1. INSTALLATION

1.1 CAUTIONS AND WARNINGS

⚠ WARNING

1. Never install telephone wiring during a lightning storm.
2. Never install telephone jacks in wet locations unless the jack is specifically designed for wet locations.
3. Never touch uninsulated telephone wires or terminals unless the telephone line has been disconnected at the network interface.
4. Use caution when installing or modifying telephone lines.
5. Avoid using a telephone (other than a cordless type) during an electrical storm. There may be remote risk of electric shock from lightning.
6. Do not use a telephone or cellular phone to report a gas leak in the vicinity of the leak.

⚠ CAUTION

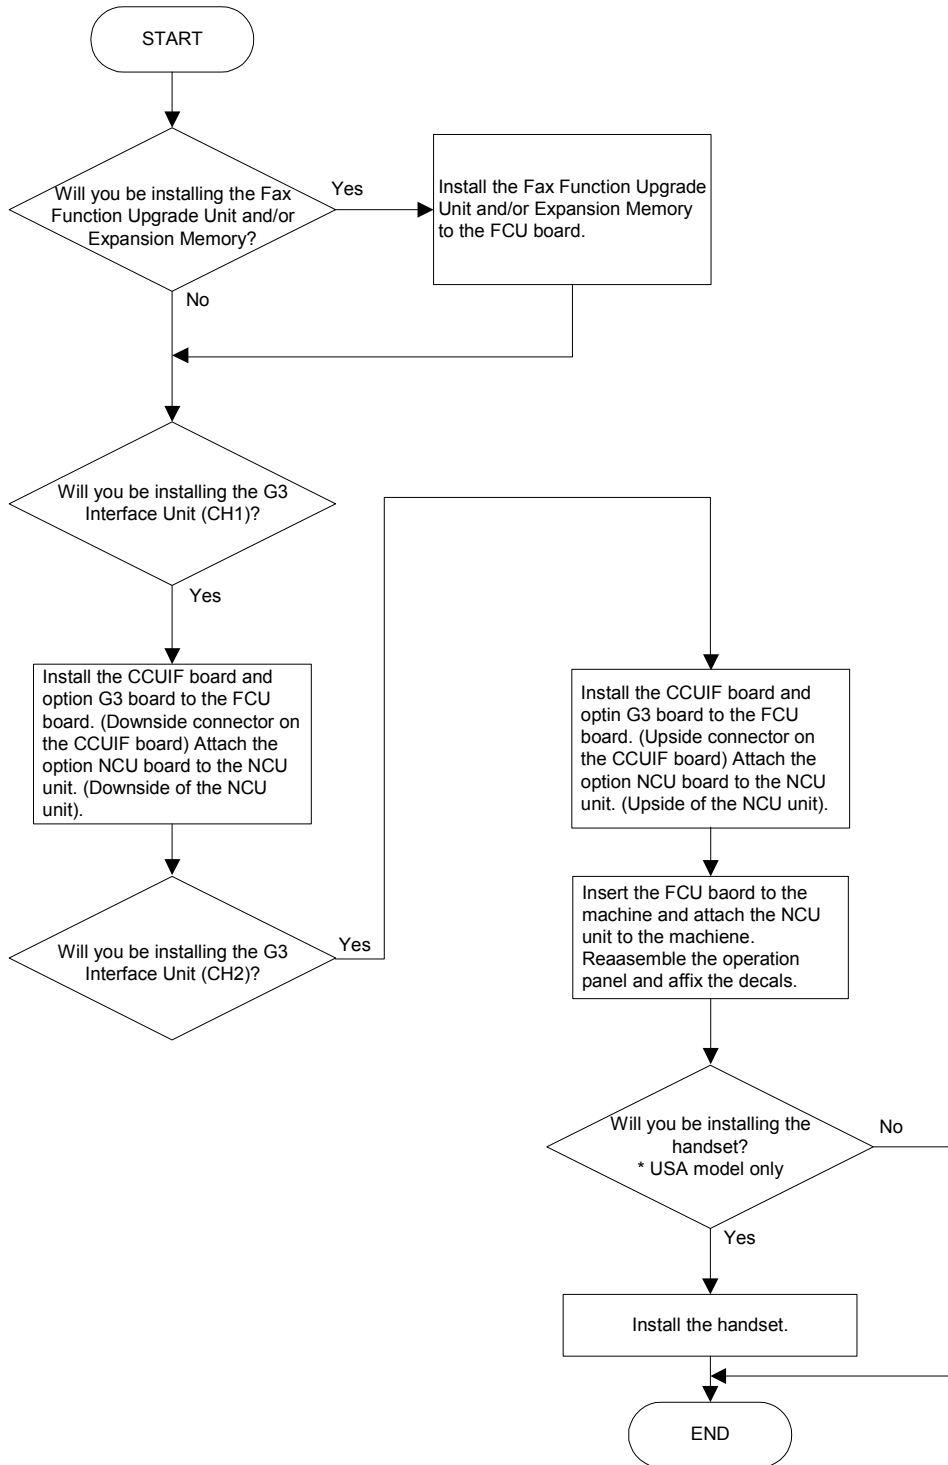

1. Before installing the fax unit, switch off the main switch, and disconnect the power cord.
2. The fax unit contains a lithium battery. The danger of explosion exists if a battery of this type is incorrectly replaced. Replace only with the same or an equivalent type recommended by the manufacture. Discard batteries in accordance with the manufacture's instructions and local regulations.

NOTE FOR AUSTRALIA

Unit must be connected to Telecommunication Network through a line cord which meets the requirements of ACA Technical Standard TS008.

1.2 PROCEDURE FLOWCHART

Before installing the fax unit and/or fax options, refer to the following flow chart.

B5471930.WMF

1.3 FAX OPTION TYPE 2045

⚠ CAUTION

Before installing this option, do the following:

1. If there is a printer option in the machine, print out all data in the printer buffer.
2. Press the operation switch to be the standby mode. Make sure the power LED is not lit then, turn off the main switch and disconnect the power cord and the network cable.

1. Remove the small cover [A] (⚙ x 1) and connector [B].
2. Remove the rear upper cover [C] (⚙ x 2).
3. Remove the rear lower cover [D] (⚙ x 2).

B5471902.WMF

B5471925.WMF

4. Attach the NCU unit [A] (⚙ x 2).
NOTE: If a G3 Interface Unit type 2045 has to be installed, attach the additional NCU boards to the NCU unit before attaching the NCU unit to the machine. Refer to the Installation Procedure for the G3 Interface Unit Type 2045.
5. Set up the jumper switches [B and C] on the NCU.
NOTE: European/Asian models only (non-U.S. version: B547-27)

Region/Country	TB1 [B]	TB2 [C]
Hong Kong	OFF	OFF
