

Connections to other video components

The unit's video output can be connected to various other video components in addition to the TV set.

- Check the shapes of the connectors provided on the component to be used, and perform the connections using one of the three methods shown in the figure below.
- Before proceeding with the connections, turn off the power of the components and make sure that your hands are dry.
- Read the operating instructions of the component which is to be connected as well.

■ 3-tube projector

- Pictures can be projected onto a large cinema-size screen from three light sources to increase your viewing pleasure.

■ Liquid crystal projector

- Pictures can be projected onto a large cinema-size screen from a liquid crystal panel to increase your viewing pleasure.

■ Projection TV

- By using a projector system to project the pictures onto a large screen, you can enjoy pictures with the kind of realism that CRT TVs cannot provide.

■ S-video connector

- This connector achieves pictures with a higher picture quality than a regular video connector.

■ Component video connectors

- Clearer pictures than those provided from the regular video and S-video connectors can be obtained. The high picture quality and high-quality pictures of DVD discs are reproduced down to even the subtle colors.
- Depending on the component used, the input connector markings (such as Y, P_B and P_R or Y, B-Y and R-Y) may differ. Read the instructions accompanying the component as well.
