6 Service Instructions Power Supply A21 (Display Unit)

(See circuit diagrams 805.8513 S and 805.8013 S)

6.1 Function Description

This module contains the rectifier with the electrolytic capacitors for two unregulated voltages (+ 9.6 V, 100 V) from which a total of 4 voltages (+ 5 V, + 5 V_{cc}, + 5 V*, + 85 V) are generated as well as its own reference voltage, voltage monitoring and the switch-on logic for the display unit.

The transformer voltages are applied to the module via X213. The module is to a limited extent a stand-alone unit (no temperature monitoring of the heat sink).

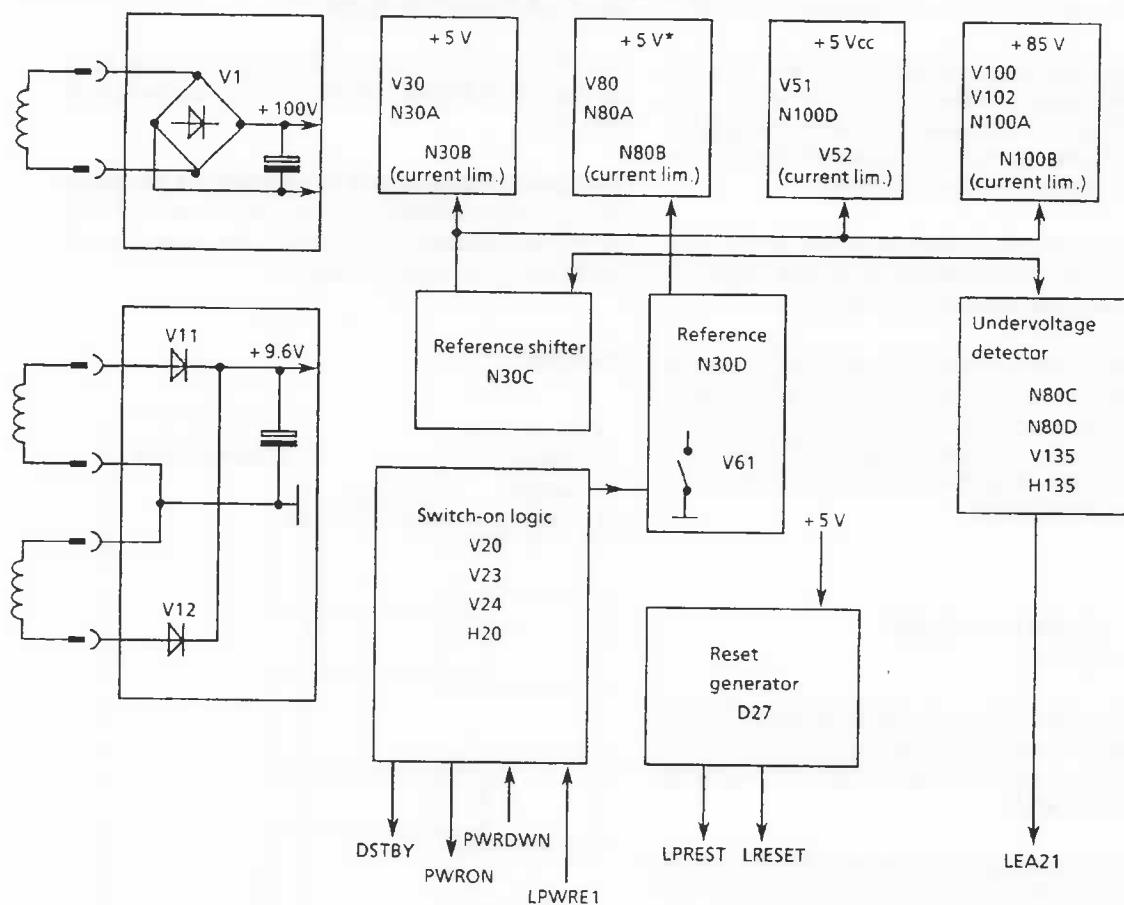

Fig. 6-1 Block diagram of the power supply module A21

6.1.1 Generation of Unregulated DC Voltages

An AC voltage of 76.5 V is applied to the rectifier via X213/1,2 and F1. C1 suppresses high-frequency rectifier noise. A DC voltage of approx. +100 V is then present at the charging capacitor C2.