Hungary	ON	ON
Poland	ON	OFF

Other	ON	OFF

TB1 ON: Keep the jumper attached. OFF: Remove the jumper.
TB2 ON: Keep the jumper at ON. OFF: Move the jumper to OFF.

NOTE: You must change the country code in both system switch 0F and NCU parameter CC (service function 08-0).

B5471904.WMF

6. Remove the controller unit [A] (⚙ x 2)
7. Remove the FCU cover [B] (⚙ x 2)

8. Turn on the battery switch (SW1) [A] On the MBU board.
9. Connect harness [B] to the FCU board (x 2).
10. Slide the FCU board [C] into the right slot of the expansion box.
 If any following options will be installed at the same time, connect the option board to the FCU board before sliding the FCU board into the expansion box. Refer to the Installation Procedure of each option.
 - Fax Function Upgrade Option Type 185 unit.)
 - G3 Interface Unit Type 2045
11. Attach the edge clamp [D] to the bottom of the expansion box, then clamp the FCU harness [E].

12. Attach the harness clamps [A] and connect the FCU harness [B] to the NCU board. Then clamp the harness as shown.
13. Reattach the FCU cover and the controller unit.
14. Remove parts [C] and [D], then install parts [E], [F] and [G]. Affix the super G3 decal [H] on the front cover as shown.

15. Cut away the telephone connector cover [A].
16. Attach the FCC decal and the serial number decal [B] to the rear cover as shown.
17. Reattach the covers.
18. If the ARDF is installed, raise the ARDF and insert the stamp cartridge [C].
19. Connect the telephone line to the "LINE" jack at the rear of the machine.
NOTE: The copier must be connected to a properly - grounded socket outlet.
20. Plug in the machine and turn on the main power switch.
21. Be sure to set the clock (date and time).
22. Enter service mode and program the serial number into the fax unit (SP-3-102-000). The serial number can be found on the serial number label (attached to the machine in step 16).

1. Remove the covers. (☛1.3)
2. Remove the controller unit [A] (☛ x 2).
3. Remove the FCU cover [B] (☛ x 2).
4. Remove the FCU harness [C] and slide out the FCU board [D].
5. Attach the four standoffs [F] to the CCUIF board [E].
6. Attach the CCUIF board to the FCU board [G].
7. Attach the flat cable [H] to the FCU board and the CCUIF board.
8. Attach the option G3 board [I] to the lower connector of the CCUIF board (☛ x 2).

