Microwave Signal Generator SMR

High-performance, cost-effective and reliable up to 40 GHz

- Instrument family with four models
  - SMR20 (10 MHz to 20 GHz)
  - SMR27 (10 MHz to 27 GHz)
  - SMR30 (10 MHz to 30 GHz)
  - SMR40 (10 MHz to 40 GHz)
- Standard version:
  CW generator with pulse modulation and digital frequency sweep
- Easily upgradeable to AM/FM signal generator and synthesized sweep generator with analog ramp sweep thanks to flexible options concept
- Optional pulse generator for radar and EMC applications
- Optional IF input for upconversion of digitally modulated IF signals
- Compact, lightweight, user-friendly: ideal in the lab and for field applications
- 3-year calibration cycle

ROHDE&SCHWARZ

The allrounder – designed for future-proofness

Maximum ease of operation

- High-contrast LC display
- Online help including IEC/IEEE-bus commands
- Simple and self-explanatory settings
- User-assignable keys
- One-hand operation with EasyWheel

Wide frequency range

- SMR20 (1 GHz to 20 GHz)
- SMR27 (1 GHz to 27 GHz)
- SMR30 (1 GHz to 30 GHz)
- SMR40 (1 GHz to 40 GHz)
- Optional extension of lower frequency limit to 10 MHz (SMR-B11)
- Frequency resolution 1 kHz, optional 0.1 Hz (SMR-B3)

High output power

- SMR20 >+10 dBm (at 20 GHz)
- SMR27 >+11 dBm (at 27 GHz)
- SMR30/40 >+9 dBm (at 30/40 GHz)

High-precision level control

- High-precision, frequency-response-compensated level control
- Setting range extendible to –130 dBm by means of RF attenuator option (SMR-B15/-B17)

Three instruments in one

- CW generator with pulse modulation capability (standard version)
- Signal generator with AM/FM and LF generator (option SMR-B5)
- Synthesized sweep generator with analog ramp sweep (option SMR-B4)

Optional pulse generator (SMR-B14)

- Operating modes: single pulse, double pulse, externally triggered, gate mode
- Pulse repetition 100 ns to 85 s
- Pulse width 20 ns to 1 s

Sweep capabilities

- Digital RF and level sweep (standard version)
- Analog ramp sweep (RF sweep, option SMR-B4)
- Max. sweep rate for ramp sweeps min. 600 MHz/ms (frequency >2 GHz)
- Digital sweep of LF generator (with option SMR-B5)
- 10 freely selectable frequency markers for RF sweep
- Operating modes: automatic, single-shot, manual, externally triggered

Optional IF input (SMR-B23/SMR-B24/SMR-B25)

- Built-in upconverter for digitally modulated IF signals (SMR-B23/-B24: DC to 700 MHz, SMR-B25: 40 MHz to 6 GHz for SMR 20 only)
- Ideal for use with Vector Signal Generator SMIQ and I/Q Modulation Generator AMIQ

SMR as CW generator

The SMR family comprises four basic models designed as CW generators with pulse modulation capability. The four models have a common lower frequency limit of 1 GHz and provide frequency coverage up to 20 GHz (SMR20), 27 GHz (SMR27), 30 GHz (SMR30) and 40 GHz (SMR40). The lower limit can be expanded to 10 MHz by the optional Frequency Extension 0.01 GHz to 1 GHz (SMR-B11).

Offering an excellent price/performance ratio, each of the four basic models is ideal for the user wishing to enter the field of microwave testing at an affordable price. Should the measurement tasks become more demanding, the basic models can be upgraded any time by means of options to give an AM/FM signal generator or a synthesized sweep generator featuring fast, fully synthesized, analog ramp sweep.

Excellent spectral purity
The SMR stands out from other generators for its excellent spectral purity. Advanced frequency synthesis with fractional-N divider makes for low SSB phase noise and high spurious suppression, both of which are for example prerequisites for reliable receiver measurements. Modern microwave filters in the output path of the instrument ensure excellent harmonics suppression. This is necessary to obtain conclusive results in scalar network analysis measurements.