Resistors R5 to R7 are used for discharging if the power switch is opened.

An AC voltage of 7.5 V is applied to the centre point rectifier circuit V11, V12 via X213/3,4,5,6 and F10, F12. C11,C12 suppress high-frequency rectifier noise. C13, C14 act as charge capacitors.

Several ground designations are used because the power supply is fitted with some sense lines. The housing of the display unit with the ground surface of the instrument motherboard is designated "Ground analog" (GNDA).

The digital ground (GNDD) is a line and is connected on the motherboard to GNDA together with the ground sense line (SGNDD).

Although these connections are made during operation via the lines of the motherboard (several mΩ), resistors R13 and R48 are provided on the module in order to guarantee defined operation and adjustment of the module without the motherboard.

6.1.2 Switch-on Logic

(See also Fig. 6-2)

The display unit is not usually switched off using the power switch at the rear of the instrument but receives a control signal from the standby key on the RF unit.

The various voltage regulators are therefore configured such that they have a very low output voltage by reducing the reference voltage.

The standby LED of the display unit is powered via the series resistor R9.

A voltage of 5.1 V is applied to emitter V20 by R10, V21.

If the standby key is pressed, the line PWRDWN (X212/2) is connected to ground and V20 switched through.

(This switching state can be produced for testing by changing over jumper X190 from 1 to 2).

The signal PWRON is output (via the motherboard to A22) by R14 via X212/20.

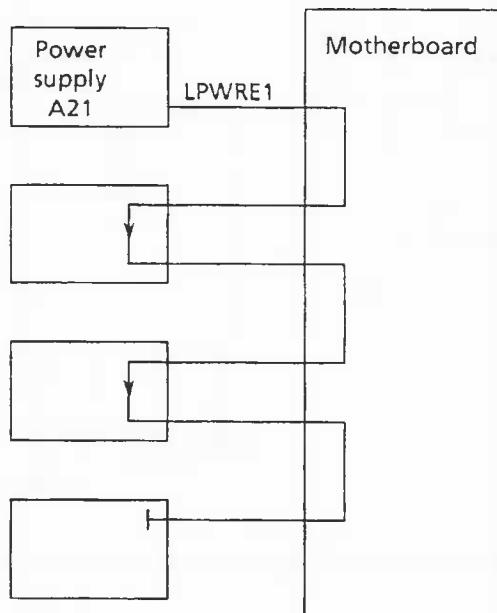

Caution:

The PWRON signal is a wired-OR link and may also be switched to ground by module A22 in the event of overtemperature.

The PWRON signal is also blocked by V23 as long as the line X212/12 LPWRE1 is not connected to ground.

This ground loop is used to monitor the presence of important modules in the instrument. If one of these modules is removed, the power pack switches off all output voltages.

Principle:

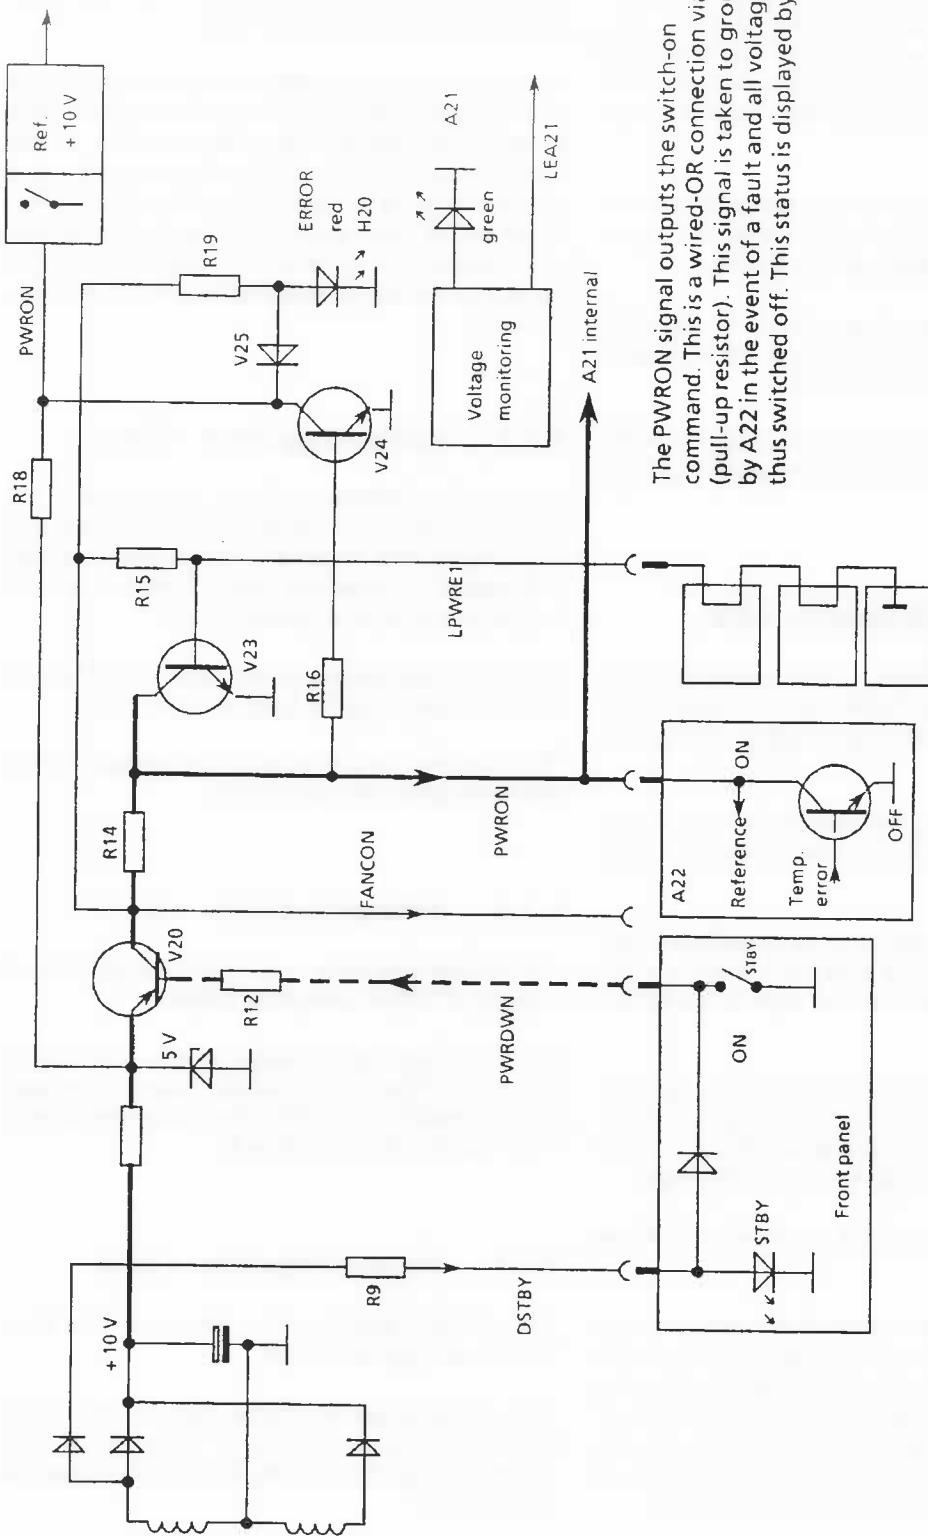

Fig. 6-2 Basic circuit diagram of switch-on logic

6.1.3 Reference Voltage

The reference voltage of this module is adjusted using R63. Since all voltages of the individual controllers are derived from this and are programmed using fixed resistors, the reference voltage is first adjusted to a nominal value of + 10 V and a fine adjustment then carried out to + 85.00 V.