B5471913.WMF

B5471914.WMF

9. Remove the NCU unit [A] (⚙ x 2).
10. Attach the Option NCU unit [B] to the lower of the reverse side of the NCU unit (⚙ x 2) as shown.

11. Set up the jumper switches [A and B] on the NCU.

NOTE: European/Asian models only (non-U.S. version: B591-27)

Region/Country	TB1 [A]	TB2 [B]
Hong Kong	OFF	OFF

TB1 ON: Keep the jumper attached. OFF: Remove the jumper.
TB2 ON: Keep the jumper at ON. OFF: Move the jumper to OFF.

NOTE: You must change the country code in both system switch 0F and NCU parameter CC (service function 08-0).

- 12. Attach the telephone jack [C] to the bracket [D]
- 13. Run through the harness through the lower hole [E] in the NCU bracket, then secure the telephone jack bracket to the NCU unit (⚙ x 1).

14. Connect harness [A] to the option NCU board
15. Attach the harness clamps [B] (x2) then clamp the harness.
16. Attach the NCU unit [C] to the machine ($\text{⚙} \times 2$), and slide the FCU board into the machine.
17. Run harness [D] through the holes.
18. Attach the ferrite core [E] to the harness.

19. Cut away the small cover [A] for the first option G3 unit.

NOTE: If there is another G3 option unit, cut away the upper small cover [B].

20. Attach the FCC decal [C] to the rear cover.

21. Reattach the covers.

NOTE: Attach the second option NCU board [D] and the second option G3 board [E] to the upper side as shown.

22. Connect the telephone line to the LINE2 jack, then plug in the machine and turn the main switch on.

NOTE: The copier must be connected to a properly - grounded socket outlet.

23. Enter service mode. Set bit 1 of communication switch 16 to "1" for the first option G3 unit. Set bit 3 of communication switch 16 to "1" for the second option G3 unit. After that turn the main switch off and on.

24. Print the system parameter list and ensure that "SG3-V34" is listed as an option.

25. Set up and program the items required for PSTN-2 communications.

1.4.1 JBIG A892

CAUTION

Before installing this option, do the following:

1. Print out all messages stored in the memory, the lists of user-programmed items, and the system parameter list.
2. If there is a printer option in the machine, print out all data in the printer buffer.
3. Turn off the main switch and disconnect the power cord, the telephone line, and the STP cable.

1. Remove the controller unit [A] (x 2).
2. Remove the FCU cover [B] (x 2).
3. Remove the FCU harness and slide out the FCU board [C]

B547I201.WMF

1. Attach the FAX function upgrade board [A].
2. Turn on the battery switch [B].
 - NOTE:** If installing the FAX unit at the same time, be sure to turn on the FCU board battery switch.
6. Install the memory [C].
7. Re-install the FCU assembly into the expansion box.
8. Plug in the machine and turn on the main switch.
9. Press the "Fax" key and ensure the Fax LED lights.
 - At this time, the following message appears;
 - "SC1207 - Adding FAX Feature Expander causes data loss. Turn main power switch off remove it to avoid loss. To continue press "Yes".
10. Press "Yes" to initialize the SRAM.
 - NOTE:** Whenever installing the FAX FUNCTION UPGRADE board at the first time, the machine displays SC1207. Ignore this SC code. This is not a problem.
11. Enter the service mode, and set bit 7 of system switch 1E to "1".
12. Print the system parameter list and make sure that "EXFUNC" is listed as an option.
13. Confirm that the memory indicator shows "100%" in standby mode.
14. Connect the telephone cable.

3. SERVICE TABLES

CAUTION

Never turn off the main power switch when the power LED is lit or flashing. To avoid damaging the hard disk or memory, press the operation power switch to switch the power off, wait for the power LED to go off, and then switch the main power switch off.

NOTE: The main power LED () lights or flashes while the platen cover or ARDF is open, while the main machine is communicating with a facsimile or the network server, or while the machine is accessing the hard disk or memory for reading or writing data.

3.2 BIT SWITCHES

<p>⚠ WARNING</p> <p>Do not adjust a bit switch or use a setting that is described as “Not used”, as this may cause the machine to malfunction or to operate in a manner that is not accepted by local regulations. Such bits are for use only in other areas, such as Japan.</p>
--

NOTE: Default settings for bit switches are not listed in this manual. Refer to the System Parameter List printed by the machine.

