1. Technical Specifications, Connections and Chassis Overview

1.1 Technical Specifications

1.1.1 Vision

Display type	: CRT, Real Flat WS
Screen size	: 28" (70 cm)
	: 32" (82 cm)
	: 36" (92 cm)
Tuning system	: PLL
Colour systems	: PAL: B/G, D/K, I, Plus
	: SECAM: B/G, D/K, L/L'
	: NTSC: playback only
Channel selections	: 100 presets
	: UVSH
Aerial input	: 75 Ω , IEC-type

1.1.2 Sound

Sound systems	: FM-mono, AM-mono
	: FM/FM: B/G, Czech
	: NICAM: B/G, D/K, I, L
Maximum power	: 4 x 20 Wrms (int.)
	: 2 x 15 Wrms (ext.)

1.1.3 Miscellaneous

Mains voltage	: 220 - 240 V
Mains frequency	: 50/60 Hz
Ambient temperature	: +5 to +45 deg. C
Maximum humidity	: 90 % R.H.
Power dissipation	: < 200 W
Standby Power dissipation	: < 350 mW

1.2 Connections

1.2.1 Front Control/Side Connections

Front and Side View

1.3 Chassis Overview

PWB Location

Figure 1-4

2. Safety and Maintenance Instructions, Warnings, and Notes

2.1 Safety Instructions

Safety regulations require that **during** a repair:

- Connect the set to the mains via an isolation transformer, as there are 'hot' parts in this chassis.
- Replace safety components, indicated by the symbol ▲, only by components identical to the original ones. Any other component substitution (other than original type) may increase risk of fire or electrical shock hazard.
- Wear safety goggles when you replace the CRT.

Safety regulations require that **after** a repair, you must return the set in its original condition. Pay, in particular, attention to the following points:

- General repair instruction: as a strict precaution, we advise you to re-solder the solder connections through which the horizontal deflection current is flowing. In particular this is valid for the:
 1. pins of the line output transformer (LOT).
 2. fly-back capacitor(s).
 3. S-correction capacitor(s).
 4. line output transistor.
 5. pins of the connector with wires to the deflection coil.
 6. other components through which the deflection current flows.

Note: This re-soldering is advised to prevent bad connections due to metal fatigue in solder connections, and is therefore only necessary for television sets more than two years old.

- Route the wire trees and EHT cable correctly and secure them with the mounted cable clamps.
- Check the insulation of the mains cord for external damage.
- Check the strain relief of the mains cord for proper function, to prevent the cord from touching the CRT, hot components, or heat sinks.
- Check the electrical DC resistance between the mains plug and the secondary side (only for sets that have an isolated power supply). Do this as follows:
 1. Unplug the mains cord and connect a wire between the two pins of the mains plug.
 2. Turn on the main power switch (keep the mains cord unplugged!).
 3. Measure the resistance value between the pins of the mains plug and the metal shielding of the tuner or the aerial connection of the set. The reading should be between 4.5 MΩ and 12 MΩ.
 4. Switch the TV 'off' and remove the wire between the two pins of the mains plug.
- Check the cabinet for defects, to prevent the possibility of the customer touching any internal parts.

2.2 Maintenance Instructions

We recommend a maintenance inspection carried out by qualified service personnel. The interval depends on the usage conditions:

- When a customer uses the set under normal circumstances, for example in a living room, the recommended interval is three to five years.
- When a customer uses the set in an environment with higher dust, grease, or moisture levels, for example in a kitchen, the recommended interval is one year.
- The maintenance inspection includes the following actions:
 1. Perform the 'general repair instruction' noted above.
 2. Clean the power supply and deflection circuitry on the chassis.
 3. Clean the picture tube panel and the neck of the picture tube.

2.3 Warnings

- In order to prevent damage to ICs and transistors, avoid all high voltage flashovers. In order to prevent damage to the picture tube, use the method shown in Fig. 2-1, to discharge the picture tube. Use a high voltage probe and a multi-meter (position V_{DC}). Discharge until the meter reading is 0 V (after approx. 30 s).

Discharge Picture Tube

Figure 2-1

- All ICs and many other semiconductors are susceptible to electrostatic discharges (ESD, symbol ▲). Careless handling during repair can reduce life drastically. Make sure that, during repair, you are connected with the same potential as the mass of the set by a wristband with resistance. Keep components and tools also at this potential. Available ESD protection equipment:
 - Complete kit ESD3 (small tablemat, wristband, connection box, extension cable and ground cable) 4822 310 10671.
 - Wristband tester 4822 344 13999.
- Together with the deflection unit and any multi-pole unit, flat square picture tubes form an integrated unit. The deflection and the multi-pole units are set optimally at the factory. We do not recommend adjusting this unit during repair.
- Be careful during measurements in the high voltage section and on the picture tube.
- Never replace modules or other components while the unit is 'on'.
- When you align the set, use plastic rather than metal tools. This will prevent any short circuits and the danger of a circuit becoming unstable.

2.4 Notes

- Measure the voltages and waveforms with regard to the chassis (= tuner) ground (⊥), or hot ground (⤵), depending on the tested area of circuitry.
- The voltages and waveforms shown in the diagrams are indicative. Measure them in the Service Default Mode (see chapter 5) with a colour bar signal and stereo sound (L: 3 kHz, R: 1 kHz unless stated otherwise) and picture carrier at 475.25 MHz (PAL) or 61.25 MHz (NTSC, channel 3).
- Where necessary, measure the waveforms and voltages with (⊥) and without (⤵) aerial signal. Measure the voltages in the power supply section both in normal operation (Ⓜ) and in standby (Ⓜ). These values are indicated by means of the appropriate symbols.
- The picture tube panel has printed spark gaps. Each spark gap is connected between an electrode of the picture tube and the Aquadag coating.

- The semiconductors indicated in the circuit diagram and in the parts lists, are interchangeable per position with the semiconductors in the unit, irrespective of the type indication on these semiconductors.
- Manufactured under license from Dolby Laboratories. 'Dolby', 'Pro Logic' and the 'double-D symbol', are trademarks of Dolby Laboratories.

Dolby PL Symbol**Figure 2-2**

- strobe p. 11 (only for 28-32PW617)

Preparation

- Place the TV on a solid surface.**

For ventilation, leave at least 5 cm free all around the TV. Do not place the TV on a carpet. To prevent any unsafe situations, do not place any objects on top of the TV. Avoid heat, direct sunlight and exposure to rain or water. Keep mobile telephones at a safe distance to avoid disturbances in picture and sound.
- Insert the aerial plug firmly into the aerial socket** at the back of the TV. For best picture quality use the suppressor-aerial cable supplied.
- Remote control:** Remove the cover of the battery compartment. Insert the 2 batteries supplied (Type R6-1.5V). Press the **TV** key to be sure your remote control is in the TV mode.

The batteries supplied do not contain the heavy metals mercury and cadmium. Nevertheless in many countries exhausted batteries may not be disposed of with your household waste. Please check on how to dispose of exhausted batteries according to local regulations.

Note: this remote control functions with TVs and other equipment which use the RC6 signalling standard.
- Wireless surround speaker system.**
 Supplied and separately packed with your TV are:
 - a wireless transmitter module with an integrated cable
 - 2 surround loudspeakers
 - connection cable
Wireless transmitter module
 • Attach the wireless module to the back of the TV as shown.
 • Connect the attached cable to the wireless module connector.
 Note: Make sure you only switch the TV on after you have plugged in the wireless module.
- Insert the mains plug of the TV in the wall socket** having a mains voltage of 220V-240V. To prevent damaging the mains (AC) cord which could cause a fire or electric shock, do not place the TV on the cord.
- Switch the TV on:** Press the power switch on the front of your TV. A green indicator on the front of the TV lights up and the screen comes on. If the indicator is red, press the **-P+** keys on the remote control.
 The green lamp blinks every time you press a key on the remote control.
 When you switch on your set for the first time, the menu LANGUAGE automatically appears on the screen. The explanation appears in different languages one at a time. Choose your own language and press the **OK** key on the remote control.

Select the INSTALLATION menu

- 1 Open the door of the remote control.
- 2 Press **OK** and **7** at the same time.

To use the menus

- 1 Use the cursor in the up/down, left/right directions to select a menu item.
- 2 Press the **OK** key to activate.
- 3 Use the **OK** key to return or to switch the menu off.

Store TV channels

After the new or extra TV channels have been stored, the TV automatically transfers those TV channels to the video recorder if it is equipped with the EasyLink function. The message **EasyLink - Downloading** appears on the screen. The programme list of the video recorder is now the same as the one of the TV. If the TV is connected to a video recorder which supports the MEXTVIEWLink function, the TV also automatically transfers the language and country selections to the video recorder.

Surround loudspeakers

There are two surround loudspeakers supplied. One is the active loudspeaker A. The other loudspeaker B is a passive one which has to be connected with the active loudspeaker.

- The slide channel switch **1** at the bottom of the active loudspeaker has been set default to channel 1 in the factory. See also Sound Setup, p. 9.
- Connect the active to the passive loudspeaker with the supplied speaker cable **2**. Insert the marked wire into the openings of the same coloured connector clips on both speakers. Do not insert the wires too far.
- The Surround sound loudspeakers can be located behind or to either side of the listener. The front of the loudspeakers do not have to face the listener. The distance between the TV and the surround speakers should not exceed 15 m. *Note: In rare occasions people moving around close to the TV may interfere with the sound transmission.*
- Set the position switch **3** to the right, if the active loudspeaker is positioned to the right side of the listener, to the left, if it is positioned to the left side of the listener (seen from the point of view of watching the TV).
- Connect the active loudspeaker to the mains with the mains cable **4**.
- Switch on the active loudspeaker with the **POWER** switch **5**. The red indicator at the front of the active surround speaker shows that the speaker is in standby. During sound transmission the indicator turns to green. 10-15 min. after the sound transmission of the TV has stopped, the indicator turns back to red to indicate the low power standby.
- To switch the active speaker off, use the **POWER** switch.

Keys on Top of the TV

Press the **M** key repeatedly to select **Volume, Brightness, Colour, Contrast, Treble and Bass**. Press the **P** - or + keys to carry out the selected adjustment. When the menu adjustment is not displayed, the **P** - or + keys enable you to select the TV channels, the **↔** - or + keys to adjust the volume.

The selected adjustment automatically switches off when no action has been executed for 10 seconds.

Should your remote control be lost or broken you can still change some of the basic picture settings with the keys on top of the TV.

4 Preparation

Select the menu language and country

First, select your language and country.

- 1 Select **Menu language** and press the **OK** key.
- 2 Select your language and press the **OK** key. Use the cursor up/down to scroll through the list and to bring up other languages which are not displayed on the screen at present.
- 3 Select **Country** and press the **OK** key.
- 4 Select the country where you are now located and press the **OK** key. Use the cursor up/down to scroll through the list and bring up other countries which are not displayed on the screen at present.

Select **Other** when none of the countries applies.

You can now search for and store the TV channels in two different ways: using **automatic installation** or **manual installation** (tuning-in channel by channel). Select your choice and press the **OK** key.

Automatic installation

In the Automatic Installation menu select **Start** and press the **OK** key to activate the searching. All TV channels are searched for and stored automatically.

If a cable system which broadcasts ACI (Automatic Channel Installation) or a TV channel transmitting a teletext page with the frequencies and programme names of all the TV channels which can be received, is detected, the search is stopped and a programme list appears.

The programme list is automatically filled with all the programme numbers and names of the TV channels transmitted.

*It is possible that the cable company or the TV channel displays a broadcast selection menu. Layout and items are defined by the cable company or the TV channel.
Make your choice with the cursor and press the **OK** key.*

To exit from the menu press the **OK** key on the remote control.

Go on to page 7.

Manual installation

Searching for and storing TV channels is done channel by channel. You must go through every step of the Manual Installation menu.

Selection mode is only present and lights up if the country selected also offers the channel option (C-channels for aerial, S-channels for cable channels). You can choose either channel or frequency mode.

1 Select the TV system. Select the country or part of the world from where you want to receive the TV channel. If you are connected to a cable system, select your country or part of the world where you are now located.

2 Press the cursor down and enter the programme number with the digit keys.

3 Search for a TV channel. Press the cursor left/right. The frequency or the channel number increases until a TV channel is found.

Direct selection of a TV channel
If you know the frequency, the C- or S-channel number, enter it directly with the digit keys 0 to 9. Ask for a list from your cable company or dealer, alternatively consult the Table of frequencies on the inside backcover of this handbook.

4 Fine tune
In case of poor reception, you can improve the reception by adjusting the frequency with the cursor left/right.

5 To store your TV channel, select **Store** and press the **OK** key.

Repeat steps **1** to **5** to store another TV channel.

6 To exit from the menu press the **OK** key on the remote control.

Give name

It is possible to change the name stored in the memory or to assign a name to a TV channel which has not yet been entered. A name with up to 3 letters or numbers can be given to the programme numbers 0 to 99. For example SUPER, BBC1, ... 99 and 0 you can also name any peripherals that are connected to a euroconnector:

- 1** Select **Give name** in the **INSTALLATION** menu and press the **OK** key
 - 2** Select the programme number.
 - 3** Press the **OK** key.
 - 4** Select the character with the cursor up/down.
 - 5** Select the following position with the cursor right.
 - 6** Select the following character.
 - 7** Press the **OK** key when finished.
 - 8** Press the **OK** key to return to the **INSTALLATION** menu.
- Space, numbers and other special characters are located between Z and A.

Reshuffle the programme list

According to your preference you can change the order of the stored TV channels.

- 1** Select **Reshuffle** in the **INSTALLATION** menu and press the **OK** key.
- 2** Select the programme number you want to exchange.
- 3** Press the **OK** key.
- 4** Select the new number you want to exchange it with.
- 5** Press the **OK** key.
Repeat the operation until all TV channels are allocated as you like.
- 6** Press the **OK** key to return to the **INSTALLATION** menu.

Select Favourite TV channels

After leaving the installation you can browse through the TV channels by pressing the **- P +** keys. Only those TV channels which are in the favourite list will be displayed. Non-favourite TV channels can still be selected with the digit keys. By default all stored TV channels are added to the favourite list.

- 1** Select **Favourite programmes** in the **INSTALLATION** menu and press the **OK** key.
- 2** Select your favourite programme number.
- 3** Select **Yes** or **No** with the cursor left/right.
- 4** Repeat for every TV channel you want to make a favourite or a non-favourite TV channel.
- 5** Press the **OK** key to return to the **INSTALLATION** menu.

In order for NEXTVIEW to function properly, the first TV channel from the favourite list should also broadcast the correct local date and time via teletext.

Install TV Setup

The Setup menu allows you to adjust initial settings, i.e. those which are not related to the installation of the TV channels.

The Setup menu contains items that control the settings of the TV's functions, features, services and peripherals you may have connected.

- 1 Use the cursor in the up/down, left/right directions to select the menu item.
- 2 Use the **OK** key to activate.
- 3 Use the **□** key to return or switch menu off.

Digital sources

See Connect Peripheral Equipment, p. 29 to connect your digital equipment, like a DVD, a digital satellite tuner or a similar digital device.

Sound Setup

See p. 9.

Decoder/Descrambler programme numbers

If a decoder or a descrambler is connected, see p. 27, you can define one or more programme numbers as decoder programme numbers.

Press the cursor left/right to select the input used to connect to your decoder: **Off**, **EXT1** or **EXT2**.

Select **Off** if you do not want the selected programme number being activated as a decoder programme number.

Select **EXT2** when the decoder is connected to your EasyLink video recorder.

When selecting the decoder, the message **EasyLink: Downloading Presets....** appears on the screen.

Picture tilt

Select **Picture tilt** with the cursor up/down. Keep the cursor left/right pressed to adjust the rotation of the picture.

Information line

Select **On** and after the selection of a TV programme or after pressing the **□** key on the remote control, a TV channel which broadcasts teletext may transmit the name of the TV channel, the programme name or another message. This is displayed on screen next to information about sound picture format and DNR setting.

When selected **Off**, only sound picture format and DNR information is displayed after the selection of a TV channel or after pressing the **□** key.

Factory settings

Select **Factory settings** and press the **OK** key to restore picture and sound settings, predefined in the factory.

Auto format

Selecting **Yes** causes the screen to automatically fill as much of the picture as possible when TV programmes are not carrying special signals detecting the correct screen format.

With the **□** key on the remote control you can still select other picture formats. See p. 12.

NEXTVIEW provider

Most broadcasters in Europe are offering teletext pages containing the day's programme schedule. These pages can be requested by switching the TV to Teletext Guide. An increasing number of broadcasters are offering an extended programme guide service called NEXTVIEW.

NEXTVIEW is a new way of presenting programme schedules and offers more features than basic teletext. With NEXTVIEW it is possible to show for instance all the movies or children programmes for tonight or the following days.

If you select **None** as NEXTVIEW provider, the TV will capture all data from the available TV channels which broadcast NEXTVIEW. Broadcaster defined menus will not be available.

If you select a programme number of a TV channel stored in the favourite list as NEXTVIEW provider, the selected TV channel will provide NEXTVIEW data and additional information of its own broadcasts as well as from other (non selected) TV channels.

Normally you will select the NEXTVIEW provider that transmits most information in your language. You can make the best selection via information from TV announcements or from the newspapers.

Important:

In order for NEXTVIEW to function properly, the first TV channel from the favourite list should also broadcast the correct local date and time via teletext. Please check at startup if the time and date are correct in the NEXTVIEW screen.

Remark:

Not all TV channels support NEXTVIEW.
How to make use of NEXTVIEW, see p. 20.

Sound Setup menu

Sound setup

Auto Surround
Wireless Surround
Extra front speakers
Distance to front
Distance to rear

Auto Surround

Sometimes the broadcaster transmits special signals for Surround Sound encoded programmes. The TV automatically switches to the best surround sound mode when **Auto Surround** is switched **On**. However it is possible to overwrite this setting.

Wireless Surround

The system has already been configured in the factory to work properly. In rare circumstances, interference from external RF (wireless) equipment such as RF headphones, mobile phones or remote controls for lights, may occur. Then it may be necessary to shift to another wireless channel. Use the cursor left/right to select another channel. Important:

Always be sure that the active surround speaker and the Wireless Surround setting are switched to the same transmitting channel. Otherwise no sound or only a distorted sound will be heard on the surround speakers.

When the TV is tuned to a channel in the neighbourhood of 864 MHz (433 MHz in case you purchased a TV with a type number in the range 28-32PW9617101 or 158 or 32-36PW9767101 or 158), the transmitter is switched off because no RF surround sound is possible. This is necessary to avoid interfered picture. You can improve the picture quality by using the suppressor aerial cable supplied.

In rare cases, when no RF surround sound is possible or when there is too much interference, use the wired back up solution with a 3.5 mm stereo jack. In this case select **Off** in the Wireless surround menu item. See Connect Peripheral equipment, p. 28.

Extra front speakers

See Connect Extra loudspeakers/Amplifier, p. 30. If no extra front speakers/amplifier are connected, do not change the predefined factory setting which is **No** (TV).

Distance to front

Select the distance between the TV and the place you sit to watch TV.

Distance to rear

Select the distance between the rear surround speakers and the place you sit.

To exit from the menu press the **□** key repeatedly.

Operation

Use of the remote control

Select peripherals

Press this key repeatedly to select EXT1, EXT2, EXT3, EXT4 or FRONT, according to where you connected the peripherals (p. 31).

TV VCR DVD SAT TUNER CD TAPE CDR

Press one of these keys to use the remote control directly in the TV, video recorder, DVD or satellite mode. A green indicator lights up. Press the same key again within 3 seconds to use the remote control in the mode indicated below the key (tuner, CD, tape or CD-recordable). A red indicator lights up. Press the key again to return to the function mentioned above the key.

○ no function

Video recorder see p. 31

NEXT TV new on/off see p. 20

OK Press this key to activate your choice, when in the menus.

Screen information

Press for 5 seconds to activate/de-activate the extended or reduced display of TV channel and programme information on the screen.

Press briefly to display information about the selected TV channel and programme, the sound reception, picture settings, the selected DNR setting and the remaining time set with the sleep timer.

0/9 Digit keys

To select a TV channel. For a two digit programme number, enter the second digit within 2 seconds. To switch immediately to a selected one digit TV channel, keep the digit key pressed a bit longer.

P/P Previous programme

The previously selected TV channel is displayed. The -indicator is only for video recorder.

Standby

The set is switched off and the red indicator (orange when acquiring NEXTVIEW information) lights up. When acquiring NEXTVIEW the TV is switched to full standby after a period of max. 1 hour and the red indicator lights up. To switch the TV on again, press **P** or the digit keys. If your EasyLink video recorder has the system standby function and you press the standby key for 3 seconds, both the TV and video recorder are switched to standby.

Freeze

To activate/de-activate the frozen picture and to hold a teletext page.

Surround mode

Press this key repeatedly to select another available surround mode: Dolby Pro Logic, 3D Surround, Dolby 3 Stereo, Stereo, Hall or Dolby Digital.

Teletext on/off see p. 25

Main menu on/off see p. 13

Volume

Press + or - to adjust the volume.

Mute

Temporarily interrupt the sound or restore it.

P Programme selection

To browse through the TV channels activated in the Favourite Programme menu.

Active control

Active control is a pro-active and automatic system. The TV continuously measures and corrects all incoming signals in order to provide the best picture possible. Thanks to the Ambient Light Sensor, which measures the light conditions of the room in which the TV is situated, the contrast, dynamic contrast, brightness and colour picture settings are adjusted automatically. The light sensor is active when the Active control function is switched to Medium (if provided) or Maximum. Press the key repeatedly to select the Active Control values Off, Minimum, Medium (if provided) or Maximum. Off, Sharpness and Dynamic Contrast are controlled automatically. Minimum, Sharpness, Dynamic Contrast and Noise Reduction are controlled automatically. (Medium) Dynamic Contrast, Colour, Sharpness and Noise reduction are controlled automatically. Maximum Contrast, Colour, Sharpness and Noise reduction are controlled automatically. While the selected Active Control setting information is on top of the screen. The picture settings are being adapted continuously and automatically. The menu items cannot be selected. Colour enhancement (green enhancement, skintone correction and blue stretch) is switched on with certain Smart Picture selections. Press the cursor in the up/down directions again to switch off the menu.

For 32-36PW9167

Dual screen see p. 18

Press to switch on Multipip. A menu line MOSAIC appears. Select the desired function with the cursor left/right and press the OK key. Scan: a scan of the TV channels placed in the favourite list is performed. Press the OK key again to have the continuation of the list. Photo Finish: the main picture is displayed in successive frozen pictures. Press the OK key again to have a new sequence of frozen pictures. Strobe: the picture is reproduced image by image. Press the OK key again to have a faster speed. Press to switch off Multipip.

For 28-32PW9167

Dual screen see p. 19

Press to reproduce the picture image by image. Press the key again to have a faster speed. Press the again to switch off the strobe function.

Smart Keys

To select predefined picture and sound settings.

Smart Sound

Each time it is pressed, a different picture setting is selected, corresponding with specific factory settings of treble and bass.

Smart Picture

Each time it is pressed, a different picture setting is selected, corresponding with specific factory settings of Contrast, Colour, Sharpness, Dynamic Contrast and Colour enhancement.

Personal refers to the personal preference settings of picture and sound selected in the picture and sound menu.

Remark: the moment you are in a predefined smart sound or picture setting and you modify a setting in the picture or sound menu, all values of the menu will overwrite the previously made settings.

Use of the menus

- 1 Press the **MAIN MENU** key to display/cancel the MAIN MENU.
- 2 Use the cursor in the up/down directions to select the PICTURE, SOUND or FEATURES menu or to select PROGRAMMES.
- 3 Press the cursor right to activate the selected menu.
- 4 Use the cursor in the up/down, left/right directions to select the menu item.
- 5 Use the **OK** key to activate.
- 6 Press the **RETURN** key repeatedly to return or to switch the menu off.

Picture menu

- **100 Hz Dig. Scan = 100 Hz + Dig. Scan (Field and line flicker reduction)** without motion compensation.
 - **Pixel Plus** = creates near-High Definition performance inside the TV on the basis of a regular input signal. The number of lines are increased and the number of pixels on a line are doubled in combination with Digital Natural Motion.
- As such Pixel Plus enhances both regular broadcast signals and DVD or Digital TV input towards unparalleled sharpness and depth, near-High Definition and natural detail.
- **Double Lines** = provides for a doubling of vertical resolution which adds astonishing sharpness and a total absence of visible picture lines. Motion compensation reduces jitter and offers smooth, yet sharp motion reproduction.

Note:
Pixel Plus is not active when Multi screen (Stroke), Teletext (Except when Subtitled is activated), NEXTView or Teletext, Dual screen is selected.

Colour enhancement

When activated, this feature automatically controls skin tone correction, green enhancement and blue stretch. It makes the colours more vivid. Select **On** or **Off** in order to activate/de-activate Colour enhancement.

Tint
Select the colour temperature: **Normal, Warm or Cool.**

Digital options
Although Pixel Plus is the most ideal setting, it may be preferable, dependent on your own preference, to select Double lines .or. 100 Hz Digital Scan.

Dynamic Contrast

To make the contrast in the darker and the brighter picture areas more noticeable, select the **Med** setting. In certain circumstances it may be preferred to select **Min, Max or Off.**

The modified adjustments for Contrast, Brightness, Colour, Sharpness, Colour enhancement, Tint, Digital options and Dynamic Contrast are automatically stored for all TV channels. Select **Factory settings** in the Setup menu to restore the predefined factory settings, see p. 8.

II Bilingual choice and sound mode selection
Press this key
• to switch from Stereo to Mono sound, in case of stereo transmission, or from Nicam Stereo to Nicam available, in case of digital transmission;
• to choose between language I (Dual I) or language II (Dual II), in case of bilingual transmission. The setting is separately stored for each TV channel.

Instant record
If your video recorder has the EasyLink function the **INSTANT** key for record can be operated in the TV mode.

Picture format
Press this key repeatedly to select another picture format: 4:3, Movie Expand 149, Movie Expand 16:9 with or without subtitling, Wide Screen, Super zoom or Automatic (when Auto format is set to Yes in the SETUP menu).
Auto format makes the picture to fill the screen as much as possible.
Sometimes also video recorder programmes carry special signals which will automatically switch the TV to the correct screen format. Auto format is disabled when in Dual screen. When in Automatic, Movie Expand 149 or 16:9 or Super zoom picture format, you can make subtitles visible with the cursor up/down.

DNR Dyn. Noise Reduction
To reduce the image noise and improve picture quality when receiving weak signals, Press the **DNR** key to select **Off, Minimum, Medium or Maximum.**

Switching Pixel Plus demo on/off
The TV screen is divided into 2 parts: in the left part Pixel Plus and Digital Natural Motion switched off; in the right part Pixel Plus and Digital Natural Motion switched on.
Press the **PIXEL PLUS** key again to switch the Pixel Plus demo off.

Select TV channels by theme
If programmes in the TV guide of nextView have defined themes, it is possible to quickly select TV programmes with the coloured keys.
Press the red, green, yellow or blue key to select one of the four predefined theme categories **MOVIES, SPORTS, CHILDREN, NEWS.**
The TV switches to the first TV channel broadcasting a programme of the selected theme. At the same time a list of all the TV channels currently transmitting a programme of the selected theme appears on the screen.
Use the cursor up/down to select a programme.
Press the same colour key again to remove the list.