V61 blocks if the instrument is switched off and approx. + 10 V is present at N30D/14. The generated reference voltage refers to GNDA.

The module also generates + 5 V, + 5 V_{CC} and + 85 V which refer to GNDD and are equipped with a ground sense line (SGNDD).

The analog subtracter (N30C, R56, R58, R70, R71) transfers the reference voltage referred to GNDA to SGNDD.

6.1.4 Voltage Regulator + 5 V

The voltage regulator + 5 V comprises the operational amplifier N30A and the power Darlington transistor V30 connected as an emitter follower.

The voltage is equipped with sense lines in the + branch (+ 5 V) and in the ground branch (SGNDD).

The reference voltage of + 10 V delivered by N30C/8 is divided into 5 V by the voltage divider R54, R55 and applied to the control amplifier N30A/3.

The output voltage is fed back via R40, R41 and C37, where R40 shorts the open-circuited sense line when testing or in the event of a fault and thus prevents the voltage becoming too high.

R35, C30, R33, C31 are used to correct the phase of the control loop.

The current through the load is monitored by R30, R31, R32. The connection of R30B results in a fold-back circuit which reduces the current limitation from 6 A down to 1.3 A in the event of a short-circuit. The control point is reached if the voltage at N30B/7 has reached 5.65 V. V36 then conducts and N30B governs the control loop.

C35 is a blocking capacitor. H45 indicates the presence of the voltage. If the output voltage is connected to a voltage with a different polarity, V35 prevents a reverse voltage larger than the diode forward voltage from occurring.

If the output voltage should rise in the control unit uncontrolled as the result of a fault, the Zener diode V46 conducts above 5.6 V. If the current flowing through the diode results in a voltage drop across R46 of more than 0.7 V, thyristor V45 is fired and short-circuits the voltage which blows the quick-acting fuse F30 and prevents damage to the modules as a result of overvoltages.

6.1.5 Voltage Regulator + 5 V_{CC}

The voltage regulator + 5 V_{CC} generates a + 5 voltage which is used to feed external equipment. The internal + 5-V supply of the instrument is therefore not influenced or damaged in the event of a short-circuit.

N100D controls the series regulator V51; R52 and V52 are responsible for current limitation.

H50 indicates the presence of the voltage; V50 is the reversed voltage protection.

6.1.6 Voltage Regulator + 5 V*

The voltage regulator + 5 V* delivers an output voltage of 5.65 V referred to GNDA.

The circuit is of similar design to the + 5-V circuit and only differs by R91 which forms a voltage divider together with R67. The maximum current which can be drawn is 350 mA.

6.1.7 Voltage Regulator + 85 V

The voltage regulator + 85 V obtains a + 10-V reference voltage via N30C/8.

The control amplifier N100A controls the series transistor V100 by means of V102, R114. The voltage divider R106, R108, R112, R113 closes the control loop.

C107 is used for dynamic negative feedback. The unregulated DC voltage is connected to GNDD via R103. N100B monitors the current via R103 and, as a fold-back circuit, limits the current of max. 500 mA to 100 mA in the event of a short-circuit.

The control point is reached at 10.65 V on N100B/7 if V101 starts to conduct.

V115 indicates the presence of the +58-V voltage by means of H115.

6.1.8 Demagnetization

The monitor tube is demagnetized each time the power supply is switched on. The transformer voltage from X213 is routed to the demagnetization coil via the dual NTC resistor (via X211/6 and 8). The high current is reduced within a few seconds when the series-connected PTC resistor warms up. The PTC resistor connected in parallel then additionally heats up the series-connected PTC resistor and holds the residual current in the range of several mA.

6.1.9 Monitoring

N80C and N80D monitor the voltages and indicate with H135 the presence and correct functioning of the module.

If one of the voltages fails or enters the current limitation because the current drain is too high (= fault in instrument), V135 is switched on and the error message LEA21 passed to the μ P system. The LED H135 is switched off at the same time via V136.

The temperature on the heat sink of module A21 is monitored by module A22 using V200.