3.2.1 SYSTEM SWITCHES

System Switch 00		SP No. 1-101-001
No	FUNCTION	COMMENTS
0	Dedicated transmission parameter programming 0: Disabled 1: Enabled	Set this bit to 1 before changing any dedicated transmission parameters. Reset this bit to 0 after programming dedicated transmission parameters.
1	Not used	Do not change the setting.
2	Technical data printout on the Journal 0: Disabled 1: Enabled	1: Instead of the personal name, the following data are listed on the Journal for each G3 communication.
<p>e.g. 0000 32V34 288/264 L0100 03 04 (1) (2)(3) (4) (5) (6) (7) (8)</p> <p>(1): EQM value (Line quality data). A larger number means more errors. (2): Symbol rate (V.34 only) (3): Final modem type used (4): Starting data rate (for example, 288 means 28.8 kbps) (5): Final data rate (6): Rx level (refer to the note after this table for how to read the rx level) (7): Total number of error lines that occurred during non-ECM reception. (8): Total number of burst error lines that occurred during non-ECM reception.</p> <p>Note: EQM and rx level are fixed at “FFFF” in tx mode. The seventh and eighth numbers are fixed at “00” for transmission records and ECM reception records.</p>		

System Switch 00		SP No. 1-101-001
No	FUNCTION	COMMENTS
2	<p>Rx level calculation</p> <p>Example: 0000 32 V34 288/264 L <u>01 00</u> 03 04</p> <p>The four-digit hexadecimal value (N) after “L” indicates the rx level. The <u>high</u> byte is given first, followed by the <u>low</u> byte. Divide the decimal value of N by -16 to get the rx level.</p> <p>In the above example, the decimal value of N (= 0100 [H]) is 256. So, the actual rx level is 256/-16 = -16 dB</p>	
3	Not used	Do not change the settings.
4	<p>Line error mark on the received page</p> <p>0: Disabled 1: Enabled</p>	If this bit is 1, a mark will be printed on the left edge of the page at any place where a line error occurred in the data. Such errors are caused by a noisy line for example.
5	<p>G3/G4 communication parameter display</p> <p>0: Disabled 1: Enabled</p>	This is a fault-finding aid. The LCD shows the key parameters (see below). This is normally disabled because it cancels the CSI display for the user. Be sure to reset this bit to 0 after testing.
6	<p>Protocol dump list output after each communication</p> <p>0: Off 1: On</p>	This is only used for communication troubleshooting. It shows the content of the transmitted facsimile protocol signals. Always reset this bit to 0 after finishing testing. If system switch 09 bit 6 is at “1”, the list is only printed if there was an error during the communication.
7	Not used	Do not change the setting.

1	Type of TEI used 0: Dynamic TEI 1: Static TEI	This is normally fixed at 0. However, some networks may require this bit to be set at 1 (see below). In this case, you may have to change the values of bits 2 to 7.
2 to 7	Static TEI value	Store the lowest bit of the TEI at bit 7 and the highest bit of the TEI at bit 2. Example: If the static TEI is 011000, set bits 3 and 4 to 1 and bits 2, 5, 6, and 7 to 0.

1	Information transfer capability shift down to retry transmission 0: Shift down procedure disabled (Default) 1: Shift down and retry the call	1: The machine changes the ISDN G3 information transfer capability informed in the [SETUP] signal to "Speech" from "3.1 kHz audio" or to "3.1 kHz audio" from "Speech" automatically and retries the transmission. The information transfer capability used in the first try is determined by the setting of G4 internal bit switch 14 bit 0. This switch is effective with some types of exchangers and T/As where they only accept calls with information transfer capability "Speech".
2	Attachment of calling ID and subaddress 0: No 1: Yes	Normally, this bit should be at 0, because most networks add the calling ID and subaddress to the SETUP signal to the receiver. However, some networks may require the machine to add this ID (and/or subaddress). Only in this case should this bit be at 1.
3	Attachment of the Lower Layer Capabilities 0: No 1: Yes	This bit determines whether Lower Layer Capabilities are informed in the [SETUP] signal. Keep this bit at 0 in most cases.
4	Attachment of the Higher Layer Capabilities 0: Yes 1: No	This bit determines whether Higher Layer Capabilities are informed in the [SETUP] signal or not. Keep this bit at 0 in most cases.
5	Attachment of the channel information element (CONN) 0: No 1: Yes	Keep this bit at 0 in most cases.
6	Attachment of the Higher Layer Capabilities for ISDN G3 transmission 0: Same as the bit 4 setting 1: Not attached	This bit determines whether Higher Layer Capabilities are informed in the [SETUP] signal for ISDN G3 transmission. This switch is effective in coping with communication problems with some types of T/A and PBX that do not respond to Higher Layer Capability "G3". When this bit is set to 0, the setting depends on the setting of bit 4. Keep this bit at 1 in most cases.

