7. Testing and Repair of the Board

7.1. Function Description

The E6GHZ board extends the frequency range of the SMIQ03 by the range 3300 to 6400 MHz.

The IQ300 signal at X504 from the IQMOD module (300 MHz, IQ-modulated) is up-converted to 900 MHz using MIXER2 (IF900). Unwanted mixer products at the output of MIXER2 are filtered off by means of bandpass filters.

The REF600 signal at X502 from the reference/step synthesis (600 MHz) is doubled and serves as LO for MIXER2 (1200 MHz).

MIXER1 converts IF900 to the range 3300 to 6400 MHz. The LO signal (4200 to 6000 MHz) for MIXER1 is generated by doubling the FIQOUT signal of the IQMOD at X505.

Unwanted mixer products at the output of MIXER1 are suppressed by means of bandpass filters and a switched filter bank containing bandpass filters and tunable highpass and lowpass filters in 4 paths.

A level control element (LEVEL PRESET) preceding the filter bank permits to set the operating point of the amplitude modulator (instrument calibration routine Level Preset). Following the filter bank, the output level of the instrument is set by the amplitude modulator.

The thin-film unit POWERUNIT includes the output stage and a detector, which detects the output level of the instrument for the frequency range 3300 to 6400 MHz. There, the signal from the IQMOD (FIQOUT at X505) is also directly through-connected to the module output (IQOUT6 at X506) for frequencies < 3300 MHz.

7.1.1. Input REF600

The REF600 signal at X502 (600 MHz, 13 dBm) is split up via a power divider, taken via an amplifier and again provided as output signal at X501 REF600E for IQMOD (600 MHz, 13 dBm) and doubled as LO signal for MIXER2 to 1200 MHz, filtered and amplified to a controlled LO level of 17 dBm.

7.1.2. Input IQ300

The IQ300 signal at X504 (300 MHz, -9 dBm) is split up via a power divider, taken via an amplifier and again provided as output signal at X503 IQ300AUX (300 MHz, -9 dBm) and is used as RF signal for MIXER2 (level -12 dBm).

7.1.3. IF900 - IF Signal of Mixer2

The IF signal of MIXER2 (900 MHz) is filtered and amplified and taken to the RF connector of MIXER1 (level -12 dBm). The RF level at X2 is adjusted to -12 dBm by means of LEVEL IF900 (R848).

7.1.4. LO Conditioning for Mixer 1

For LO conditioning, the FIQOUT signal is doubled by the POWERUNIT at X9 from 2100 to 3000 MHz to 4200 to 6000 MHz. For suppression of subharmonics, the lowpass filter LP5100 is cut in at frequencies at FIQOUT < 5100 MHz. A level control ensures a constant LO level at X1 (17 dBm).

7.1.5. RF Path at IF Output of Mixer1

The mixer output signal (-18 dBm) is taken via amplifiers and filters to the level preset control element and via the filter bank and the AM modulator to the input X6 of the POWERUNIT . The amplifier stages have a gain (S21) of approx. 8 dB each, thus compensating for the filter attenuations.

7.1.6. Filter Bank

The tunable filters are set according to the frequency; the necessary data is determined in the module test in the production and contained in the EEPROM of the module.

Each tracking filter is driven by a tuning voltage. IQFILT1 and IQFILT2 drive the lowpass filters, IQFILH1 and IQFILH2 the highpass filters. In the deactivated filter paths, the respective lowpass filters are set to minimum and the highpass filters to maximum tuning voltage via selector switches (0 or 20 V).

The four control bits FILOFF1 to FILOFF4 check the selector switches and the ON/OFF functions of the filter paths.