Time display
The time, downloaded from the TV channel (with teletext) stored on programme number 1 or the lowest favourite programme number, is displayed on the screen.
This function is not available when continuous subtitles have been switched on.

Teletext functions see p. 26

Zoom
Press the **ZOOM** key repeatedly to select one of the zoom magnifications (x1, x4, x9, x16). Additionally you can shift the selected zoom window over the screen with the cursor.
Press **RETURN** to activate/de-activate the continuous display of the zoom magnification. The zoom window is reset after selecting another TV channel, another picture format or when another picture format is selected automatically.
Zooming is disabled in Dual Screen mode.

Sound menu

The modified adjustments for Volume, Treble and Bass are automatically stored for all TV channels. Select **Factory settings** in the Setup menu to restore the predefined factory settings, see p. 8.

Select **Surround settings** in the Sound menu.

The contents of the Surround settings menu depends on the selected Surround mode.

Surround settings

The graphical representation of the speakers is displayed on screen when controls are being changed or when in test tone mode. The drawing on screen is updated according to the chosen loudspeaker setup and the selected surround mode. Speakers which are active are highlighted. In 3D surround mode the graphical representation of the rear loudspeakers is replaced by the symbol . The menu item **3D effect** appears and the level of the 3D effect can be adjusted.

Note: If extra front speakers are connected and selected in the Sound Setup menu, all internal TV speakers produce centre sound. See Connect Peripheral Equipment, Extra loudspeakers/Amplifier, p. 30.

Adjustment of the volume level of the loudspeakers

The menu item **Test** enables you to have a reference of the internal and the rear loudspeakers loudness.

- 1** Select **Test start** and press the **OK** key. A steady noise tone is switched sequentially through the available loudspeakers, for 2 seconds each. This enables you to have a reference of the loudness of each loudspeaker and to adjust the level of each until they all sound equally loud. The loudspeakers activated light up in the screen graphic.
- 2** Select **Centre volume**, **Balance**, **Rear volume left** or **right** and alter the selected adjustments.
- 3** Select **Test stop** and press the **OK** key when you have finished the adjustment of the speaker levels.

Headphone volume

See Connect Peripheral Equipment, p. 28 for the connection of the headphone.

Delta volume

Here you may adjust the volume differences of each selected TV channel or external device separately. This can compensate volume differences between different broadcasters. Use the **- P +** keys to compare to the volume of other TV channels or externals.

Night mode (only available with certain Dolby Digital sound sources)
Select **Yes** to reduce the dynamics of the sound and to improve listening at low volume. This is useful for late-night listening, e.g. to a DVD disc.

Surround Modes
Select the Surround mode according to the sound mode being broadcast.

3D Surround (optimal with Dolby Surround broadcasting)
3D Surround enables you to experience the effect of Dolby Surround Pro Logic without the need of having rear speakers connected or activated. With Dolby Digital or MPEG Multichannel an improved virtual effect is offered. The graphical representation of the rear loudspeakers is replaced by the symbol . Select the level of **3D effect** with the cursor left/right.

Pro Logic (with Dolby Surround broadcasting)
In addition to the left and right internal speakers, the centre and the rear surround loudspeakers reproduce the Dolby Surround Pro Logic sounds. This sound is always present in the movie or programme marked with **DD** Dolby Surround. This mode is especially recommended for such programmes or movies. Dolby Pro Logic signals are also present on some DVD tracks.

Note: Normal stereo broadcast is not always encoded to produce a rear surround sound.

Dolby Digital* or **MPEG Multichannel**
When you have connected a DVD player or a Laser Disc player containing a Dolby Digital decoder (AC-3) or MPEG 2 decoder output. (See Connecting Peripherals, Digital equipment p. 29), you can enjoy Multichannel Surround Sound in your home when playing discs recorded in Dolby Digital or MPEG2. In addition to the left and right internal speakers, the centre, the left and right rear surround loudspeakers and the subwoofer reproduce the Dolby Digital or Dolby MPEG 5-channel Surround sounds. Select Dolby Digital or MPEG Multichannel Surround mode.

Dolby 3 Stereo (optimal with Dolby Surround broadcasting)
The sound signal is now distributed over the front, left, the front right and the centre TV loudspeakers. The rear loudspeakers do not produce any signal.

Hall
The special sound signal is distributed over the rear loudspeakers which creates a hall effect from the rear. The centre loudspeaker does not reproduce any signal. This mode is recommended when you wish to add surround sound to a broadcast which is not encoded Dolby Surround or to a mono signal.

Stereo
This mode reproduces only the left and right front sound signals. You only hear a stereo sound if the broadcast which you are receiving is transmitted in stereo or nicam stereo.

Features menu

- 1 Press the **OK** key to display/cancel the **MAIN MENU**.
- 2 Use the cursor in the up/down directions to select the **FEATURES** menu.
- 3 Press the cursor right to activate the selected menu.
- 4 Use the cursor in the up/down directions to select a menu item.
- 5 Use the cursor in the left/right directions to select the desired setting.

With two extra front loudspeakers connected

To enhance the sound reproduction of your TV you may connect two extra front loudspeakers via an external amplifier. See Connect Peripheral Equipment, Extra Loudspeakers/Amplifier, p. 30
In the Surround modes, Hall and Stereo (+ amp) is added to indicate that you should switch on your amplifier as in these modes the internal TV speakers do not produce any sound.
The subwoofer output is muted.

Note: If extra front speakers are connected and selected, all internal TV speakers produce centre sound in the surround modes Pro Logic, Dolby 3 Stereo, Dolby Digital, and MPEG.

Press the **OK** key to return to the **SOUND** menu.

Dolby Digital sound reception info via the **OK** key

Press the **OK** key.
When Dolby Digital sound is reproduced, the sound info on screen displays the number of loudspeaker signals which are transmitted.
This is indicated by 2 numbers: the first one indicates the number of front loudspeaker signals, the second one the number of rear loudspeaker signals.
Eg. "Dolby Digital 3/2" means that 3 front signals are transmitted: left, right and centre, and 2 rear signals: left and right surround.
"Dolby Digital 1/0" means that a mono signal is transmitted.
"Dolby Digital 2/0" means that the transmission contains a stereo signal which can be Dolby Pro Logic encoded.
In this case the surround mode will display Dolby Pro Logic.

Programme list

- 1 Press the **OK** key to display/cancel the **MAIN MENU**.
 - 2 Select **PROGRAMMES** with the cursor up/down.
 - 3 Press the cursor right to activate and to display an overview of all the TV channels installed.
 - 4 Press the cursor up/down to run through the list and press **OK** to select the desired TV channel.
- Press the **OK** key to switch off the Programme list.

Sleep timer

With the sleep timer you can set a time period after which the TV should switch itself to standby.
The counter runs from **Off** up to **180 min**.
One minute before the TV is set to go to standby, the remaining seconds appear on screen. Not visible in dual screen mode. You can always switch off your set earlier or change the set time.

Child lock

If the child lock is on, the TV can only be switched on with the remote control. The **P** - and + keys on top of the TV cannot be used to select a TV channel. In this way you can prevent unauthorised use of your TV.
If the message **Child lock On** appears, the child lock must be switched off before you can use the **P** - and + keys on top of the TV to select a TV channel.

Subtitle

TV channels with teletext often transmit certain programmes with subtitling. See Teletext, Continuous Subtitles, p. 26 how to select the proper subtitle page from the teletext index.
Select **Subtitle On** or **Off**.

Press the **OK** key to switch off the Features menu.

Dual screen

Only for 32-36PW9767

- 1 Press the **[Left Arrow]** key to switch on Dual screen.
The TV screen is divided into 2 parts:
- the left side for the picture of the selected TV channel;
- the right side for the picture from the TV channel in the favourite programme list following on the selected TV channel.
 - 2 Press the **[Right Arrow]** key under the door of the remote control to select a vertical squeezed or a non vertical squeezed picture size.
- Select left and right pictures**
- 1 Press **+ P** - to run through the TV channels in the left picture.
 - 2 Press the cursor up/down to select the TV channels in the right picture.
Also TV channels which are not in the favourite list may be selected.
Press the cursor left/right to select peripheral equipment connected to **EXT1, EXT2, EXT3, EXT4 or FRONT**.
 - Selecting TV channels in the right picture with the cursor up/down is not possible when a menu is displayed on the screen.
 - Programmes via a decoder/descrambler can not be reproduced in the right picture.
 - The sound of the right picture can be heard via headphones. Only programmes via a peripheral can be heard in stereo.
 - Zooming is reset to 1x when Dual screen is switched on.

Swapping screens

Press the **[P]** key to swap the right and left picture. The sound is swapped as well.

Select still picture

- Press the **[Freeze]** key to freeze the left picture.
- Press the **[Freeze]** key to freeze the right picture.

Possible Dual screen combinations

- TV channel/TV channel: see Select left and right pictures.
 - TV channel/Peripheral: see Select left and right pictures.
 - Peripherals/TV channel
 - Select the connection (**EXT1, EXT2, EXT3, EXT4 or FRONT**) of the connected peripheral.
 - Press the **[P]** key.
 - TV channel/Teletext
 - Press the **[Teletext]** key to display teletext of the selected TV channel.
 - Press the **[Freeze]** key.
- To operate teletext, see p. 25.
- The **+P** - keys can only be used to run through the teletext pages.
 - Press the **[Teletext]** key again to return to a full screen picture or press the **[Teletext]** key again to return to a full teletext picture.
- TV channel/NEXTVIEW
 - Press the **[NEXTVIEW]** key to display NEXTVIEW.
 - Press the **[Freeze]** key.
- To operate NEXTVIEW, see p. 20
- Press the **[Teletext]** key again to return to a full screen picture or press the **[Teletext]** key again to return to a full NEXTVIEW picture.

BBC1	BBC2
BBC1	EXT2
EXT2	BBC1
BBC1	CEEFAX
BBC1	NEXTVIEW

Dual screen

Only for 28-32PW9617

- 1 Press the **[Left Arrow]** key to switch on Dual screen.
The TV screen is divided into 2 parts:
- the left side for the normal main picture;
- the right side for teletext broadcast by the selected TV channel or for NEXTVIEW.
- To operate NEXTVIEW, see p. 20.
To operate teletext, see p. 25.
- If Dual screen is **Off**, the picture, teletext or NEXTVIEW is displayed full screen.
- 2 Press the **[Right Arrow]** key under the door of the remote control to select a vertical squeezed or a non vertical squeezed picture size.
 - 3 Press **+ P** -, digit keys or colour keys to run through the teletext pages.
 - 4 Press the **[Teletext]** key to return to a full picture screen and to select another TV channel with the **+ P** - keys or with the digit keys.

Select still teletext picture

Press the **[Freeze]** key to freeze the teletext picture.
The info in this page is not being updated by the teletext broadcaster.

NEXTVIEW / Teletext guide

In the Setup menu, p. 8, you were asked to select a NEXTVIEW provider. If the selected provider supports nextTVView then the TV will automatically present the NEXTVIEW programme schedule. If the TV channel supports just teletext, then the TV will switch automatically to teletext guide. Both facilities are offering the same functions: record, remind, info and watch. However, in case of Teletext guide the broadcaster is responsible for the availability of these functions.

Some broadcasters provide information about their own programmes and sometimes other TV channels for one or more days. You can search for the programmes you want to watch up to 7 days in advance. It is also possible to search for a programme by theme, e.g. sport, movie, etc. Once a programme has been selected it can be tagged, to remind you, or to record on the video recorder automatically (provided the video recorder is equipped with NEXTVIEWLink), once, daily, weekly or series. Teletext guide/NEXTVIEW also allows direct access to detailed information about programmes if provided by the broadcaster.

The broadcaster is responsible for the content of the information. The TV is responsible for the capture of that information and for the presentation to the user.

Use of the Teletext guide/NEXTVIEW menus

- 1 Press the **OK** key on the remote control to display/cancel the Teletext Guide/NEXTVIEW menu.
- 2 Use the cursor in the up/down, left/right directions to select the date, **DAY** for the daily guide, **THEME** for the theme guide, **OVERVIEW** for an overview of all the programmes which are marked as reminders or for recording, the programme guide page number or to enter the programme list.

Teletext guide

TV channels which broadcast teletext also transmit a page with the programme guide of the day. For each selected TV channel the programme guide page can be selected with the **OK** key:

- automatically if the selected TV channel supports services like PDC (Programme Delivery Control) or MP (Magazine Inventory Page).
- if automatic pre-selection is not possible then the index page is displayed and the proper programme guide page number of the selected TV channel has to be entered with the digit keys.

The programme guide page will be stored automatically only if it satisfies Video Programming via Teletext (VPT) requirements.

Every time you press the **OK** key, the programme guide page of the selected TV channel will be available if the TV channel does not support NEXTVIEW.

The function items record, remind, info and watch, corresponding with the coloured keys, become highlighted if the displayed programme page satisfies the Video Programming via Teletext (VPT) requirements. Select a Programme item and press one of the function keys, e.g. Record or Remind. See Basic functions further on. The Info item is enabled if the selected programme contains a page number with an optional subcode referring to a page with more info about the programme.

NEXTVIEW modes to sort and represent information

Menu
If in the Setup menu, see p. 8, you have selected a TV channel as NEXTVIEW provider which also supports NEXTVIEW, NEXTVIEW menu is displayed or can be selected. The selected TV channel is responsible for this menu. The NEXTVIEW menu appears when NEXTVIEW is switched on.

Use the cursor up/down to select a menu item. Use the cursor right to select the menu item. While going through the menus, the TV is collecting the sorting criteria to finally display a list of programme events. The functions in the left column are shown at reduced brightness as long as the menu is displayed. If **None** has been selected as NEXTVIEW provider in the Setup menu, the broadcaster's defined menu will not be available.

Day
The day guide provides an overview of all programme titles active in the selected time block. Time blocks are 15 minute intervals starting from the current time of the current day. The default order is based on the programme list of the favourite TV channels as stored in the installation of the TV. TV channels not marked as favourite TV channels will not appear. Default NEXTVIEW opens with the day screen if the broadcast does not have its own menu.

NEXTVIEW

- 3 Select a programme with the cursor up/down.
- 4 Press one of the colour keys to select one of the basic functions (if available): record, remind, watch, info. See Basic functions further on.
- 5 Press the **OK** key to return to the header area again.

Teletext guide

- 3 Enter the proper programme guide page number with the digit keys or with the **- P +** keys.
- 4 Press the cursor left/right to run through the subpages.
- 5 Select a programme with the cursor up/down.
- 6 Press one of the colour keys to select one of the basic functions (if available): record, remind, watch, info. See Basic functions further on.
- 7 Press the **OK** key to return to the header area again.

Channel
The Channel guide provides an overview of all programmes that are broadcast by a single channel during one day. Previous programmes can be made visible via cursor up. The list will start with the earliest broadcast programme. With cursor left/right another favourite TV channel can be selected.

Theme
The theme guide displays a list of all programmes at the selected date, that matches with the selected category (news, sport, culture, movies, ...). The default starting item will be the current or next programme on the current TV channel. The **THEME** selection is only present if programmes in the TV guide have defined themes.

Overview
The Overview menu provides a list of programmes that are marked as reminders and those that have to be recorded. When more than one programme to be recorded has an overlap in time, these programmes will be marked by a red colour. After the programme has been broadcast, all items set for once will be deleted from the list the following day. This menu can be used to change a reminder or programmes to be recorded.

Note: the TV will automatically interpret the broadcast time (as shown on the teletext guide) of your selected programme into the correct local time and date.

Basic functions

The functions Record, Remind, Info and Watch can be activated with the corresponding colour keys on the remote control. If the function is not available, then the text is shown at reduced brightness. Select a programme with the cursor up/down.

Record [R] or Remind [R]

- Press the red colour key to activate **Record** or the green colour key to activate **Remind**.
If the programme number of the broadcaster is not yet known, a message appears with the request to input the correct programme number with the cursor left/right and press OK.
- A small menu pops up in which you can choose the interval: once, daily or weekly, or clear an earlier made record or remind setting. The default interval is set to **Once**. If a programme is an episode of a series, it is identified by the system and the options **daily** and **weekly** are replaced by the option **series**. In this case the system identifies when the next episode of the series will be broadcast. This is not possible in the Teletext guide.
- Use the cursor in the left/right directions to select the interval.
The colour of the tag refers to the interval.
Press the **OK** key.

When Record [R] is activated:

Storing appears to indicate the video recorder is programmed.

When Remind [R] is activated:

- a message will appear on the screen the moment the tagged programme with [R] starts, when watching the TV later on.
- the TV switches on the moment the tagged programme with [R] starts, when the TV is in standby.

*Note: Recordings and reminders are not possible when the broadcaster does not transmit dates and times of the programmes. The message **No TV programming possible** appears. Make sure you are on the TV programming page.*

Info

- Press the yellow colour key to activate **Info**. Advertisements or information relating to the selected programme are displayed. In some cases all of the information does not fit on the screen. Use the cursor up/down to browse through all of the information.
- Press the yellow colour key again to switch off the information.

Watch

Press the blue colour key to activate **Watch**. This function is only available if a currently broadcast programme is selected. Otherwise the function is not available. The selection causes the TV to tune to the selected TV channel. **NEXTVIEW** is switched off.

Teletext

Select Picture/NEXTVIEW-Teletext Guide

Press the **Teletext** key.
Press the **NEXTVIEW** key.
The screen is divided into two parts: the left side for the normal main picture, the right side for NEXTVIEW/Teletext Guide.
Press the **Teletext** key to return to a full NEXTVIEW/Teletext guide screen and press the **NEXTVIEW** key to return to a full picture screen.

Most TV channels broadcast information via teletext. Each channel which broadcasts teletext transmits a page with information on how to use its teletext system. Look for the teletext page with the main index (usually p. 100). Depending on the TV channel, teletext is transmitted in different systems.

The colours used in the options line correspond with the colour keys of your remote control.

About Easy Text

Easy Text considerably reduces the waiting time (on condition that the teletext broadcast of the particular TV channel is received for at least half a minute) by:

- a direct selection of previous and following pages which are in transmission and of the pages referred to in the options line
- a habit-watcher list: frequently used pages are put automatically in a list of preferred pages, so that they are immediately available
- the precapturing of the page numbers referred to in the displayed page
- the precapturing of all the subpages.

Switch Teletext on and off

Press **Teletext** to switch the teletext on or off.
The main index page appears on the screen together with two information lines at the top and one option line at the bottom of the screen.

Remark: if the displayed teletext characters on screen do not correspond with the characters used in your language, press the **Teletext** key, under the cover of the remote control, repeatedly to select language group 1 or 2.

Select a Teletext page

With the digit keys

Enter the desired page number with the digit keys. The page counter seeks the page or the page appears immediately when the page number has been stored in the memory.
A message appears when you have entered a non-existent or incorrect page number. Page numbers beginning with 0 or 9 do not exist. Choose another number.

With the option line

Select with the colour keys, corresponding to the coloured options at the bottom of the screen, the desired subpage.

Select Picture/Teletext

Select a TV channel which broadcasts teletext.

Press the **Teletext** key.

Press the **NEXTVIEW** key.

The screen is divided into two parts: the left side for the normal main picture, the right side for teletext broadcast by the selected TV channel.

Press the **Teletext** key to return to a full screen picture or press the **NEXTVIEW** key to return to a full teletext picture.

Quickly run through the teletext pages

Press the cursor up/down or the **Teletext** + keys to run through the previous or the following pages.

Select the previously selected txt page

Press the **PAP** key.

Acquisition and updating of NEXTVIEW info

Acquisition and updating of NEXTVIEW is done when you are watching the TV channel of the selected NEXTVIEW provider, see Setup menu p. 8, or when the TV is switched to standby.

The indicator on the front of the TV remains orange during standby.

After all needed acquisition or updating is complete, it turns red.

Acquisition of fresh data will happen once during the night.

Note: it may be necessary to put the TV in standby mode when all NEXTVIEW information is outdated, e.g. returning from holiday.

Video recorder restrictions with NEXTVIEW

The **Record** item and the automatic recording will only be present and possible if your video recorder is equipped with NEXTVIEWLink.
Your video recorder should be connected to **EXTERNAL 2**. See Connect Peripheral Equipments, p. 27.

The daily, weekly and series options, the number of recordings set and the way overlapping recordings are managed, depend on the type of video recorder you have. When all video recorder timers are full, **No free record timer** appears on the screen.

Upload video recorder overview.

When the TV is switched on, the timer recordings are uploaded to the TV to check if any manual addition or deletions have been done. This is shown in the overview. The video recorder manages and removes timer recordings when performed.

Some NEXTVIEWLink video recorders do not allow a daily programming of the recording to start on a Saturday or Sunday. In this case the item **daily** will be removed from the menu on those days.

Connect Peripheral Equipment

There is a wide range of audio and video equipment that can be connected to your TV. The following connection diagrams show you how to connect them.

Video recorder

Connect the aerial cables ①, ② and, to obtain the optimum picture quality, eurocable ③ as shown below.

If your video recorder is provided with the EasyLink function, the eurocable supplied with it should be connected to EXTERNAL 2 to benefit from the EasyLink functionality.

If the eurocable ③ is not used the following steps are required:

- 1 Search for and store the test signal of the video recorder
- 2 Unplug the aerial cable ① from the aerial socket of your video recorder.
- 3 Switch on your TV and put the video recorder on the test signal. (See the handbook for your video recorder)
- 4 Search for the test signal of your video recorder in the same way as you searched for and stored the TV signals. See Installation, Searching for and storing TV channels, Manual Installation, p. 6.
- 5 Score the test signal under programme number 0 or between 90 and 99.
- 6 Replace the aerial cable in the aerial socket of your video recorder after you have stored the test signal.

Select the index teletext page

Press the grey colour key to display the main index (usually p.100).

Only for T.O.P teletext broadcasts :
TOP orders the pages in categories and adds other possibilities of enhancing ease of use.
Press [3]. ATOP over view of the teletext subjects available is displayed.
Not: all TV channels broadcast T.O.P teletext. When the teletext system is not T.O.P teletext, a message appears at the top of the screen.
Select with the cursor up/down, left/right the desired subject and press the OK key.

Select subpages

When a selected teletext page consists of different subpages, one of the subpages appears on the screen. The coloured number in the first information line refers to the displayed subpage.
The other subpages can be selected in 2 ways :

With the cursor left/right

The other subpage numbers appear in white as soon as the transmission has found them. They are stored in the memory so that they are available while the teletext page is on screen.
Select with the cursor left/right the previous or the following subpage.

With the OK key

- Enter the subpage number yourself:
Press [OK]. Enter the desired subpage with the digit keys : eg. 3 for the third page of seven subpages.
The TV searches for the selected subpage.

Automatically rotating subpages:

- Press [OK] again to cancel the entered digit key for the subpage.
Now the subpages rotate automatically.
- Press [OK] again to select the subpages with the cursor left/right again.

Special teletext functions

- Hold**
Press [OK] to stop the automatically rotating of the subpages or to stop the page counter from seeking when you have entered a wrong page number or when the page is not available.
Enter another page number.
- Enlarge**
Press [2] repeatedly to display the upper part, the lower part and then to return to the normal page size. When the upper part is displayed, you can scroll the text line by line using the cursor up/down.
- Reveal**
Press [3] to reveal/conceal the hidden information, such as solutions to riddles and puzzles.

Select Continuous Subtitles

TV channels with teletext often transmit programmes with subtitling. For each TV channel you can store a subtitle page which will be displayed continuously if the programme being broadcast is transmitted with subtitles.

Switch on teletext and select the proper subtitle page from the index.
Switch off teletext.
Now the subtitle page is stored for the selected TV channel.

Once subtitles have been stored and Subtitle On has been selected they will automatically be displayed on the selected TV channel if subtitles are in the transmission. Select Subtitle On or Off in the Features menu, see p. 17. The subtitle symbol [SUB] appears when Subtitle On is selected.

Remark: you are in teletext mode, so only teletext functions are available.

Decoder and video recorder
Connect a eurocable ③ to your decoder and to the special euroconnector of your video recorder. See also the video recorder handbook.
See Define Decoder/Discrambler prog. numbers, p. 8.
You can also connect your decoder directly to EXTERNAL 1 or 2 with a eurocable.

Video recorder and other equipment (except Digital Sources)

- 1 Connect the aerial cables ①, ② and ③ as shown. Better picture quality can be obtained if you also connect eurocable ③ to EXTERNAL 2, and a eurocable ④ to EXTERNAL 1, 3 or 4.
- 2 Look for the test signal of your peripheral in the same way as you do for a video recorder.

When a video recorder is connected to EXTERNAL 1 you can only record a programme from your TV.
Only when a video recorder is connected to EXTERNAL 2 it is possible to record a programme from your TV as well as from other connected equipment. See Record with your video recorder, p. 33.

Note: EXTERNAL 1 can handle CVBS and RGB, EXTERNAL 2 CVBS, Y/C and RGB, EXTERNAL 3 and 4 only CVBS. It is preferred to connect peripherals with RGB output to EXTERNAL 1 or 2 as RGB provides a better picture quality.

Camera & camcorder

- 1 Connect your camera or camcorder to sockets at the right side of your TV.
 - 2 Connect the equipment to **VIDEO 2** and **AUDIO L 3** for mono equipment. Press the **III** key repeatedly to select the sound coming from one or both loudspeakers of your TV.
 - 3 For stereo equipment also connect **AUDIO R 3**.
- S-VHS quality with an S-VHS camcorder is obtained by connecting the S-VHS cables with the **S-VIDEO** input **1** and **AUDIO** inputs **3**.
- Warning: Do not connect cable 1 and 2 at the same time. This may cause picture distortion!*

Wired rear loudspeakers

When no wireless RF surround sound is possible or when there is too much interference you can still enjoy Dolby Pro Logic and Dolby Digital surround sound by connecting the two rear loudspeakers to the TV with a stereo cinch to stereo 3.5 mm jack cable. Connect the (not supplied) cable with the **PRE-AMP IN (TV)** connector at the back of the active surround loudspeaker and with the black and red **REAR R** or **L** outputs at the back of the TV.

Headphone

- 1 Insert the plug into the headphone socket (H) at the right side of the TV.
 - 2 Press **HK** on the remote control to switch off the internal loudspeakers of the TV. *The headphone impedance must be between 8 and 4000 Ohm. The headphone socket has a 3.5 mm jack.*
- In the **SOUND** menu select: **Headphone volume** to adjust the headphone volume.

Digital equipment (DVD, digital Set Top Box,...)

- 1 Press **2** and **7** at the same time.

Connect your digital equipment with a eurocable **1** to one of the euroconnectors (**EXT1**, **EXT2**, **EXT3** or **EXT4**), or with a cinch cable to the **VIDEO** input at the right side of the TV (see illustration above).

For digital sources with a Dolby Digital (AC-3)/MPEG2 audio output also connect an audio cable **2** to the **DIGITAL AUDIO IN** socket of your TV to enjoy MultiChannel surround sound. This is only valid when you have connected your digital equipment to **EXT1**.

- 2 Select **Digital sources** in the **Setup** menu of the **INSTALLATION** menu and select:
 - **None** if you have no digital source connected,
 - **EXT1**, **EXT2**, **EXT3** or **EXT4** if you have connected your equipment to a euroconnector,
 - **EXT1 + Dig. Audio** if you have connected your digital equipment with a Dolby Digital/MPEG2 audio output to **EXT1** and to the **DIGITAL AUDIO IN** socket,
 - **EXT1.2.3** or **4 + Dig. STB** if you have connected your Digital Set Top Box to one of the euroconnectors,
 - **FRONT** in case you connected your equipment to the right side of the TV.