High-precision output level
Microwave signal generators are frequently used for calibrating test receivers. This task calls for a highly accurate and stable output level settable with high resolution. This is ensured by a high-precision, frequency-response-compensated level control for levels higher than –20 dBm. The setting range can be extended to –130 dB with the optional RF Attenuator SMR-B15 or SMR-B17.

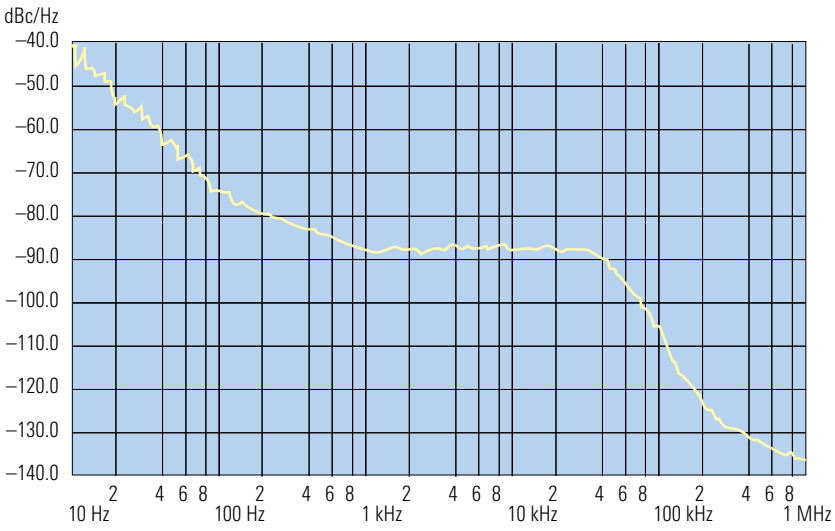
Stable output frequency
The crystal reference built in as standard ensures an accurate, low-drift output frequency. The SMR can be fitted with the optional OCXO Reference Oscillator SMR-B1 to satisfy the most stringent requirements on accuracy and aging.

High output level saves you real cash
All microwave test setups involve high losses caused by the use of long cables, power dividers, directional couplers and RF relays. Expensive microwave amplifiers are usually the only means to remedy this. But not with the SMR: the high output power provided by all models eliminates the need for such a costly component.

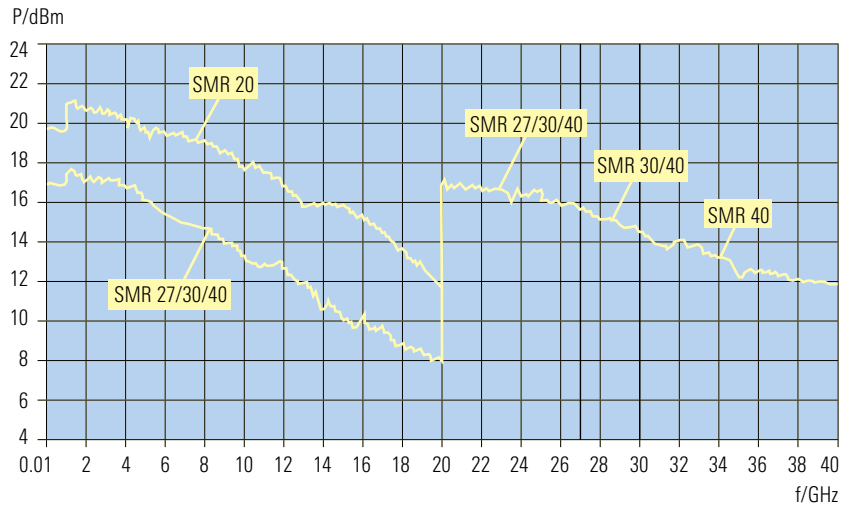
Application-oriented frequency resolution
The standard frequency resolution of 1 kHz of the SMR offers a comfortable margin for most applications, for example frequency response measurements in the laboratory and in production and servicing. To satisfy more stringent requirements, e.g. for scientific applications and research, the SMR-B3 option is available to improve frequency resolution to 0.1 Hz.

Pulse modulator included
Pulse modulation is still the most important modulation mode for microwave applications. Each of our basic units is, therefore equipped with a high-quality pulse modulator. The on/off ratio is better than 80 dB, the rise/fall time shorter than 12 ns. Pulse widths of up to 25 ns are possible.