There are four frequency ranges:

| Frequency range | SMIQ output frequency | FIQOUT from IQMOD | LO frequency Mixer 1 | Sideband | Control signal LP5100_ON |
|-----------------|-----------------------|-------------------|----------------------|----------|--------------------------|
| FB1 | 3300 to 4200 MHz | 2100 to 2550 MHz | 4200 to 5100 MHz | lower | L |
| FB2 | 4200 to 5100 MHz | 2550 to 3000 MHz | 5100 to 6000 MHz | lower | H |
| FB3 | 5100 to 6000 MHz | 2100 to 2550 MHz | 4200 to 5100 MHz | upper | L |
| FB4 | 6000 ... 6400 MHz | 2550 ... 2750 MHz | 5100 ... 5500 MHz | upper | H |

7.1.7. RF Level Control

The command value for the amplitude modulation ($f > 3.3$ GHz) and the level control is applied to the module via X500.A2 UREFAM. At frequencies < 3.3 GHz, the control bit AM_ON switches over to a command value generated on the module, since the amplitude modulation is already generated on the IQMOD module. The temperature-compensated and linearized detector output voltage is applied as actual value to the control amplifier N29, which drives the AM modulator.

The level linearity is adjusted using trimmers RF DC ZERO (R394) and DETECTOR OFFSET (R173). The nominal value for the level control is set via D/A converter D2. The control bandwidth is switched over via control bit AM_SLOW_ON. For the IQ mode or in the operating mode "ALC OFF MODE TABLE", the AM modulator is controlled by the level D/A converter (ALC_ON = Low, DETOUT_ON = Low), N29 will then operate as amplifier.

7.1.8. Diagnosis

Diagnosis voltages determined via RF rectifiers feature large tolerances and can only be used as indicators (RF level present / not present). RF test points without directional couplers do not detect the forward power, but the RF voltage, which is to a large extent dependent on the matching (impedance) and therefore features large fluctuations versus the frequency.

7.2. Measuring Instruments and Auxiliary Means

- DC voltmeter, ammeter (e.g. UDS5)
- RF power meter (e.g. NRVD)
- RF spectrum analyzer up to 20 GHz (e.g. FSM)
- RF network analyzer up to 8 GHz (e.g. ZVC)

7.3. Troubleshooting

For first error diagnosis it is recommended to use the test program included in the service kit, which offers comprehensive possibilities.

Before starting more detailed troubleshooting in the RF paths, it is recommended to check the serial interface for correct data transmission and the diagnosis, reference, operating point and control voltages for the correct value.

7.3.1. RF Level

Error message:

ALC LOOP FAILURE

No level

or

**fault during
Level Preset calibration
at frequencies > 3.3 GHz**

**Level cannot be varied at all
frequencies > 3.3 GHz**

**No level in only one frequency
range FB1 to FB4 of the filter
bank**

**Level linearity out of
tolerance**

First check at which frequencies the level control does not work. To this end, check the frequency ranges FB1 to FB4 of the filter bank.

Check control voltages of the LO level control loops.

Check diagnosis voltages of the RF test points.

Check detector and control amplifier.

Perform RF level adjustment

Check detector, level D/A converter and control amplifier

Fault at RF-SWITCH1 or RF-SWITCH2, missing or faulty control voltage of tunable filters. Check the RF chain of the filter bank using network analyzer

Perform adjustment

7.3.2. Spectral Purity of Output Signal IQOUT6

| | |
|---|--|
| Too small harmonics | Check operating point of RF amplifier in POWERUNIT, harmonics at X6, operating points of amplifiers in RF path. |
| Too small spurious responses at $f_{nw} = 0.5*(f_{RF} \pm 900 \text{ MHz})$ | Chip of switch or switch control in POWERUNIT faulty, braided cord in upper module cover in the area of the POWERUNIT missing. |
| Too small spurious responses at 300 MHz from carrier | LO level of MIXER1 is faulty, bandpass filters in the IF900-path faulty |
| Too small spurious responses at 600 kHz from carrier | Module cover does not fit tightly, bandpass filters in the LO 1200 path faulty |
| Too small spurious responses at 900 MHz from carrier | LO suppression by the tracking or permanent filters of the filter bank is insufficient. Determine the faulty frequency range of the filter bank FB1 to FB4, check the tuning voltages, measure from X4 to X8 using network analyzer. |

7.4. Testing and Adjustment

All measured values with no tolerance indicated are meant to be understood as reference values.