- 3 Press the **2** key to switch off all menus.

*Note: When you have connected a digital source + Digital audio to **EXT1** and a digital STB to one of the other externals*

- 1 Always select **EXT1 + Dig. Audio** in the Digital sources menu.

- 2 When you want to watch digital broadcasts via your Set Top Box, use the **2** key on the remote control, to select the external where the STB has been connected. **Multimedia** setting using the Smart Picture **2** key without changing the picture settings manually.

Other equipment

Other equipment can be connected to one of the remaining euroconnectors.

Connect Extra loudspeakers / Amplifier

Stereo amplifier and two extra FRONT speakers
To enhance the sound reproduction of your TV you can connect two extra speakers via an external amplifier.

Connect extra subwoofer

- 1 Connect the audio cables to the audio input of your amplifier and to **AUDIO FRONT L** and **R** at the back of your TV. The output level is controlled by the volume control of your TV.
Note: Switch off the TV and your audio amplifier before connecting them. Set the audio amplifier's volume to minimum.
- 2 Select **Extra front speakers Yes (Amp)** in the Sound Setup menu. See p. 9.
See Surround settings, p. 15 for the available Surround modes.
- 3 Adjust the volume of the audio amplifier.
You may make use of the test tone function in the Surround Settings menu, see p. 14, to have a reference of the loudness of the separate loudspeakers.
Note: Once you have adjusted the volume of the amplifier, do not change it while watching TV as the whole configuration operates with the volume adjustment of your TV.

Dolby Pro Logic Surround amplifier

Although your TV is already equipped with a Digital Multichannel decoder you might want to connect your own Dolby Surround amplifier.

- 1 Connect the Dolby Pro Logic Surround amplifier to the **AUDIO FRONT L** and **R** at the back of your TV.
- 2 Select **Extra front speakers No** in the Sound Setup menu. See p. 9.
The audio output is now independent of volume, treble, bass and surround settings.
- 3 Switch off the volume of the TV with the mute key .
All volume settings, tone control and speaker connections have to be done via the external Dolby Pro Logic amplifier.

Attention: the sound info on screen will not correspond with the actual sound reproduction. You will not be able to reproduce multichannel Dolby Digital or wireless surround sound through the AUDIO L and R output of your TV.

To select connected equipment

If the TV is connected to a video recorder with the EasyLink function, in some cases the TV will be switched on, even when it was in standby. (E.g. playmode, tape...)
This is not possible when Child Lock On is selected.

Equipment connected with an aerial cable only :
Select the programme number under which you have stored the test signal with the digit keys.

Equipment connected to a euroconnector or to the right side of the TV

Press the **CH** key repeatedly to select **EXT1, EXT2, EXT3, EXT4** or **FRONT**, according to where you connected your equipment at the back or the right side of your TV.
Remark: Most equipment (decoder, video recorder, satellite receiver) carries out the switching itself.

If you want to change to TV channels?

Enter the programme number of the TV channel which you want to watch with the digit keys or press the **TV** key.

Audio- and video equipment keys

Most of the audio and video equipment from our range of products can be operated with the remote control of your TV.

Press the **VCR, DVD, SAT, TUNER, CD, TAPE** or **CDR** key according to the equipment you want to operate with this remote control. See Use of the remote control, p. 10.

Video recorder
Press one of the video recorder keys after you pressed the **VCR** key.

- for record,
- ◀ for rewind,
- for stop,
- ▶ for play,
- ▶▶ for fast forward,
- /- for selecting 1- or 2-digit programme numbers from the videorecorder,
- P + for sequential programme selection from the video recorder tuner,
- 0 to 9 to select a programme number from your video recorder tuner,
- ⏻ to switch the video recorder to standby
- ⏸ VCR timer

These keys function with equipment which use the IEC5 signalling standard.

*If your video recorder has the EasyLink function the key **INSTANT** ● for recording under the door of the remote control can be operated in the TV mode.*
*If your EasyLink video recorder has the system standby function, when you press the **⏻** key for 3 seconds, both TV and the video recorder are switched to standby.*

- DVD keys**
Press one of the following keys after you have pressed the DVD key.
- to switch the DVD menu on or off
 - to select a DVD chapter
 - to select a DVD title
 - to select your choice of subtitle language
 - pause
 - to search down
 - stop
 - play
 - to search forward
 - 0-9** to enter a programme number from your DVD
 - OK** to enter the selected menu item

These keys function with equipment which use the RC6 signalling standard and with Philips DVD players.

Satellite receiver keys
Press one of the TV keys after you have pressed the SAT key.

These keys function with equipment which use the RCS signalling standard.

- Tuner, CD, Tape and CDR keys**
Press one of the following keys after you have pressed the TUNER, CD, TAPE or CDR key.
- to switch the menu on or off (tuner)
 - to select a frequency (tuner)
 - to record
 - to search down (tuner); rewind (CD/tape); speed down (CD)
 - stop
 - play
 - to search up (tuner); forward (CD/tape); speed up (CD)
 - RDS display (tuner); info on screen (CD/CDR)
 - RDS news/TA (tuner); disc increment (CD/CDR)
 - pause (CD/CDR/tape)
 - surround modes (CD/CDR/tape)
 - + P -** next/previous (CD)

Record with your video recorder without EasyLink

To record S-VHS quality, connect an S-VHS peripheral directly to the video recorder.

- 1** Record a TV programme
- 2** Select the programme number on your video recorder.
- 3** Set your video recorder to record.
- 4** See the handbook for your video recorder.

Switching programme numbers on your TV does not disturb recording.

Record a programme on your video recorder connected to EXTERNAL 3 from Audio/Video equipment connected to EXTERNAL 1, EXTERNAL 3, EXTERNAL 4 or to sockets on the right side of the TV

- 1** Switch on the equipment.
- 2** Select the right external on your video recorder.
- 3** Set your video recorder to record.
- 4** You record what you are watching on the screen.

Do not switch programme numbers or do not switch off your TV when you are recording!

Record with your video recorder with EasyLink

If you have connected an S-VHS video recorder, provided with the EasyLink function, you can record S-VHS quality from an S-VHS peripheral connected to the right side of the TV. (E.g. from an S-VHS camcorder)

In TV mode, it is possible to start a direct recording of the programme, which is being displayed on the TV screen. Press the **INSTANT** record key, under the door of the remote control.

The video recorder switches on from standby and a message of what is being recorded appears on the screen. The video recorder starts recording the programme you are watching. Switching programme numbers on your TV does not disturb recording!

When recording a programme from a peripheral connected to EXTERNAL 1, 3, 4 or FRONT, you can not select another TV programme on the screen. To watch TV programmes again, press the programme number you want to select twice. Attention: the recording is stopped and your video recorder switches to standby.

If you switch to standby during recording of a programme from a peripheral connected to EXTERNAL 1, 3, 4 or FRONT, the blinking lamp on the front of your TV indicates that you are still recording. The blinking stops after the recording is finished.

Record with your video recorder with NEXTVIEWLink

If your video recorder is equipped with NEXTVIEWLink, and you tagged one or more programmes to be recorded automatically in the NEXTVIEW mode, it is not necessary for the TV to be in the standby mode or switched on for the recording to start.

Tips

Care of the screen
Clean the TV with a slightly damp soft cloth. Do not use abrasive solvent as it can damage the TV screen.

Mobile telephone warning!
To avoid disturbances in picture and sound, malfunctioning of your TV or even damage to the TV, keep away your mobile telephone from the TV.

- Poor Picture**
- Have you selected the correct TV system?
 - Is your TV or house aerial located too close to loudspeakers, non-earthed audio equipment or neon lights, etc.?
 - Mountains or high buildings can cause double pictures or ghost images. Sometimes you can improve the picture quality by changing the direction of the aerial.
 - Is the picture or teletext unrecognisable? Check if you have entered the correct frequency. See Installation, p. 6.
 - Are brightness, sharpness and contrast out of adjustment? Select Factory settings in the Setup menu, p. 8.
 - Sometimes poor picture quality is possible when having activated an S-VHS camera or camcorder connected to the right side of your TV and another peripheral is connected to EXT1, EXT2, EXT3 or EXT4 at the same time. In this case switch off one of the other peripherals.

- No picture**
- Is the aerial connected properly?
 - Are the plugs tightly connected in the aerial socket?
 - Is the aerial cable in good condition and does it have suitable plugs?
 - Are the connection facilities to a possible second TV in good condition? If in doubt, consult your dealer.

- No sound**
- No sound on any channel? Check the volume isn't at minimum.
 - Is the sound interrupted with the mute key **MUTE**? Check if your speaker configuration corresponds with the selections made in the Sound Setup menu, p. 9. E.g. is your amplifier switched on when you have 2 extra front speakers connected?
 - No sound from the rear speakers or the centre speakers? Select an appropriate surround mode, according to the broadcasted sound signal or adjust the volume or check if the wireless transmitter is properly connected. See Surround Modes, p. 15.
 - In case you connected digital equipment with a digital audio connection you have to select **EXT1** + **dig. audio** in the Sound Setup. Digital sources, p. 29 to reproduce sound.

- Remote control**
- If your TV no longer responds to the remote control, the batteries may be dead or the wrong mode (TV or other peripheral, see p. 3) is selected.
 - You can still use the **M** key and the **-/+** keys at the top of your TV.
- Menu**
- Have you selected the wrong menu? Press the same key again to exit from the menu.
- NEXTVIEW - No information**
- See Acquisition and updating of NEXTVIEW information, p. 24.
- NEXTVIEW - Displayed time is wrong**
- The broadcaster on programme number one does not transmit the correct local date on time. Use **Reshuffle** in the **INSTALLATION** menu to place another broadcaster on programme number one.

- Wireless Surround speaker system**
- Are the active surround speaker and the Surround Sound setting in the Setup menu switched to the same transmitting channel?
 - External RF equipment, mobile telephones or people moving around close to the TV may disturb the sound transmission.
 - When no RF surround sound is possible, or when there is too much interference, try to switch to another wireless channel or use the wired back up solution. See Install Sound Setup, p. 9.
 - When you switch to another wireless transmitting channel as well in the setup menu as on the speaker box.
 - For wireless transmitter modules with a built in antenna, direct the antenna to achieve the best reception.

- No solution**
- Switch your TV off and then on again once.
- Never attempt to repair a defective TV yourself.**
- Check with your dealer or call a TV technician.

End of life directives

Philips is paying a lot of attention to producing environmentally-friendly in green local areas. Your new TV contains materials which can be recycled and reused. At the end of its life specialised companies can dismantle the discarded TV to concentrate the reusable materials and to minimise the amount of materials to be disposed of.

Please ensure you dispose of your old TV according to local regulations.

How to dispose of dead batteries?

The batteries supplied do not contain the heavy metals mercury and cadmium. Nevertheless in many countries dead batteries may not be disposed of with your household waste. Please ensure you dispose of dead batteries according to local regulations.

Glossary

- 100 Hz Digital Scan**
- If you look at a television screen you will see small imperfections in the picture caused by line vibration. Digital Scan (an internal process) removes interline flicker. When combined with 100 Hz, you will see a totally stable image.
- Automatic Channel Installation (ACI)**
- Automatically installs all TV channels in the same order as offered by your cable company. Provided of course that the data is transmitted. It also automatically includes programme number and programme name. With ACI, channel installation is fully automatic, simple and fast.
- Child Lock**
- Feature to prevent unauthorised use of your TV.
- Digital Natural Motion**
- 100 Hz Digital Natural Motion eliminates the juddering effect that is noticeable when there are moving objects in the picture. This results in razor sharp pictures and ensures smooth movements.
- DNR**
- Digital Noise Reduction. By encoding signals digitally in 100 Hz sets, it is possible to clean up picture noise. This is especially beneficial in poor signal areas and when viewing poor quality video tapes.
- Dolby Digital**
- The audience is completely surrounded by the sound. Both the left/right/centre and subwoofer speakers and the surround speakers are driven by the digitally processed sound system of the TV. The Dolby Digital sound contains 6 independent digital channels which results in a CD sound performance from both the front and rear sound channels.
- Dolby Surround Pro Logic**
- Literally wraps you in 4-channel sound. It brings your favourite movies to life with all the realism and impact of cinema sound as though you are part of the action.
- Easy Link**
- Digital "intelligent" ESI bus-system between TV and VCR (Start connection required). Turns source selection and control into a one-button operation.
- Easy Text**
- Teletext memory that automatically memorises Teletext pages and gives you instant access to them.
- Euroconnector**
- A 21-pin connector system enabling you to simply connect various types of audio/video and computer equipment.
- Menu**
- On-screen display of functions and facilities in a well-organised survey, which you can select using your remote control.
- NEXTVIEW**
- NEXTVIEW is a new feature to assist the TV and VCR user in selecting the programmes she or he likes to watch from a television programme guide on the screen. It enables the user to see a description of every programme, and mark interesting programmes to be reminded (auto TV on) or recorded (NEXTVIEWLink video recorder required).
- NTSC**
- The broadcasting system used in the USA, Japan and parts of South America and Southeast-Asia.
- Smart Picture and Sound Controls**
- Keys on the remote control to select predefined picture and sound settings.
- Sleep timer**
- Function with which you can set a time period after which the TV should switch itself to standby.
- Picture Freeze**
- TV mode which allows you to "freeze" a certain image in order to study a specific detail at ease, e.g. to make notes of certain programme information like phone numbers.
- Teletext**
- See also Easy Text
- WST/World Standard Teletext. FLOF/Full Level One Features. System applied by the BBC, RVE... that provides a fast access to the teletext pages.
- TOP: Table of (Teletext) Pages. German system for an easy access to the teletext pages.
- Tint**
- TV-function to modify the general colour balance between cool and warm and to adjust it according to your personal preference.

4. Mechanical Instructions

Index of this chapter:

1. Set Disassembly
2. Service Positions
3. Board Removal
4. Set Reassembly

Note: Figures below can deviate slightly from the actual situation, due to different set executions.

4.1 Set Disassembly

Follow the disassemble instructions in described order.

4.1.1 Wireless Surround Transmitter Removal (if attached)

Transmitter module

Figure 4-1

1. Remove the cable [1] of the Wireless Surround Transmitter box (at the left side of this RJ45 plug you can find the release-hook of the lock-mechanism).
2. Pull the Wireless Surround Transmitter box backwards. It is clicked to the rear cover via three clamps [2].

4.1.2 Rear Cover Removal

Rear view

Figure 4-2

Warning: disconnect the mains power cord before you remove the rear cover.

First, remove the top cover (= plate with 'saucer'):

1. Remove the three fixation screws [1] that hold the cover plate.
2. Pull the cover (horizontally) backwards.

To be able to access the electronics of the set, you must remove the rear cover:

1. Remove the three remaining fixation screws [2] of the I/O-cover plate.
2. Remove the remaining fixation screws [3] at the two sides and the top of the rear cover.
3. Now remove the rear cover. Make sure that wires and cables are not damaged during cover removal.

4.1.3 I/O Cover Plate Removal

Cover plate

Figure 4-3

It is rather easy to remove the I/O-cover plate:

1. Release the hook on the left side (pull slightly outwards).
2. Now remove the plate (it hinges at the right side).

4.1.4 Sub-woofer Removal

How to remove the sub-woofer:

1. Disconnect the loudspeaker cable at the top of the sub-woofer box.
2. The subwoofer has two rubber feet at the bottom. Behind them, there is a snap hook. Release this hook (pull backwards), and at the same time pull the sub-woofer box upwards.
3. Now remove the sub-woofer.

4.1.5 DAF-module Removal

DAF-bracket

Figure 4-4

How to remove the DAF-module:

1. Press down the snap hook [1].
 2. At the same time, slide the complete DAF-module to the left
- Caution:** be very careful not to damage the CRT while doing this!.
3. Now lift the module from the LSP top bracket.

4.1.6 Support Brackets Removal

SSP support bracket

Figure 4-5

How to remove the 'module support bracket' on the Small Signal Panel (SSP):

1. Remove the two fixation screws [E].
2. Pull the snap-hooks [F] to the outside direction, and remove the bracket. The left snap-hook is somewhat difficult to release (with some effort it is possible to release it, by manipulating the hook with a finger underneath the MCS-module at the left hand side).

LSP support bracket

Figure 4-6

How to remove the 'module support bracket' on the Large Signal Panel (LSP):

1. Remove the two fixation screws [1].
2. Remove the Top Supply panel (besides the LSP, see 'Service position 3' below).
3. Now remove the bracket.

4.2 Service Positions

This chassis has several predefined service positions:

1. For the component side of the main chassis panels (SSP, LSP and Top Supply).
 2. For the copper side of the Multi Channel Sound (MCS) panel.
 3. For the copper side of the Top Supply panel (TSP).
 4. For the copper side of both the LSP and TSP.
- All service positions are explained in more detail below.

4.2.1 Service Position 1

Overview 1

Figure 4-7

1. Pull the complete SSP- and LSP assembly about eight cm backwards
- Caution:** be very careful not to damage the CRT panel with the DAF-module!.
- The brackets are not fixed together, but can be repositioned backwards, as if they were one bracket.
2. Hook the brackets in the first row of the fixation-holes in the bottom plate (in other words: re-position the fixation from [1] to [2]).
 3. Now all important service test points are accessible at the topside of the SSP.

4.2.2 Service position 2

Overview 2

Figure 4-8

In its normal position, the MCS module can be serviced from the copper side (left hand side). In order to gain access to the other side of the board (reflow side), do the following:

1. First, release the snap construction at the bottom side of the MCS module. To do this, release the hook with e.g. a screwdriver (approach it from the rear).
2. After release, rotate the board about 220 degrees clockwise (hinge at connectors). The board can lean on the SSP top bracket.
3. All reflow components and test points on this side, are accessible now.

4.2.3 Service Position 3

Overview 3

Figure 4-9

In order to gain easy access to the copper side of the Top Supply (TSP) assembly, do the following:

1. Pull the two release hooks (F) of the TSP-bracket backwards (see figure of 'Service position 2').
2. After you hear a release click, you can lift the bracket.
3. Now, rotate the assembly 90 degrees clockwise (from vertical to horizontal position).
Caution: before doing this, release the wire cables from their clamps and, if necessary, disconnect the wire cable 0390 coming from the rotation-coil.
4. Place the two support-posts [F] of the assembly over the two ribs that are available on the right side of the LSP bracket.

5. The copper side of the TSP, with its service test points is available now.

4.2.4 Service position 4

Overview 4

Figure 4-10

In order to gain easy access to the component sides of the LSP and Top Supply assembly, do the following:

1. First, reinforce the above-described 'TSP fixation' with a screw (the rear support-post contains a hole for this).
2. Now move as well the SSP- as the LSP bracket about 25 cm to the right.
3. Rotate the complete LSP/TSP assembly 90 degrees anti-clockwise, such that snap hook [G] is placed into hole [H]. If necessary, reinforce this construction with a screw.
4. Now you can measure all the service test points of the LSP on the right hand side, and of the TSP at the left hand side.
5. For measurement safety, shift the left front hook of the SSP bracket in the right SSP hole of the bottom plate (see [K] of service position 1).

4.2.5 FDS-module

One side is easy accessible whit the module on its place. One way to measure the other side (= FBX side) is to remove the FBX and overrule the protections (see 'Repair Tips' in chapter 5).

4.2.6 Feature Box (FBX)

First, remove the shielding of the FBX. Now, the test points on the 'LOT side' are easy accessible.

To get access to the test points on the 'FDS side', you have to remove the FDS module and bypass the RGB-path (see also the 'Repair Tips' in chapter 5).

4.2.7 Auto-SCAVEM

This panel is placed in front of the SSP. Because most of its components are placed on the bottom side, you must lift the panel from its bracket before you can measure it. Therefore release the two fixation clamps (one at the 'SSP side' and one at the 'LSP side'), and lift the panel.

4.3 Board Removal

Sometimes, it can be necessary to swap a complete Printed Wiring Board (PWB). How that can be done is explained below.

4.3.1 Small Signal Panel (SSP)

1. Remove the 'module support bracket' (see paragraph 4.1.6).
2. Release the three fixation clamps on the right hand side of the bracket.
3. Press the board upwards at the same side.
4. Remove the board from the bracket.

4.3.2 Top Supply Panel (TSP)

1. Remove the fixation screws (one at the top, one on the right side, and two on the left side).
2. Release the two top-corner snap constructions (see circle in figure 'Position 4'), by forcing them outwards.
3. The panel hinges at the bottom of the bracket. Remove the bracket, by forcing the two sides of the bracket somewhat outwards.

4.3.3 Large Signal Panel (LSP)

1. Remove the Top Supply module (see paragraph above)
2. Remove the 'module support bracket' (see paragraph 4.1.6).
3. Remove the fixation screw in the middle of the Large Signal board.
4. Release the fixation clamps on the right, rear, and front side of the bracket (the board hinges at the left side).
5. Remove the board from the bracket.

4.3.4 Top Control Assy/Panel

Control assy

Figure 4-11

1. Release both fixation screws about 5 full turns.
2. Pull the complete assy back- and upwards (it hinges in the cabinet front).
3. Flip the assy, and you can access the board by releasing (carefully) the four fixation clamps.

4.3.5 Side-I/O Assy/Panel

Side I/O

Figure 4-12

1. Release the snap-hook [1] with your finger.
2. At the same time, pull the assy backwards [2].
3. Release the two fixation clamps on the right side of the bracket (the board hinges at the left side).
4. Remove the board from the bracket.

4.3.6 Mains Switch Assy/Panel

Mains Switch

Figure 4-13

1. Release the two fixation clamps (rather difficult to reach), by pushing them upwards [1]. At the same time, pull the complete assy backwards [2]
Note: be aware that the degaussing coil can hamper this.
2. Release the two fixation clamps on the two sides of the bracket (the board hinges at the connector side).
3. Remove the board from the bracket.
4. When the light guide (sitting in the cabinet, in front of the LEDs) is defective, you can replace it by pushing it forwards at the left side (seen from the rear). It hinges at the right side.

4.3.7 Wireless Active Surround Box

Exploded view

Figure 4-14

The box consists of four panels (W1 to W4), which are part of one family/combi-board. They are fixed together with wire cables (sometimes without connectors).

1. Remove the four screws which hold the front cover.
2. If necessary, unplug the loudspeaker and the LED panel (W4).
3. Remove the two screws which hold the clickfit connector for the passive loudspeaker.
4. Remove the six screws that hold the metal frame (which hold all PWBs and transformer).
5. See photo above for the exploded view.

PWB location

Figure 4-15

Each panel is now easily accessible to measure. If necessary, remove the panel from the metal frame by removing the belonging screws. See photo above for the panel positions. See further chapter 8.7 of the Training Manual MG3.1E.

To reassemble the box, do all processes in reverse order.

Be sure that, before the front cover is mounted:

- The (blue) antenna wire is mounted correctly in its guiding brackets.
- The 'foam dust cover' is replaced on the channel selector switch (on the bottom PWB).
- All wires/cables are returned in their original positions.

4.4 Set Reassembly

To reassemble the whole set, do all processes in reverse order.

Be sure that, before the rear cover is mounted:

- The mains cord is mounted correctly in its guiding brackets.
- All wires/cables are returned in their original positions.

5. Service Modes, Error Codes and Fault Finding

Index of this chapter:

1. Test Points
2. Service Modes
3. Problems and Solving Tips (related to TV-settings).
4. ComPair
5. Error Codes
6. Protections
7. Repair/Service Tips

5.1 Test Points

5.1.1 General Test Conditions

Perform the measurements under the following conditions:

- Service Default Mode.
- Video: Colour bar signal.
- Audio: 3 kHz left, 1 kHz right.

5.1.2 Waveform Test Points

The chassis is equipped with test points, which are, in most cases, printed on the circuit board assemblies (if not, please check chapter 6 'test point overview'). They refer to the functional blocks. The test points have names starting with I for IF, S for sound etc. The numbering is done in a logical sequence for diagnostics.

Note: Not all test points are measured, but they can serve as identification names in Service communication (e.g. ComPair fault find trees, SearchMan files).

In the following cases, there will be no waveform:

- When already a V_{DC} voltage is displayed in the diagrams, or when the waveform does not have an added value.
- External AV-inputs are not measured, as the waveform is equal to the source (dependent of load resistor matching).

5.1.3 DC-voltage Test Points

From practically all semiconductor pins, the DC-voltages are measured. These values are displayed in the circuit diagrams. If a DC-value is displayed between brackets then this value is measured in STANDBY-mode.

5.2 Service Modes

Service Default Mode (SDM) and Service Alignment Mode (SAM) offer several features for the service technician, while the Customer Service Mode (CSM) is used for communication between a Philips Customer Care Centre (P3C) and a customer.

There is also the option of using ComPair, a hardware interface between a computer (see requirements below) and the TV chassis. It offers the ability of structured troubleshooting, test pattern generation, error code reading, software version readout, and software upgrading.

Requirements: a Pentium processor, Windows 95/98, and a CD-ROM drive (see also paragraph 5.4).

5.2.1 Service Default Mode (SDM)

Purpose

- To create a pre-defined setting to get the same measurement results as given in this manual.
- To override SW protections (only when SDM is entered via the 'service pins' on SSP connector 0356).

Specifications

- Tuning frequency: 475.25 MHz for PAL/SECAM.
- Colour system: SECAM L for France or PAL B/G for the rest of Europe.
- All picture settings at 50 % (brightness, colour, contrast).
- All sound settings at 50 % (except volume: at 25 %).
- All service-unfriendly modes (if present) are disabled, like:
 - (sleep) timer,
 - child/parental lock,
 - blue mute,
 - auto switch-off (when no 'IDENT' video signal was received for 10 minutes),
 - skip/blank of non-favourite pre-sets,
 - smart modes,
 - auto store of personal presets,
 - auto user menu time-out.

How to Enter SDM

Use one of the following methods:

- Use the standard RC-transmitter and key in the code **0 6 2 5 9 6**, directly followed by the 'MENU' button.

Note: It is possible that, together with the SDM, the main menu will appear. To switch it off, push the 'MENU' button again).
- Short pins 2 and 3 on connector 0356 of the SSP (see Fig. 'SSP Component Side' in chapter 8) while the set is in the normal operation mode.

Caution: Entering SDM by this method will override all the processor-controlled protections. When doing this, the service-technician must know exactly what he is doing, as it could lead to damaging the set.
- Use the 'DEFAULT' button on the Dealer Service Tool (RC7150).
- Use the DST-emulation feature of ComPair.

SDM Menu

CL 16532044_031.eps
140501

Figure 5-1

After entering SDM, a blank screen is visible, with 'Service Default' in the lower right part for recognition.

How to Navigate

To toggle to the SAM mode, use a standard customer RC-transmitter and key in the code **0 6 2 5 9 6**, directly followed by the 'OSD (i+)' key.

How to Exit

Switch the set to STANDBY by pressing the Standby button (⏻) on the remote control transmitter. If you switch the set 'off' via the mains switch, the set will return in SDM when Mains power is re-applied.

5.2.2 Service Alignment Mode (SAM)

Purpose

- To perform (software) alignments.
- To change option settings.
- To easily identify the used software version.
- To view operational hours.
- To display (or clear) the error code buffer.

