PART 3	Service

How to use this manual

This workshop manual provides technicians with detailed information on RM2152 the new version of the old RM2150 DSC Watch Receiver and the old RM2151 DSC/Telex Receiver.

Please note:

Any responsibility or liability for loss or damage in connection with the use of this product and the accompanying documentation is disclaimed.

The information in this manual is furnished for informational use only, is subject to change without notice, may contain errors or inaccuracies, and represents no commitment whatsoever.

This agreement is governed by the laws of Denmark.

Overview of RM2152

The RM2152 may have a number of names, depending on whether it is a SAILOR, NORCONTROL, Husun or Sperry product. In this manual, however, only the SAILOR names are used.

The table below shows the different names used for each unit, emphasizing the SAILOR names

Compact HF SSB DSC Watchreceiver RM2152	SAILOR	NORCONTROL	Husun	Sperry
	RM2152	RM2152	2152	RM2152

1 GENERAL INFORMATION

1.1 INTRODUCTION

Compact HF SSB RM2152 is the DSC and TELEX scanning receiver with built-in DSC and TELEX modem.

It has been developed on the basis of SAILOR's many years of experience with short wave communication equipment.

It has the same high reliability as all SAILOR equipment is known for.

It has been constructed so that it fits in with other units in the Compact Programme 2000.

SAILOR HF SSB PROGRAMME 2000 CONSISTS OF THE FOLLOWING UNITS:

- RE2100: Control unit with integral receiver and exciter.
- T2130: 250W PEP SSB transmitter with integral power supply for RE2100.
Supply voltage 24V DC.
- AT2110: 250W PEP aerial coupler for outdoor use.
- N2160: 12V DC power supply for T2130.
- N2161: 110/220/240V AC, 50 Hz power supply for T2130.
- N2165: AC/DC power supply for RM2152

1.2 GENERAL DESCRIPTION

RM2152

- is an all solid state constructed microcomputer controlled SSB short wave radio modem.
- covers the frequency range 100 kHz to 30 MHz.
- is a scanning receiver with integral DSC and TELEX modem.
- has a special serial input/output (SP-BUS) enabling RM2152 to communicate with the other units in the Compact 2000 programme.
- is fully synthesized and has a high stability reference oscillator (TCXO).
- has an- easy-to-read display with controlable backlight.
- has a push-button keyboard offering an attractive tactile feeling and a safe finger-guide in the metal front. The keyboard is fitted with night-illumination of the lettering.
- is a fully automatic ARQ telex unit with HF SSB RE2100 and the terminal equipment H2098A/H2099/H1253B. The terminal equipment can be replaced by a personal computer.
- is a fully automatic DSC unit with HF SSB RE2100.
- has a read-out in alpha numerical display of received DSC information. Printer not necessary.
- has easy to understand menu-controlled DSC calls.

1.3 TECHNICAL DATA

SYSTEMS SPECIFICATIONS

Communication protocol	DSC: CCIR Rec. 493-9 (class A), 541-8. ETS 300 338, IEC 945. Telex: CCIR Rec. 625, 476-3, 490, 491(1978), CCITT Rec. 130.
Other Rec's:	In compliance with ETSI, CEPT, MPT, FTZ and FCC.
Modes of operation:	ARQ, FEC, SELEC, and DSC.
Line signal:	Two tone keyed, 100 baud synchronous. DSC: 10 unit code, 7 bits information and 3 bits parity. TELEX: 7 unit code, constant 4B/3Y ratio.
Call codes:	DSC: 9 digits station identification. TELEX: 5 digits and 9 digits with dual ship ID-codes for individual and group calls.
Keys:	All keys are back-illuminated.
Display:	" Graphic LCD display with adjustable backlight angle.
Acoustic Alarm:	DISTRESS and URGENCY alert, alert for other type of received calls. Warning for wrong or missing entries.
Scanning facilities:	10 scan programmes containing up to 6 different frequencies.
Call stacks:	The 5 last received ordinary calls. Not older than 48 hours. The 20 last received DISTRESS calls. Not older than 48 hours.
Program memory:	384 kilobyte main memory in EPROM. 512 kilobyte volatile RAM. 64 kilobyte Nonvolatile RAM (battery back-up). 32 kilobyte Nonvolatile EEPROM.

RECEIVER SPECIFICATIONS

Receive System:	Double conversion super heterodyne 1st IF 70 MHz. 2nd IF 10.73 MHz.
Frequency Range:	100 kHz to 29999.9 kHz.
Antenna impedance:	50 Ω
Frequency Stability:	Better than 0.39 ppm.
IF selectivity:	Passband ripple better than 1 dB. 3 dB bandwidth at ± 150 Hz to ± 350 Hz. 60 dB bandwidth at ± 750 Hz.
Sensitivity:	DSC calling sensitivity -18 dB/V. TELEX calling sensitivity -18 dB/V. (CEPT method of test.)
Adjacent Channel:	40 dB at ± 500 Hz.
Selectivity:	(CEPT method of test).
Automatic gain control:	Less than 2 dB variation of detector output level for 90 dB input signal variation. (0 dB/V to 90 dB/V) Fast attack time and slow decay time.

