SERVICE PROCEDURES

1. Replacement of lamp

This unit is used two lamps listed below.

Circuit no.	Part no.	Description
PL001	210149	PL14V0.06AW-3.0, Power indicator
PL902	210064A	PL6.3V, 250mA, Dial plate illumination

2. Safety-check output

(Only U.S.A. model)

After correcting the original service problem, perform the following safety check before releasing the set to the customer. Connect the insulating-resistance tester between the plug of power supply cord and nickel screw on the back panel.

Specifications: 3.3Mohm ± 10% at 500V.

3. Change of band step/de-emphasis

Universal models are equipped with a band step/ de-emphasis switch on the back panel. This switch is set to following position.

	Emphasis	AM step
set position	50μsec.	9 kHz
other	75μsec.	10 kHz

4. Change of voltage

Universal models are equipped with a voltage selector to conform with local power supplies. This switch is located on the back panel. Be sure to set this switch to match the voltage of the power supply in your area before tuning the power switch on.

This switch is set to 220V at the factory. Voltage is changed by sliding the groove in the switch with the screwdriver to the right or left. Confirm that the switch has been moved all the way to the right or left before turning the power switch on.

5. Memory preservation

This unit dose not require memory preservation batteries. A built-in memory power back-up system preserves contents of the memory during power failures and even when the unit is unplugged. The unit must be plugged in and the power switch turned on and off once in order to charge the super capacitor of C409. Note that since this is not a permanent memory, the power switch must be turned on and off a few times each month to keep the back-up system operable. The period of time during which memory contents are preserved after power has last been turned off varies depending on climate and the location and placement of the unit. On the average, memory contations are protected over a period of 2 weeks after the last time power has been turned off. This period is shorter when the unit exposed to very high humidity or used in an area with an extermely humid climate.