Specifications

- Software version.
- Operational hours counter.
- Options setting.
- Error buffer reading and erasing.
- Software alignments.

How to Enter

Use one of the following methods:

- Use the standard RC-transmitter and key in the code **0 6 2 5 9 6** directly followed by the 'OSD (+)' button.
- Short pins 1 and 2 of connector 0356 on the SSP.
- Use the 'ALIGN' button on the Dealer Service Tool (RC7150), enter password **3 1 4 0** and press 'OK'.
- Use the DST-emulation feature of ComPair.

The following screen is visible:

SAM Menu

CL16532044_032.eps
140501

Figure 5-2

- **Date.** Displays the software date.
- **ID.** Displays the main software version of the ROM (example: MG32E11. 0_01234 = AAABCD.D_XXXXX).
 - A = the chassis name (MG32).
 - B = the region: E = Europe, A = Asia Pacific, U = NAFTA, L = LATAM.
 - C = the language cluster number.
 - D = the main software version number.
 - X = latest 5 digits of 12nc code software.
 - For the latest software versions, see the 'Product Survey - Colour Television' publication, which is issued 4 times per year.
- **Operation Hours.** Displays the accumulated total of operation hours.
- **Errors** (followed by maximal 10 errors). The most recent error is displayed at the upper left (for an error explanation see paragraph 5.5).
- **Defect. Module.** Here, the module that generates the error is displayed. If there are multiple errors in the buffer that have not all been generated by a single module there is probably another defect. It will then display the message 'Unknown' here.
- **Reset Error Buffer.** When you press the 'OK' button, the error buffer is reset.
- **Functional Test.** All devices are tested via the 'OK' button. Eventual errors are displayed in the error buffer. The error buffer is not erased, the content returns when this test is terminated.
- **Alignments.** This will activate the 'Alignments' sub-menu.

- **Dealer Options.** Extra features for the dealers.

Note: When an NVM was corrupted (or replaced) in the MG3.1E chassis, the microprocessor replaced the content with default data (to assure that the set can operate). However, all presets and alignment values are gone now, and option numbers are also not correct. So, this was a very drastic way. In the MG3.2E chassis, the procedure is implemented in another way:

- The moment the processor recognises a corrupted NVM, an extra line will be added to the SAM menu: '**Initialise NVM**'.
- Now, you can do two things (dependent of the service instructions at that moment):
 - Save the content of the NVM via ComPair for development analysis, **before** initialising. This will give the Philips Service department an extra possibility for diagnosis (e.g. when Development asks for this).
 - Initialise the NVM (same as in the past, however now it happens conscious).

How to Navigate

- In SAM, you can select the menu items with the 'CURSOR UP/DOWN' key on the RC-transmitter. The selected item will be highlighted. When not all menu items fit on the screen, move the 'CURSOR UP/DOWN' key to display the next/previous menu items.
- With the 'CURSOR LEFT/RIGHT' keys, it is possible to:
 - (De)activate the selected menu item.
 - Change the value of the selected menu item.
 - Activate the selected submenu.
- When you press the 'MENU' key in a submenu, you will return to the previous menu.

How to Exit

Use one of the following methods:

- Press the 'MENU' button on the RC-transmitter.
- Switch the set to 'STANDBY' (⏻) via the RC-transmitter.
- Switch the set 'off' and 'on' with the mains switch.
- Press the 'EXIT' button on the DST.

5.2.3 Customer Service Mode (CSM)

Purpose

When a customer is having problems with his TV-set, he can call his dealer. The service technician can then ask the customer to activate the CSM, in order to identify the status of the set. Now, the service technician can judge the severness of the complaint. In many cases, he can advise the customer how to solve the problem, or he can decide if it is necessary to visit the customer.

The CSM is a read only mode, therefore modifications in this mode are not possible.

How to Enter CSM

Use one of the following methods:

- Press the 'MUTE' button on the RC-transmitter simultaneously with the 'MENU' button on the TV (top control) for, at least, 4 seconds (be sure to point the RC-transmitter directly to the IR-receiver of the set, otherwise you will activate the 'Dealer Demo Mode').
- Key in the code **1 2 3 6 5 4** via the standard RC transmitter.

Notes

- Activation of the CSM is only possible if there is no (user) menu on the screen!
- If you do not point the RC-transmitter correctly to the RC-receiver in the set, and you push the 'MENU' button for more than 6 s, the TV starts in 'demo' mode. To leave this mode, push 'MENU' again for more than 6 s.

After activation of the Customer Service Menu, the following screen (Customer Service Menu 0) will appear:

CSM Menu 0

CL16532149_072.eps
061201

Figure 5-3

- **Type number.** This information (e.g. 32PW9767/12) is very helpful for a helpdesk or repair shop, as reference for further diagnosis. In this way, it is not necessary for the customer to look at the rear of his TV-set.
- **FBX SW Version.** The 12nc-code of the build-in Feature Box software version. For the latest software versions, see the 'Product Survey - Colour Television' publication, which is issued four times per year.

By means of the 'CURSOR-DOWN' knob on the RC-transmitter the Customer Service Menu 1 will appear. By means of the 'CURSOR-UP' knob on the RC-transmitter the Customer Service Menu 0 will appear again.

Customer Service Menu 1 represents following information:

CSM Menu 1

CL16532044_034.eps
140501

Figure 5-4 CL

- **Software version.** The build in software version (e.g. MG32E11.0_XXXXX). You will find details of the software versions in the chapter 'Software Survey' of the 'Product Survey - Colour Television' publication. This publication is issued four times a year.
- **Code 1.** Gives the last five errors of the error buffer. As soon as the built-in diagnose software has detected an error the buffer is adapted (see paragraph 5.5.3 for a description).
- **Code 2.** Gives the first five errors of the error buffer. As soon as the built-in diagnose software has detected an error the buffer is adapted. The last occurred error is displayed on the leftmost position of code 2. Each error code is displayed as a 3 digit number. When less than 10 errors occur, the rest of the line(s) is (are) empty. In case of no errors, the text 'No Errors' is displayed (see paragraph 5.5.3 for a description).
- **LS Volume.** Gives the Last Status of the volume as set by the customer for this selected transmitter. The value can vary from 0 (volume is minimum) to 36 (volume is maximum). Volume values can be changed via the volume key on the RC-transmitter.

- **LS Brightness.** Gives the Last Status of the brightness as set by the customer for this selected transmitter. The value can vary from 0 (brightness is minimum) to 63 (brightness is maximum). Brightness values can be changed via the 'CURSOR LEFT' and 'CURSOR RIGHT' keys on the RC-transmitter after pressing the 'MENU' button and selecting 'PICTURE' and 'BRIGHTNESS'.
- **LS Contrast.** Gives the Last Status of the contrast as set by the customer. The value can vary from 0 (contrast is minimum) to 63 (contrast is maximum). Contrast values can be changed via 'CURSOR LEFT' and 'CURSOR RIGHT' keys on the RC-transmitter after pressing the 'MENU' button and selecting 'PICTURE' and 'CONTRAST'.
- **LS Colour.** Gives the Last Status of the colour saturation, as set by the customer. The value can vary from 0 (colour is minimum) to 63 (colour is maximum). Colour values can be changed via 'CURSOR LEFT' and 'CURSOR RIGHT' keys on the RC-transmitter after pressing the 'MENU' button and selecting 'PICTURE' and 'COLOUR'.
- **LS Headphone.** Gives the Last Status of the headphone volume, as set by the customer. The value can vary from 0 (volume is minimum) to 24 (volume is maximum). Headphone volume values can be changed via the 'CURSOR LEFT' and 'CURSOR RIGHT' keys on the RC-transmitter after pressing the 'MENU' button and selecting 'SOUND' and 'HEADPHONE'.
- **Sharpness.** Gives the sharpness value. The value can vary from 0 (sharpness is minimum) to 7 (sharpness is maximum). In case of bad antenna signals, a too high value of the sharpness can result in a noisy picture. Sharpness values can be changed via the 'CURSOR LEFT' and 'CURSOR RIGHT' keys on the RC-transmitter after pressing the 'MENU' button and selecting 'PICTURE' and 'SHARPNESS'.
- **Dolby.** Indicates whether the received transmitter transmits Dolby sound (present) or not (not present). Attention: The presence of Dolby can only be tested by the software on the Dolby Signalling bit. If a Dolby transmission is therefore received without a Dolby Signalling bit, then this indicator will show 'not present' even though such a Dolby transmission is received.
- **Surround Mode.** Indicates the by the customer selected surround mode (or automatically chosen mode). In case the set is a Non-Dolby set, there will be displayed '0'. If it is a Dolby-set then is displayed: 'Stereo', '3D Surround', 'Dolby Pro Logic', 'Dolby 3 Stereo', or 'Hall'. These settings can be influenced by toggling the surround mode button on remote control (white button). It can also have been selected automatically by signalling bits (internal software).
- **Tuner Frequency.** Indicates the frequency the selected transmitter is tuned to. The tuner frequency can be changed via the 'CURSOR LEFT' and 'CURSOR RIGHT' keys for fine tune or by entering directly with the digit keys 0 to 9 on the RC-transmitter after opening the installation menu and selecting 'MANUAL INSTALLATION'. Pressing 'TIMER' and 'ENLARGE' at the same time can open the installation menu.

By means of the 'CURSOR-DOWN' knob on the RC-transmitter the Customer Service Menu 2 will appear. By means of the 'CURSOR-UP' knob on the RC-transmitter the Customer Service Menu 1 will appear again.

Customer Service Menu 2 represents following information:

CSM Menu 2

CUSTOMER SERVICE MENU 2			
13	Centre Volume	..	
14	DNR	...	
15	Noise Figure	...	
16	Digital Option	...	
17	Colour System	
18	TV System	
19	Audio System	
20	Tuned bit	
21	Speaker Config.	
22	Digital Sources	
23	Rear volume left	..	
24	Rear volume right	..	

CL 16532149_073.eps
061201

Figure 5-5

- **Centre Volume.** Gives the volume value of the centre loudspeaker. This value can vary from 0 (minimum volume) to 63 (maximum volume). Centre volume can be changed via the 'CURSOR LEFT' and 'CURSOR RIGHT' keys on the RC-transmitter after pressing the 'MENU' button and selecting 'SOUND', 'DOLBY PRO LOGIC' and selecting 'CENTRE VOLUME'. This feature is only available when surround mode is in 'DOLBY PRO LOGIC', 'DOLBY 3 STEREO', or '3D SURROUND'.
- **DNR.** Gives the setting of the Dynamic Noise Reduction for the selected transmitter. The DNR can be changed via the 'DNR' button on the remote control handset. The following selections are possible:
 - 'OFF - MIN - MED - MAX' or,
 - 'OFF - AUTOMATIC' (for sets with 'Automatic Noise Reduction').
- **Noise Figure.** Gives the noise ratio for the selected transmitter. This value can vary from 0 (good signal) to 127 (average signal) and to 255 (bad signal).
- **Digital Option.** Gives the selected digital mode. Change via the 'CURSOR LEFT' and 'CURSOR RIGHT' keys on the RC-transmitter, after pressing the 'MENU' button and selecting 'PICTURE', 'DIGITAL OPTIONS'. Options are:
 - 100 HZ DIG. SCAN.
 - PIXEL PLUS.
 - DOUBLE LINES.
- **Colour System.** Gives information about the colour system of the selected transmitter.
 - Black and white: No colour carrier received
 - PAL: PAL signal received
 - SECAM: SECAM signal received
 - NTSC: NTSC signal received
- **TV System.** Gives information about the video system of the selected transmitter.
 - BG: BG signal received
 - DK: DK signal received
 - I: PAL I signal received
 - L: SECAM L signals received
 - M38.9: NTSC M signal received with video carrier on 38.9 MHz
 - MN: NTSC M signal received
- **Audio System.** Gives information about the audio system of the selected transmitter.
 - Sound Muted: No sound
 - Dolby Pro Logic: Dolby Pro Logic sound received
 - Mono: Mono sound received
 - Stereo: Stereo sound received
 - Dual I: Language I received
 - Dual II: Language II received
 - Digital Mono: Digital mono sound is received
- Digital Stereo: Digital stereo sound is received
- Digital Dual I: Digital language I is received
- Digital Dual II: Digital language II is received
- **Tuned bit.** Gives information about the tuning method of the stored pre-set. If a channel is found via 'automatic installation', you will see the value 'On'. When you change this (automatically found) frequency via 'fine tune' adjustment (installation menu - manual installation), the displayed value will change to 'Off'. Therefore, when you see the value 'Off' in this line, it is an indication that the received channel is a non-standard signal (e.g. of a VCR).
- **Speaker config.** Gives the speaker configuration settings. In case the set is a non-Dolby set, it displays '0'. If it is a Dolby-set, it displays: 'FULL INTERNAL', 'L/R EXTERNAL', 'SURROUND EXTERNAL' or 'FULL EXTERNAL'. Change the speaker configuration (for a Dolby-set), via the 'CURSOR LEFT' and 'CURSOR RIGHT' keys on the RC-handset after opening the 'INSTALLATION' menu and selecting 'SETUP'. Open the 'INSTALLATION' menu by pressing the 'TIMER' and 'ENLARGE' buttons at the same time.
- **Digital Sources.** Gives the configuration setting for the digital source. If one of these is selected, the starting point is a top quality signal on that input and a number of settings are therefore changed automatically. Change the digital source via the 'CURSOR LEFT' and 'CURSOR RIGHT' keys on the RC-transmitter after opening the installation menu and selecting 'SETUP'. Pressing 'TIMER' and 'ENLARGE' at the same time can open the installation menu. It displays:
 - NONE
 - EXT1, 2, 3, or 4
 - EXT1 + DIG. AUDIO
 - EXT1, 2, 3, or 4 + DIG. STB (Digital Set Top Box)
 - FRONT
- **Rear volume Left.** Only valid when Dolby Digital option is 'on'. This gives the volume value of the left surround sound loudspeaker. This value can vary from 0 (minimum volume) to 63 (maximum volume). Rear volume left can be changed via the 'cursor left' and 'cursor right' keys on the remote control handset after pressing the 'menu' button and selecting 'sound', 'Surround settings' and selecting 'Rear volume left'.
- **Rear Volume Right.** Only valid when the Dolby Digital option is 'on'. This gives the volume value of the right surround sound loudspeaker. This value can vary from 0 (minimum volume) to 63 (maximum volume). Rear volume right can be changed via the 'cursor left' and 'cursor right' keys on the remote control handset after pressing the menu button and selecting 'sound', 'Surround settings' and selecting 'Rear volume right'.

How to Exit CSM

Use one of the following methods:

- After you press a key on the RC-transmitter (with exception of the 'CHANNEL' and 'VOLUME' keys).
- After you switch the TV-set 'off' with the mains switch.

5.3 Problems and Solving Tips (Related to TV-settings)

Note: Below described problems are all related to the TV settings. The procedures to change the parameter (or status) of the different settings are described.

5.3.1 Picture Problems

Worse Picture Quality in Case of Digital Sources (e.g. DVD)

1. Check line 'Digital sources'. This will give the indication 'Front', 'Ext1', 'Ext1 + Dig. Audio', 'Ext2', 'Ext3', 'Ext4' or 'None'.

2. Check if the digital source is really connected to the indicated external input. If not, change the input to the correct one.

Snowy/Noisy Picture

Check line 'Noise Figure'. In case the value is 127 or higher and also high on other programs, check the aerial cable/aerial system.

Picture too Dark

1. Press 'Smart Picture' button on the Remote Control handset. In case picture improves, raise the brightness value or raise the contrast value. The new value(s) are automatically stored for all TV channels.
2. After switching on the Customer Service Mode, the picture is OK. Raise the brightness and/or the contrast value. The new value(s) are automatically stored for all TV channels.
3. Check lines 'Brightness' and 'Contrast'. The brightness and/or the contrast value is low (<15). Raise the brightness and/or contrast value.

Picture too Bright

1. Press 'Smart Picture' button on the Remote Control handset. In case picture improves, reduce the brightness value or reduce the contrast value. The new value(s) are automatically stored for all TV channels.
2. After switching on the Customer Service Mode, the picture is OK. Reduce the brightness value or reduce the contrast value. The new value(s) are automatically stored for all TV channels.
3. Check lines 'Brightness' and 'Contrast'. The brightness and/or the contrast value is high (>70). Reduce the brightness value or raise the contrast value.

Fading Picture

Digital scan effect. Check line 'DNR'. The status of 'DNR' is a value between 0 and 100. This value has not really a practical explanation. In case you have a fading picture, you could influence the 'DNR'-level by navigating route: 'Menu' - 'Picture' - 'DNR'. There are four different levels selectable.

White Line around Picture Elements and Text

1. Press 'Smart Picture' button on the Remote Control handset. In case picture improves, reduce the sharpness value. The new value(s) are automatically stored for all TV channels.
2. After switching on the Customer Service Mode, the picture is OK. Reduce the sharpness value. The new value(s) are automatically stored for all TV channels.
3. Check line 'Sharpness'. Reduce the sharpness value. The new value(s) are automatically stored for all TV channels

No Picture

Check line 'Tuned bit'. In case the value is 'on', install the required program again. Open the installation menu by pressing 'Timer' and 'Enlarge' at the same time, and perform manual installation.

Blue Picture and/or Unstable Picture

No proper signal is received. Check line 'Noise Figure'. If value is higher than 127, suspect the signal. Check your cable- or aerial signal.

Black and White Picture.

Check line 'Colour'. In case the value is low (<30), raise the value of colour. The new value(s) are automatically stored for all TV channels.

No Colours/ Colours not Correct / Unstable Picture / Colour Lines around Picture Elements.

Check lines 'TV System'. Check if system is OK.
BG stand for PAL B/G, L/La for SECAM L, I for PAL I or L', D/K or SECAM D/K. They correspond with the System selections

made in the 'install' menu, respectively West Europe, France, UK, and East Europe. In case system is wrong, correct this via manual installation.

Menu Text not Sharp Enough.

1. Press 'Smart Picture' button on the Remote Control handset. In case picture improves, reduce the contrast value. The new value(s) are automatically stored for all TV channels.
2. After switching on the Customer Service Mode, the picture is OK. Reduce the contrast value. The new value(s) are automatically stored for all TV channels.
3. Check line 'Contrast'. If the value is high (>75), reduce it.

5.3.2 Sound Problems

No Sound from Left and Right Speaker.

1. Press 'Smart Sound' button on the Remote Control handset. In case sound improves, raise the volume value. The new value(s) are automatically stored for all TV channels.
2. After switching on the Customer Service Mode, the volume is OK. Raise the volume value. The new value(s) are automatically stored for all TV channels.
3. Check line 'Volume'. The value is low, so raise it. The new value(s) are automatically stored for all TV channels.

Sound too Loud for Left and Right Speaker.

1. Press 'Smart Sound' button on the Remote Control handset. In case sound improves, reduce the volume value. The new value(s) are automatically stored for all TV channels.
2. After switching on the Customer Service Mode, the volume is OK. Reduce the volume value. The new value(s) are automatically stored for all TV channels.
3. Check line 'Volume'. The value is high, so reduce it. The new value(s) are automatically stored for all TV channels.

No Sound from Centre Speaker.

1. Check line 'Centre Volume'. If the value is low, raise it.
2. In case of a Dolby set, check line 'Surround mode'. The centre speaker is only active in the surround modes 3D Surround, ProLogic, Dolby 3 Stereo and DD.

Sound too Loud from Centre Speaker.

Check line 'Centre Volume'. If the value is high, reduce it.

No Sound from Rear Speakers.

1. Check line 'Surround mode'. In case this line is 'Off' or 'Hall', change the surround mode into 3D Surround, ProLogic, Dolby 3 Stereo and DD.
2. Check line 'Rear volume'. If the value is low, raise it. The new value(s) are automatically stored for all TV channels.
3. Check lines 'Rear volume left' and 'Rear volume right'. If the value is low, raise them. The new value(s) are automatically stored for all TV channels.
4. Check if the surround boxes receive sound, the green LED should be on.
5. Check if the correct RF-channel is chosen. Look at the bottom of the active box for the RF-channel of the surround speakers. Check the installed RF-channel in the installation menu. If this RF-channel is different, change it to the correct one.

5.4 ComPair

5.4.1 Introduction

ComPair (Computer Aided Repair) is a service tool for Philips Consumer Electronics products. ComPair is a further development on the European DST (service remote control),

which allows faster and more accurate diagnostics. ComPair has three big advantages:

- ComPair helps you to quickly get an understanding on how to repair the chassis in a short time by guiding you systematically through the repair procedures.
- ComPair allows very detailed diagnostics (on I²C level) and is therefore capable of accurately indicating problem areas. You do not have to know anything about I²C commands yourself because ComPair takes care of this.
- ComPair speeds up the repair time since it can automatically communicate with the chassis (when the microprocessor is working) and all repair information is directly available. When ComPair is installed together with the SearchMan electronic manual of the defective chassis, schematics and PWBs are only a mouse click away.

5.4.2 Specifications

ComPair consists of a Windows based faultfinding program and an interface box between PC and the (defective) product. The ComPair interface box is connected to the PC via a serial or RS232 cable.

In this chassis, the ComPair interface box and the TV communicate via a bi-directional infrared link.

The ComPair faultfinding program is able to determine the problem of the defective television. ComPair can gather diagnostic information in two ways:

- **Automatic** (by communication with the Receiver box): ComPair can automatically read out the contents of the entire error buffer. Diagnosis is done on I²C level. ComPair can access the I²C bus of the Receiver box. ComPair can send and receive I²C commands to the micro controller of the Receiver box. In this way, it is possible for ComPair to communicate (read and write) to devices on the I²C busses of the Receiver box.
- **Manually** (by asking questions to you): Automatic diagnosis is only possible if the micro controller of the Receiver box is working correctly and only to a certain extent. When this is not the case, ComPair will guide you through the faultfinding tree by asking you questions (e.g. *Does the screen give a picture? Click on the correct answer: YES / NO*) and showing you examples (e.g. *Measure test-point 17 and click on the correct oscillogram you see on the oscilloscope*). You can answer by clicking on a link (e.g. text or a waveform picture) that will bring you to the next step in the faultfinding process.

By a combination of automatic diagnostics and an interactive question/answer procedure, ComPair will enable you to find most problems in a fast and effective way.

Beside fault finding, ComPair provides some additional features like:

- Up- or downloading of pre-sets.
- Managing of pre-set lists.
- Emulation of the (European) Dealer Service Tool (DST).
- If both ComPair and SearchMan (Electronic Service Manual) are installed, all the schematics and the PWBs of the set are available by clicking on the appropriate hyperlink. **Example:** *Measure the DC-voltage on capacitor C2568 (Schematic/Panel) at the SSP.*
 - Click on the 'Panel' hyperlink to automatically show the PWB with a highlighted capacitor C2568.
 - Click on the 'Schematic' hyperlink to automatically show the position of the highlighted capacitor.

Stepwise Start Up / Shut Down

Under normal circumstances, a fault in the power supply, or an error during start-up, will switch the television to protection mode. ComPair can take over the initialisation of the television. In this way it is possible to distinguish which part of the start-up routine (hence which circuitry) is causing the problem.

Stepwise start up explanation

This is realised via ComPair and is very helpful when a protection is activated (see also chapter 5.6).

Table 5-1

State	Mode description	Display LEDs	Enabled protections
0	- Low power standby - uP in Standby	Red 'on'	None
1	- High power standby - TV-set in standby	Red 0.5 Hz	None
2	- Supply 'on' - Protections 5V2, 8V6, and DC-PROT activated.	Orange/ Green0.25 Hz	67, 68, and 76
3	- Sound ICs initialised - Protections FBX- and TUNER activated.	Orange/ Green0.5 Hz	+ 77 and 80
4	- EHT startup - No black-current stabilisation - Protections VFB, HFB, LDP, and BC-PROT activated (blanked picture).	Orange/ Green2 Hz	+ 70, 71, 73, and 74
5	- TV operates - Unblanked picture.	Orange/ Green10 Hz	

Stepwise shut down explanation

In the stepwise shutdown mode, state 2 is skipped (it is not possible to de-initialise ICs).

Table 5-2

State	Mode description	Display LEDs(*)	Disabled protections
5	- TV operates - Unblanked picture.	Orange/ Green10 Hz	-
4	- EHT startup - No black-current stabilisation - All protections are enabled.	Orange/ Green2 Hz	-
3	- Sound ICs stay initialised - All protections are 'off'.	Orange/ Green0.5 Hz	74, 73, 71, and 70
1	- High power standby- TV-set in standby	Red 0.5 Hz	80, 77, 76, 68, and 67
0	- Low power standby- uP in Standby	Red 'on'	-

Note (*): When the set is in stepwise mode and, due to stepping-up, a protection is activated; the set will really go into protection (blinking red LED). The set will not leave the stepwise-mode however. By stepping up, the set can be activated again, until state X where the protection was activated. At state (X-1) diagnostic measurements can be performed.

5.4.3 How to Connect

1. First, install the ComPair Browser software on your PC (read the installation instructions carefully).
2. Connect the RS232 interface cable between a free serial (COM) port of your PC and the PC connector (marked with 'PC') of the ComPair interface.
3. Connect the Mains power adapter to the supply connector (marked with 'POWER 9V DC') on the ComPair interface.
4. Switch the ComPair interface 'off'.
5. Switch the Receiver box 'off' (remove the Mains power).

6. Point the ComPair interface to the 'Service send-LED' on the front of the set.
7. Plug the Mains power adapter in a Mains power outlet and switch on the interface. The green and red LEDs light up together. The red LED extinguishes after approximately 1 second, while the green LED remains lit.
8. Start the ComPair program and read the 'introduction' chapter.

Interface Connection

Figure 5-6

Interface Arrangement

Figure 5-7

5.4.4 How to Order

ComPair order codes:

- Starter kit ComPair, SearchMan software, and ComPair interface (excluding transformer): 4822 727 21629
- ComPair interface (excluding transformer): 4822 727 21631
- Starter kit ComPair software (registration version): 4822 727 21634
- Starter kit SearchMan software: 4822 727 21635
- ComPair CD (update): 4822 727 21637
- SearchMan CD (update): 4822 727 21638

5.5 Error Codes

The error code buffer contains all detected errors since the last time the buffer was erased. The buffer is written from left to right. When an error occurs that is not yet in the error code buffer, it is written at the left side and all other errors shift one position to the right.

5.5.1 How to Read the Error Buffer

It is possible to read out the error buffer in several ways:

- **On screen via the SAM.**
In case picture is OK, the error buffer can be read easiest via the SAM. In the main menu of the SAM the last 10 different error codes occurred are displayed. The most recent detected error code is displayed on the left side.
Examples:
 - **003 000 000 000 000**: error code 3 is the last and only detected error.
 - **002 003 000 000 000**: error code 3 was first detected and error code 2 is the last detected (newest) error.
- **On screen via the CSM.**
Same explanation as above.
- **Via ComPair (or DST).**
See ComPair/DST manual.

5.5.2 How to Clear the Error Buffer

Use one of the following methods:

- By activation of the 'RESET ERROR BUFFER' command in the SAM menu:
- When you transmit the commands 'DIAGNOSE' - '99' - 'OK' with ComPair (or with a DST). This works in all modes, except SAM.