Plug the board onto the adapter included in the service kit and set up the RF connections. The adapter can then be plugged into the chassis together with the board.

Before carrying out any tests, set the instrument to a defined initial status by means of PRESET.

7.4.1. Testing the Data Transmission

The board is addressed via the serial interface. Subaddress 1 is used for the data transmission, . Subaddress 2 is used for reading and writing to the EEPROM, which contains calibration data for the filter control.

Testing: When changing between the frequencies $f_1 < 3.3 \text{ GHz}$ and $f_2 > 3.3 \text{ GHz}$, the bit SWE6-ON at D14/4 must change between low and high.

7.4.2. Testing the Reference Voltages

| Test point | Nominal value/V |
|------------|-----------------|
| X20.3 | 10 ± 0.010 |
| X20.2 | -10 ± 0.010 |
| X20.1 | 4.55 ± 0.02 |

7.4.3. Testing the Operating Points of the Amplifier Stages

Use a DC voltmeter to check the voltages. Measure at the collector or drain connector.

| Circuit diagram sheet | Amplifier | Component No. | Ic/mA | U/V |
|-----------------------|----------------|---------------|-------|-----------------|
| 3 | RFAMP23 | N38 | 70 | 4.9 ± 0.1 |

| 26 | RFAMP19 | V94 | 93 | 7.1 ± 0.1 |
| 27 | RFAMP20 | V95 | 93 | 7.1 ± 0.1 |
| 28 | RFAMP22 | N37 | | 3.4 ± 0.2 |
| 29 | POWER UNIT Vcc | P11 | 500 | 7.3 ± 0.2 |
| 29 | POWER UNIT Vgg | P12 | | $-5 \dots -0.5$ |

7.4.4. Testing the Switching Voltages of RFSWITCH 1

Use a DC voltmeter to check the voltages. (Tolerance ± 0.3 V)

| | Test point | Filter OFF | FB1 on | FB2 on | FB3 on | FB4 on |
|----------|------------|------------|--------|--------|--------|--------|
| SYNFIL 0 | C891 | 4.42 | 4.18 | -1.65 | -1.65 | 4.55 |
| SYNFIL 1 | C753 | 9.80 | -0.76 | 9.80 | 9.80 | 9.80 |
| SYNFIL 2 | C892 | -10.00 | -10.00 | 3.30 | -10.00 | -10.00 |
| SYNFIL 3 | C757 | 9.83 | 9.83 | 9.83 | -3.30 | 9.83 |
| SYNFIL 4 | C755 | -10.03 | -10.03 | -10.03 | -10.03 | 6.21 |

7.4.5. Testing the Switching Voltages of RFSWITCH 2

Use a DC voltmeter to check the voltages. (Tolerance ± 0.3 V)

| | Test point | Filter OFF | FB1 on | FB2 on | FB3 on | FB4 on |
|-----------|------------|------------|---------|---------|---------|---------|
| SYNFIL 0N | C895 | -1.67 V | -1.67 V | 4.22 V | 4.58 V | -1.67 V |
| SYNFIL 1N | C894 | -9.82 V | 3.34 V | -9.82 V | -9.82 V | -9.82 V |
| SYNFIL 2N | C899 | 9.97 V | 9.97 V | -0.76 V | 9.97 V | 9.97 V |
| SYNFIL 3N | C898 | -9.83 V | -9.83 V | -9.83 V | 6.24 V | -9.83 V |
| SYNFIL 4N | C897 | 10.05 V | 10.05 V | 10.05 V | 10.05 V | -3.32 V |

7.4.6. Testing the Tuning Voltages

The diagram shows general characteristics of the tuning voltages. Individual calibration data may deviate from this curve; usually, there are deviations from the smooth tuning characteristics because of the calibration process. The upper curves show IQFILH1 and IQFILH2, the lower ones IQFILT1 and IQFILT2 (identical in this case). All 4 voltages can be read out via the diagnosis (Udiag = 20V * DACWERT/4095).