6.2 Testing and Adjustment

As already mentioned in the circuit description, all voltages are derived from the + 10-V reference voltage and depend on its adjustment.

The + 85-V supply is factory-set to $\pm 0.1\%$ using the reference voltage. An aging error of $\pm 2\%$ is permissible for the + 85 V.

Caution:

Adjustment of R63 changes all voltages by the same percentage.

The output voltages should have the following tolerances after the adjustment:

- + 5 V $\pm 2\%$ (measured at sense point)
- + 5 V* = 5.64 V $\pm 2\%$
- + V_{CC} = 5 V $\pm 2\%$
- + 85 V $\pm 2\%$

Note:

If a voltage exceeds the tolerance limits when the + 85 V is adjusted, an adjustment is also permissible whilst all other voltages are within the tolerances.

6.3 Troubleshooting

The power supply module A22 (display unit) is also incorporated in the troubleshooting.

The instrument does not respond on power-up.

- ▶ Check AC supply and fuse.
- ▶ Check that the power-on command is available at the module (PWRDWN must be Low at X212/2). If the signal is High, the power-on command can be simulated by the jumper X191/1 and 2 (test position).
- ▶ If the above-mentioned measures are not successful, the voltages at the charging capacitors C13, C18 and C2, as well as the voltages at cathode V21 and at N30D/14 (+ 10 V reference) must be checked. The latter is switched by V61.

Only the red LED lights up and possibly the blowers are working.

- ▶ If important modules are missing in the instrument, the current loop (LPWRE1 at X212/12) is interrupted and the signal High appears. This can be bypassed by setting jumper X191 to the test position (1 and 2).
- ▶ An overtemperature fault is present. The blowers rotate at a medium speed in this case, the output voltages are switched off. X222/8 (LETEMP) must be Low. The instrument switches itself on again when cooled down.

X222/8 (LETEMP) is Low, but blowers are not on.

- ▶ X222/3 (FANCON) must be High.
- ▶ -15.6 V must be present at X222/17 and the voltage at X222/18 must be between -0.7 V and approx. + 20 V (depends on speed).

The line to the 2nd temperature sensor on module A22 is interrupted.

- ▶ In this case, the voltage at X222/4 (TEMPC) is > 5 V.

The instrument can be switched on, but the green LED does not light up.

- ▶ Check which voltages are missing using the yellow LEDs. If all LEDs light up, check the tolerances of the voltages using a voltmeter.

Possible causes for a missing voltage:

- ▶ Current drain in instrument is too high, or a module is faulty.

In this case, disconnect the modules in succession from the power supply by pulling out and then switch the instrument on again. The faulty module can then be determined.

- ▶ The overvoltage protection has been triggered. A short-circuit may be present on a module, or the series regulator or control is faulty. The voltage usually then enters the current limitation unless the series transistor is faulty and the fuse is blown.

- ▶ A short-circuit is present in the instrument with a voltage of opposite polarity. The current then flows via the polarity diode.

Refer to the circuit description if components are suspect within the module.

This is a detailed schematic diagram of an electronic circuit board, likely a printed circuit board (PCB) layout. The diagram shows a complex network of interconnected components, primarily resistors (labeled R), capacitors (labeled C), and integrated circuits (labeled V). Key components include:

- Integrated Circuits (ICs): V11, V12, V13, V14, V15, V16, V17, V18, V19, V20, V21, V22, V23, V24, V25, V26, V27, V28, V29, V30, V31, V32, V33, V34, V35, V36, V37, V38, V39, V40, V41, V42, V43, V44, V45, V46, V47, V48, V49, V50, V51, V52, V53, V54, V55, V56, V57, V58, V59, V60, V61, V62, V63, V64, V65, V66, V67, V68, V69, V70, V71, V72, V73, V74, V75, V76, V77, V78, V79, V80, V81, V82, V83, V84, V85, V86, V87, V88, V89, V90, V91, V92, V93, V94, V95, V96, V97, V98, V99, V100, V101, V102, V103, V104, V105, V106, V107, V108, V109, V110, V111, V112, V113, V114, V115, V116, V117, V118, V119, V120, V121, V122, V123, V124, V125, V126, V127, V128, V129, V130, V131, V132, V133, V134, V135, V136, V137, V138, V139, V140, V141, V142, V143, V144, V145, V146, V147, V148, V149, V150, V151, V152, V153, V154, V155, V156, V157, V158, V159, V160, V161, V162, V163, V164, V165, V166, V167, V168, V169, V170, V171, V172, V173, V174, V175, V176, V177, V178, V179, V180, V181, V182, V183, V184, V185, V186, V187, V188, V189, V190, V191, V192, V193, V194, V195, V196, V197, V198, V199, V200.