Notes:

- When the error buffer is full (10 codes), no new error can be stored anymore. However, of every error raised is monitored how long it exists in the error buffer. When for any reason a false raised error exists in the buffer, it will be deleted after 50 hours. If this error still is actual after 50 hours, it will be raised again. In this way, it is safeguarded that history of error codes is stored.
- Sometimes it is an option to first write down the error buffer content, reset the buffer, and look again which error codes are generated by the set.
- If the content of the error buffer has not changed for 50 hours, it resets automatically.

5.5.3 Error Codes Overview

In case of non-intermittent faults, clear the error buffer before you begin the repair. These to ensure that old error codes are no longer present.

If possible, check the entire contents of the error buffer. In some situations, an error code is only the result of another error code and not the actual cause (e.g., a fault in the protection detection circuitry can also lead to a protection).

Table 5-3

5.6 Protections

5.6.1 Introduction

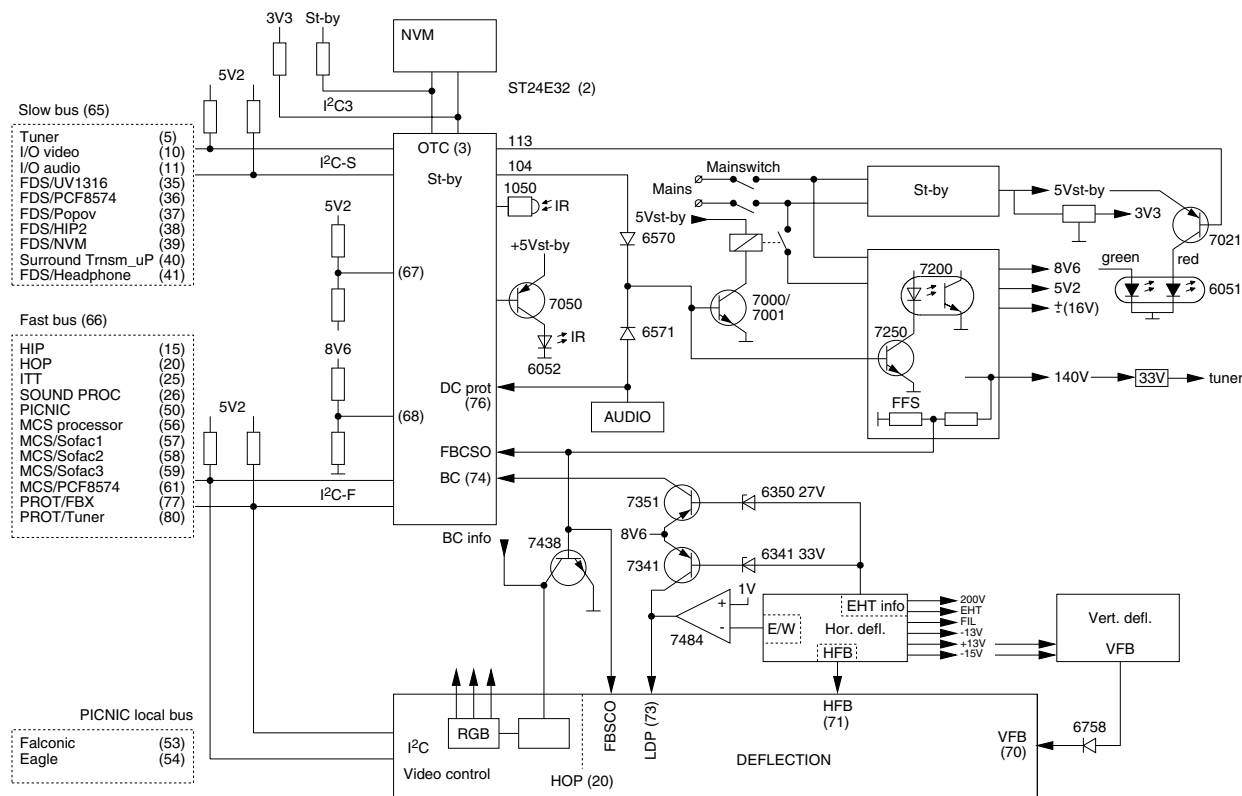

This chassis has only one microprocessor (OTC), which remains active during Standby. This because the power of the microprocessor (and the attached memory chip set) is coming from the 3V3 supply, which is derived from the 5V Standby circuitry.

Therefore, in both 'Power on' as in 'Standby' mode, the microprocessor is connected to this power supply. The

microprocessor controls the Standby line for switching 'on' and 'off' the main supply. In the Standby mode, or in the protection mode, the Standby line will open the contacts of relay 1002 via T7000, which results in switching 'off' the mains input to the main supply. In the mean time, via T7550, the LED-intensity of the opto-coupler will increase, which results in a quick shutdown of the power supply.

If a fault situation is detected, an error code is generated and, if necessary, the set is put in protection mode. This mode is indicated by blinking of the red front LED.

Protection Structure

CL 16532149_074.eps
211201

Figure 5-8

We can divide the protections in four groups:

- Protection from I²C-busses (fast and slow) or I²C-IC errors (device errors).
- Protection from the inputs on the OTC.
- Protection from the status register of the HOP (communicated via I²C-bus).
- DC-protection (from the sound amplifiers) monitored on the OTC.

5.6.2 Protection from the I²C Bus

In normal operation, some registers of the I²C controlled ICs are refreshed every 200 ms. During this sequence, three I²C-busses (and the I²C-ICs as well) are checked.

Possible protections:

- An I²C-bus protection will take place if the SDA and SCL are whether short-circuited to ground or to each other.
- An I²C-device protection can occur, when there is malfunction in communication with one specific device, or if the power supply of the device is missing.
- A FBX- and/or Tuner circuitry protection can occur, when one of these circuits do not respond for more than 1 second (measured via I²C). The set goes in protection mode.

5.6.3 Protection from the Inputs on the OTC

If a protection is detected at an input of the OTC, all protection inputs of the OTC will be scanned every 200 milliseconds for five times. If the protection on one of the inputs is still activated after 1 sec., then the set will be put in the protection-mode. Before the scanning is started, a so-called 'ESD refresh' is carried out. This is done, because the interrupt on one of the inputs might be caused by a Flash or ESD. As both phenomena can harm the settings of some ICs, they are initialised again to ensure the normal picture and sound conditions of the set.

8V6 and 5V2 Protection.

The OTC senses the presence of the 8V6 and 5V2. If the 8V6 and 5V2 is not present, then an error code is stored in the error buffer.

BC (Beam Current) Protection.

A circuit on the SSP measures the beam current. If this current exceeds a certain reference level, the BC-input of the OTC is set to 'high' via D6350 and T7351. The error code is stored in the error buffer and the set is put in protection mode.

DC Protection.

Speaker Protection

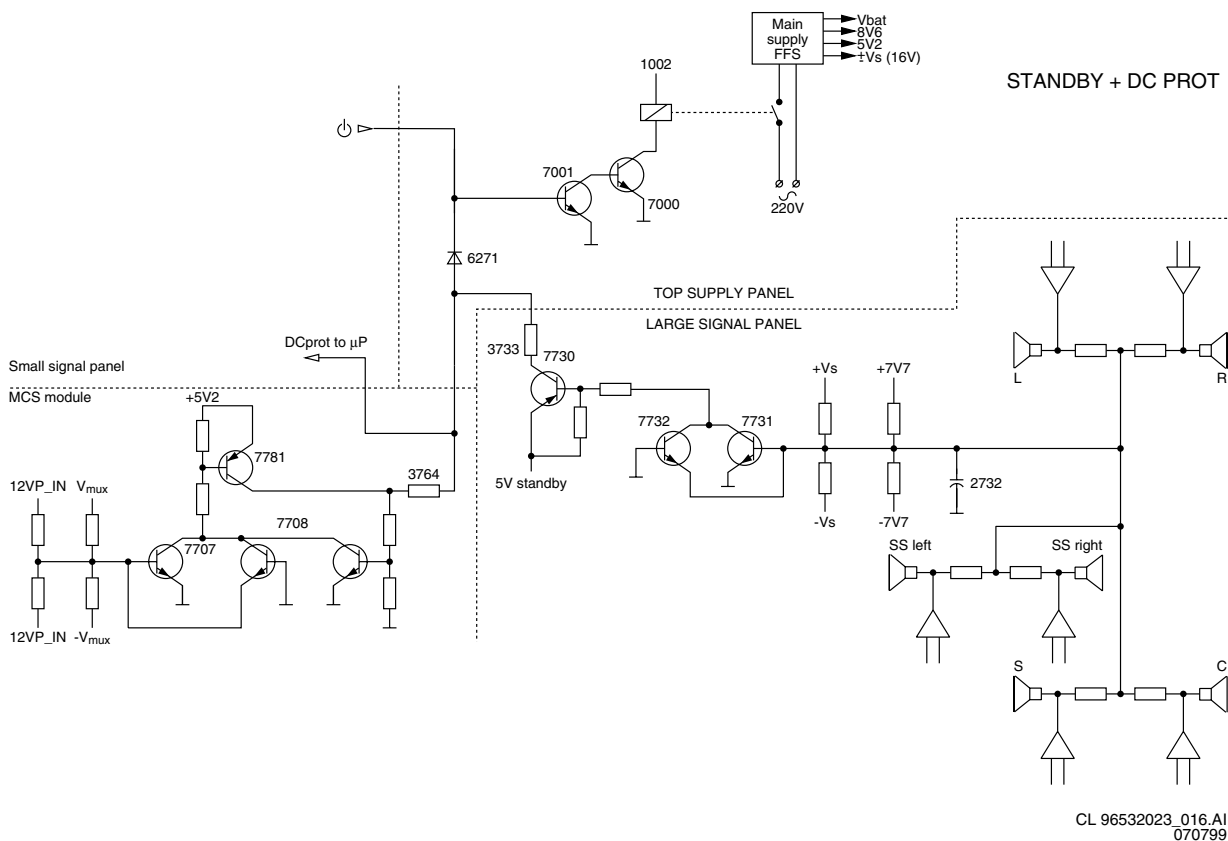

Figure 5-9

This is an important protection, measured by a circuitry on the LSP. The output of the protection circuit will slow down the power supply immediately via the opto-coupler. Then, via relay 1002, the supply is set to Standby-mode at once. To be able to store the error code in the error buffer, the protection signals are also wired to the OTC. The protection is activated in case of:

- Unbalance between +Vs and -Vs.
- Unbalance between +7V7 and -7V7.
- V_{DC} on one of the audio amplifier outputs.
- Unbalance in the supplies of the MCS-module.

5.6.4 Protections from the Status Register of the HOP

Every 200 milliseconds the status register of the HOP is read by the OTC via I²C. If a protection signal is detected on one of the inputs of the HOP, then the relevant error bit in the HOP register is set to 'high'. If the error bit is still 'high' after 1 s., the OTC will store the error code in the error buffer and depending on the relevancy of the error bit the set will either go into the protection-mode or not.

HFB: Horizontal Flyback

HFB Protection

Figure 5-10

If the horizontal flyback is not present, then this is detected via the HOP. One status bit is set to 'high'. The error code is stored in the error buffer and the set will go into the protection mode

VFB: Vertical Flyback

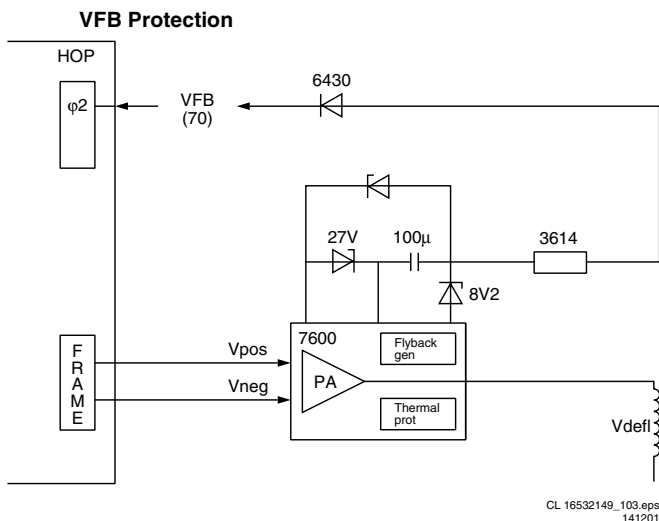

Figure 5-11

The HOP will blank the screen, if the vertical flyback signals are not present at the VFB-guard input. The relevant status bit will be set in the register of the HOP. The error code is stored in the error buffer; in this case, protection is not necessary.

LDP: Line Deflection Protection

LDP Protection

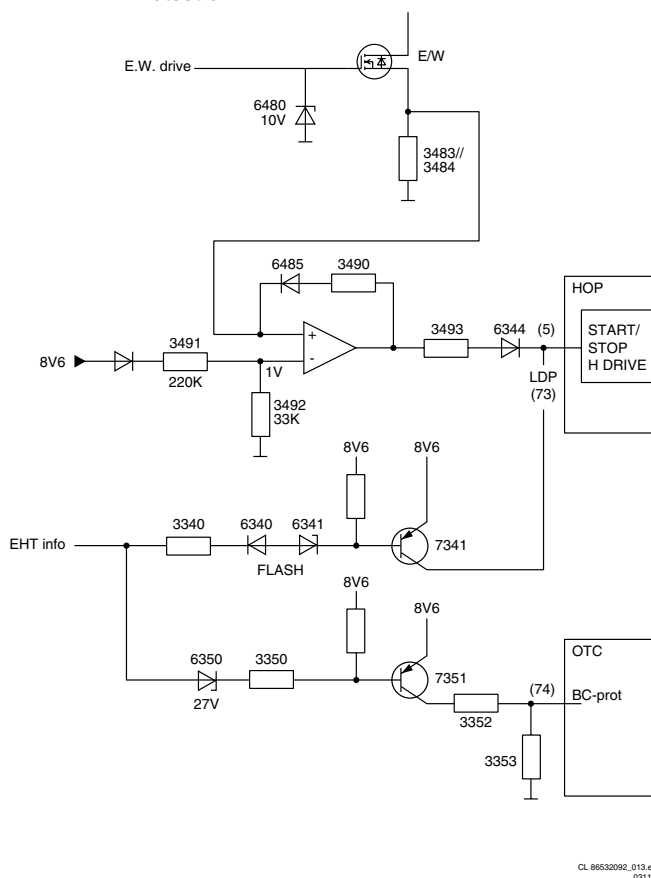

Figure 5-12

Two protection circuits are connected to the LDP-input of the HOP:

- **Flash detection.** From the EHT-info, via D6341 and T7341 a flash will stop the H-drive and line output stage immediately. The FLS-bit in the status register of the HOP is set to 'high'. As the

duration of a flash is very short, the FLS-bit will be reset to 'low' again after the flash refresh, and via a slow start the set will start again.

- **LDP detection.** The EW-protection, coming from the line-output is also connected to the same input as above. The current through the EW-stage is measured by R3483 and R3484 on the LSP. The voltage across these precision resistors will increase in case of a failure at the line output stage. If the voltage becomes higher than 1 V, then the output of IC7484 will become 'high' and remains 'high' via D6485 and R3490. Via D6344 the H-drive will be stopped. The FLS-bit will be set to 'high' and remains 'high' by means of the software filtering even after a flash refresh. The OTC will put the set in Standby-mode. The error code is stored in the error buffer and the set gets into the protection mode.

5.7 Repair/Service Tips

Below, you will find some additional repair/service tips:

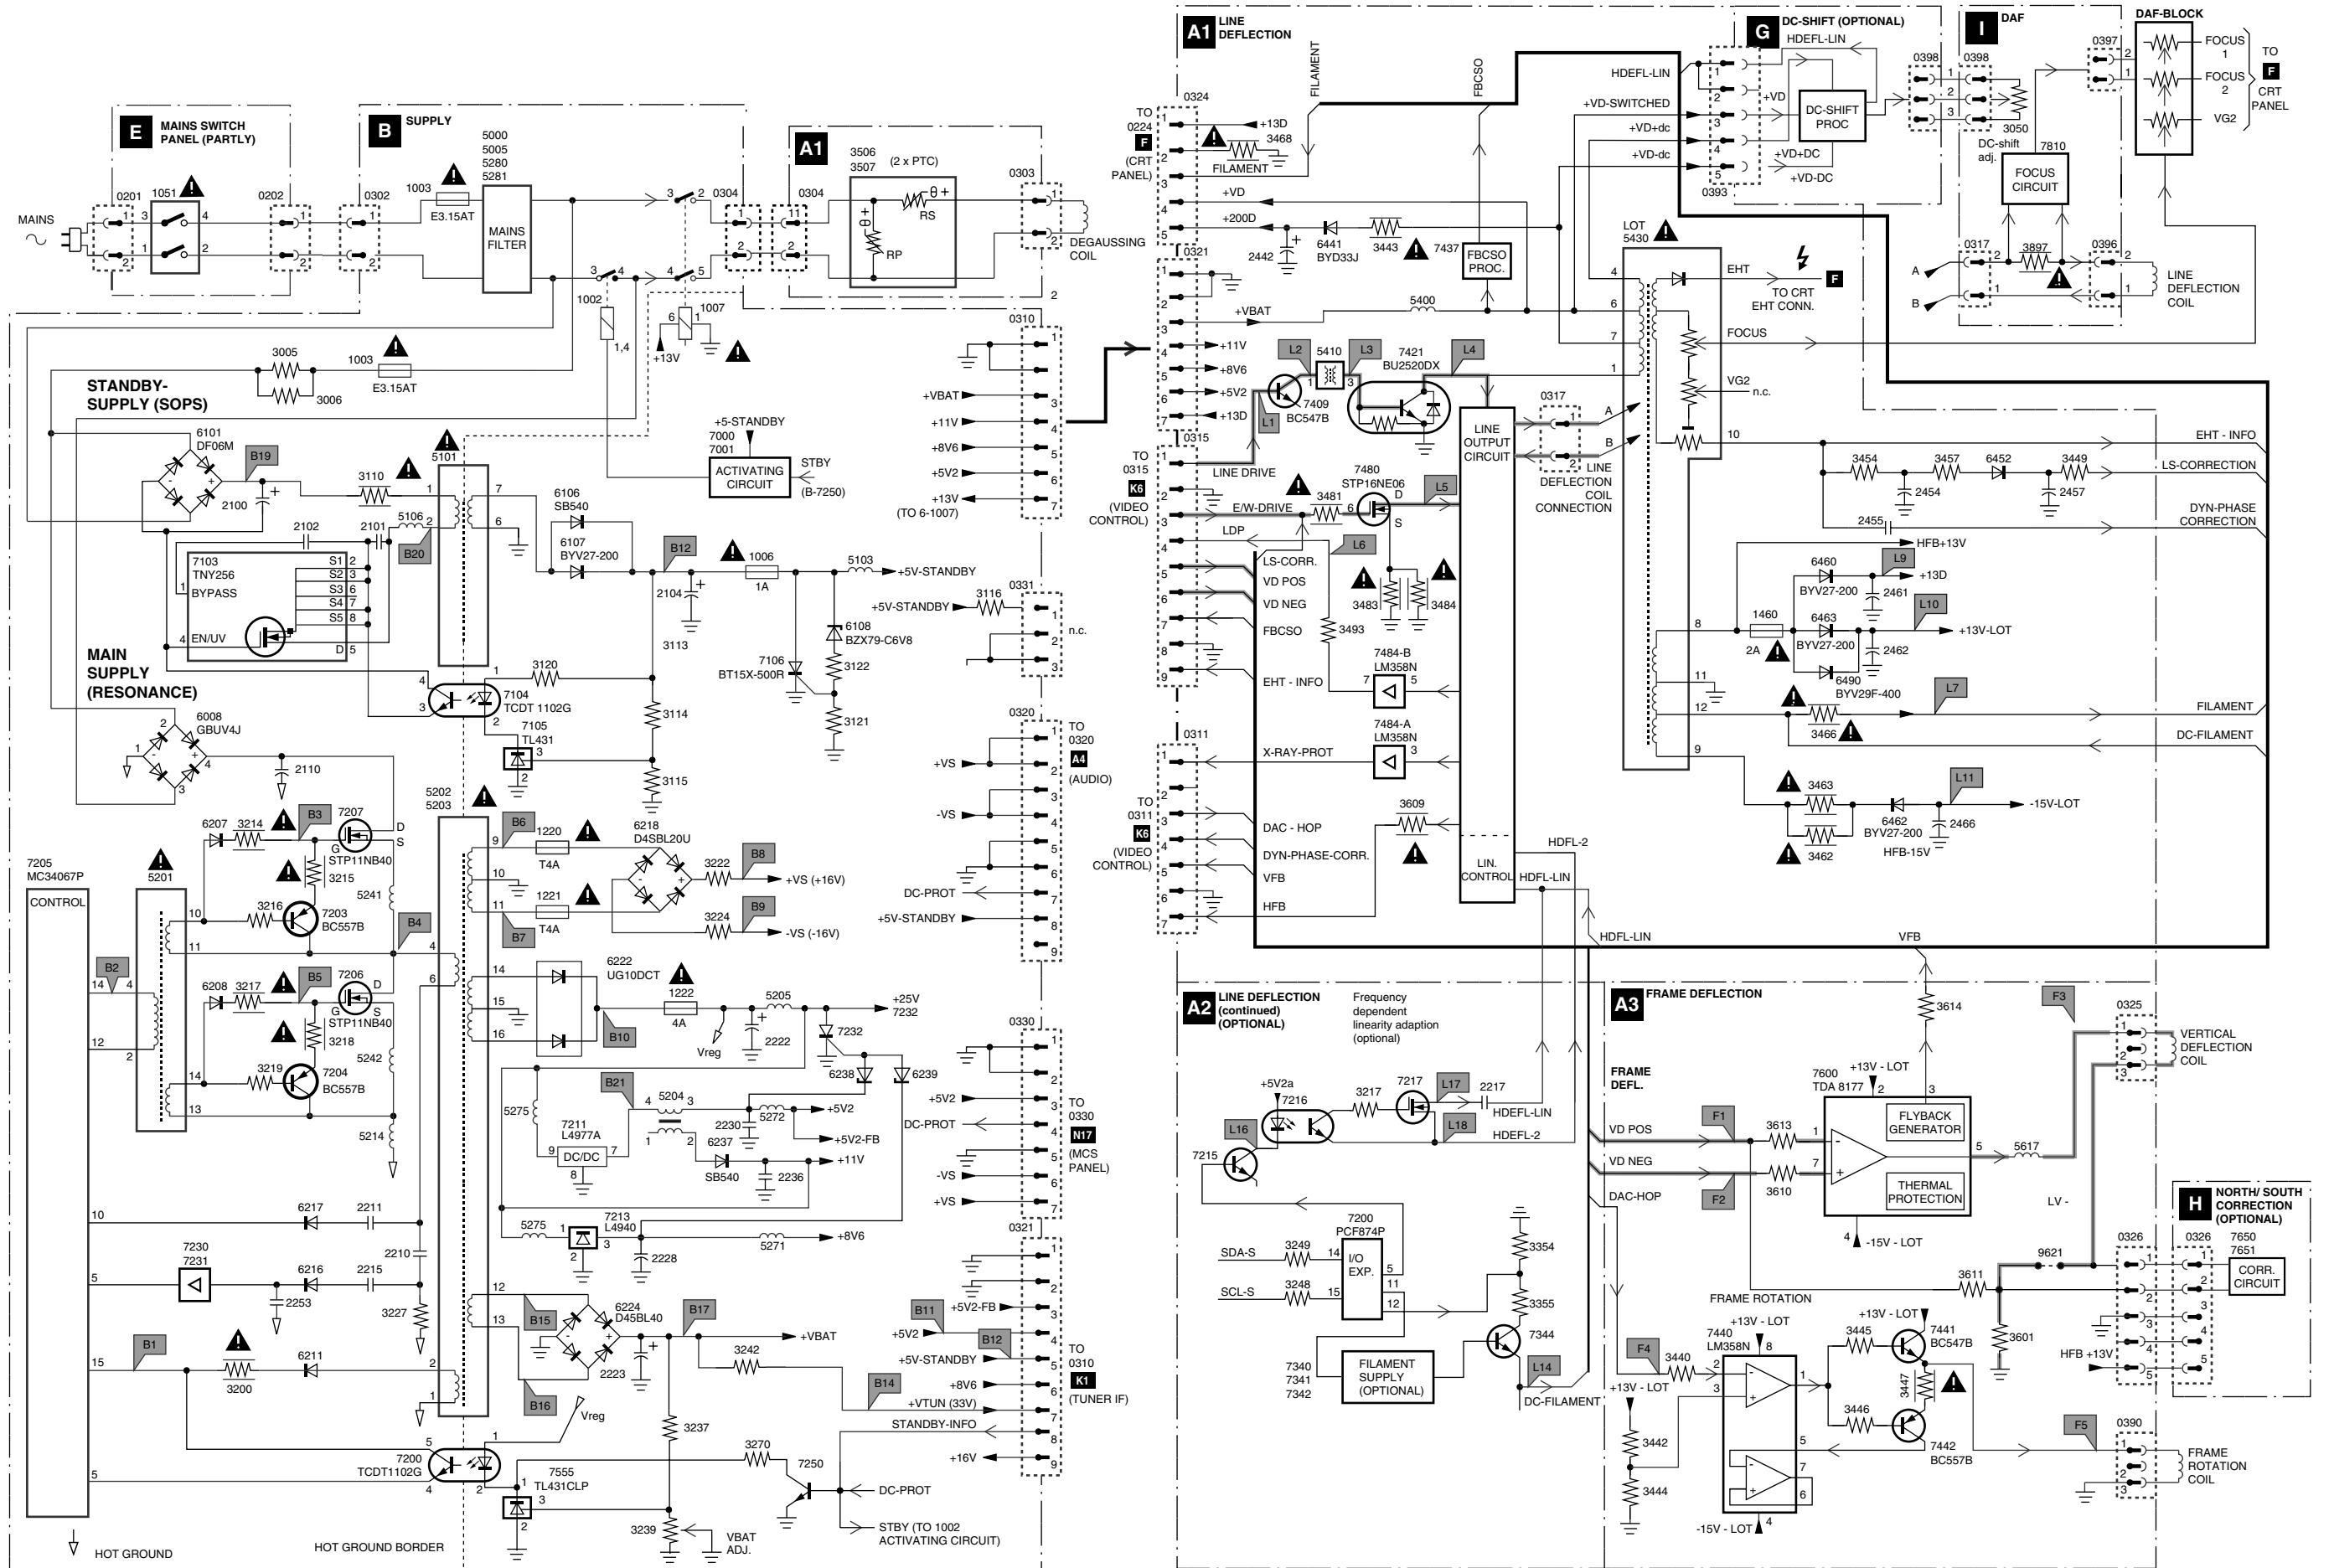

- To have a good **service position of the FDS module**, remove the FBX module. As the set will go in protection now, you have to overrule this. Therefore, go to the Service Default Mode via the HW-entry method (short jumpers on SSP). There will be no picture, but as the signal processing of the FDS-module is done **before** the FBX processing, you can measure the necessary waveforms, and check if the module is functioning.
- To have a good **service position of the FBX module**, remove the FDS module. To keep the set functioning, you have to bypass the YUV-path now: short pins 1-7, 2-8, and 3-9 of connector 0352.
- More **User Service Tips** are described in chapter 3 of this manual (page 34 of the DFU).
- Be aware that when you switch 'off' the TV-set, the active surround speaker is going to standby after about 10 minutes.
- In Pixel Plus mode, the **OSD menus** are a little different in size. This is normal.
- When one wants to **store settings of the FDS module**, first one has to make a hardware intervention (see explanation on diagram M1). This is because of the fact that the local NVM has a write protection that is not controlled by the main microprocessor. Be sure to remove the connection after storing.
- When the set has a **'hazy' focus**, this can be related to a bad focus setting, but can also be related to a malfunctioning of the parabola modulation part of the Auto Scavem circuitry (see diagram SC).
- An easy indication if the **'Pixel Plus' feature is functioning correctly**, is via the 'Pixel Plus Demo Mode'. To activate this, press the 'Pixel Plus' button on the RC-transmitter (see also DFU).
- When **no wireless sound** is possible, or when there is too much interference, you can still enjoy Dolby surround sound by connecting the two rear loudspeakers to the TV with a stereo cinch to stereo 3.5 mm jack cable. This cable can be ordered as service part nr. 3104 311 02251 (10 m. backup cable).