7.4.7. Testing the RF Signal Paths

The module accommodates SMP or MMCX test connectors X1 to X9. At these coaxial interfaces, matching and gain can be measured using a network analyzer, for example. For this purpose, the coupling capacitor, which is located at this place in the signal path, must be soldered from the desired input or output to the test connector. In addition to a number of coupling capacitors in the signal path, there are grounded through-connections (GND). There, it is possible, e.g. to solder in a coaxial cable and connect its inner conductors to the signal path. For specifications of nominal gain or nominal level please refer to the block diagram. S-parameter measurements in the frequency range 3 to 6 GHz require extensive equipment and knowledge. Therefore, such measurements should only be performed by trained personnel.

7.4.8. Adjusting the Drain Current of A510 in the POWER UNIT

Cut in the ammeter at X14.1 - X14.2.
Use trimmer R172 to adjust the current to 500 ± 5 mA.

7.4.9. Adjusting the Reference 10 V

Use trimmer R608 to adjust to $10 \text{ V} \pm 0.001 \text{ V}$ at the test point X20.4.

7.4.10. RF-DC-ZERO Adjustment at Output Detector

Remove jumper at X14.1-X14.2, set the voltage at X16.1 (reference X16.2) to $-17 \text{ mV} \pm 0.5 \text{ mV}$ using potentiometer R394, plug in the jumper at X14.1-X14.2.

7.4.11. Adjusting the RF Level Linearity

Instrument settings: PRESET, RF 3301 MHz, LEVEL 2.1 dBm, LEVEL/LEVEL/ATTENUATOR MODE FIXED.

Connect power sensor of power meter to RF connector of SMIQ. Save the measured value as reference value on the power meter and select the Δ dB display. Set LEVEL -18.1 dBm.

Use potentiometer R173 to adjust the DETECTOR OFFSET to 20-dB drop on the power meter.

By adjusting alternately using potentiometer R173 and potentiometer R394 (RF-DC-ZERO), the level deviation from the nominal value can be minimized in the level range -20 dBm to 13 dBm.

7.4.12. Adjusting the IF900 Level

Remove the module, unscrew the screening cover.

Unsolder the coupling capacitor C663 from the signal path and solder in such that R625 is connected to X2.

Place the module onto the service adapter, set up the RF connections, install the adapter into the instrument. Make sure to allow for sufficient cooling of the module, since the cooling effect of the screening covers and the air current is missing.

Instrument setting PRESET, RF 3301 MHz.

Connect a power meter to X2 and measure the level (f = 900 MHz). Adjust the RF level at X2 to -12 dBm using LEVEL IF900 (R848).

7.4.13. Calibration of the Tunable Filters

The filters are calibrated in the factory in the module pretesting. This is necessary when replacing tuning diodes in the tunable filters or the EEPROM.

7.4.14. Tables and Interfaces

7.4.14.1. Diagnosis

RF: Diagnosis voltage determined via RF rectifier.

IR: Interrupt at processor when the permissible thresholds are exceeded.

TF: Division factor (corresponds to voltage divider ratio at test point).