If you wish to enable fallback when any CPS code is detected, set this bit to "1". This switch is effective in coping with fallback problems where the CPS code does not match those specified in the ITU-T recommendation.

5	Called ID mapping 0: Called party number 1: Keypad facility	0: Called ID is mapped to the called party number. 1: Called ID is mapped to the keypad facility. Note that the subaddress is not mapped. On the 5ESS network (USA), set it to 1.
6	Numbering plan for the called party number 0: Unknown 1: E.164	E.164: This may be used in Sweden if an AXE10 exchanger is fitted with old software, and in Australia. Unknown: This is the normal setting.
7	Subaddress coding type 0: IA5 (NSAP) 1: BCD (ISO8348)	This is normally kept at 0. However, some networks require this bit to be at 1.

0 to 1	Answer delay time Bit 1 0 Setting 0 0 No delay 0 1 1.0 s delayed (1TR6) 1 0 0.5 s delayed 1 1 Not used	In some countries, a time delay to answer a call is required. Otherwise, use this switch as follows: If the machine is connected to the same bus from the DSU as a model K200 is connected, the machine receives most of the calls because the response time to a call is faster than the K200. If the customer wants the K200 to receive most of the calls, adjust the response time using these bits. If the customer does not want one machine to receive most of the calls, use subaddresses to identify each terminal.
2	Action when receiving [SETUP] signal containing user-specific called party subaddress 0: Ignores the call 1: Receives the call	Normally, the 3rd octet of called party subaddress information in the [SETUP] signal is set to NSAP. However, some networks may add "user-specific" subaddress to the [SETUP] signal, and the result of this is that the machine won't answer the call if a subaddress is specified. So, change this bit to 1 to let the machine receive the call if the machine is connected to such a network.
3-4	Not used	Do not change these settings.
5	Indicated bearer capabilities 0: 56 kbps 1: 64 kbps	1: 64 kbps calling is indicated in the Bearer Capabilities, but communication is at 56 k. Use this bit if the machine is connected to a network which does not accept a 56 kbps data transfer rate as a bearer capability.

0 to 6	Condition for fallback from G4 to G3 Bits 0 to 6 of bit switch 17 contain a CPS code, and bits 0 to 6 of bit switch 18 contain another CPS code. If a CPS code is received which is the same as either of these, communication will fall back from ISDN G4 mode to ISDN G3 mode. The CPS codes must be the same as those specified in table 4-13 of ITU-T recommendation Q.931. Examples: Bit 6 5 4 3 2 1 0 1 0 0 0 0 0 1 CPS code 65 1 0 1 1 0 0 0 CPS code 88	For the codes in bits 0 to 6 of bit switches 17 and 18 to be recognized, bit 7 of bit switch 17 must be 1. Also, bit 0 of the Communication Switch 07 must be at 0, or Fallback from G4 to G3 will be disabled.
7	This bit determines whether fallback from G4 to G3 occurs on receipt of one of the CPS codes programmed in bit switch 17 or 18, or on receipt of a certain standard code. 0: Fallback occurs on receipt of any of the following CPS codes: Universal (Euro ISDN) - #3, #18, #57, #58, # 63, # 65, #79, #88, and #127 Germany 1TR6 mode - #3, #53, #58, and #90 Others - #3, #65, and #88 1: Fallback from G4 to G3 occurs on receipt any of above CPS codes or one of the CPS codes programmed in bit switch 17, 18, 1A, 1B, or 1C

7	This bit helps to choose the CPS code set for G4 to G3 fallback. 0: Fallback occurs on receipt of the CPS code set, which is specified by the country code setting. 1: Fallback occurs on receipt of the Universal CPS code set (#3, #18, #57, #58, # 63, # 65, #79, #88, and #127) even if another country code is programmed. If bit switch 17 bit 7 is "1", fallback occurs on receipt of the Universal CPS code set or one of the CPS codes programmed in bit switches 17, 18, 1A, 1B, or 1C.	

G4 to G3 fallback

Bit 0 of Communication Switch 07 must be at 0, or fallback from G4 to G3 will be disabled.