8. Electrical Alignments

Index of this chapter:

1. Introduction.
2. Option settings.
3. Hardware alignments.
4. Software alignments.

Notes: The Service Default Mode (SDM) and Service Alignment Mode (SAM) are described in chapter 5. Menu navigation is done with the 'CURSOR UP, DOWN, LEFT or RIGHT' keys of the remote control transmitter.

8.1 Introduction

8.1.1 Start Conditions

Perform all electrical adjustments under the following conditions:

- Power supply voltage: 230 V_{AC}/50 Hz (± 10 %).
- Connect the set to the mains via an isolation transformer with low internal resistance.
- Allow the set to warm up for approximately 20 minutes.
- Measure the voltages and waveforms in relation to chassis ground (with the exception of the voltages on the primary side of the power supply).
- Caution: never use the cooling fins/plates as ground.
- Test probe: R_i > 10 MΩ, C_i < 20 pF.
- Use an isolated trimmer/screwdriver to perform the alignments.

Perform all electrical adjustments with the following start settings (for all CRTs):

- Set LIGHT SENSOR 'off' (set ACTIVE CONTROL to 'off' with the remote control).
- Set BRIGHTNESS to '23' (via PICTURE menu, set indicator somewhat below the centre (= 32) point).
- Set COLOUR ENHANCEMENT to 'off' (via PICTURE menu).
- **Set DIGITAL OPTIONS to 'Pixel Plus' (via PICTURE menu), unless otherwise stated.**
- Set DYNAMIC CONTRAST to 'off' (via PICTURE menu).
- Set CATHODE DRIVE at '15' (via SAM - Alignments - General - Drive - Cathode).

8.1.2 Adjustment Sequence

Use the following adjustment sequence:

1. Modules, units and PWBs.
2. Set the correct TV-set 'options'.
3. Rough adjustment of 'Vg2' and 'Focus'.
4. Rough adjustment of 'Geometry'.
5. Accurate adjustment of 'Vg2' and 'Focus'.
6. Rough adjustment of 'Geometry'.
7. Software alignments (cut-off, cathode drive, peak white, white drive, etc).

8.1.3 Factory Default Settings

In case something goes wrong during the alignments, use the following **factory default** settings:

- Contrast = 48 (≈ 3/4 of scale).
- Colour = 33 (28"), 32 (32"), or 31 (36").
- Sharpness = 3.
- Colour Enhancement = On.
- Tint = Normal.
- Digital Options = Pixel Plus.
- Dynamic Contrast = Medium.

8.2 Option settings

The microprocessor communicates with a large number of I²C ICs in the set. To ensure good communication and to make digital diagnosis possible, the microprocessor has to know which ICs to address. The presence/absence of these specific ICs (or functions) is made known via the option codes.

You can set the 'hardware related' options via the SAM: 'Alignments - Options' or 'Option Numbers' menu. You can set the 'software related' options via the SAM: 'Dealer Options' menu .

Important:

- After you have changed the option(s), save them via the 'Store' command.
- The new option setting is only active after the TV is switched 'off' and 'on' again via the mains switch (the NVM is then read out again).

8.2.1 Options

Select this sub-menu to set the initialisation codes (= options) of the TV via text menu's.

Table 8-1

Menu-item	Subjects	Options	Physically in the set
Dual screen/PIP	Aux type	None	Dual Screen/PIP module not present.
		Video Dual Screen	Dual Screen module present
		PIP	PIP module present
	Text Dual Screen	Yes	Text Dual Screen present (only for 16:9 sets)
		No	Text Dual Screen not present
	Aux Headph. Sound(optional)	Yes	
	No		
Teletext/EPG	TXT	Yes	Feature enabled
		No	Feature disabled
	NextView present	Yes	Feature enabled
		No	Feature disabled
	NextView type	Flashram	Flash-RAM (IC7013 on SSP) present
No Flashram		Flash-RAM (IC7013 on SSP) not present	
Communication	Easylink Plus	Yes	Feature enabled
		No	Feature disabled
Picture Tube	CRT Type	4:3	4:3 picture tube
		16:9	16:9 picture tube
	CRT size	28 / 32 / 36 / 29 / 34	Screen size in inches
	Picture Rotation(only for 16:9)	Yes	Frame rotation circuitry (IC7440 on LSP) present
		No	Frame rotation circuitry (IC7440 on LSP) not present
	Dynamic focus	Yes	Dynamic focus picture tube present
		No	Dynamic focus picture tube not present
	One point control	Yes	Feature enabled
		No	Feature disabled
Anti-moirE filter	Yes	Not used	
	No	Not used	
Video repro	Featurebox type	Eco	PROZONIC not present
		Prozonic	PROZONIC present
		Falcons	FALCONIC present
		1050i/1250i	Progressive scan mode
		Eagle	Pixel plus mode
	Split Screen	Yes	
		No	
	Field memories	2	
		3	
	Lightsensor	Yes	Feature enabled
		No	Feature disabled
	Combfiler	Yes	Feature enabled
		No	Feature disabled
	Auto scavem	Yes	Feature enabled
		No	Feature disabled
	Picnic AGC	Yes	In 'Normal' operation: Yes
No		During 'Drive' alignments: No	
Signalling bits	Yes	Format recognised	
	No	Format not recognised	
Audio Repro	Dolby	None	
		Pro Logic	
		Digital	MCS panel present
	Rear speakers	Corded	Not valid
		Virtual	Not valid
		Cordless	Active surroundbox present
	Acoustic system	FL7	Not valid
		FL8	Not valid
		FL9 Monitor	Not valid
		FL9 DAS	Not valid
FL11		Soft design with full range speakers at both sides	
Miscellaneous	Heatsink Present	Yes	Heatsink present on CRT panel (diagram F)
		No	Heatsink not present on CRT panel (diagram F)

8.2.2 Option numbers

Select this sub-menu to set all options at once (expressed in two long numbers).

An option number (or 'option byte') represents several options. When you change these numbers directly, you can set all options very fast. All options are controlled via eight option numbers.

Example: Option numbers 32PW9767/12:

1. **05984 12568 03840 00016**
2. **12326 00001 00000 04358**

The first line indicates the hardware related options 1 to 4, the second line is reserved for the software related options. Every 5-digit number represents 16 bits (so maximum number is 65536, if all options are set).

Table 8-2

Option Byte	Bit	Option name	Settings (given in decimal values)		Option number		
Hardware Option 1	0	Feature Box	0 = Eco	1 = PROZONIC	Sum of HW Option 1		
	1		3 = FALCONIC (bit 0+1)	2 = 1050i/1250i			
	2			4 = Eagle			
	3		Comb Filter	0 = Off		8 = On	
	4	Auto Scavem	0 = Off	16 = On			
	5	Field Memory	0 = 2 Memories	32 = 3 Memories			
	6	Light Sensor	0 = Off	64 = On			
	8	PICNIC	0 = Off	256 = On			
	9	PICNIC AGC	0 = Off	512 = On			
	10	FALCONIC	0 = FALCONIC v1	1024 = FALCONIC v2			
	11	LNA	0 = Off	2048 = On			
	12	WSS	0 = Off	4096 = On			
	13	Time Constant	0 = Normal	8192 = Fast			
	Hardware Option 2	1	Dolby ProLogic	0 = Off		2 = On	Sum of HW Option 2
2		Virtual Rear Speakers	0 = Off	4 = On			
3		Cordless Rear Speakers	0 = Off	8 = On			
4		Dolby Digital	0 = Off	16 = On			
8		P50 (Easylink +)	0 = Off	256 = On			
12		EPG	0 = Off	4096 = On			
13		EPG type	0 = Type 2	8192 = Type 2C3			
Hardware Option 3	0	EXT3	0 = Off	1 = On	Sum of HW Option 3		
	1	EXT4	0 = Off	2 = On			
	4	Dual Screen	0 = Off	16 = PIP			
	5			32 = Dual Screen			
	6	TXT/EPG Dual Screen	0 = Off	64 = On			
	7	AUX Headph. Sound	0 = Off	128 = On			
	8	Aspect Ratio	0 = 4:3	256 = 16:9			
	9	Tilt	0 = Off	512 = On			
	10	DAF	0 = Off	1024 = On			
	11	One Point Control	0 = Off	2048 = On			
	12	Heat Sink	0 = Off	4096 = On			
	14	Home Cinema	0 = Off	16384 = On			
	Hardware Option 4	2	China IF	0 = Off		4 = On	Sum of HW Option 4
		4	Teletext	0 = Off		16 = On	
5		China Text	0 = Off	32 = On			
Software Option 1	0	Auto TV	0 = Off	1 = On	Sum of SW Option 1		
	1	Auto Store Mode	0 = None	2 = PDC/VPS			
	2		6 = PDC/VPS/TXT Page	4 = TXT Page			
	4	Picture Mute	0 = Off	16 = On			
	5	Demo Mode	0 = Off	32 = On			
	6	Virgin Mode	0 = Off	64 = On			
	12	TXT Preference	0 = TOP	4096 = FLOF			
	13	TXT Region	0 = East	8192 = West			
Software Option 2	0	CTI	0 = Off	1 = On	Sum of SW Option 2		
Software Option 3					Sum of SW Option 3		
Software Option 4	0	Cabinet		1 = FL7	Sum of SW Option 4		
	1		3 = FL9 DAS (bit 0+1)	2 = FL8			
	2		6 = FL11 (bit 1+2)	4 = FL9 Monitor			
	3						
	8	Picture Tube Size	0 = 28"	256 = 32"			
	9		768 = 29" (bit 8+9)	512 = 36"			
	10			1024 = 34"			
	11						

When all the correct options are set, the sum of the decimal values of each Option Byte (OB) will give the option number.

Note: When the EAROM is replaced, all options will require a re-setting. To be certain that the factory settings are reproduced exactly, you must set both option number lines. You can find the correct option numbers on a CRT sticker inside the TV set.

8.2.3 Dealer Options

Table 8-3

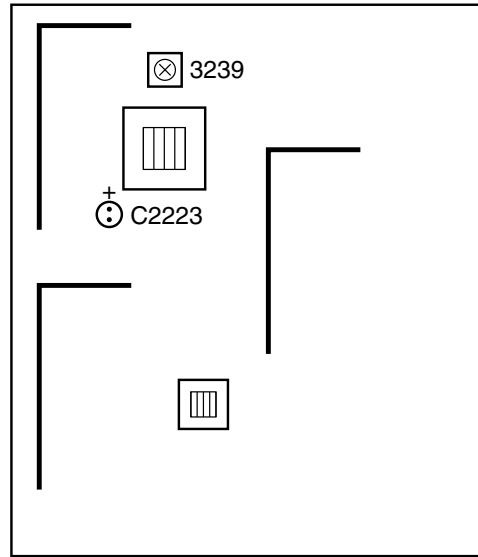

Name	Subjects	Options	Physically in set
Picture	CTI	Yes	CTI enabled
		No	CTI disabled
Personal	Blue Mute	Yes	Blue mute active, in case no picture detected
		No	Noise, in case of no picture detected
	Virgin Mode	Yes	TV starts up once with language selection menu, after mains switch on for the first time (virgin mode)
		No	TV does not starts up once with language selection menu, after mains switch on for the first time (virgin mode)
	Auto Store Mode	None	Autostore mode disabled (not in installation menu)
		PDC-VPS	Autostore mode via ATS (PDC/VPS) enabled
TXT page		Autostore mode via ACI enabled	
PDC-VPS-TXT		Autostore mode via ACI or ATS enabled	
Demo Menu Enable	Yes	Demo menu enable	
	No	Demo menu disable	
Auto TV	Yes	Auto TV mode enabled	
	No	Auto TV mode disabled	
Teletext	TXT Preference	TOP	Preference to TOP Teletext
		FLOF	Preference to FLOF Teletext
	East/West TXT	West	TXT characters for non -/58 sets
		East	TXT characters for -/58 sets

8.3 Hardware Alignments

8.3.1 Alignments on the Top Supply Panel (TSP)

+141 V (V_{BAT}) Supply Voltage

TSP (component side)

CL 16532149_075.eps
061201

Figure 8-1

1. Switch the set 'off'.
2. Connect a voltmeter across C2223 (see also diagram B, + V_{BAT}).
3. Switch the set 'on'.
4. Use potentiometer R3239 (see figure above) to adjust the V_{BAT} supply voltage to $+141 \pm 0.5$ V.

8.3.2 Alignments on the Large Signal Panel (LSP)

For the Focus and Vg2 alignment, see paragraph 8.3.3.

8.3.3 Alignments on the Double Astigmatic Focus (DAF) Panel

DAF Module

CL 06532016_017.eps
030300

Figure 8-2

Vg2 Adjustment

Method 1 (without oscilloscope)

1. Activate the SAM.
2. Select 'Alignments'.

3. Select the 'General' sub-menu.
4. Set 'Vg2 Test Pattern' to 'On'.
5. You will now get OSD feedback during Vg2 alignment.
6. First turn the Vg2 (= SCREEN) potmeter on the DAF-module (or LOT) to the left (see figure above)
7. OSD feedback will show 'Out high'.
8. Turn the Vg2 potmeter slowly clockwise until you read 'In low'. This is the correct value.

Method 2 (with oscilloscope)

Waveform Vg2 alignment

Figure 8-3

In the frame-blanking period of the R, G and B signals (applied to the CRT), the 'HOP' video processor (IC7300) inserts a measuring pulse as reference for the Vg2 adjustment. See figure above.

Measure all three signals, and use the pulse with the highest DC-level for the Vg2 adjustment.

1. Go, via the MENU key, to the PICTURE menu, and set CONTRAST and BRIGHTNESS to '0'
 - Service tip:** First, write down the actual values so you can restore them after the alignment.
2. Activate the SDM (see chapter 5).
3. Connect the RF output of a pattern generator to the antenna input. Test pattern is a 'black' picture (blank screen on CRT without any OSD info) with a carrier frequency of 425.25 MHz.
4. Set the channel of the oscilloscope to 50 V/div and the time base to 0.2 ms. Trigger the scope external via a CVBS signal (e.g. via pin 19 of the SCART1 connection).
5. Ground the scope at the CRT panel ('cold' side) and connect a 10:1 probe to one of the cathodes of the picture tube socket (see diagram F).
6. Measure the 'cut off' pulse during the first full line after the frame blanking (see figure above). You will see two pulses, one being the 'cut off' pulse and the other being the 'white drive' pulse (measure the pulse with the lowest value, this is the cut-off pulse).
7. Measure all three cathodes, and select the one with the highest V_{DC} value for the alignment. Adjust the $V_{CUT\ OFF}$ of this gun with the SCREEN potentiometer on the LOT (see figure 8-5) to the correct value:
 - for 28" CRTs: $160 \pm 3 V_{DC}$.
 - for 32" CRTs: $170 \pm 5 V_{DC}$.
 - for 36" CRTs: $170 \pm 3 V_{DC}$.
8. Restore CONTRAST and BRIGHTNESS to the normal settings (see point 1).

Focus Alignment

Tune the set to a 'circle' or 'crosshatch' test pattern (use an external video pattern generator), and set BRIGHTNESS, COLOUR and SHARPNESS to nominal, and CONTRAST to maximum.

Now there are three set executions:

1. **For picture tubes with potmeters on the DAF module.** Align the focus, by means of the 2 focus potentiometers on the DAF-module (above the LOT, see figure 8.2) until the horizontal and vertical lines at 1/4 from east and west, at the height of the centre line, are of minimum width without introducing a visible haze. First, align the FOCUS1 (green) and then the FOCUS2 (black) potentiometer.

2. **For picture tubes with potmeters in the LOT.** Adjustment is identical.
 3. **For 32" Real Flat picture tubes.** First, align the 'static' focus potmeter (black) until the vertical lines, at the height of the centre line, are of minimum width without introducing a visible haze. Then, align the 'dynamic' focus potmeter (green) until the vertical lines, at the height of the centre line, are of minimum width without introducing a visible haze.
- Repeat steps if necessary.

8.3.4 Alignments on the Small Signal Panel (SSP)

40.4 MHz Neighbour-channel Sound Trap

SSP (component side)

Figure 8-4

1. Tune to a checker board test-pattern (system BG - and with a carrier frequency of 475.25 MHz).
2. Connect an oscilloscope (trigger line frequent) to pin 19 (CVBS out) of the SCART1 connection.
3. Align coil L5103 (on SSP, diagram K1) completely downwards (see figure above).
4. Align the coil upwards till under- and overshoot arise at the black/white and white/black transitions in the video signal (see figure below).
5. Align the coil downwards again until above mentioned under- and overshoot is just disappeared.

Waveform 40.4 MHz Alignment

CL 86532057_006.AI
170798

Figure 8-5

8.3.5 Alignments on the Full Dual Screen (FDS) Panel

These alignments are of interest when ICs, e.g. HIP (IC7501-TDA9320H) or EAROM (IC7991-M24C04), are exchanged on the FDS-module, or if the FDS Tuner (UV1316) has been exchanged.

40.4 MHz Neighbour-Channel Sound Trap

1. Tune the FDS-module to a checker board test-pattern (system BG - and with a carrier frequency of 475.25 MHz). See to it that the main program of the set is tuned to another channel.
2. Connect an oscilloscope (trigger line frequent) to pin 19 (CVBS out) of the SCART2 connection. This output is WYSIWYR (what you see is what you record)
3. Align the coil L5103 (on FDS, just below the tuner) completely downwards.
4. Align the coil upwards till under- and overshoot arise at the black/white and white/black transitions in the video signal (see figure above).
5. Align the coil downwards again till above mentioned under- and overshoot is just disappeared.

IF AFC

See paragraph 'Software Alignments - General - VDS/PIP - IF AFC' below.

Tuner AGC

See paragraph 'Software Alignments - General - VDS/PIP - Tuner AGC' below.

8.3.6 Alignments on the Surround Transmitter Module (diagr. R)

This alignment can only be performed when having mentioned (in alignment instructions) equipment.

Limited repair can be exercised if defective circuit is in the area that no alignment is needed.

If defective part is in circuitry where alignments are necessary, two things can be done:

- Swap panel by a new one.
- If alignment equipment is available, module can be aligned according described alignment-instructions.

Frequency Deviation Level of Transmitter

1. Insert on test points R1 (= F103) and R2 (=F106) a sine wave signal of 400 Hz with a amplitude of $3 V_{RMS}$.
2. Align potmeter 3157 such, that the frequency-deviation is 75 kHz (+/- 5 kHz). This corresponds with a amplitude of 80 mV_{RMS} (230 mV_{PP}) on testpoint R11 (=F112).

8.3.7 Alignments on the Surround Receiver Module (diagram U)

Surround Receiver Component Side

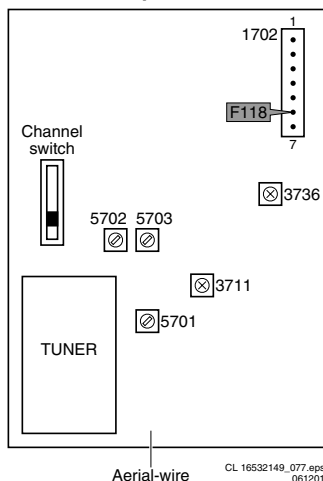

Figure 8-6

This alignment can only be performed when having mentioned (in alignment instructions) equipment.

Limited repair can be exercised if defective circuit is in the area that no alignment is needed.

If defective part is in circuitry where alignments are necessary, two things can be done:

- Swap panel by a new one.
- If alignment equipment is available, module can be aligned according described alignment-instructions.

Note: the aligned components are lacquered, so clean them first.

Alignment of FM-Detection Coil

Use a RF-generator as source: 1 mV, modulation 75 kHz.

1. Dependent of the receiver-version, place receiver on channel 4 (433, 926, or 864 MHz).
2. Align coil 5701 such, that a maximal audio frequency is detected at test point U6 (= F114).
3. Now swap the generator from frequency -150 kHz to +150 kHz, with the same amplitude and modulation.
4. Align 5107 such, that the 'stop' pulse (at F104, cathode of 6701) is symmetrical around 10.7 MHz (low value is < 0.3 V, high value is > 3.5 V).

Alignment of Tuned/Mute Level

Use a RF-generator as source: 3 to 7 μ V, modulation 75 kHz.

1. Dependent of the receiver-version, place receiver on channel 4 (433, 926, or 864 MHz)
2. Align potmeter 3711 such, that mute-level is down at 3 μ V and high at 7 μ V at pin 6 of connector 1702 (=F118).

Alignment of VCO-Demodulator

Use a RF-generator as source: 1 mV, unmodulated.

1. Dependent of the receiver-version, place receiver on channel 4 (433, 926, or 864 MHz).
2. Align potmeter 3736 such, that you measure 100 kHz (+/- 300 Hz) at test point F131 (pin 11 of TDA1578A).

8.4 Software Alignments

Put the set in the SAM mode (see chapter 5). The Service Alignment Menu will now appear on the screen.

Via 'Alignments' the following submenu's can be selected:

1. **General:** all non-geometry related adjustments.
2. **Normal Geometry:** General geometry alignments.
3. **Super Wide Geometry:** Geometry alignments for the 'Panorama' position in 16:9 sets.
4. **Options:** Setting the initialisation codes in the TV via menu's.
5. **Option Numbers:** All options together, expressed in two long numbers. The original factory setting for these numbers can be found on the picture tube sticker on the inside of the set.
6. **Store:** Store all alignments.

Notes:

- **Important:** Once you have completed the alignments/settings, select the item 'Store' (in main Alignment menu) to save all the values in the permanent memory of the set.
- If you changed and stored the Option codes, switch the set 'off' and 'on' with the mains switch. This, to activate the new settings. When switching via Stand-by, the option code settings are NOT read by the microprocessor.
- If an empty EAROM (permanent memory) is detected, all settings are set to pre-programmed default values.
- A built-in test pattern can be called up in some sub-menus. You can activate this pattern via the 'Test pattern on/off' item. The test pattern only appears AFTER the specific alignment is selected. The test patterns are generated by the Teletext-IC (OTC).

The alignments are explained now in the sequence of the sub-menu.

8.4.1 General

Drive*Method 1 (with colour analyser)*

1. Go to the SAM 'Alignments - General - Drive' menu
2. Switch the 'Test pattern' to 'on' (you get a white block in middle of the image now).
3. Set 'Tint' to 'Normal'.
4. First, align the 'Cathode parameter'. This value is dependent of the picture tube size (see table 'Cathode parameter' for the colour-analyser readings).
5. Now, set the white levels for the three Tint-settings 'Normal', 'Warm' and 'Cool'. Align to the next values (see table 'White levels').

Table 8-4

CRT size/type	Light output (cd/m ²)
28" RF WS	390
32" RF WS	370
36" RF WS	330

Table 8-5

	Cool	Normal	Warm
X	280	289	314
Y	287	299	329
Temp. (K)	10200	8700	6500

Method 2 (without colour analyser)

1. Even without having a colour-analyser you can set some parameters. This is the next best solution. These parameters are average values coming from production (statistics).
2. Set 'Tint' to 'Normal'.
3. First, set the 'Cathode parameter' to the value '5'.
4. Now set the R-, G- and B-parameters for the three tint-settings 'Cool', 'Normal' and 'Warm'. See table 'Tint-settings' below for the values.
Note: These values are only for the 32" CRT. At the moment of writing, the information for the 28 and 36" CRTs was not yet available. As soon as they are available, we will publish a 'Service Information'.
5. **Red BL offset:** herewith the Black Level can be aligned very precise. Default value is '7'.
6. **Green BL offset:** herewith the Black Level can be aligned very precise. Default value is '7'.

Table 8-6

32" CRT	δ Cool	Normal	δ Warm
R	-1	40	+ 2
G	0	29	0
B	+ 4	34	- 10

Luminance Delays

With the 'Luminance delays' alignment the luminance information is placed on the chrominance information (brightness is pushed onto the colour). Use a colour bar/grey scale pattern as test signal.

- **Lum. Delay PAL:** Apply a PAL colour bar/grey scale pattern as a test signal. Adjust 'Lum. Delay PAL' until the transients of the colour part and black and white part of the test pattern are at the same position.
- **Lum. Delay SECAM:** Apply a SECAM colour bar/grey scale pattern as a test signal. Adjust 'Lum. Delay SECAM' until the transients of the colour part and black and white part of the test pattern are at the same position.

- **Lum. Delay Bypass:** apply a NTSC colour bar/grey scale pattern as a test signal. Adjust value until the transients of the colour and black & white part of the test area are at the same position.

EHT Compensation

Fixed setting: 0

Soft Clipper

Fixed setting: Pwl + 0%

Luma Gain

Fixed setting: 1

IF AFC

The SAM-mode is needed to make alignment, a test generator to make signal and the Installation-menu to check the 'Fine Tune' value.

Supply, via a video generator (e.g. PM5518), a TV-signal with a signal-strength of at least 1 mV and a frequency of 475.25 MHz. Use BG if possible, otherwise match the system of your generator with the received signal in the set.

Alignment procedure:

1. Go to the 'Installation' menu.
2. Select 'Manual installation'.
3. Tune the TV-set to the system and frequency described above via 'Search - 475 - OK'.
4. If the frequency showed in the line 'Fine tune' is between 475.18 MHz and 475.31 MHz, you don't need to re-adjust the IF-AFC.
5. If not, adjust the frequency in the 'Fine tune' line to 475.25 MHz and 'Store' the program (this is very important because this will disable the AFC algorithm).
6. Now go to the SAM and select 'Alignments - General - IF AFC'.
7. During the 'IF AFC'-parameter adjustment, one can see OSD feedback in the top of the screen. The OSD feedback can give 4 kind of messages:

Table 8-7

AFC-window	AFC-frequency vs. reference
Out	High
In	High
In	Low
Out	Low

The first item ('In' or 'Out') informs you whether you are in or out the AFC-window.

The second item ('High' or 'Low') informs you about whether the AFC-frequency is too high or too low.

1. First you must align the 'IF AFC'-parameter such that you come into the AFC-window (= 'In')
2. Then you must look for the point where the 'IF AFC'-parameter changes from High to Low. This level is the value you are looking for.
3. After adjustment 'Store' the value.
4. Now return to the 'Installation' menu.
5. Select 'Manual Installation - Search - 475 - OK' and 'Store'. This will set the AFC 'on' again.

Service-Tip: If you do not trust the accuracy of the frequency of your Service-generator, first 'measure' with 'Fine tune'-line (manual install-menu) of a good set your video generator.