Diagnosis multiplexer D27:

| Diag. point SMIQ | Test point | Type | IR | Umin/ Volt | Umax/ Volt | TF |
|------------------|--|------|----|---------------|---------------|----|
| 10 2400 | Reference 10 kΩ | DC | | -10m | +10m | 1 |
| 11 2401 | VDETOUT Output level of module | RF | | 0 | 10 | 4 |
| 12 2402 | UTEMP | DC | | 0 | 5 | 1 |
| 13 2403 | Free | | | | | |
| 14 2404 | IQFILT1 tuning voltage LP tracking filter | DC | | 0 | 20 | 5 |
| 15 2405 | IQFILT2 tuning voltage LP tracking filter | DC | | 0 | 20 | 5 |
| 16 2406 | IQFILH1 tuning voltage HP tracking filter | DC | | 0 | 20 | 5 |
| 17 2407 | IQFILH2 tuning voltage HP tracking filter | DC | | 0 | 20 | 5 |

| Diagnosis multiplexer D25: | | | | | | |
|----------------------------|----------------------------------|------|----|-----------|-----------|----|
| Diag. point SMIQ | Test point | Type | IR | Umin/Volt | Umax/Volt | TF |

7.5. Disassembly and Assembly

After opening the instrument, unlocking the module and loosening the RF connections, the module can be taken out of its slot. The screening covers of the module are fastened with screws; loosen the screws of the upper cover first and tighten them last.

For mounting the POWERUNIT observe the mounting instructions (see component location plan).