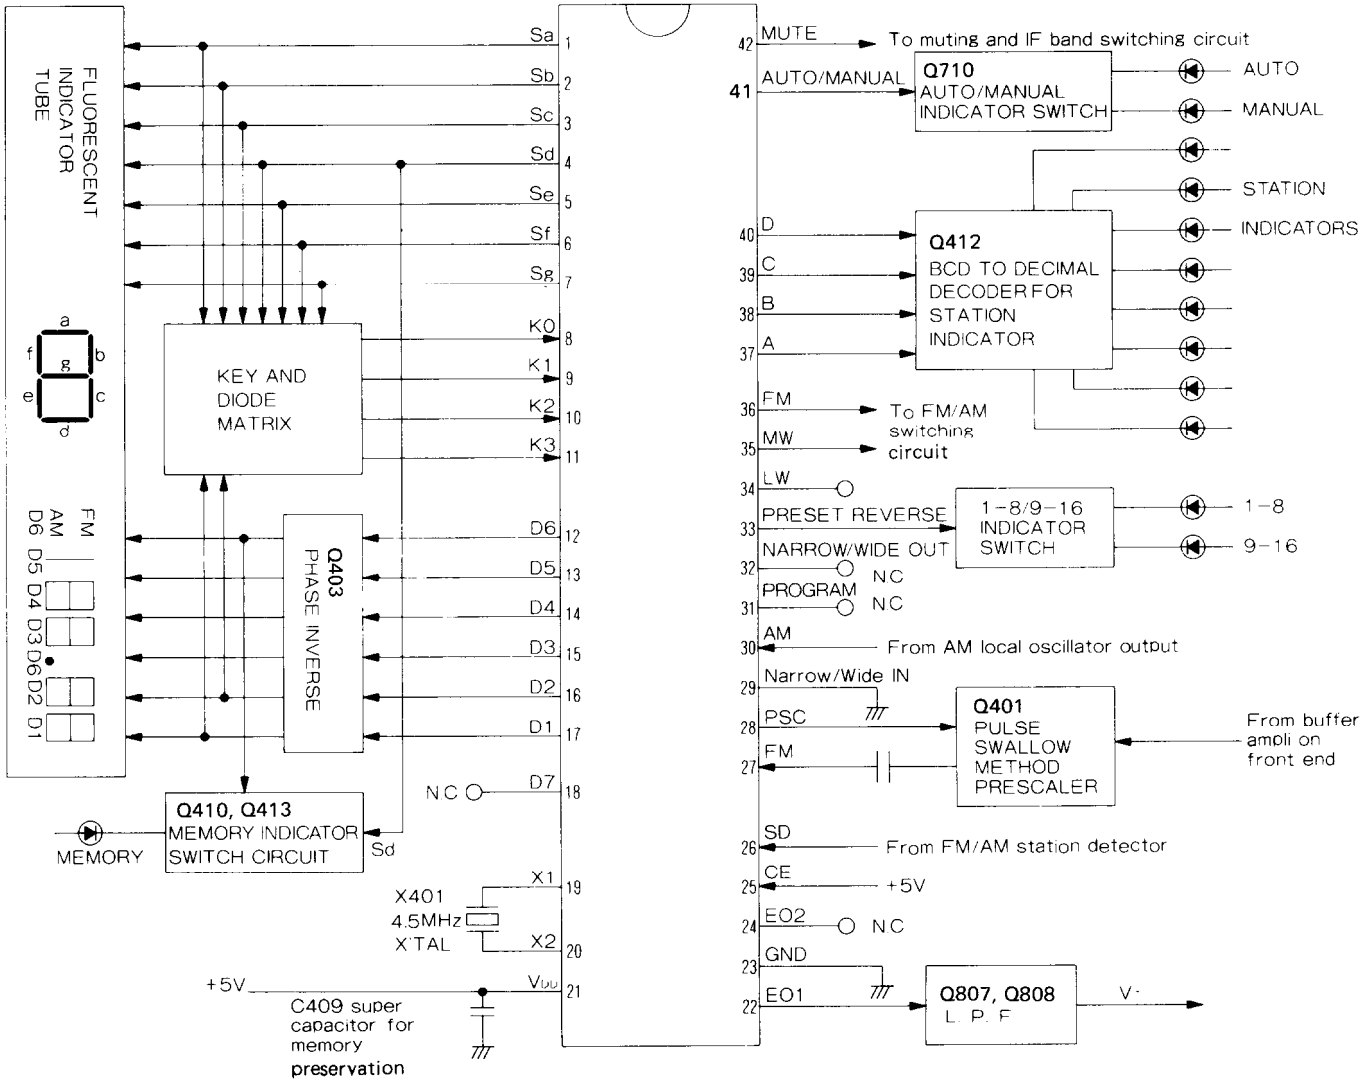
MICROCOMPUTER OPERATION



Pin No.	Symbol	Terminal	Description
1 – 7	Sa – Sg	Segment outputs	Display tube signal terminal output and key return signal source terminals; active high. Since these terminals can handle 30V, they are connected directly to the segment terminals of the fluorescent display tube.
8 – 11	K0 – K3	Key return signal inputs	Terminals for input of the key return signals from external matrix circuit.
12 – 18	D1 – D7	Digit outputs	Display tube digit output signal terminals; active low. D1 and D2 are used the key return signal source.
19, 20	X1, X2	X'tal	Connect to the 4.5MHz crystal oscillator.
21	V_{DD}	Power source input	Device power source terminal; supplies 5V during normal operation and 2.5V from the super capacitor C409 for memory preservation.

Pin No.	Symbol	Terminal	Description
22, 24	E01, E02	Error outputs	Charge pump output of the phase detector with constitutes the PLL. High level is output when the divided oscillation frequency is higher than the reference frequency. In the opposite case, low level is output. Floating occures when the frequencies match. The output is applied to the variable capacitor diode in the front end through the low pass filter Q807 and Q808. The output from both terminals is same, but only E01 is used.
23	GND	Ground	
25	CE	Chip enable	Device selection signal input terminal. High level ... Normal operation Low level ... Memory preservation
26	SD	Station detector signal input	Input terminal for detecting whether or not a broadcast signal is being received during auto-tuning. Stopped by the high level.
27	FM	FM local oscillator signal input	Input terminal for FM local oscillator is divided by 1/16 or 1/17 by prescaler Q401.
28	PSC	Pulse swallow control output	This terminal outputs a signal that switches the prescaler division ratio of Q401 to 1/16 or 1/17 when the pulse swallow method is used for division. (FM only)
29	NARROW/ Wide out	IF band width output	Terminal for switching narrow and wide of IF band width. Not used.
30	AM	AM local oscillator signal input	Terminal for input of the AM local oscillator signal.
31	PROGRAM	Program selection signal output	Terminal for indicator output whether or not the program mode. Not used.
32	NARROW/ Wide out	IF band width switching output	Terminal for specifications output of IF band width. Not used.
33	Preset Reverse	Preset reverse indication output	Terminal for indication output whether M1 – M8 or M9 – M16 the preset key.
34	LW	Band switching signal outputs	Terminals for signal output switching of each band. High level is output from terminal of FM (pin no. 36) and low level is output from other terminals (pin no. 34 & 35) during FM reception. LW is not used with T-4087.
35	MW		
36	FM		
37 38 39 40	A B C D	Preset station indication outputs	Terminals for BCD code output of preset station indicator.
41	AUTO/ MANUAL	Auto/Manual indication output	Terminal for indication output whether or auto the tuning mode. This terminal becomes high during auto mode and low during manual mode.
42	MUTE	Muting output	Output terminal which mutes the shock noise occurring when the PLL is released; active high. The muting signal is output as shown below. UP/DOWN of manual/auto mode, preset memory is recalled, band switching and preset scan.