Other significant labels include:

 - Resistors: R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, R12, R13, R14, R15, R16, R17, R18, R19, R20, R21, R22, R23, R24, R25, R26, R27, R28, R29, R30, R31, R32, R33, R34, R35, R36, R37, R38, R39, R40, R41, R42, R43, R44, R45, R46, R47, R48, R49, R50, R51, R52, R53, R54, R55, R56, R57, R58, R59, R60, R61, R62, R63, R64, R65, R66, R67, R68, R69, R70, R71, R72, R73, R74, R75, R76, R77, R78, R79, R80, R81, R82, R83, R84, R85, R86, R87, R88, R89, R90, R91, R92, R93, R94, R95, R96, R97, R98, R99, R100, R101, R102, R103, R104, R105, R106, R107, R108, R109, R110, R111, R112, R113, R114, R115, R116, R117, R118, R119, R120, R121, R122, R123, R124, R125, R126, R127, R128, R129, R130, R131, R132, R133, R134, R135, R136, R137, R138, R139, R140, R141, R142, R143, R144, R145, R146, R147, R148, R149, R150, R151, R152, R153, R154, R155, R156, R157, R158, R159, R160, R161, R162, R163, R164, R165, R166, R167, R168, R169, R170, R171, R172, R173, R174, R175, R176, R177, R178, R179, R180, R181, R182, R183, R184, R185, R186, R187, R188, R189, R190, R191, R192, R193, R194, R195, R196, R197, R198, R199, R200.

Capacitors: C1, C2, C3, C4, C5, C6, C7, C8, C9, C10, C11, C12, C13, C14, C15, C16, C17, C18, C19, C20, C21, C22, C23, C24, C25, C26, C27, C28, C29, C30, C31, C32, C33, C34, C35, C36, C37, C38, C39, C40, C41, C42, C43, C44, C45, C46, C47, C48, C49, C50, C51, C52, C53, C54, C55, C56, C57, C58, C59, C60, C61, C62, C63, C64, C65, C66, C67, C68, C69, C70, C71, C72, C73, C74, C75, C76, C77, C78, C79, C80, C81, C82, C83, C84, C85, C86, C87, C88, C89, C90, C91, C92, C93, C94, C95, C96, C97, C98, C99, C100.

Power and Ground: BG, H1, H2, H3, H4, H5, H6, H7, H8, H9, H10, H11, H12, H13, H14, H15, H16, H17, H18, H19, H20, GND, GND4, GND5, GND6, GND7, GND8, GND9, GND10, GND11, GND12, GND13, GND14, GND15, GND16, GND17, GND18, GND19, GND20, GND21, GND22, GND23, GND24, GND25, GND26, GND27, GND28, GND29, GND30, GND31, GND32, GND33, GND34, GND35, GND36, GND37, GND38, GND39, GND40, GND41, GND42, GND43, GND44, GND45, GND46, GND47, GND48, GND49, GND50, GND51, GND52, GND53, GND54, GND55, GND56, GND57, GND58, GND59, GND60, GND61, GND62, GND63, GND64, GND65, GND66, GND67, GND68, GND69, GND70, GND71, GND72, GND73, GND74, GND75, GND76, GND77, GND78, GND79, GND80, GND81, GND82, GND83, GND84, GND85, GND86, GND87, GND88, GND89, GND90, GND91, GND92, GND93, GND94, GND95, GND96, GND97, GND98, GND99, GND100.