7.6. External Interfaces

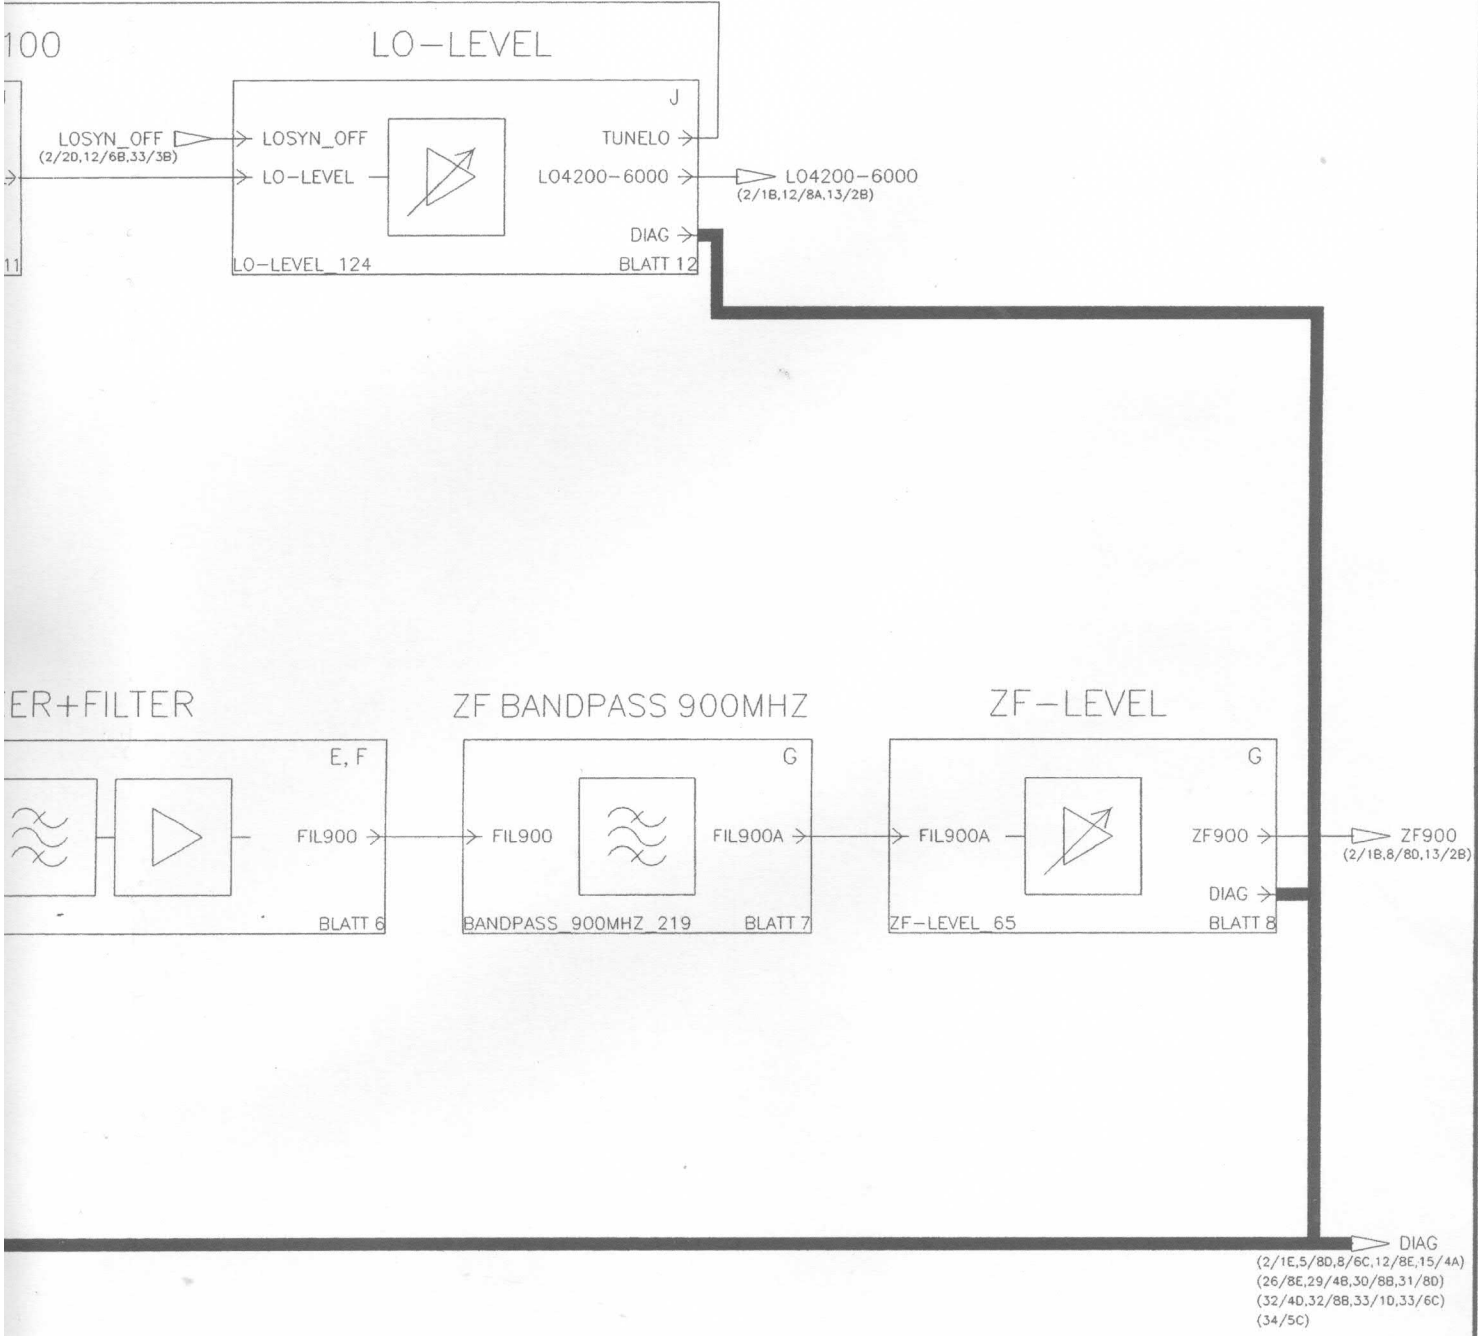

| Signal name | from module | Signal data | Remark |
|-------------|------------------------------|---|--|
| IQ300 | IQMOD (IQ AUX) | 300 MHz \pm 50 MHz for IQ modulation -9 dBm \pm 0.1 dB 50 ohms S11 < -15 dB | |
| REF600 | Reference/ step synthesis | 600 MHz 13 dBm \pm 1 dB 50 ohms S11 < -15 dB | |
| VREFAM | IQMOD | DC ... 100 kHz 6 VDC \pm (AM * 6 V) | Modulation signal for AM |

POWER-UNIT 1084.9500.02 with
 11ST. 088.0024 and
 11ST. 005.0280 and
 5ST. 048.6496 screws.