The CPS codes for which fallback occurs are decided as follows.

- G4 bit switch 17, bit 7 - If set to "0", fallback occurs on receipt of a code from a set that depends on the country code. If set to "1", fallback occurs for the 5 CPS codes programmed in bits 0 to 6 of G4 bit switches 17, 18, 1A, 1B, and 1C, in addition to the country code set.

Note that if G4 bit switch 18, bit 7 is set to "1", the CPS code set that is used is always the Universal set, regardless of the country code setting.

3.3 NCU PARAMETERS

The following tables give the RAM addresses and the parameter calculation units that the machine uses for ringing signal detection and automatic dialing. The factory settings for each country are also given. Most of these must be changed by RAM read/write (SP2-102), but some can be changed using NCU Parameter programming (SP2-103, 104 and 105); if SP2-103, 104 and 105 can be used, this will be indicated in the Remarks column. The RAM is programmed in hex code unless (BCD) is included in the Unit column.

NOTE: The following addresses describe settings for the standard NCU.
Change the fourth digit from “5” to “6” (e.g. 680500 to 680600) for the settings for the first optional G3 interface unit.
Change the fourth digit from “5” to “7” (e.g. 680500 to 680700) for the settings for the second optional G3 interface unit.

NOTES:

1. If a setting is not required, store FF in the address.
2. Italy and Belgium only

RAM address 68055E: the lower four bits have the following meaning.

Bit 2 - 1: International dial tone cadence detection enabled (Belgium)

Bit 1 - Not used

Bit 0 - 1: PSTN dial tone cadence detection enabled (Italy)

If bit 0 or bit 2 is set to 1, the functions of the following RAM addresses are changed.

680508 (if bit 0 = 1) or 680538 (if bit 2 = 1): tolerance for on or off state duration (%), and number of cycles required for detection, coded as in address 680533.

68050B (if bit 0 = 1) or 68053B (if bit 2 = 1): on time, hex code (unit = 20 ms)

68050C (if bit 0 = 1) or 68053C (if bit 2 = 1): off time, hex code (unit = 20 ms)

3. Pulse dial parameters (addresses 68054A to 68054F) are the values for 10 pps. If 20 pps is used, the machine automatically compensates.
4. The first ring may not be detected until 1 to 2.5 wavelengths after the time specified by this parameter.
5. The calculated level must be between 0 and 10.
The attenuation levels calculated from RAM data are:
High frequency tone: – 0.5 x N_{680552/680554}–3.5 dBm
– 0.5 x N₆₈₀₅₅₅ dBm
Low frequency tone: – 0.5 x (N_{680552/680554} + N₆₈₀₅₅₃) –3.5 dBm
– 0.5 x (N₆₈₀₅₅₅ + N₆₈₀₅₅₃) dBm

NOTE: N₆₈₀₅₅₂, for example, means the value stored in address 680552(H)

6. 68054A: Europe - Between Ds opening and Di opening, France - Between Ds closing and Di opening
68054D: Europe - Between Ds closing and Di closing, France - Between Ds opening and Di closing
7. Tone signals which frequency is lower than 1500Hz (e.g., 800Hz tone for AI short protocol) refer to the setting at 6805B5h. Tones which frequency is higher than 1500Hz refer to the setting at 6805B6h.
8. 68054A, 68054D, 68054E: The actual inter-digit pause (pulse dial mode) is the sum of the period specified by the RAM addresses 68054A, 68054D, and 68054E.

3.4 DEDICATED TRANSMISSION PARAMETERS

Each Quick Dial Key and Speed Dial Code has eight bytes of programmable parameters allocated to it. If transmissions to a particular machine often experience problems, store that terminal's fax number as a Quick Dial or Speed Dial, and adjust the parameters allocated to that number.

The programming procedure will be explained first. Then, the eight bytes will be described.

3.4.1 PROGRAMMING PROCEDURE

1. Set the bit 0 of System Bit Switch 00 to 1.
2. Press "Dest. Management" in the facsimile standby mode.
3. Press "Program/Change/Delete Quick Dial".
4. Select the destination key you want to program.
5. When the programmed dial number is displayed, press "Start".
Make sure that the LED of the Start button is lit as green.

B547S901.WMF

6. The settings for the switch 01 are now displayed. Press the bit number that you wish to change.
7. To scroll through the parameter switches, either:
8. Select the next switch: press "Next"
or
Select the previous switch: "Prev." until the correct switch is displayed.
Then go back to step 6.
9. After the setting is changed, press "OK".
10. After finishing, reset bit 0 of System Bit Switch 00 to 0.

