

HDTV Sequences DV-HDTV

Comprehensive collection of high-resolution transport and elementary streams

- ◆ Large choice of transport streams compatible with DVB and ATSC
- ◆ All video streams also available as elementary streams for individual combination with Stream Combiner™ software
- ◆ Ready for use with DVRG or DVG
- ◆ Sequence length of up to 32 seconds
- ◆ Support of all customary video formats and frame rates
- ◆ Different audio formats: MPEG-1 Layer 2 and AC-3
- ◆ Endless replay with non-interrupting transition from sequence end to sequence start for video and audio in the event of replay by DVRG

ROHDE & SCHWARZ

The DV-HDTV option from Rohde&Schwarz is a versatile combination of MPEG-2-coded streams for high-definition TV. Its versatility enables the testing of diverse units to almost all worldwide standards. In addition to several video formats for the European and American television, MPEG-coded and AC-3-coded audio data are supplied.

All video streams, with audio streams combined to transport streams, can be loaded to the DVG and DVRG from Rohde&Schwarz, and directly replayed. To combine individual transport streams with the Stream Combiner™ software, all the elementary streams used are stored individually on the CD-ROMs. This allows easy creation of customized MPEG-2-compliant transport streams.

The transport streams supplied are stored in the GTS format, which was developed by Rohde&Schwarz, and which allows endless, continuous and errorfree replay also at the transition between the beginning and the end of a stored sequence. The Stream Combiner™ software can also create transport streams in the GTS format.

Characteristics

Video and audio formats

The collection of transport and elementary streams comprises a variety of sequences. They are based on several test patterns and real film sequences. All video sequences are available as elementary streams in various resolutions and frame rates. They are complemented by audio signals in different formats, both in MPEG-1 Layer 2 and AC-3. The transport streams are designed to comply with the DVB and ATSC standards according to the formats of the video streams included. Furthermore, the transmission path (terrestrial, cable or satellite), defined by the transport stream, varies.

Applications

Besides the differentiation into audio and video formats, the collection can be subdivided into three groups:

- ◆ Transport streams for replay by DVG and DVRG
- ◆ Transport streams for replay by DVRG
- ◆ Elementary streams for the creation of transport streams with the Stream Combiner™ software for replay by DVRG or DVG

Due to the different lengths of the video and audio frames (e.g. ATSC: 33.366 ms/32 ms), an even number of video frames does not always result in an even number of audio frames. In the ATSC standard this is only possible at 32.032 seconds. Hardware limitations of the MPEG-2 Measurement Generator DVG may interrupt audio signals at the transition between sequence end and sequence start.

Frame examples taken from the transport and elementary stream collection

Installation

The installation depends on the device. On the DVRG, the transport streams can be replayed directly from a CD via the CD-ROM drive or the CD burner option within the DVRG, or can be copied to the hard disk with WindowsNT Explorer.

The option is installed on the DVG via a PC. The transport streams are replayed to the DVG with a special cable, which is supplied with Stream Combiner™. If Stream Combiner™ is not available, the cable can be ordered as an inexpensive alternative via the Transport Stream Update Option DVG-Z1.

The Stream Combiner™ software can either directly access the elementary streams from CD-ROM, or the elementary streams can be copied from the CD-ROM to the hard disk for ease of operation.

Documentation

Comprehensive documentation (see box) describes the characteristics of each transport stream. The relevant transport stream parameters and a description of the video and audio elementary streams are documented. The length of the sequence (time and number of frames) and the generator to be used (DVG and/or DVRG) are also provided. Thus, the documentation complements the library of transport and elementary streams as an effective tool.