- The power unit should be mounted in the following order:
1. Fix power unit by means of screws 1+2 (tighten screws only 11)
 2. Lay and connect cables.
 3. Mount top cover and fix power unit by means of screws 3+4 (front side, next SMA connector)
 4. Tighten screws 1+2 with 60 Ncm
 5. Remove top cover.
 6. Wire eight lead-through filters of power unit with PCB (inclu
 7. Mount top and bottom covers and tighten all remaining screws (7 1tms 088.0024 + 005.0280 on components side, 5 1tms 048.6496 soldered side.)

1084.9500.02 with
 3.0024 and
 5.0280 and
 3.6496 screws.

It should be mounted in the following order:
 unit by means of screws 1+2 (tighten screws only lightly.)
 connect cables.
 cover and fix power unit by means of screws 3+4
 (next SMA connector)
 screws 1+2 with 60 Ncm
 cover.
 lead-through filters of power unit with PCB (include strain relief).
 and bottom covers and tighten all remaining screws with 60Ncm.
 3.0024 + 005.0280 on components side, 5 times 048.6496 on
 side.)

POWER-UNIT 1084.9500.02 MIT
 11ST. 088.0024 UND
 11ST. 005.0280 UND
 5ST. 048.6496 VERSCHRAUBEN.

DIE POWER-UNIT SOLLTE NACH FOLGEN
 1. POWER-UNIT MIT SCHRAUBE 1+2 BEFESTIGT
 2. KABEL VERLEGEN UND EINSTECKEN.
 3. DECKEL OBEN BESTUECKEN, UND POWER-UNIT
 MIT SCHRAUBE 3+4 BEFESTIGEN. (STIRNSEITE)
 4. SCHRAUBE 1+2 MIT 60Ncm FESTZIEHEN.
 5. DECKEL OBEN WIEDER ENTFERNEN.
 6. 8 X DURCHFUEHRUNGSFILTER DER POWER-UNIT
 7. WENN DIE DECKEL OBEN UND UNTEN MONTIEREN
 RESTLICHEN SCHRAUBEN MIT 60Ncm FESTZIEHEN.
 (7 ST. 088.0024 + 005.0280 AUF BAUTSEITE
 5 ST. 048.6496 AUF LOETSEITE.)

POWER-UNIT 1084.9500.02 MIT

- 11ST. Ø88.0024 UND
- 11ST. Ø05.0280 UND
- 5ST. Ø48.6496 VERSCHRAUBEN.

DIE POWER-UNIT SOLLTE NACH FOLGENDER REIHENFOLGE MONTIERT WERDEN:

1. POWER-UNIT MIT SCHRAUBE 1+2 BEFESTIGEN. (SCHRAUBEN NUR LEICHT ANZIEHEN.)
2. KABEL VERLEGEN UND EINSTECKEN.
3. DECKEL OBEN BESTUECKEN, UND POWER-UNIT MIT SCHRAUBE 3+4 BEFESTIGEN. (STIRNSEITE, NEBEN SMA STECKER)
4. SCHRAUBE 1+2 MIT 60Ncm FESTZIEHEN.
5. DECKEL OBEN WIEDER ENTFERNEN.
6. 8 X DURCHFUEHRUNGSFILTER DER POWER-UNIT MIT LP VERDRAHTEN. (MIT ZUGENTLASTUNG)
7. WENN DIE DECKEL OBEN UND UNTEN MONTIERT WERDEN, ALLE RESTLICHEN SCHRAUBEN MIT 60Ncm FESTZIEHEN.

(7 ST. Ø88.0024 + Ø05.0280 AUF BAUTEILSEITE.
5 ST. Ø48.6496 AUF LOETSEITE.)
