## Non-contact Speedometers

$\mathbf{L C}_{\text {series }}$

The LC-series is on-vehicle type of non-contact, non-marking speed measurement system with high accuracy. High-speed tests up to a maximum $320 \mathrm{~km} / \mathrm{h}$ can be performed by LC-5200 System.

# LC-1100/2100 

## Spatial filter type speed detectors

#### Abstract

The LC-1100/2100 spatial filter type speed detectors are designed exclusively for use with the LC Series noncontact speedometers.

> The LC-1100 is designed for use with the LC-5200/761 systems, and features a mid-speed to high-speed measurement range from $1.5 \mathrm{~km} / \mathrm{h}$ to $320 \mathrm{~km} / \mathrm{h}$.

The LC-2100 can measure speeds in both the positive and negative directions, including zero speed. It is designed for use with the LC-761 system, and can measure lateral direction speeds and low straight-line speeds in the range from -20 to $+20 \mathrm{~m} / \mathrm{s}(-72$ to $+72 \mathrm{~km} / \mathrm{h})$.

## Explanation of the Measurement Principles

## Extraction of Specific Unevenness in the Reflection

The spatial filter type speed detector is a very special sensor that extracts only specific unevenness in the reflection (uneven color, uneven surface, and so forth), from the irregular patterns formed by particles of various sizes such as small stones, sand, and asphalt on the road surface and railroad tracks, and patterns formed by tire marks.
To be more specific, from the irregular pattern on the road surface, only those components that are arranged in a regular sequence at 2.3 mm intervals are located. The fluctuations in the amount of reflected light generated by these components are converted to electrical signals and sent to the speedometer where the signals are passed through a bandpass filter, shaped into a waveform, converted to a pulse train, and calculated. Accordingly, since the signals were generated from the unevenness in the reflection at 2.3 mm intervals, the speed and the distance can be obtained by multiplying the values calculated in the specified time by 2.3 mm .

## Converting a Photoelectric Current into an Easy-to-Understand Signal

Now, why is it that we can only extract the unevenness in the reflection that occurs at regular 2.3 -mm intervals? The surface pattern of the road surface is passed through the objective lens and the slit, and an image is formed on top of the special lightreceiving elements of the comb-shaped structure which acts as a spatial filter. Furthermore, as the vehicle that is being measured moves, variations in the photoelectric current occur.
Comparatively small amounts of unevenness in the reflection with respect to the lattice spacing pitch are averaged out with the large amounts of unevenness in the reflection by the "comb-shaped structure", and, depending on the differential effects from the pair of elements, the variations in the photoelectric current are almost cancelled out. By the way, getting back to the unevenness in the reflection ( $2.3-\mathrm{mm}$ interval) in the lattice pitch, large variations to the photoelectric current occur at each of the elements in the pair, and, on top of that, since a half-phase shift occurs, the variations cannot cancel each other out. That is to say, this is why only the specific unevenness in the reflection (unevenness every 2.3 mm ) that is determined by the element structure and the optical system can be extracted for the extracted signal.
In addition, with the LC-2100, electrical processing is used to apply a frequency shift with respect to the detection signal obtained from the spatial filter, thereby enabling the extraction of a speed signal in the positive direction.

LC-1100/2100

## LC-5200 system

## For mid-speed to high-speed tests

## Can handle high-speed tests up to a maximum of $320 \mathrm{~km} / \mathrm{h}$. High-performance, attaché-case type device with a built-in printer; can also perform fuel consumption tests.

## Features

- Easy-to-read fluorescent display tube used in the display
- Selectable display pattern to suit the test conditions (single-row or double-row display)
- Built-in printer enables easy output of data
- The measurement data can be saved to a compact flash memory card
- Ten test modes provided
- Compact design
* FP Series Volumetric Type Flow Detector is required to perform the test mode No. 7 \& 8 .

