hall surround modes and can be adjusted either manually or via the remote control. Delay can be set to 15, 20 or 30 milliseconds. The longer the delay, the larger the apparent acoustical size of the listening room.

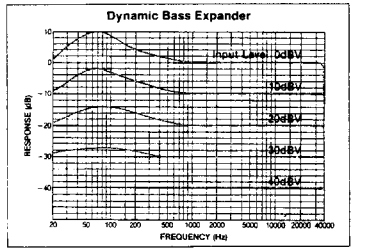
Discrete Pre-Out and Main-In Terminals

If you own a separate preamp or power amp, you'll appreciate the TX-SV90 PRO's pre-out and main-in terminals. The pre-out terminals for the front, rear and center channels allow you to route these signals directly to a separate power amp, bypassing the power amp blocks completely. You can also connect the TX-SV90 PRO to a separate preamp using the main-in facilities for the front left and front right channels only.



*Dynamic Bass Expander**

This exclusive Onkyo feature helps you get the most out of any sound source, especially your VCR or videodisc player. It expands low frequency response depending on the input signal level. The effect is totally new because the rate of expansion changes constantly, unlike conventional bass boost circuits. Deep bass impact and definition increase without altering the upper midbass and midrange. You can defeat the circuit when desired.



98-Function Programmable Universal Remote Control Included

With the RC-AV90M you can control all the components in your A/V system. This not only includes infrared remote compatible Onkyo components, but virtually any component or appliance made by any manufacturer that accepts infrared codes. All RI commands for RI system remote compatible Onkyo components are preprogrammed. They can also be replaced with other control codes. And a total of 98 separate control codes can be programmed. So you'll have complete command over your A/V system no matter how many separate components there are.

***There may be some cases of incompatibility due to nonstandard systems used by some manufacturers.**

SERVICE PROCEDURES

1. Replacing the fuses

For continued protection against fire hazard, replace only with same type and same rating fuse.

2. Change of AM band selector

With the exception of the worldwide model, a AM BAND step selector switch is not provided.

Band step	D714
10kHz → 9kHz	Additional
9kHz → 10kHz	Eliminated

– Worldwide model –

Woldwide models are equipped with a band step selector switch. This switch is located on the back panel. This switch is set to 9kHz at the factory, but may have to be reset to 10kHz depending on the area where the unit is used.

	Band step
U.S.A.	10kHz
Other region	9kHz

3. Memory preservation

This unit does not require memory preservation batteries. A built-in memory power back-up system preserves contents of the memory during power failures and even when the unit is unplugged. The unit must be plugged in and the power switch turned on and off once in order to charge the back-up system. Note that since this is not a permanent memory the power switch must be turned on and off a few times each month to keep the back-up system operative. The period of time during which memory contents are preserved after power has last been turned off varies depending on climate and placement of the unit. On the average, memory contents are protected over a period of 3 to 4 weeks (a minimum of 2 weeks) after the last time power has been turned off. This period is shorter when the unit is exposed to very high humidity or used in an area with an extremely humid climate.

4. Safety-check out

(Only U.S.A. model)

After correcting the original service problem perform the following safety check before releasing the set to the customer.

Connect the insulating-resistance tester between the plug of power supply cord and terminal GND on the back panel. Specifications: 3.3 Mohm ±10% at 500V.

5. Change of voltage

Worldwide models are equipped with a voltage selector to conform with local power supplies. This switch is located on the back panel. Be sure to set this switch to match the voltage of the power supply in your area before turning the power switch on.

This switch is set to 220V at the factory. Voltage is changed by sliding the groove in the switch with the screw-driver to the right or left. Confirm that the switch has been moved all the way to the right or left before turning the power switch on.

ADJUSTMENT PROCEDURES

• Preparation

1. Input
   FM mono: 1kHz, 75kHz devi., 60dB/μV
   FM stereo: 1kHz, L+R 67.5kHz devi.,
   Pilot signal 19kHz 7.5kHz devi.
   AM: 400Hz 30% mod.
2. Outputs
   Connect the non-inductive type resistors of 8ohms to the front speaker, center speaker, and rear speaker terminals unless otherwise noted.
3. Standard Knob Position
   TAPE MONITOR ..... SOURCE
   VOLUME ..... Maximum
   BASS/TREBLE/BALANCE/INPUT
   BALANCE ..... Center
   MUTING/LOUDNESS ..... Off
   VCR 2 ..... STEREO
   FRONT SPEAKER ..... A
   CENTER/REAR SPEAKERS ..... ON
   SURROUND MODE ..... Bypass
   SIMULATED STEREO ..... Off
   DYNAMIC BASS EXPANDER ..... Off

Amplifier Section

1. Idling Current Adjustment (Front)
Connect the DC voltmeter to the terminals IID and VCT on the pre./main amplifier pc boared. Adjust the semi-fixed resistors R533 and R534 so that the indication of voltmeter is 7.5±1.5mV.
Note: Open load, Adjust after switching on for 5 minutes.

2. Idling Current Adjustment (Center)
Connect the DC voltmeter to the terminals IID and VCT on the rear and center amplifier pc board. Adjust the semi-fixed resistor R592 so that the indication of voltmeter is 7.5±1.5mV.
Note: Open load, Adjust after switching on for 5 minutes.

3. Dolby Noise Level Adjustment
Connect the AC voltmeter to the terminals TP9 and TPE. Press the button TEST of remote control transmitter. Adjust R804 so that the indication of voltmeter is 60mV. (30~120mV).

NOTE

- THE COMPONENTS IDENTIFIED BY MARK ⚠ ARE CRITICAL FOR SAFETY. REPLACE ONLY WITH PART NUMBER SPECIFIED.
- VOLTAGE (MEASURED WITH VOLTMETER) ⊏ IS DC VOLTAGE. (NO INPUT SIGNAL)
- ALL PNP TRANSISTORS ARE EQUIVALENT TO 2SA1015-GR UNLESS OTHERWISE NOTED.
- ALL NPN TRANSISTORS ARE EQUIVALENT TO 2SC1815-GR UNLESS OTHERWISE NOTED.
- ALL DIODES ARE EQUIVALENT TO 1SS133 UNLESS OTHERWISE NOTED.
- ELECTROLYTIC CAPACITORS (–#) ARE IN μF/WV.
- ALL CAPACITORS ARE IN pF/50WV UNLESS OTHERWISE NOTED. EX) 3pF→030, 33pF→330, 330pF→331, 0.033μF→333
- ALL RESISTORS ARE IN OHMS 1/4 WATTS UNLESS OTHERWISE NOTED.
- THE THICK LINES IN PC BOARD ARE THE PRINTING SIDE OF THE PARTS. EX) ▭ PRINTING SIDE
- CIRCUIT IS SUBJECT TO CHANGE FOR IMPROVEMENT.