These guaranteed values illustrate that the SMR is the ideal generator for use in the development, production and maintenance of radar equipment.



SSB phase noise at 10 GHz



Typical max. output level as a function of frequency (with options SMR-B15 and SMR-B17)

Pulse generator option

The optional Pulse Generator SMR-B14 is an ideal complement to the pulse modulator. It generates single and double pulses with pulse frequencies up to 10 MHz. The pulse generator can also be triggered externally and operated in the external gate mode. The pulse width and delay are freely selectable over a wide range.

Digital frequency and level sweeps

The digital frequency sweep with step times from 10 ms allows convenient frequency response measurements on microwave circuits. The start and stop frequencies are freely selectable. A trigger input enables synchronous operation with external equipment.

The 20 dB level sweep allows, for example, amplifier or mixer compression to be determined.

SMR as signal generator

AM/FM/Scan modulator option

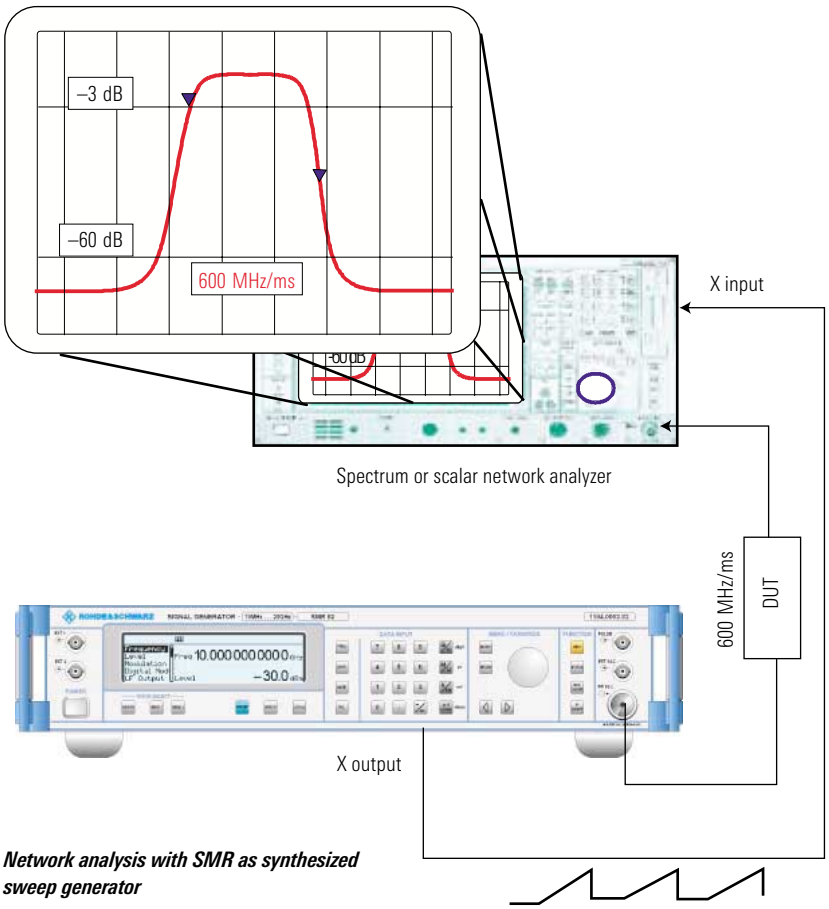
The optional AM/FM/Scan Modulator SMR-B5 added to the basic models turns them into fully-fledged signal generators with AM and FM modulation capability. The option also includes an LF generator for sinewave and squarewave signals from 0.1 Hz to 10 MHz.

FM and FSK

The FM modulator has a modulation bandwidth from DC to 5 MHz. Digital frequency shift keying (FSK) is possible with data rates from 0 Hz to 2 MHz.

Simultaneous modulation modes

All modulation modes of the SMR can be combined. This allows the generation of complex modulation signals for modern communication and location systems. The combination of pulse modulation and FM simulates Doppler effects or chirp signals. Simultaneous AM and pulse modulation provides the types of signal occurring in pulse radar applications with rotating antenna. The combination of FM and AM can be used to check fading effects of FM receivers.