| No. | Test MODE | Test Description | Measurement Units, Other |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | Speed Step | Distance Step, Other |
| 0 | TEST <br> (Calibration and equipment testing) | Measurement of the distance, time, and average speed from GATE ON to GATE OFF (white line detection possible) |  |  |
| 1 | $\begin{aligned} & \text { SS400-1000 } \\ & \text { (Standing-start } \\ & \text { acceleration test) } \end{aligned}$ | Measurement of the distance, time, and section acceleration rate from the vehicle's standing-start position up to the $400-\mathrm{m}$ or $1000-\mathrm{m}$ position | $\begin{aligned} & \text { Switched every } \\ & 5 \mathrm{~km} / \mathrm{h} \\ & 10 \mathrm{~km} / \mathrm{h} \\ & 20 \mathrm{~km} / \mathrm{h} \end{aligned}$ | Switched every 25 m ( 50 m after 100 m ) 50 m ( 100 m after 200 m ) 100 m (200 m after 400 m ) |
| 2 | ACCEL. <br> (Passing acceleration test) | Measurement of the distance, time, and section acceleration rate from GATE ON (JUST speed function enabled) up to the $400-\mathrm{m}$ or $1000-\mathrm{m}$ position |  |  |
| 3 | COAST DOWN <br> (Coast-down test) | Measurement of the coast-down time and the coastdown coefficient from GATE ON (JUST speed function enabled) up to the $400-\mathrm{m}$ or $1000-\mathrm{m}$ position |  | Switched every $25,50,100 \mathrm{~m}$ |
| 4 | BRAKE-1 <br> (Brake test 1) | Measurement of the initial speed at the braking start time point and the braking distance, time, and average deceleration until the stopping point | (Calculates and displays MFDD) |  |
|  | BRAKE-2 | Measurement of the initial speed at the braking | Measures deceleration using STEP DATA |  |
| 5 | (Brake test 2) | start time point and the braking distance, time, and section deceleration until the stopping point | Switched every $5,10,20 \mathrm{~km} / \mathrm{h}$ | Switched every 5, 10, 20 m |
| 6 | METER CHECK <br> (Meter calibration) | Comparison of the vehicle's speedometer with the actual speed |  | Desired number of times measured |
| 7 | F-CONST. (Constant fuel consumption test) | Measurement of the amount of fuel consumption and the fuel consumption rate from GATE ON up to the $500-\mathrm{m}$ or $1000-\mathrm{m}$ position |  | Switched every 100, 500, 1000 m |
| 8 | F-PATTERN <br> (Fuel consumption pattern test) | Measurement of the amount of fuel consumption and the fuel consumption rate while changing the running pattern |  | Auto GATE OFF possible after 2 or 5 patterns |
| 9 | D. STEP PRINT <br> (Fixed distance) | Continuous printing of the distance, time, and instantaneous speed from GATE ON (white line detection possible) to GATE OFF |  | Switched every $50,250,500 \mathrm{~m}$ |

## Simultaneous measurement of the straight-line speed, lateral speed, and the sideslip angle. Optimal system for operational and stability tests.

The LC-761 Sideslip Testing System measures the vehicle's speed with respect to the ground and the sideslip angle. Since it outputs the vehicle's straight-line speed, lateral speed, and sideslip angle, the motion aspects during operational and stability tests can be continuously monitored. The LC-1100 detector is designed for the measurement of straight-line speeds, and the LC-2100 for the measurement of lateral speeds. Minute detector mounting angle errors have appeared until now as large speed error components in the measurement of vehicle lateral speeds. With the LC-761 system, an auto correction function is provided to correct any mounting angle error in the LC-2100 and thereby ensure accurate lateral speed measurement. Moreover, since the distance pulse output from the LC-5200 can be input as a straight-line speed signal, measurement of the sideslip angle can be performed while saving the straight-line speed data to the LC-5200's memory.
(The LC-1100 is not required when $1 \mathrm{~cm} / \mathrm{P}$ signals are input.)

## For the LC Series

FP Series Volumetric Type Flow Detectors* ${ }^{* 1}$
The FP Series flow detectors are compact, lightweight volumetric-type flow meters that are ideal for in-vehicle mounting. Three measurement ranges are provided: 0.06 to $60 \mathrm{l} / \mathrm{h}, 0.3$ to $120 \mathrm{l} / \mathrm{h}$, and 1 to $1440 \mathrm{l} / \mathrm{h}$. Fuel quantities from micro-capacity flows during idling through to large-capacity flows under highspeed, high-load conditions can be measured. Moreover, a function for detecting the direction of rotation compensates for errors caused by pulsating or back flows enables highly accurate measurement within $\pm 0.2 \%$ or $\pm 0.5 \%$ of the reading.
Compatible models : LC-5200 system (FP-213/2140H/215)
Measurement ranges : 0.06 to $60 \mathrm{l} / \mathrm{h}$ (FP-213)

$$
0.3 \text { to } 120 \mathrm{l} / \mathrm{h}^{* 2}(\mathrm{FP}-2140 \mathrm{H})
$$

1 to 1440 l/h (FP-215)
Accuracy
: Within $\pm 0.2 \%$ of reading (FP-2140H) Within $\pm 0.5 \%$ of reading (FP-213/215)
Applicable fluids
Note: *1 The signal cable is sold separately.

