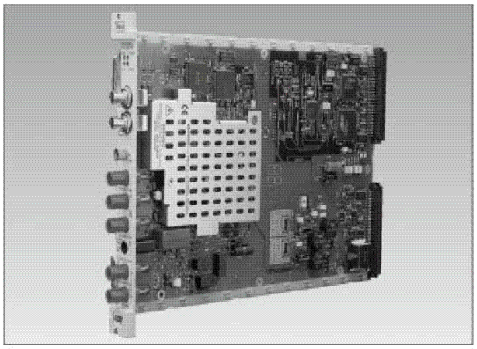
RACAL INSTRUMENTS™ 4152A



6.5 Digit Multimeter

- **"Test System" Multimeter Supports Limit Testing, Averaging, Math and Vector Operations**
- **Measures AC and DC Voltages and Currents, 2/4 Wire Ohms, Frequency and DC/DC Ratios**
- **Supports Scanner via VXI Backplane**
- **Up to 65 Range Changes Per Second and 30 Function Changes Per Second**
- **Up to 6 Readings/s at 6.5 Digits, 1000 Readings/s at 4.5 Digits**
- **Driver Support Includes LabVIEW, LabWindows/CVI and VXI*plug&play***

Racal Instruments™ 4152A, 6.5 digit Digital Multimeter (DMM), combines DC and AC current and voltage measurements as well as 2/4 wire Ohms, frequency and DC ratio measurements into a one slot, C-sized VXIbus-based instrument. The 4152A includes instrument driver support for standard environments like LabWindows/CVI and Lab-VIEW.

Advanced Features for High "Test System" Throughput
The 4152A's advanced features like limit testing, averaging, speed/resolution trade-offs, and fast function changes provide the high "test system" throughput required in today's production test environments. The 4152A's limit testing feature supports high-speed go/no-go testing and increases throughput by reducing the need to store and retrieve data. Averaged and vector (multiple read) measurements can be made to reduce external processing and increase throughput.

By fine-tuning the measurement speed of the 4152A's continuously integrating, multi-slope A/D converter, a balance between the need for fast throughput and measurement accuracy can be reached. For example, at 6.5 digits, the 4152A can take up to 6 readings per second with up to 0.0019% accuracy, or, at 4.5 digits, the 4152A can take up to 1000 readings per second with up to 0.012% accuracy. Since real-world test systems sometimes require range and function changes within a test cycle, the 4152A can change ranges within a function at a rate of up to 65 per second and can change measurement functions at the rate of up to 30 per second.

Software Driver Support
We provide LabWindows/CVI, and LabVIEW instrument drivers as well as a VXIplug&play Install Disk for the WIN and WIN32 Frame-works which adds support for Visual Basic, C and C++, to support quick integration into the most popular software platforms for VXIbus-based test systems. Because DMM's used in test systems often require scanned measurements, application examples are given interfacing the 4152A to Racal Instruments™ 1260 Series switching for automatic scanned measurements.

FREQUENCY AND PERIOD

Summary

Voltage (max): 300 V_{rms}

Accuracy: 0.006% of reading

Measurement Method

Reciprocal-counting technique.

AC-coupled input using the AC voltage measurement function.

Voltage Ranges

100 mV_{rms} to 300 V_{rms}, auto or manual.

Gate Time

10 ms, 100 ms or 1 s

Settling Considerations

Errors will occur when attempting to measure the frequency or period of an input following a dc offset voltage change. The input blocking RC time constant must be allowed to fully settle (up to 1 s) before the most accurate measurements are possible.

Measurement Considerations

All frequency counters are susceptible to error when measuring low-voltage, low-frequency signals. Shielding inputs from external noise pickup is critical for minimizing measurement errors.

SYSTEM CONSIDERATIONS

Settling Considerations

Reading settling times are affected by source impedance, cable dielectric characteristics, and input signal changes.

Measurement Considerations

We recommend the use of Teflon® or other high impedance, low-dielectric absorption wire insulation for these measurements.

Teflon is a registered trademark of E.I. DuPont deNemours and Co.