Tuner AGC

1. Supply a TV-signal, with a frequency of 475.25 MHz and a signal-strength of about 2 mV.
2. Measure the DC-voltage on pin 1 of the Tuner (position 1200). With the 'Tuner AGC'-alignment in the SAM-menu, this voltage can be aligned.

- Alignment is correct when the DC-voltage is just below 3.8 V.

Blend Intensity

Use this alignment when the micro controller or HOP-IC has been replaced.

It aligns the level of transparency of the menu-picture blended into the main-picture.

- Position the BRIGHTNESS-, CONTRAST- and COLOUR setting in the middle position (picture-menu).
- Apply a signal with a 100 % white video-pattern.
- Connect an oscilloscope to pin 7 of connector 0340 of the CRT panel and measure the Red output level.
- Align 'blending intensity'-parameter such, that the blended signal is 65 % of the black-white amplitude. Practically this will be about 1.3 V (blended signal) versus 2 V (full white signal). The parameter is adjustable between 0 and 31.

Adjust Peak White Limiter

Enter for all picture tubes the value '4'.

Vg2 Test Pattern

Here, you can activate the Vg2 Test pattern. See paragraph 'Hardware Alignments' for a description.

VDS/PIP (optional)

With this adjustment, you can set the following parameters (which are stored in the local memory IC7991):

- IF AFC.** This alignment is identical to the one described above.
- Tuner AGC.** See description below:
 - Supply a video signal, with a frequency of 475.25 MHz and a signal-strength of about 2 mV to the set.
 - Measure the DC-voltage on pin 1 of the tuner 1102 (easiest way is to measure on SMD capacitor C2116, just underneath the tuner).
 - Align the voltage via the menu. The alignment is correct when the DC-voltage is just below 3.8 V

8.4.2 Normal Geometry

Note: Use for all geometry alignments an **external** pattern generator with a geometry pattern (e.g. crosshatch).

Geometry Alignments

Figure 8-7

Vertical Slope

This alignment is meant to align the zero crossing of the frame-deflection to the mechanical middle of the picture tube.

- First set the start conditions for 16:9 sets: '**V. S-correction**' value on '0' for the 28" sets, and '9' for the 32" and 36" sets. Position the boundary-stripes of the test pattern on the edges of the picture tube.
- Align '**V. slope**' (during alignment the below-half of the picture is blanked). Match the middle line of the test pattern with the upper edge of this blanking picture. Push the MENU button again, to return to the previous menu.

Service tip: When the set is equipped with a rotation coil, use this menu item to check its correct alignment. If alignment is not correct, go to the INSTALLATION menu, choose SETUP, press OK, and choose PICTURE TILT. With the use of a crosshatch test pattern, align it to a correct horizontal picture.

Vertical Amplitude and Centring

- Use '**V. amplitude**' to align the vertical amplitude so that the entire test pattern is visible.
- Use '**V. shift**' to align the picture vertically in the middle.
- Repeat the '**V. amplitude**' alignment if necessary.

Vertical S-correction

Align '**V. S-correction**' such that a block at the top of the picture has the same height as a block in the middle of the picture.

Horizontal amplitude and centring

- Use '**H. amplitude**' to align the horizontal amplitude so that the entire test pattern is visible.
- Use '**H. shift**' to align the picture horizontally in the middle.
- Repeat the '**H. amplitude**' alignment if necessary.

Note: If you cannot compensate the drift in the horizontal shift, go to the next subject 'DC-shift'.

DC-shift

In case the horizontal linearity in wide-screen mode is out of tolerance, add a 'DC-shift correction' panel (3104 328 00641) to connector 0393 on the LSP (see figure below).

Caution: Be sure to switch 'off' the set first. On this DC-shift panel, cut position 9031 for correction to the right or cut position 9030 for correction to the left.

Caution: never plug in a not pre-aligned module in a set !!!

DC-shift Connector

CL 16532149_078.eps
201201

Figure 8-8

In 32" and 36" sets, an **adjustable** DC-shift feature is always present. This is located on the DAF panel (potentiometer 3050). How to align:

1. Increase BRIGHTNESS to '45' (3/4 of scale).
2. Set DC-shift potmeter (item 3050 on DAF module) at midway. Maybe it is necessary to unhook the DAF module first, in order to access this potmeter (see chapter 4).
3. Apply a circle as test pattern.
4. Enter the SAM, choose ALIGNMENTS, and NORMAL GEOMETRY.
5. Write down the H. AMPLITUDE value.
6. Reduce H. AMPLITUDE until overscan and grey zones at the left and right are well visible.
7. Adjust H. SHIFT until picture is positioned symmetrically in the grey zone.
8. Recall the H. AMPLITUDE value.
9. Turn potmeter 3050 on the DAF module, until the picture edges are just visible.
10. Store the new value for H. SHIFT into the NVM (via the main Alignment menu).

East/west alignment

1. Use '**East/West Parabola**' to align the vertical lines until straight.
2. Use '**Upper East/West corner**' to align the vertical lines in the upper corners until straight.
3. Use '**Lower East/West corner**' to align the vertical lines in the lower corners until straight.
4. Use '**East/West Trapezium**' to align for a rectangular.
5. Use '**Horizontal Parallelogram**' to align for straight vertical lines if necessary.
6. Use '**Horizontal Bow**' to correct the E/W parabola such that it becomes symmetrical.

Repeat steps 1 to 6 if necessary.

8.4.3 Super wide geometry

You only need to set the following values (if the normal geometry alignment has been performed correctly):

- **V. shift:** enter here the value of the 'normal geometry' alignment.
- **V. amplitude:** adjust image such that the outer vertical lines are just visible.
- **V. S-Correction:** enter here the value of the 'normal geometry' alignment.
- **H. amplitude:** enter here the value of the 'normal geometry' alignment subtracted by 2.
- **E/W Parabola:** enter here the value of the 'normal geometry' alignment.

8.4.4 100Hz Geometry

As all alignments are done in Pixel Plus mode @ 75 Hz, the 100 Hz mode needs an extra alignment:

- Select '**100Hz Geometry**'. The set automatically switches to 100 Hz mode.
- **V. slope:** Match the middle line of the test pattern with the upper edge of this blanking picture. Push the MENU button again, to return to the previous menu.
- After the alignment, return to the previous menu. The set automatically returns to 'Pixel Plus' mode.

9. Circuit Descriptions, Abbreviation List and Data Sheets

7. Abbreviation List
8. IC Data Sheets

Note:

- Only **new** circuits (compared to the MG3.1E) are described. For the other circuit descriptions, see the training manual of the MG3.1E. This manual is available in different languages:
 - 3122 785 10007 = English (GB)
 - 3122 785 10008 = Dutch (NL)
 - 3122 785 10009 = German (D)
 - 3122 785 10011 = French (F)
 - 3122 785 10012 = Italian (I)
 - 3122 785 10013 = Spanish (E)
- Figures can deviate slightly from the actual situation, due to different set executions.
- For a good understanding of the following circuit descriptions, please use the diagrams in chapter 6 and 7. Where necessary, you will find a separate drawing for clarification.

9.1 Introduction

In the MG3.2E, a high-resolution mode is introduced, in order to obtain a sharper picture. This feature is called 'Pixel Plus'. It includes the following changes:

- A new 'Feature Box version 7' (FBX7), which contains the 'Eagle' IC. This IC is responsible for the definition improvement.
- With 'Pixel Plus', the pixels in horizontal direction are doubled.
- The number of vertical lines per picture is increased to 833, which improves the vertical definition.
- The frame deflection works on 75 Hz (which is the best compromise without introducing flicker).
- The signal bandwidth from FBX7 to picture tube is increased, in order to be able to cope with these high definition signals.
- A new Scavem circuit is necessary for the higher definition. This Scavem is dependent of the used picture tube and the picture content, and is controlled by the AutoTV algorithm. That is why it is called 'Auto Scavem'.

In addition, the Top Power Supply is adapted, so it can deliver more power.

In the 'Digital Options' menu, you now have three options:

- Digital Scan (100 Hz)
- Pixel Plus (75 Hz)
- Double Lines (50 Hz).

In all modes, the line frequency is 31250 Hz. Pixel Plus is the preferred mode. That is why the optimal geometry of this chassis is set for 75 Hz.

Standard OSD is developed for 625 lines. Therefore, in 833 lines mode, this will give smaller fonts and a different screen position. To solve this, larger fonts are used.

In 'TXT' and 'TXT Double Window' mode, the set is switched to 'Natural Motion'. For subtitles 'Pixel Plus' is used, this will result however in somewhat smaller fonts. In 'Full Double Window' mode, the set is in 'Pixel Plus' mode.

9.2 Power Supply (Diagram B)

There are two important changes on the Top Supply Panel (TSP):

The mains harmonic coil (item 5280) is now mounted directly on the supply board, i.s.o. using an external 'Mains Harmonic' unit.

The 8V6 and 5V2 supplies have to deliver more power. This is accomplished in the following way. The existing DC/DC converter MC34167 was not able to deliver a higher output current and had a rather high working temperature. Therefore, it is replaced by another type, the L4977A (item IC7211). This IC uses the same working principle, but has a higher maximum output current, and works at a lower temperature. However, it needs a higher supply voltage of 24 V_{DC} (i.s.o. 16 V_{DC}). This higher supply voltage is achieved by changing transformer T5202. The output voltage of the converter is determined by the value of R3230 and 3231. A disadvantage of the new DC/DC converter is that it needs more external components, and therefore needs more space. This extra space is found by changing the Standby Supply circuitry. This change involves the replacement of items TS7100 to 7103 by a single TNY256 IC (pos. 7103). This IC generates drive-pulses for transformer T5101. The maximum frequency is 132 kHz at full load, and decreases with smaller loads. The working principle of this IC is called 'cycle skipping'. It implies that the IC supplies a pulse train, to which cycles are removed or added, hereby changing the output frequency. One disadvantage of using this IC is the increased chance of introducing picture spook. Therefore, capacitors 2101 and 2106 are added, to minimise this effect. Regulation of the 5 V Standby voltage happens as before (via opto-coupler 7104). If this feedback circuit is interrupted, the IC starts to work in an open loop configuration, and the output voltage will rise rapidly to 12 V. To prevent this, an Over Voltage Protection (OVP) circuit is added (thyristor T106 and zener 6108). If the 5 V Standby voltage exceeds the zener voltage (6.8 V), the thyristor is triggered, and will limit the output voltage.

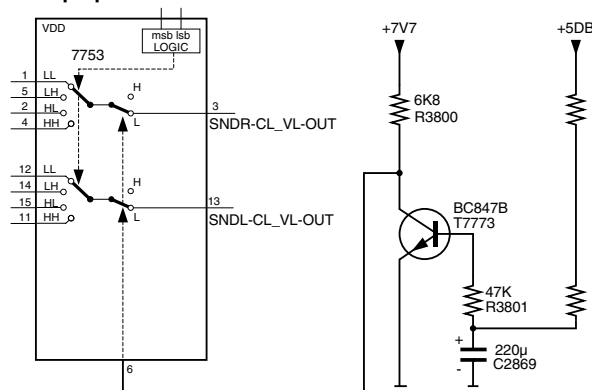

9.3 Video Path

9.3.1 Power Supply Tuner (Diagram K1)

The power supply of the Tuner is now controlled with a voltage stabiliser (item IC7113). This is done, to assure a more accurate power supply to the tuner.

9.3.2 Anti-Plop Circuit (Diagram K3)

Anti-plop

CL 16532149_079.eps
131201

Figure 9-1

As capacitor C2869 is not charged at power start-up, transistor TS7773 will block and pin 6 of audio switch IC7753 is 'high'. This means that the sound is muted. After charge-up, TS7773 will conduct and the audio signals are passed.

9.3.3 RGB Path (Diagram F)

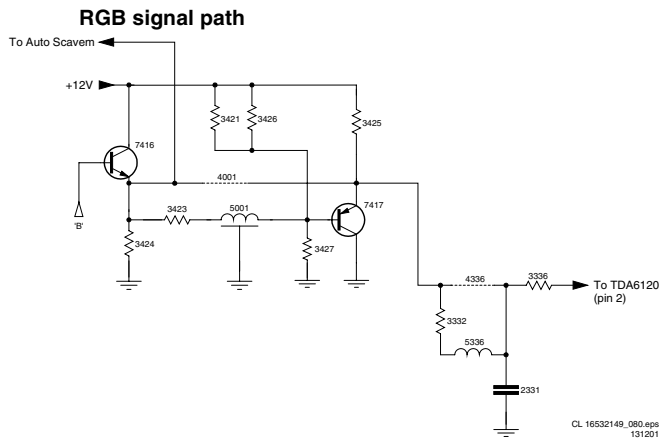

Figure 9-2

The RGB signals from the HOP are fed to three identical amplifiers (TDA6120). We take one of them (B, item 7330) as example for the description. After emitter follower TS7416, the signal is tapped for the Auto Scavem circuitry, and is fed to TS7417. This emitter follower sends the signal, with the same DC-voltage, to the amplifier. In order to cope with the higher definition, this IC has a larger bandwidth (20 MHz) as the one used in the MG3.1E.

9.4 Feature Box 7 (Diagram L)

The objective for this chassis is was, to reach a sharper picture by means of a higher definition. This is achieved via the so-called 'Pixel Plus' feature. So, what is Pixel Plus?

9.4.1 Introduction

In the Feature Box 7 (FBX7), a new IC is used, called the 'Eagle'. This IC does the following picture improvements:

- Horizontal: increases from 840 to 1680 pixels per line (the number of pixels is doubled per line). This, by itself, does not mean an improvement in definition however. To achieve that, the new pixels are digitally processed inside the Eagle with Luminance Transient Improvement (LTI) and Peaking. This will give the new pixels extra picture information, which results in steeper slopes and contrast improvement at details.
- Vertical: increases from 625 lines (PAL) to 833 lines. Also, those new lines are processed inside the Eagle with LTI and Peaking, again resulting in lines with extra picture information.
- The line frequency is fixed on 31250 Hz and the frame frequency at 75 Hz (this will give no frame-flicker). Also, other modes, like 'Digital Scan' are still possible.
- The colour enhancement features of the TOPIC are done by the Eagle.

9.4.2 Block diagram

FBX7

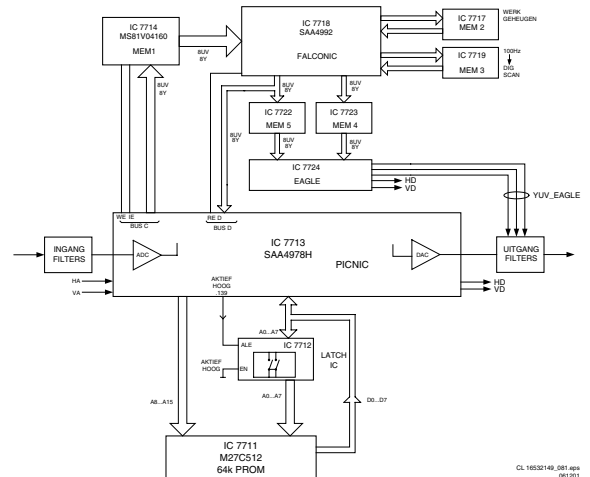

Figure 9-3

The 50 Hz YUV signals, coming from the HIP, are fed to the PICNIC via an anti-aliasing filter.

The (AABB) frame frequency doubling is done by the PICNIC (SAA4978, 160 pins QFP) together with a field memory (MEM1). This IC can handle most 100 Hz functions (except Progressive Scan).

This PICNIC has an internal CPU and a (small) integrated ROM. The actual FBX7 software is located in an external ROM (item 7711). In order to limit the number of connections between the PICNIC and the external ROM, a number of lines are used twice. The lines A8 to A15 are fixed lines, while the lines A0 to A7 are made switchable with the eight data lines of the ROM. This is done via a Latch (item 7712), which is controlled by pin 139 of the PICNIC (the ALE signal). Via bus 'C', a digitalised signal is presented to MEM1, which is used for the 50 to 100 Hz conversion. The signal goes further via the data-bus to the FALCONIC. This IC has the following functions:

- Line flicker reduction.
- Digital Noise Reduction (DNR).
- Progressive scan (262.5 - 525 or 312.5 - 625 lines per frame).

At the end, the digital YUV signals enter, via MEM4 and MEM5, the Eagle IC.

This IC has the following functions:

- Luminance Transient Improvement (LTI).
- Peaking.
- Programmable number of lines.
- Programmable number of pixels per line.
- Demo mode (split screen).
- Improved colour transients (CTI) and colour enhancement (TOPIC).
- Improved vertical zoom.

The digital YUV-signals from the Eagle go, via a passive output filter, to the HOP.

As only the Eagle IC is new, it is described below in more detail. For a detailed description of the other ICs, please check the training manual of the MG3.1E.

9.4.3 Eagle (Diagram L2)

Introduction

Some strong picture improvements are carried out inside the Eagle, which all contribute to the excellent picture quality. These improvements are:

- LTI (both horizontal and vertical).
- CTI (only horizontal).

- Peaking (both horizontal and vertical).
- More pixels per line.
- More lines per frame.
- Better colour transitions.

By means of over sampling, the video signals get a sample frequency of 64 MHz, a bandwidth of 20 MHz, and 1680 pixels per line (was 32 MHz, 10 MHz and 840 pixels/line). This requires two extra field memories (MEM4 and MEM5).

The Eagle can handle four different modes:

- **Digital Natural Motion (PAL):**
100 Hz, 2fH, 2:1 Interlace (1680 pixels x 625 lines)
- **Pixel Plus (PAL):**
75 Hz, 2fH, 2:1 Interlace (1680 pixels x 833 lines)
- **Double Lines (PAL):**
50 Hz, 2fH, 2:1 Interlace (1680 pixels x 1250 lines)
- **Pixel Plus (NTSC):**
60 Hz, 2fH, 2:1 Interlace (1680 pixels x 1050 lines)

LTI (Luminance Transient Improvement)

The main objective of LTI is a steeper slope at contrast transitions (e.g. from 10 mV to 900 mV within 3 pixels i.s.o. 5 pixels for one detail). It is based on waveform altering around a signal jump.

Important: The LTI, as used in the Eagle, is designed for interpolated picture contents. This means that for pixel/line doubling, one of the two pixels/lines is an interpolated value. When a picture jump is interpolated, you will get extra room to make it steeper (you get extra pixels to describe the slope).

Without interpolation, you cannot use this kind of LTI.

- LTI can add 'ears' to the waveform at the jump (a kind of controlled overshoot).
- LTI 'estimates' the frequency of the jump and will adapt the amplification to this frequency.
- LTI is applied both horizontal as vertical.
- LTI is amplitude dependent. This means that only 'big' jumps are processed. It works with a threshold, which is coupled to the noise meter via the Auto TV software.
- LTI is also frequency dependent. This means that it is distributed over the slopes. When there are many steep slopes in the signal, LTI will only process the steepest ones. If there are only a few slopes, LTI will process all of them. This is fully hardware implemented.

Horizontal LTI

Figure 9-4

For horizontal LTI, the number of pixels is doubled (64 MHz) by means of interpolation. Pixel A at the transition will keep its luminance value, while the (new) pixels B can have a luminance value of zero to max. 31. For example:

- Pixels B can keep the same value (gain = 0)
- Pixels B can get the value of C and C' (gain = 8), which will give a steeper slope.
- Pixels B can also get the value of D and D' (gain = 31), which will give an even steeper slope with the so-called 'ears'. These 'ears' will give a **contrast** improvement.

For CTI, the same principle is used, in order to get better **colour** transitions.

Vertical LTI

Figure 9-5

The principle for vertical LTI is the same as for horizontal LTI. The shift from 625 to 833 lines is done by means of a scaler. With these extra interpolated samples, it is possible to create steeper slopes, possibly with 'ears'.

Peaking/Coring

The objective of 'peaking' is contrast improvement (e.g. from 50 to 70 mV_{PP} for one detail).

It uses a noise threshold (coring = non-linear filtering around zero-level), thus it works everywhere in the picture (except below the threshold level).

The added difference signal is frequency dependent, which results in frequency dependent contrast improvement. When the difference signal becomes too large, the peaking is reduced (smartness).

Peaking

Figure 9-6

To obtain above shown filter characteristic, filters are set at three parameters (A, B, and C). In this way, only the higher frequencies are 'lifted'. After sending the luminance signal through these filters, the filter output is added to the original signal. In this way, the so-called 'ears' are created, together with the steeper slopes. These 'ears' will give a **contrast** improvement at details.

Both horizontal and vertical peaking is **amplitude dependent**: the higher the signal jump, the lower the peaking. This is done to avoid that high jumps get big 'ears', because this will introduce nasty contouring. To avoid peaking on noise levels, coring is used. The coring threshold is set via the Auto TV software, by means of the noise meter.

Therefore, the result is that **only details** are processed by the peaking.

The horizontal peaking is also **frequency dependent**: it is possible to perform peaking around three frequencies (when combined, it is even possible to peak at variable frequencies). In Auto TV, this feature is software coupled to the sharpness meter, in order to get the most optimal filter characteristic. The vertical peaking works on a fixed frequency.

Colour Enhancements

In the FBX6 (as used in the MG3.1E), the TOPIC handled the colour enhancement features, such as: 'skin tone correction', 'blue stretch', and 'green enhancement'. In the new FBX7, all this is done by the Eagle IC.

Power Supply and POR

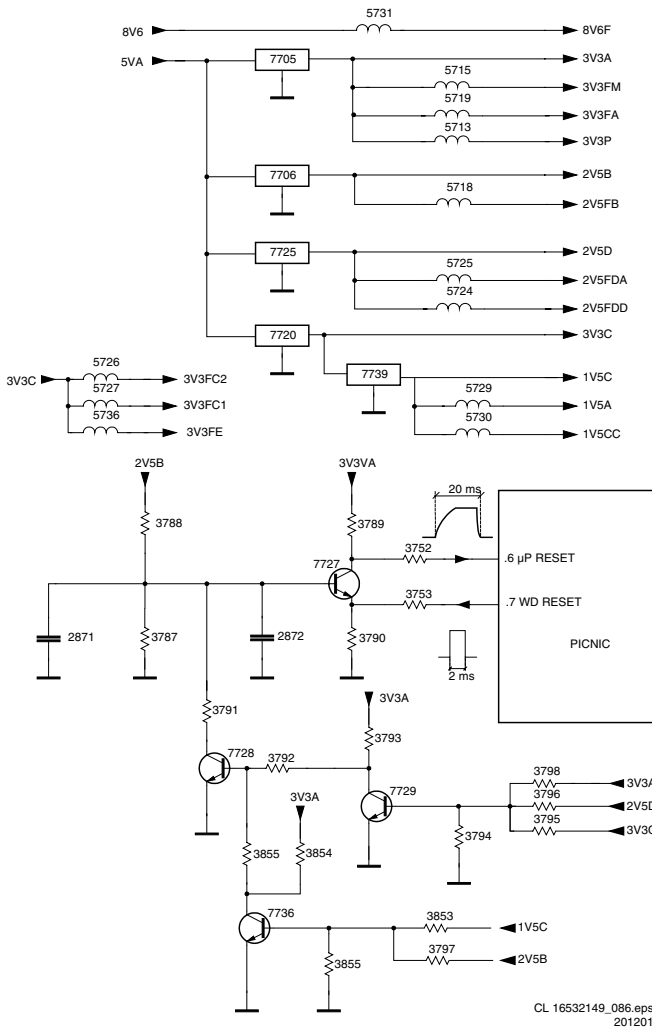

Figure 9-7

Besides the two incoming voltages 8V6 and 5V2, also five voltage stabilisers are used to derive the necessary voltages. This is done for power consumption reasons.

Via a reset circuit (TS7727) a reset pulse (POR) of 20 ms is generated for the μ P inside the PICNIC and for the ROM. After 'power on', the 3V3 is built up (derived from the 5V2). Transistor TS7727 blocks and pin 6 of the PICNIC will follow the rising slope of the power supply. As soon as the power supply is stabilised, capacitor C2872 will charge (via R3788). When this voltage reaches 0.6 V (after 20 ms), TS7727 starts to conduct, and the voltage at pin 6 goes low again. The μ P is reset now. If the PICNIC cannot communicate with the ROM, the 'watchdog' will generate a reset pulse (on pin 7), which will re-start the cycle again.

If one of the power supplies is absent (or too low), then a safety problem can occur in some cases (e.g. a too high temperature of the stabiliser). To prevent this from happening, the voltage dividers at the bases of the transistors TS7729 and TS7736, are calculated such that they will block when above described situations occurs. In this case, the base of TS7727 is kept 'low' by the conducting TS7728, until the problem is solved. The μ P receives no POR pulse, and cannot be reset.

Output

The YUV signals presented to the HOP come from the Eagle. These three signals have all the same circuitry so it is explained once (for Y).

YUV Output Filter

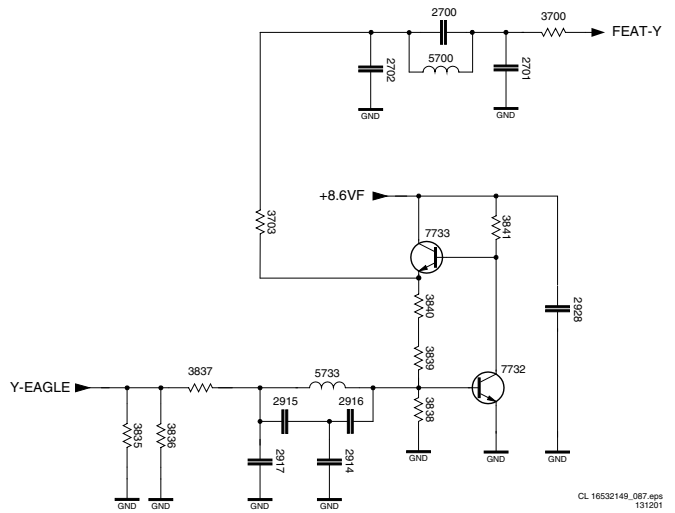

Figure 9-8

The YUV signals are first filtered by a 64 MHz passive filter (L5733 and C2914-2917). Because the output signals from the Eagle are too small to drive the HOP directly, they are amplified by the circuit around TS7732 and TS7733. The gain is determined by R3839, R3840, and R3837. For the Y-signal the gain is 2, for the U-signal it is 1.33, and for the V-signal it is 1.05.

9.5 Auto Scavem

9.5.1 Introduction

To improve the sharpness, the Scan Velocity Modulation (Scavem) circuit modulates the deflection speed as a function of the picture contents. This feature uses a separate Scavem deflection coil.

Auto Scavem is introduced, to be able to display the high definition signal from the FBX7. As the Scavem circuit is now controlled by the Auto TV software, it is called Auto Scavem. The circuit, with the Scavem amplifier, is located on a separate PWB (in front of the SSP), and is connected to the picture tube panel.

9.5.2 Normal Scavem

Block diagram

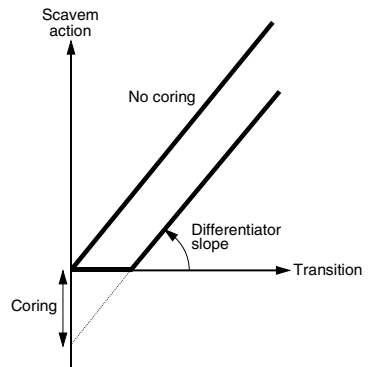

Figure 9-9

With normal Scavem (as used in the MG3.1E), the RGB signals are added together and differentiated before they drive the Scavem coil. The coring block prevents that Scavem processing is done on low signal levels.