*2 Can be modified to 0.3 to $200 \mathrm{l} / \mathrm{h}$ upon request

## LC-065 Brake Test Commander

When a braking test is performed, the LC-065 inputs a voltage signal (12 or 24 VDC) from the brake lamp and a non-voltage 1a contact signal from the tape switch (provided) or other source, and outputs an external start signal for the LC Series. This enables a voltage input from the vehicle's brake lamp to be added to the non-voltage 1a contact signal.
Compatible models : LC-761 system
Input signals : Non-voltage 1a contact signal and a voltage signal (12 or 24 VDC )
Operating temperature range : 0 to $+50^{\circ} \mathrm{C}$
Outer dimensions : $160(\mathrm{~W}) \times 30(\mathrm{H}) \times 58$ (D) mm
Weight
: Approx. 200 g

## SF-061 Carrying case for the LC-1100/2100 models

The SF-061 carrying case holds the LC-1100/2100 detector already mounted on its mounting fixture, together with accessories such as the external display unit, remote box, cables, and so forth. Accordingly, only two items are required to be taken to the measurement site: the LC Series main unit and the SF-061 carrying case. Moreover, the carrying case is useful for shipping the equipment to remote sites, and for storing the equipment when it is not in use.
Compatible models : LC-1100/2100
Material
: FRP (fiber-reinforced plastic)
Casters
: Four rotating caster wheels
Outer dimensions
: 530 (W) x $530(\mathrm{H}) \times 230$ (D) mm
Weight
: Approx. 7 kg

## LC-0001A Halogen lamp for LC-1100/2100

The LC-0001A is a replacement halogen lamp for the light projector used in the LC-1100/2100 detectors.
Compatible models : LC-1100/2100
Standard : 12 VDC 50 W (4.2 A) halogen lamp
PU-206 Recording paper for use with a printer
PU-206 : For the LC-5200 (10 rolls/box)

## ■ Non-contact Speedometer Specifications

| Specification Model name |  | LC-5200 |
| :---: | :---: | :---: |
| Measurement range |  | 1.5 to $320 \mathrm{~km} / \mathrm{h}$ |
| Overall accuracy |  |  |
|  | eed | $\pm 0.5 \%$ |
|  | stance | $\pm 0.1 \%$ STD (when 400 m or longer) |
| Built-in display unit |  | Fluorescent display tube (speed, distance, and simultaneous display of these two parameters) |
| Display parameter setting range |  | (varies slightly according to the mode selected) |
|  | eed | 4 digits 0.1 to $320.0 \mathrm{~km} / \mathrm{h}$ |
|  | stance | 6 digits 0.0 to 99999.9 m |
|  | me | 6 digits 0.00 to 9999.99 s |
|  | el rate | 4 digits 0.00 to $99.99 \mathrm{~km} / \mathrm{l}$ |
| External display unit |  | Speed, distance, and simultaneous display of these two parameters |
| Speed display time |  | 0.5 s automatic repeat |
| Analog output section |  |  |
| Speed |  | 0 to $+6.4 \mathrm{~V} / 0$ to $320 \mathrm{~km} / \mathrm{h}$ |
| Linearity |  | Within $\pm 0.2 \%$ of full scale |
|  | sponse | Approx. $0.04,0.3 \mathrm{~s}$ automatically switched |
| Pulse output section |  |  |
|  | stance | $1 \mathrm{~cm} / \mathrm{P}$ |
|  | vel | TTL (22 k 2 load or higher) |
| Start/stop signals |  | Auto (Standing-start, speed, distance, stop coherence method) Manual operation, external input, white line detection, brake lamp input |
| Memory capacity |  | Approx. 15,000 steps |
| CF memory |  | Type I |
| Format method |  | FAT format |
| Memory format |  | Measurement data is saved in the CSV format. |
| Test modes |  |  |
| 0 | TEST | Calibration and equipment performance check tests |
| 1 | SS400-1000 | Standing-start acceleration test |
| 2 | ACCEL | Passing acceleration test |
| 3 | COAST DOWN | Coast-down test |

|  | el consumption rate | 4 digits |
| Recording method |  | Switched between AUTO and MANUAL |
| Other functions |  | Fixed format for each test |
| Input pulse (flow) |  | FP series, $0.1 \mathrm{ml} / \mathrm{P}$ |
| Input pulse (distance) |  | $1 \mathrm{~cm} / \mathrm{P}$ |
| Power supply |  | 10 to 15 VDC |
| Power consumption |  | Approx. 8 A (including light projector current) |
| Operating temperature range |  | 0 to $+50^{\circ} \mathrm{C}$ |
| Outer dimensions |  | 330 (W) $\times 160$ (H) $\times 350$ (D) mm |
| Weight (excluding detector) |  | Approx. 7.5 kg |