Network analysis with SMR as synthesized sweep generator

SMR as synthesized sweep generator

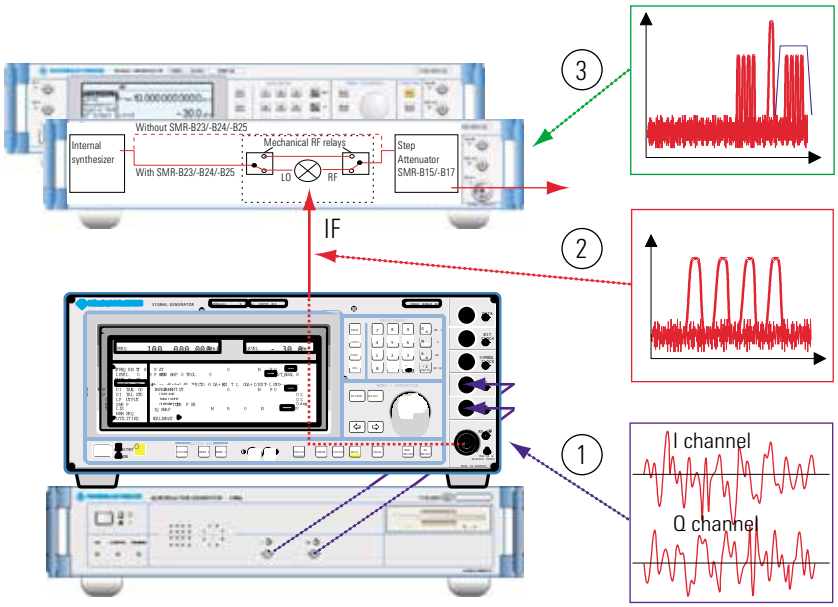
Analog ramp sweep option

The analog ramp sweep mode corresponds to the analog sweep of classic sweep generators except that the sweep is fully synchronized over the complete range. In this way, the excellent frequency accuracy of digital step sweeps is achieved on the whole, and this at much higher sweep rates of min. 600 MHz/ms from 2 GHz on.

In conjunction with scalar network analyzers or suitable spectrum analyzers, realtime adjustment of microwave filters can be performed, for example.

To mark important frequency ranges such as filter bandwidths or the position of attenuation poles, the SMR has 10 user-selectable frequency markers which can be output as pulse markers at the marker output (TTL level) or alternatively modulated on the RF level as level markers (level reduction of 1 dB).

The use of the SMR in conjunction with a scalar network or spectrum analyzer is illustrated by the figure at the bottom of page 4.



SMR as upconverter for digitally modulated signals

SMR as upconverter

IF input option

Vector signal generators like the SMIQ generate all types of digitally modulated signals up to 6.4 GHz. To generate signals up to 40 GHz, the SMR offers upconversion capability by means of the IF input option. A typical application is shown by the figure above. The I/Q Modulation Generator AMIQ supplies the I and Q signals (1) for modulating the Vector Signal Generator SMIQ.

The modulated RF signal of the SMIQ (2) is applied directly to the IF input of the SMR. At the RF output of the SMR, the converted, digitally modulated signal of the SMIQ is brought out (3). In the example illustrated above, the selective circuits of the DUT separate the wanted signal from unwanted components generated during upconversion.

Alternatively, suitable external bandpass filters can be used.

Vibration, random	10 Hz to 300 Hz, acceleration 1.2 g (rms)
Shock	40 g shock spectrum, meets MIL-STD-810D, MIL-T-28800D, class 3/5
Electromagnetic compatibility	meets EN 50081-1 and EN 50082-1 (EMC directive of EU)
Leakage (carrier frequency <1 GHz)	<0.1 µV (induced in a two-turn coil 25 mm in diameter at a distance of 25 mm from any surface of the enclosure)
Radiated susceptibility	10 V/m
Power supply	100 V to 120 V (AC), 50 to 400 Hz 200 V to 240 V (AC), 50 to 60 Hz, autoranging, max. 200 VA
Safety standards	DIN EN 61010-1, IEC 1010-1, UL 3111-1, CSA 22.2 No. 1010-1
Conformity marks	VDE-GS, CSA, NRTL/C
Dimensions (W x H x D)	427 mm x 88 mm x 450 mm
Weight	<12 kg when fully equipped