3.4.2 PARAMETERS

The initial settings of the following parameters are all FF(H) - all the parameters are disabled.

Switch 01	
FUNCTION AND COMMENTS	
ITU-T T1 time (for PSTN G3 mode)	
If the connection time to a particular terminal is longer than the NCU parameter setting, adjust this byte. The T1 time is the value stored in this byte (in hex code), multiplied by 1 second.	
Range:	
0 to 120 s (00h to 78h)	
FFh - The local NCU parameter factory setting is used.	
Do not program a value between 79h and FEh.

Bit 0: Substitute reception when the base copier is in an SC condition

0: Enabled, 1: Disabled

Bits 1 and 2: Condition for substitute rx when the machine cannot print messages (Paper end, toner end, jam, and during night mode)

Bit 2 1 Setting

0 0 The machine receives all the fax messages.

0 1 The machine receives the fax messages with RTI or CSI.

1 0 The machine receives the fax messages with the same ID code.

1 1 The machine does not receive anything.

Bit 3: Not used

Bit 4: Not used

Bit 5: Just size printing 0: Off, 1: On

Bit 6: Not used

Bit 7: Add paper display when a cassette is empty 0: Off, 1: On

Bits 0 to 5: Not used

Bit 6: Scan sequence in Book transmission

0: Left page then right page, 1: Right page then left page

Bit 7: Not used

6800D7(H) - User parameter switch 07 (SWUSR_07)

Bits 0 and 1: Not used

Bit 2: Parallel memory transmission 0: Off, 1: On

Bits 3 to 7: Not used

6800D8(H) - User parameter switch 08 (SWUSR_08)

Bits 0 and 1: Not used.

Bit 2: Authorized reception

0: Only faxes from senders whose RTIs/CSIs are specified for this feature are accepted.

1: Only faxes from senders whose RTIs/CSIs are not specified for this feature are accepted.

Bits 3 to 7: Not used.

6800D9(H) - User parameter switch 09 (SWUSR_09) : Not used

6800DA(H) - User parameter switch 10 (SWUSR_0A)

Bit 0: Not used

Bit 1: 2 into 1 0: Off, 1: On

Bit 3: Page reduction 0: Off, 1: On

Bits 4 to 7: Not used

6800DB(H) - User parameter switch 11 (SWUSR_0B)

Bit 0: Not used

Bit 1: Method of transmitting numbers after the "Tone" mark over an ISDN line

0: UUI, 1: Tone

Bits 2 to 5: Not used

Bit 6: Printout of messages received while acting as a forwarding station

0: Off, 1: On

Bit 7: Polling Standby duration 0: Once, 1: No limit

6800DC(H) - User parameter switch 12 (SWUSR_0C): Not used

6800DD(H) - User parameter switch 13 (SWUSR_0D)

(This switch is not printed on the user parameter list.)

Bits 0 to 4: Not used

Bit 5: Action when receiving a SETUP signal containing no called number and the G4 subscriber number was programmed in this machine.

0: Respond to the call, 1: Do not respond to the call

Bit 6: Action when the received HLC (Higher Level Capabilities) is Tel or BC (Bearer Capabilities) is Speech.

0: Do not respond to the call, 1: Respond to the call

This switch determines which information transfer capabilities the machine can accept when receiving a call.

1: When the received HLC is Tel (digital telephone) or BC is Speech (voice), the machine responds to the call. In short, the machine receives every call.

This switch is useful for communication problems when the other terminal informs the above transfer capabilities although it is a fax machine.

Bit 7: ISDN SPID programming (used only in the USA)

6800DE(H) - User parameter switch 14 (SWUSR_0E)

Bit 0: Message printout while the machine is in Night Printing mode 0: On, 1: Off

Bit 1: Maximum document length detection

0: Double letter, 1: Longer than double-letter (well log) – up to 1,200 mm

Bit 2: Batch transmission 0: Off, 1: On

Bit 3: Fax mode settings, such as resolution, before a mode key (Copy/Fax/Printer/Scanner) is pressed

0: Not cleared, 1: Cleared

Bits 4 to 6: Not used

Bit 7: Manual service call (sends the system parameter list to the service station)

0: Off, 1: On

6800DF(H) - User parameter switch 15 (SWUSR_0F)

Bits 0, 1 and 2: Cassette for fax printout

Bit 2	1	0	Setting
0	0	1	1st paper feed station
0	1	0	2nd paper feed station
0	1	1	3rd paper feed station
1	0	0	4th paper feed station

0: Not needed, 1: Needed

Bits 3 to 6: Not used

Bit 7: Press “Start” key without an original when using the on hook dial or the external telephone,

0: displays “Cannot detect original size”.