9.5.3 Auto Scavem (Diagram SC)

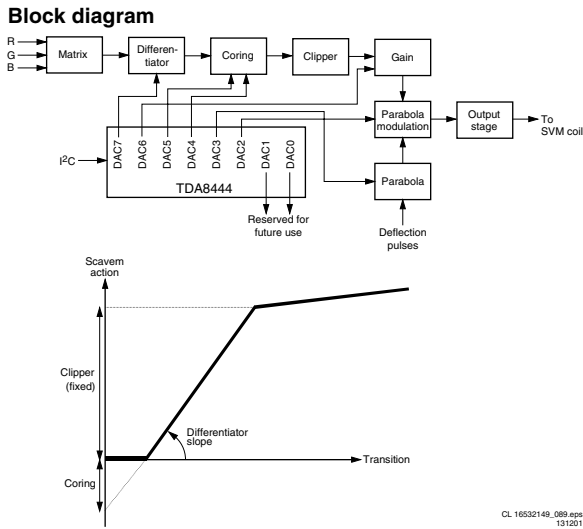

Figure 9-10

This new Auto Scavem circuit include some extra blocks:

- Clipper
- Parabola modulation

Auto Scavem is fully software controlled, by means of I²C. The speed, at which Auto Scavem is adapted, is controlled by the Auto TV algorithm. This adaptation takes place together with the FBX initialisation, and takes about 1 second. The different circuit stages are controlled via a DAC (item 7500, TDA8444). The new Auto Scavem circuitry also produces higher Scavem currents, which results in sharper pictures. For the circuit description, we splitted the circuit in eight stages.

Matrix and Differentiator

Stage 1 and 2

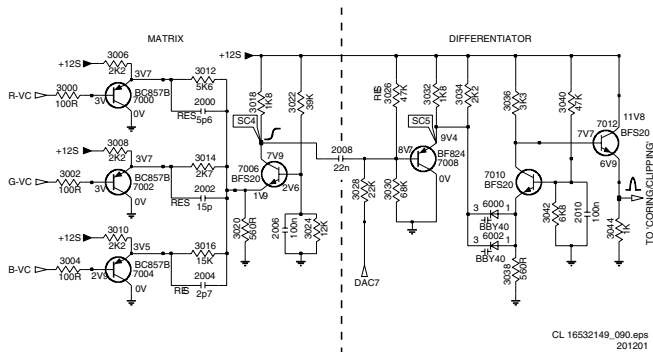

Figure 9-11

The RGB signals are added via transistors 7000, 7002 and 7004, on the emitter of transistor 7006. This is done via resistors 3012, 3014, and 3016, which have a different 'weight' factor. This, to regain the luminance signal.

The next circuit is the differentiator. The combined signal enters this circuit at the base of transistor 7008. The DC-level of this transistor is controlled by the DAC7 line, which is dependent of the 'sharpness meter' reading in the Auto TV algorithm. By means of this control signal, the voltage and capacity of varicap diode 6000 is altered, which will adapt the differentiator.

The slope of the differentiator is controlled by this DC-level. The differentiation itself is done by varicap diode 6000. Output signal goes from the collector of transistor 7010 via emitter follower (= buffer) 7012, to the next stage.

Coring/Clipping and Gain

Stage 3 and 4

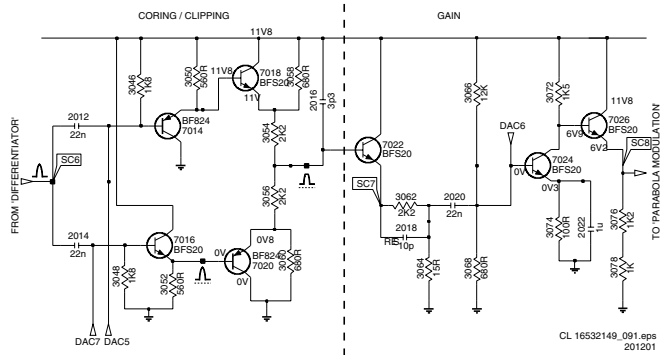

Figure 9-12

The coring circuit (items 7014 and 7016) prevent Auto Scavem on the lowest signal levels (= noise), while the clipper circuit (items 7018 and 7020) always give the same amount of Scavem above a certain level.

The levels at which this must happen, are controlled by the DAC4 and DAC5 lines, and are dependent of the 'noise meter' reading in the Auto TV program.

The input signal enters this circuit at emitter follower 7022, and is strongly attenuated via voltage divider R3062 and R3064. This, because the gain of transistor 7024 is set with the adjustable voltage divider of R3066, R3068 and R3070. The level at which this happen, is controlled by the DAC6 line, and is dependent of the 'sharpness meter' reading in the Auto TV program, the picture tube size, and the sharpness setting by the customer.

Parabola Generation

Stage 5

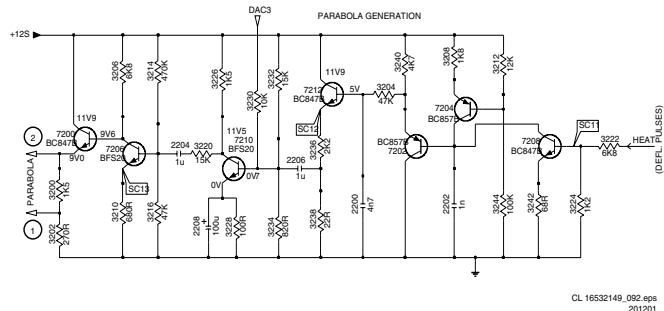

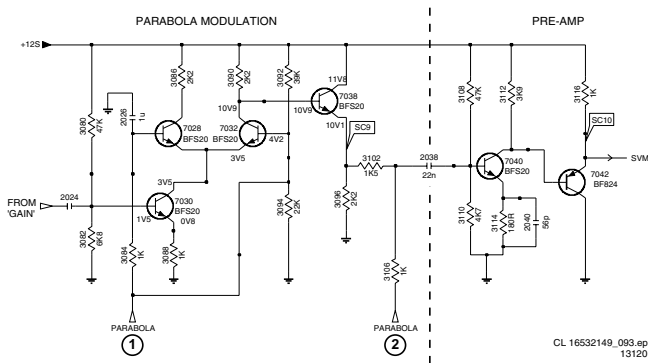

Figure 9-13

In addition, the Scavem signal is modulated with a parabola. This is necessary, because the picture tube is less sensitive for Scavem in the centre as on both sides.

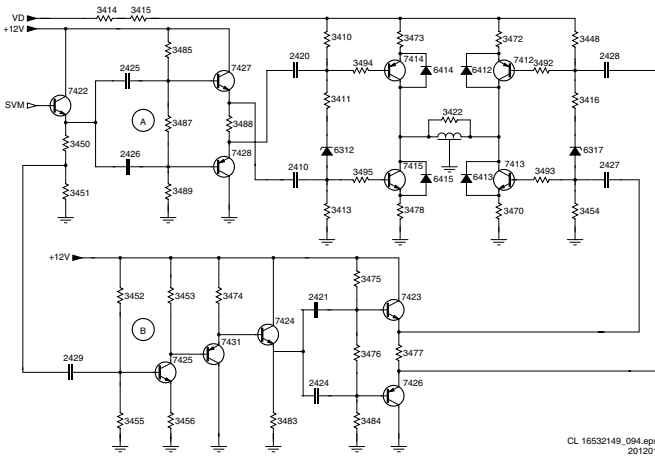

On the CRT-panel, the 'heater' pulses are used to create a parabola on line frequency. This parabola is made with transistors 7204 and 7206. The DC-level of these transistors is controlled via the DAC3 line. In this way, you can control the parabola via software. The level is dependent of the 'sharpness meter' reading in the Auto TV program, the picture tube size, and the sharpness setting by the customer.

Parabola Modulation and Pre-amplifier**Stage 6 and 7****Figure 9-14**

The Scavem signal enters at the base of transistor 7030. Transistors 7028 and 7032 are complementary. Normally, the same current goes through both components, but because on one of them (7028) the parabola signal is offered, the Scavem signal is now modulated and inverted.

After buffer 7038, the parabola signal is again added to the (now inverted) signal, so that only the modulated signal is available on the input of the pre-amplifier (items 7040 and 7042).

Pre-amplification is done via a voltage amplifier (7040) and an emitter follower (7042).

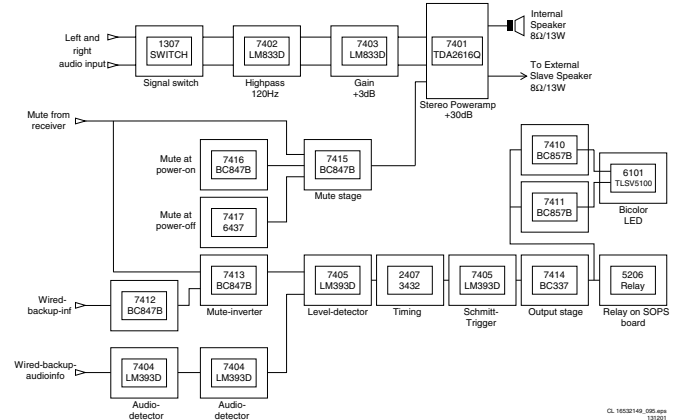

Final Amplifier (Diagram F)**Stage 8****Figure 9-15**

Finally, the Auto Scavem signal arrives, via emitter follower 7422, at stage [A] on the CRT panel. Transistors 7427 and 7428, together with power transistors 7414 and 7415, form the power amplifier, which can deliver the high Scavem currents. From the emitter of 7422, a signal is taken for stage [B]. This signal is **inverted** by transistor 7425 and buffered by 7431 and 7424. The next stage is identical to that of stage [A]. At a positive alteration of the Scavem signal, transistors 7427 and 7415 in stage [A] will conduct, while 7428 and 7414 are blocked. In stage 'B', the positive pulse is inverted, so transistors 7426 and 7412 will conduct, while both 7423 and 7413 are blocked. The Scavem current will flow now, via transistor 7412, through the Scavem coil and then through 7415.

During negative alterations, the current will flow through transistor 7414, the Scavem coil, and transistor 7413.

9.6 Wireless Surround Amplifier (Diagram W)

This module is also used in the MG3.1E, but the circuit was not described yet.

9.6.1 Block Diagram**Wireless Surround Amplifier****Figure 9-16****9.6.2 Amplifier (Diagram W1)**

The used amplifier, TDA2616Q, is a stereo power amplifier with voltage gain of 30 dB. This power amp can deliver 2 x 12.5 W into 8 Ω load. Here the amplifier is used with a symmetrical power supply, therefore no output capacitors are necessary. To avoid oscillations, a so-called 'Boucherot network' (R3453-C2433, and R3452-C2434) is placed on both outputs.

The amplifier is powered by a symmetrical power supply. Main components are: the mains transformer, diodes 6407-6418, and capacitors 2404-2405. The measured output voltage varies between: +/- 14.5 and 19 V_{DC}. This depends of the delivered output power in both speakers (at nominal mains voltage).

IC7402 and all passive components around this part, form a high pass filter (-3 dB/120 Hz). This filter is implemented because the used box and speaker are not intended to reproduce low frequencies. A pre-amp, IC7403, gives an additional 3 dB gain to give the whole system the correct sensitivity.

The pre-amplifier and filter-part, work on a symmetrical power supply +/- 9 V_{DC}. These voltages are derived from the main supply with zenerdiodes 6401-6402, resistors 3401-3404, and capacitors 2402-2403

Mute

To ensure 'plop' free operation, some additional circuits are required. The power amp can be muted in three different ways by transistor 7415:

- **At 'power on'**. The circuit around 7416 gives a delayed at start-up, to allow the power supplies to become stable.
- **At 'power down'**. In normal operation, transistor 7417 is 'on', 7415 is 'off', and amplifier 7401 is enabled. At power down, the transistor 7417 is fast switched 'off', 7415 is 'on', and the amplifier is muted before the power supplies become instable. Diode 6437 gives an additional mute when the relay switches off.
- **Mute from the receiver**. When there are perturbations and interferences during the transmission, the mute output line of the receiver (connector 1401 - pin 1) becomes 'high' (4 V_{DC}), and turns 'on' transistor 7415. This will mute the output amplifier.

Timing

When the transmission of AC3 surround signals is ended (e.g. television 'off'), the mute line from the receiver becomes 'high' and mutes the amplifier via TS7415. At the same moment, the output of 7405 becomes 'low'. Now, capacitor 2407 starts discharging into R3432. When the voltage on the positive input of the comparator becomes lower than the voltage on the negative input, the output of the comparator turns from 'high' to 'low' and the relay is switched 'off' by 7414. The established time is 11 until 15 minutes (RC-time R3432/C2407). If the mute line turns 'low' during this discharge period, the capacitor 2407 is charged again and the complete timing is reset.

Wired Backup

When there is no possibility to use the **wireless** link (due to perturbations or interferences), it is possible to use a 'wired' backup solution. On the rear of the box is a backup input. By plugging in a cable with 3.5 mm stereo jack (order under nr. 3104 311 02251), the power supply for the receiver is interrupted. The audio signal enters the amplifier now via this backup input. An audio detector (7404) is added on the amplifier board, to obtain the same functionality when we use the wired backup.

The level detector (7405) is then triggered by the output of the audio detector, i.s.o. the mute line coming from the receiver.

LED control

TS7410 and 7411 control the red or green part of a bicolour LED, according to the voltage on the collector of TS7414.

9.6.3 Power Supply (Diagram W2)

The box can operate in two different modes: 'standby' and 'active' mode.

- In the standby mode all power is delivered by a so-called standby SOPS. This is a self-oscillating power supply, which can deliver 12 V_{DC} for the receiver board and the timing circuitry. The delivered current in the standby mode is rather low, mainly because the receiver board has a 'sleep' period of 3 seconds, and a 'listen' period of 0.2 s.
- In active mode (relay 'on'), the main transformer bypasses the standby supply, and all the needed power is now delivered by this transformer (via diodes 6405-6406 and capacitor 2401). This is done to reduce dissipation in standby mode.

SOPS standby supply: a stable output voltage of 12 V_{DC} is obtained by use of a low-drop voltage regulator L4940V12. The feedback is formed with components R3201, 3204, 3205, 3206, and an optocoupler.

At primary side, there is a rectifier part that produces 350 V_{DC} (items 6206 and 2207). The SOPS is formed by the FET 7207, transformer 5204, current-limiter 7206, 6205, and 6210, a control circuit (7204, 7205, and 6207) and an optocoupler (7203). The whole system works always in 'burst' mode. When a higher current is necessary, the burst period becomes larger, and the burst-repeat frequency increases. The SOPS can operate on mains voltages between 90 and 264V_{AC}. When the output voltage rises above 20 V_{DC}, (e.g. caused by a fault in the feedback system of the SOPS), the circuit around thyristor 6211 short-circuits the SOPS output. This gives a reliable protection for the whole circuit.

9.7 Abbreviation List

16:9-ARFRONT	16:9 aspect ratio input from side I/O
50Hz/60Hz	50Hz/60Hz mains frequency
6-CHANNEL DAC	6- Channel DAC
ADC	Analogue to Digital Converter
AFC	Automatic Frequency Control
AGC	Automatic Gain Control
AM/FM	Amplitude Modulation/Frequency Modulation
AM-SOUND	Amplitude modulated sound signal
AUDIO_C	Audio Centre
AUDIO_L	Audio Left
AUDIO_R	Audio Right
AUDIO_SL	Audio Surround Left
AUDIO_SW	Audio Subwoofer
AUDIO-L-PROC	Audio Left Processed
AUDIO-R-PROC	Audio Right Processed
AUDIO-SR	Audio Surround Right
AUX-SUPPLY	Auxiliary supply
BC-PROT	Beam Current Protection
BG	System B and G
BLC-INFO	Black Current Information
B-SC1-IN	Blue SCART1 in
B-SC2-IN	Blue SCART2 in
B-TXT	Blue teletext
B-vc	Blue from video-controller
C	Centre
C/16/9	Chrominance input
C-7-OUT	Chrominance on pin 7 SCART (variant)
CENTER	Centre speaker
C-FRONT	Chrominance front input
CL_DS_L	Constant Level Dual Screen Left
CL_DS_R	Constant Level Dual Screen Right
CL_L	Constant Level Left
CL_L_OUT	Constant Level Left out
CL_R	Constant Level Right
CL-R-OUT	Constant Level Right out
CODEC	Coding/Decoding
COMP	Comander ON/OFF
ComPair	Computer aided rePair
CORDL_L	Cordless Left
CORDL_R	Cordless Right
CORE TOP LEVEL	Core Top Level
CRT	Cathode ray tube
CSM	Customer Service Mode
C-UI	Chrominance UI
CVBS	Composite Video Blanking and Synchronisation
CVBS_Y-UI	CVBS Y UI
CVBS-PIP-DS	CVBS Picture In Picture dual Screen
CVBS-SC1-IN	CVBS SCART1 in

SDA-S	Data line of the I2C-bus slow	STEREO	Stereo
SDM	Service Default Mode	SUBCAR	Sub Carrier
SECAM	Sequence Couleur Avec Memoire. Colour system mainly used in France and East Europe. Colour carriers are 4.406250 MHz and 4.250000 MHz	SUB-H	Horizontal Sync Sub-TV-Program (via FDS)
SEL_SOFAC_0	Selection-signal for SOFAC 0	SUB-V	Vertical Sync Sub-TV-Program (via FDS)
SEL_SOFAC_1	Selection-signal for SOFAC 1	SUBWOOFER	Subwoofer speaker
SEL_TO-MCS_LR	Selection switch MCS Left Right	SURROUND-LEFT	Surround Left
SELECT TO EXT2	Selection of Extern 2 input	SURROUND-RIGHT	Surround Right
SELECT_TO_CORDL_1	Selection signal for Cordless 1	SW	Subwoofer
SELECT_TO_MCS_CINCH_0	Selection signal for MCS Cinch 0	SYNC-SELECT	Synchronisation selection
SELECT_TO_MCS_CINCH_1	Selection signal for MCS Cinch 1	TOPIC	The Outmost Picture Improvement IC
SELECT-AUDIO CINCH1	Selection of audio via cinch input 1	TRIG	Triggering
SELECT-AUDIO-CINCH2	Selection of audio via cinch input 2	TUNED	Tuned-flag coming from the IF-IC TDA1597
SELECT-AUDIO-LR	Selection of Audio Left and Right	UB-DEC	U-input for FDS
SELECT-TO_CORDL_0	Selection signal for Cordless 0	U-DEC	U-dec (input signal for PICNIC)
SERVICE-DEFAULT	Service pin to activate SDM	U-DS-1FH	U Dual Screen 1 x Horizontal Frequency
SERVICE-MODE	Service pin to activate SAM	U-DS-2FH	U Dual Sound 2 x Horizontal Frequency
SIF	Sound Intermediate Frequency	U-DS-OUT	U Dual Screen out
SIFM	Sound Intermediate Frequency Mono	UF-DEC	U-MAIN input POPOV IC

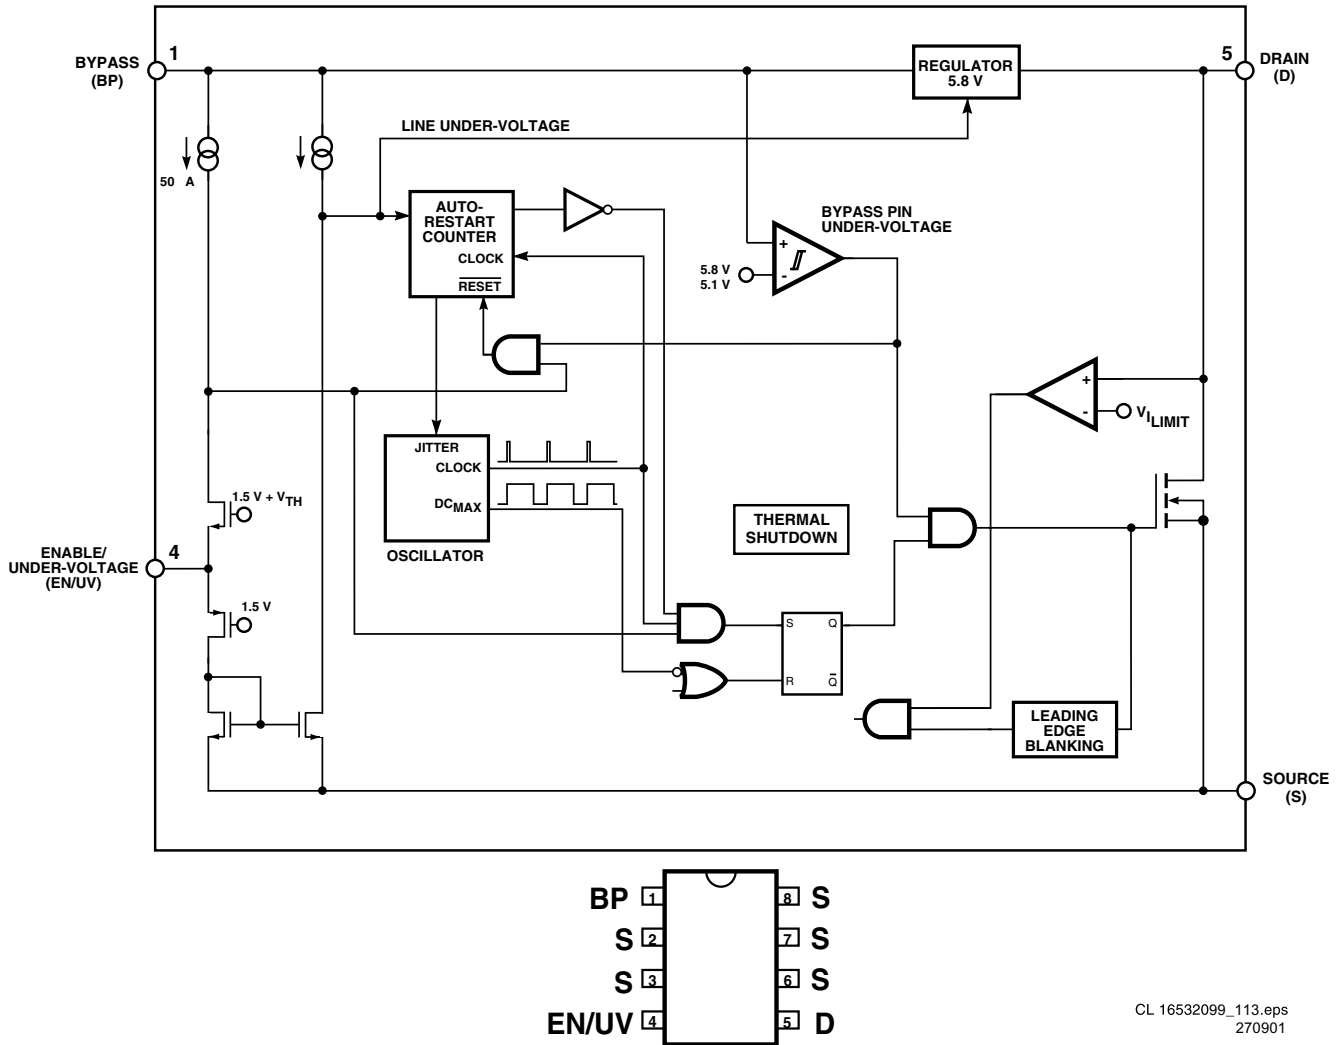

U-FEAT	U-feature-box (output signal from PICNIC)	YF-SUB	Y-SUB input POPOV IC
UF-SUB	U-SUB input POPOV IC	Y-OUT	Luminance-signal to HOP-IC
UI	Universal Interface	Y-SUB	Y-output of HIP-IC on FDS
U-OUT	U-signal to HOP IC	YUV	Component video
U-SUB	U-output of HIP-IC on FDS	YUV-SELECT-2FH	YUV selection 2 x Horizontal Frequency
VA	Vertical Acquisition	uP	Micro Processor
VA1	Vertical Sync (diversity)		
VB-DEC	V input for FDS		
VD	Vertical Drive coming from PICNIC		
VD-D	Vertical sync to FDS		
V-DEC	V-dec (input signal for PICNIC)		
VDEFL-1	Vertical deflection connection 1		
VDEFL-2	Vertical deflection connection 2		
VDNEG	Negative vertical drive signal		
VDPOS	Positive vertical drive signal		
+VD-switched	Only for VGA sets (VD switched i.s.o. V_bat).		
V-DS-1FH	V Dual Screen 1 x Horizontal Frequency		
V-DS-2FH	V Dual Screen 2 x Horizontal Frequency		
V-DS-OUT	V Dual Screen out		
VFB	Vertical Flyback Pulse		
VF-DEC	V-MAIN input POPOV IC		
V-FEAT	V-Feature box (output signal from PICNIC)		
VF-SUB	V-SUB input POPOV IC		
VGA-B	VGA Blue		
VGA-FBL	VGA Fast-blanking		
VGA-G	VGA Green		
VGA-R	VGA Red		
VL_L	Variable level Left		
VL_R	Variable level Right		
VL_SL	Variable level Surround Left		
VL_SR	Variable level Surround Right		
VL_SW	Variable Level Sub-Woofer		
VL_SW_DBE	Variable Level Subwoofer Dynamic Bass Enhancement		
VLL_C	Variable level Centre		
V-OUT	V-signal to HOP-IC		
VOUT_C	V-out Centre		
VOUT_L	V-out Left		
VOUT_R	V-out Right		
VOUT_SL	V-out Surround Left		
VOUT_SR	V-out Surround Right		
VOUT-SW	V-out Subwoofer		
VREG	Opto-coupler feedback signal		
VS-DS	Main, vertical sync input POPOV IC		
V-SUB	V-output of HIP-IC on FDS		
WIRED BACKUP-INFO	Wired back up information		
WIRED-BACKUP AUDIO INFO	Audio signal (surround)		
WIRELESS SURROUND RECEIVER	Wireless Surround receiver		
WIRELESS TRANSMITTER	Wireless Transmitter		
X-RAY-PROT	X-Ray Protection		
X-tal	Quartz crystal		
Y/C	Luminance (Y) / Chrominance (C) signal		
Y_CVBS-SC2-IN	Luminance or CVBS SCART2 in		
YB-DEC	Y input for FDS		
Y-DEC	Luminance-dec (input signal for PICNIC)		
Y-DS-1FH	Y Dual Screen 1 x Horizontal Frequency		
Y-DS-2FH	Y-Dual Screen 2 x Horizontal Frequency		
Y-DS-OUT	Y Dual Screen out		
YF-DEC	Y-Main input POPOV IC		
Y-FEAT	Luminance Feature box (output signal from PICNIC)		

9.8 IC Data Sheets

In this paragraph, the internal block diagrams and pinning are given of ICs that are drawn as a 'black box' in the electrical diagrams (with the exception of 'memory' and 'logic' ICs).

9.8.6 Diagram U, TDA1597 (IC7701)

Internal Block Diagram and Pinning

The pin numbers given in parenthesis refer to the TDA1597.

- (1) Connecting pin 13 (11) to ground is only allowed to measure the current on pin 16 (14).
- (2) FM-MUTE-OFF.
- (3) FM-OFF.
- (4) FM-MUTE-ON.

Block diagram and application circuit.