| Specification Model name | LC-761 |
| :---: | :---: |
| Measurement range |  |
| Straight-line speed | 1.5 to $250 \mathrm{~km} / \mathrm{h}$ |
| Lateral speed | -20 to +20 m/s |
| Sideslip angle | 0 to $\pm 25^{\circ}$ |
| Overall accuracy |  |
| Speed | $\pm 0.5 \%$ |
| Distance | $\pm 0.1 \%$ STD (when the straight line is 400 m or longer) |
| Built-in display unit | Red LEDs |
| Display parameter setting range |  |
| Straight-line speed | 4 digits 000.0 to $250.0 \mathrm{~km} / \mathrm{h}$ |
| Lateral speed | Polarity + 4 digits 00.00 to $\pm 20.00 \mathrm{~m} / \mathrm{s}$ |
| Straight-line distance | 5 digits 0000.0 to 9999.9 m |
| Lateral distance | Polarity + 4 digits 000.0 to $\pm 999.9 \mathrm{~m}$ |
| Display method | The straigh-line speed and lateral direction distance are switch-selectable. The straight-line distance and lateral direction speed are switch-selectable. |
| External display unit |  |
| Straight-line speed | 4-digit LCD, 0.0 to $250.0 \mathrm{~km} / \mathrm{h}$ |
| Sideslip angle | Analog meter display (0 to $\pm 25^{\circ}$ ) |
| Speed display time | 0.5 s automatic repeat |
| Analog output section |  |
| Straight-line speed | 0 to $+5.0 \mathrm{~V} / 0$ to $250 \mathrm{~km} / \mathrm{h}$ |
| Lateral speed | 0 to $\pm 10.0 \mathrm{~V} / 0$ to $\pm 20 \mathrm{~m} / \mathrm{s}$ |
| Sideslip angle | 0 to $\pm 12.5 \mathrm{~V} / 0$ to $\pm 25^{\circ}$ |
| Linearity | Within $\pm 0.2 \%$ of reading |
| Response | Approx. 0.08 s (straight-line speed) |
| Pulse output section |  |
| Distance | $1 \mathrm{~cm} / \mathrm{P}$ (always output) |
| Time | $1 \mathrm{~s} / \mathrm{P}$ (Only output for GATE ON) |
| Level | TTL (10 k 2 load or higher) |
| Start/stop signals | Manual operation, external input, white line detection |
| Auto correction functions | Auto correction of the LC-2100 mounting angle error (torsional angle) (the correctable range is within $\pm 5^{\circ}$, but only up to $200 \mathrm{~km} / \mathrm{h}$ ) |
| Power supply | 10 to 15 VDC |
| Power consumption | Approx. 12 A (includes the whole system) |
| Operating temperature range | 0 to $+50^{\circ} \mathrm{C}$ |
| Outer dimensions | 335 (W) $\times 110$ (H) $\times 420$ (D) mm |
| Weight (excluding detector) | Approx. 9 kg |

## - Spatial Filter type Speed Detector Specifications

| Specification Model name | LC-1100 |
| :--- | :--- |
| Speed measurement range | 1.5 to $320 \mathrm{~km} / \mathrm{h}$ (When the radius is 10 R or higher at <br> a level surface on the test course) |
| Detector mounting height | $500 \pm 100 \mathrm{~mm}$ (height between the measurement <br> surface and the detector tip) |
| Detector mounting angle | $0^{\circ} \pm 3^{\circ}$ (torsional angle), $90^{\circ} \pm 3^{\circ}$ (forward direction), <br> $90^{\circ} \pm 10^{\circ}$ (diagonal angle) |
| Measurement area | Approx. $46 \mathrm{~mm} \times 60 \mathrm{~mm}$ (forward direction x vehicle width direction) |
| Light projector | $12 \mathrm{VDC}, 50 \mathrm{~W}(4.2 \mathrm{~A})$ Life: Approx. 400 hours of continuous use |
| Outer dimensions | Approx. $179(\mathrm{~W}) \times 330$ (H) $\times 88$ (D) mm (excluding the mounting fixture) |
| Weight | Approx. 1.6 kg (when the mounting fixture is excluded) <br> Approx. 5.2 kg (when the mounting fixture is included) |

| Specification $\quad$ Model name | LC-2100 |
| :---: | :---: |
| Speed measurement range | -20 to $+20 \mathrm{~m} / \mathrm{s}(-72$ to $+72 \mathrm{~km} / \mathrm{h})$ |

## Non-contact Speedometer/Odometer Set

## This set combines the non-contact LC-3110 speed detector with a display unit to enable easy speed and running distance measurement as well as braking tests.

## LC-0110 Relay Box

- The LC-0110 is a relay box that was developed exclusively for use with the LC-3110, and features a built-in control circuit for displaying the speed and distance.
- BNC connectors are used for the speed analog output and distance pulse output ( $10 \mathrm{~mm} / \mathrm{P}$ ) functions to enable simplified wiring.
- Adding a further DL-0170 display unit (this is an optional setting) enables brake testing to be performed. The brake start speed's holding and braking distances are displayed.

## DL-0170 Display unit

- If 5 VDC circuit, $10 \mathrm{~mm} / \mathrm{P}$, measurement gate signals or reset signals are input, the displays shown in the table at the right are enabled.

Relay Box Specifications