1: Receives fax messages.

6800E2(H) - User parameter switch 18 (SWUSR_12)

Bit 0: TTI date 0: Off, 1: On

Bit 1: TTI sender 0: Off, 1: On

Bit 2: TTI file number 0: Off, 1: On

Bit 3: TTI page number 0: Off, 1: On

Bit 4 to 7: Not used

6800E3(H) - User parameter switch 19 (SWUSR_13)

Bit 0: Offset sort function for the fax (only using the shift tray on the 1,000 sheet finisher)

0: Disabled, 1: Enabled

Bit 1: Journal format

0: The Journal is separated into transmissions and receptions

1: The Journal is separated into G3-1, G3-2, G3-3 and G4 communications

Bit 2: Action when the paper cassette that was selected by the specified cassette selection feature becomes empty.

(This switch is not printed on the user parameter list.)

0: The machine will not print any received files until paper is added.

1: The machine will use other cassettes to print received files that are not specified by this feature.

Bit 3: 90° image rotation during B5 portrait Tx

(This switch is not printed on the user parameter list.)

0: Off, 1: On

Bit 4: Reduction of sample images on reports to 50% in the main scan and sub-scan directions. (This switch is not printed on the user parameter list.)

0: Technician adjustment (printer switch 0E bits 3 and 4), 1: 50% reduction

4. DETAILED SECTION DESCRIPTIONS

4.1 ADDRESS BOOK

The address book (directory) for this machine combines under one user name the fax address and mail address.

All the address data is stored on the HDD. Up to a maximum of 2,000 items can be stored for addresses.

4.1.1 ADDRESS BOOK BACKUP

The address data can be backed up, and frequently backing up the address book data is recommended. If for any reason data can no longer be read from the HDD, you can use the backed up data to restore the address book.

Overview of Data Backup

B547D501.WMF

Detailed Descriptions

There are three methods you can use to back up address book data:

- HDD ↔ IC Card
- FCU (MBU) ↔ IC Card
- HDD ↔ FCU

Each is described below.

1. HDD ↔ IC Card

Address data stored on the HDD can be uploaded to an IC card with SP5846 51 (UCS Settings - All Directory Info. Upload), or address data backed up on the IC card can be downloaded to the HDD with SP5846 52 (UCS Settings – All Directory Info. Download).

2. FCU (MBU) ↔ IC Card

Address data stored in the FCU (MBU) can be uploaded to an IC card with SP5846 51 (UCS Settings - All Directory Info. Upload), or address data backed up on the IC card can be downloaded to the FCU with SP5846 52 (UCS Settings – All Directory Info. Download).

3. HDD ↔ FCU

Address data stored on the HDD can be uploaded to the FCU (MBU) with SP5846 80 (UCS Settings - FCU Backup), or when there is address data in the FCU and the HDD has just been replaced, this data is downloaded automatically to the new HDD.

SP Modes

1. SP5846 051 UCS Settings - All Directory Info. Upload

This SP mode is used to upload address data to an IC card. The machine automatically detects where the address data is stored. If there is address data on the HDD, the address data from the HDD is uploaded to the IC card. If the HDD is not present, then the address data from the FCU is uploaded. If one IC card is not large enough to hold all the address data, as many IC cards as needed can be used to hold all of the address data.

2. SP5846 052 UCS Settings – All Directory Info. Download

This SP mode downloads address data from an IC card. The machine automatically determines where to store the address data. If there is address data on the HDD, then the data is downloaded to the HDD. If HDD is not present, then the address data is downloaded to the FCU.

3. SP5846 080 UCS Settings - FCU Backup

This SP mode is used to take fax address data from among the address data on the HDD and upload it to the FCU. However, the FCU is capable of holding only up to 500 items for address data, so if more than 500 address items are stored on the HDD, only the first and oldest 500 address on the HDD are backed up. If FAX Function Upgrade Unit (Option) is installed, up to 1200 address items can be backed up.

NOTE: In preparation for the possibility that data can no longer be read from the HDD, we recommend that the CE back up the address data to the FCU when visiting the customer. However, when address data is backed up to the FCU, only the fax data in the address book is backed up, and the other data (e-mail address, etc.) are not backed up. For this reason, the customer should be instructed about how to frequently back up the address book data using SmartNet – Monitor Admin.
