# HIGH PERFORMANCE MULTIPORT SWITCHES

Issue: 18-Dec-2006

# SPnT Coaxial Switches DC to 6 GHz, DC to 20 GHz, DC to 26.5 GHz, DC to 40 GHz

Radiall's PLATINUM SERIES switches are optimised to perform at a high level over an extended life span. With outstanding RF performances, and a guaranteed Insertion Loss repeatability of 0.03 dB over a life span of 10 million switching cycles. PLATINUM SERIES switches are perfect for automated test and measurement equipment, as well as signal monitoring devices.

# HIGH PERFORMANCE MULTIPORT SWITCHES

### **ELECTRONIC POSITION INDICATORS**

### This option is not available with type 4.

The electronic position indicators utilise photo-MOS transistors which are driven by the mechanical position of the RF paths moving elements. The circuitry consists of a common which can be connected to an output corresponding to selected RF path. If one or several RF paths are closed, the corresponding indicators are connected to the common. The photo-MOS transistors are configured for AC and/or DC operation. The electronic position indicators require the supply (20 to 32 VDC) to be connected to pin 1 and ground connected to pin 15.

Pin number	Function
2	Indicator Common
 4	Indicator RF path 1
 6	Indicator RF path 2
 8	Indicator RF path 3
 10	Indicator RF path 4
12	Indicator RF path 5
14	Indicator RF path 6

Ways 1 and 4 are not connected for SP4T switches.

# HIGH PERFORMANCE MULTIPORT SWITCHES

#### **DRIVING THE SWITCH**

#### Type 4: without TTL and without indicator.

Each RF path is driven independently. Each path can be closed or open by applying ground to the corresponding "open" or "close" pin.

### Standard drive:

- Connect pin 15 to ground.
- Connect pin 1 to supply (+20 VDC to +32 VDC).
- Select desired RF path by applying ground to the corresponding "close" pin (Ex: ground pin 3 to close RF path 1).
- To open desired RF path connect ground to the corresponding "open" pin (Ex: ground pin 4 to open RF path 1).
- To open all RF paths, first ensure that all RF path "close" pins are disconnected from ground. To complete the operation, connect pin 16 to ground.

#### Make-Before-Break

Make-Before-Break switching can be accomplished by closing the new RF path before opening the previously selected RF path. To complete the operation, close the new RF port. A minimum of 15 ms must be allowed before opening the previously selected RF port.

Ways and 4 are not connected for SP4T switches.

# **TECHNICAL DATA SHEET**

R 594

# HIGH PERFORMANCE MULTIPORT SWITCHES

Issue: 18-Dec-2006

Type 7: with TTL (option "2") / without TTL (option "1") and indicators.

Each RF path can be closed by applying Ground or TTL "High" for option 2 to the corresponding "drive" pin. In general, except for Make-Before-Break drive, all other RF paths are simultaneously opened by internal logic.

Ways 1 and 4 are not connected for SP4T switches.

### Standard drive option "1"

- Connect pin 15 to ground.
- Connect pin 1 to supply (+20 VDC to +32 VDC)
- Select (close) desired RF path by applying Ground to the corresponding "drive" pin (Ex: apply Ground to pin 3 to close RF path 1).
- To select another path, ensure that all path unwanted RF "drive" pins are disconnected from Ground (to prevent multiple RF path engagement). Apply Ground to the "drive" pin which corresponds to the desired RF path.
- To open all RF paths, ensure that all RF path "drive" pins are disconnected from Ground. Complete the operation by applying Ground to pin 16.

### TTL drive option "2"

- Connect pin 15 to ground.
- Connect pin 1 to supply (+20 VDC to +32 VDC)
- Select (close) desired RF path by applying TTL "High " to the corresponding "drive" pin (Ex: apply TTL "High" to pin 3 to close RF path 1).
- To select another path, ensure that all unwanted RF path "drive" pins are in TTL "Low" position (to prevent multiple RF path engagement). Apply TTL "High" to the "drive" pin which corresponds to the desired RF path.
- To open all RF paths, ensure that all RF path "drive" pins are in TTL "Low" position. Complete the operation by applying TTL "High" to pin 16.

### **Break-Before-Make**

Open the undesired RF path. After 15 ms (minimum), close the new RF port.

#### Make-Before-Break

Ensure that the previously selected RF path "drive" is connected to Ground (or TTL "High" for option "2", then close the new RF path.