Blocking:	Better than 55 dB for unwanted signals in the band 1 kHz to 3 kHz away from the wanted signal. Better than 75 dB for unwanted signals more than 3 kHz away from the wanted signal. (CEPT method of test)
Co-channel rejection:	Less than 6 dB. (CEPT method of test).
Intermodulation:	IP3 better than 8 dBm. (CEPT method of test).
Spurious and IF Rejection:	Better than 70 dB. (CEPT method of test).
Spurious Emission:	Better than 1nW at antenna connector.
Audio Power:	1 Watt into 8 ohm, less than 10% distor.

LOCAL INTERFACE

Printer interface:	Parallel centronics.
Remote control:	CCITT Rec V.10 SPECIAL (RS-423, T-BUS), multidrop addressing for control of transmitter and data equipment control/polling.
Navigator interface:	NMEA 0183.
Terminal interface:	CCITT Rec. V.24/V.28 (rs-232C)
External alarm:	Alarm output, rs-410 type N (open drain).

LINE INTERFACE

Tone frequencies:	1700 ± 85 Hz, accuracy within 0.5 Hz.
Modulation:	Phase-continues AFSK keying.
Frequency stability:	Better than 0.1 Hz.
Filter tracking:	Adaptive tracking within ± 85 Hz.
Decision filtering:	Bit-slicing with multipath correction.
Demodulation filter:	4 pole bessel.
RX-tone input:	Strap selectable internal/external. +10 dBm to -20 dBm, continues adjustable, 600 Ohm balanced.
RX dynamic range:	35 dB.
TX-tone output:	+10 dBm to -20 dBm, continues adjustable, 600 Ohm balanced.
Free-signal detection:	Automatic detection and handling of free-signals.
Radio control input:	RS-410 type N.
Radio control output:	RS-410 type N (open drain).

GENERAL

DC power source: +18Vdc ± 5%, 0.5 Amp.
 -18Vdc ± 5%, 0.2 Amp.
 +9Vdc ± 5%, 0.5 Amp.

Ambient temperature: -15°C to 55°C operating.
 -20°C to 70°C storage.

Relative humidity: 95% non-condensing.

Vibration: IEC, CEPT and MPT 1204.

Dimension: H*W*D, 98 mm * 210 mm * 300 mm.

Weight: 3.7 Kg.

1.4 CONTROLS

37151

Volumen control and on/off switch for the mains.

Access to the functions <Display>,<Pos>,<Stns>,<Time>,<Test>,<Options>,<Print> and <Sun>.

<Display>: Give access to the display set up menu.

<Pos>: Give access to the position set menu.

<Stns>: Give access to key data in the station table.

<Time>: Give access to set the internal clock.

<Test>: Give access to the internal/external test menu.

<Options>: Give access to the radiomodem set up menu.

<Print>: Give access to a printer set up and a print menu.

<Sun>: Give access to key in the number of sun-spots, used in the MUF-program.

Give access to the distress menu or transmits the distress signal when **distress** and **send** are activated simultaneously.

Give access to the scan menu or to the scan edit menu when **scan** and then the **edit** key is activated.

Give access to select 2187.5 kHz.

Give access to a message book of received DSC calls, distress as well as ordinary calls.
MSG

Give access to make a DSC call to a telecom. subscriber with keyed in data or to make any other DSC call when **call** and then the **edit** key is activated.
A distress relay call can be composed when **call** and then the **edit** key is activated.

Used in combination with other keys.
Scan and **edit** give access to edit a scan programme.
Addr book and **edit** give access to edit data stored in the address book.
Call and **edit** give access to compose a DSC call of any kind.

When activated the DSC call will be transmitted.
Transmits the distress signal when **distress** and **send** are activated simultaneously.

Next is used to activate the next display menu, **last** is used to activate the previous display menu.

When activated the cursor will move in counter clock-wise direction. If the cursor is placed in a writing -space and the left arrow is used, the cursor will move one step to the left and the information will be deleted.

When the up/down arrow show in the display menu the up/down key can be used to extend the display menu.

When the up/down arrow show in the display menu the up/down key can be used to extend the display menu.

When activated the cursor will move in the clock-wise direction.

Digits from 0 to 9 or letters from A to Z.

Terminate a key-in sequence and stop a transmission of a Distress or ordinary DSC call.

Set the decimal point or the deg sign.

1.5 PRINCIPLE OF OPERATION AND BLOCK DIAGRAM

MAIN PROCESSOR UNIT

FILTER UNIT

DISPLAY UNIT

This unit contains a graphical LCD display.

SYNTHESIZER UNIT

This unit contains all frequency generating parts.

The reference oscillator which is a temperature compensated crystal oscillator (TCXO) with a frequency of 10,73152 MHz.

The receiver needs two LO-signals. These signals are generated in two separate PLL's, one having output frequencies from 70 MHz to 100 MHz and the other having output frequency of 59,26912 MHz. The synthesizer which covers from 70 MHz to 100 MHz is a fractional synthesizer with a resolution of 10 Hz. This PLL is used as LO-injection to the first mixer at the receiver front end.

RECEIVER FRONT END UNIT

This unit contains input protection circuit, input filters, 1st mixer and 70 MHz IF filter.

The input filter is a mixture of lowpass, highpass and bandpass filter to obtain max. performance in the entire band from 100 kHz to 30 MHz.

The mixer is a FET mixer with high level LO-injection to give the mixer good high signal quality. This mixer converts the incoming radio signal to a 70 MHz IF signal. The mixer is followed by a 70 MHz bilitic quartz filter with a bandwidth of 15 kHz.

RECEIVER UNIT

This unit contains all necessary circuits to convert the 70 MHz IF signal to an audio signal.

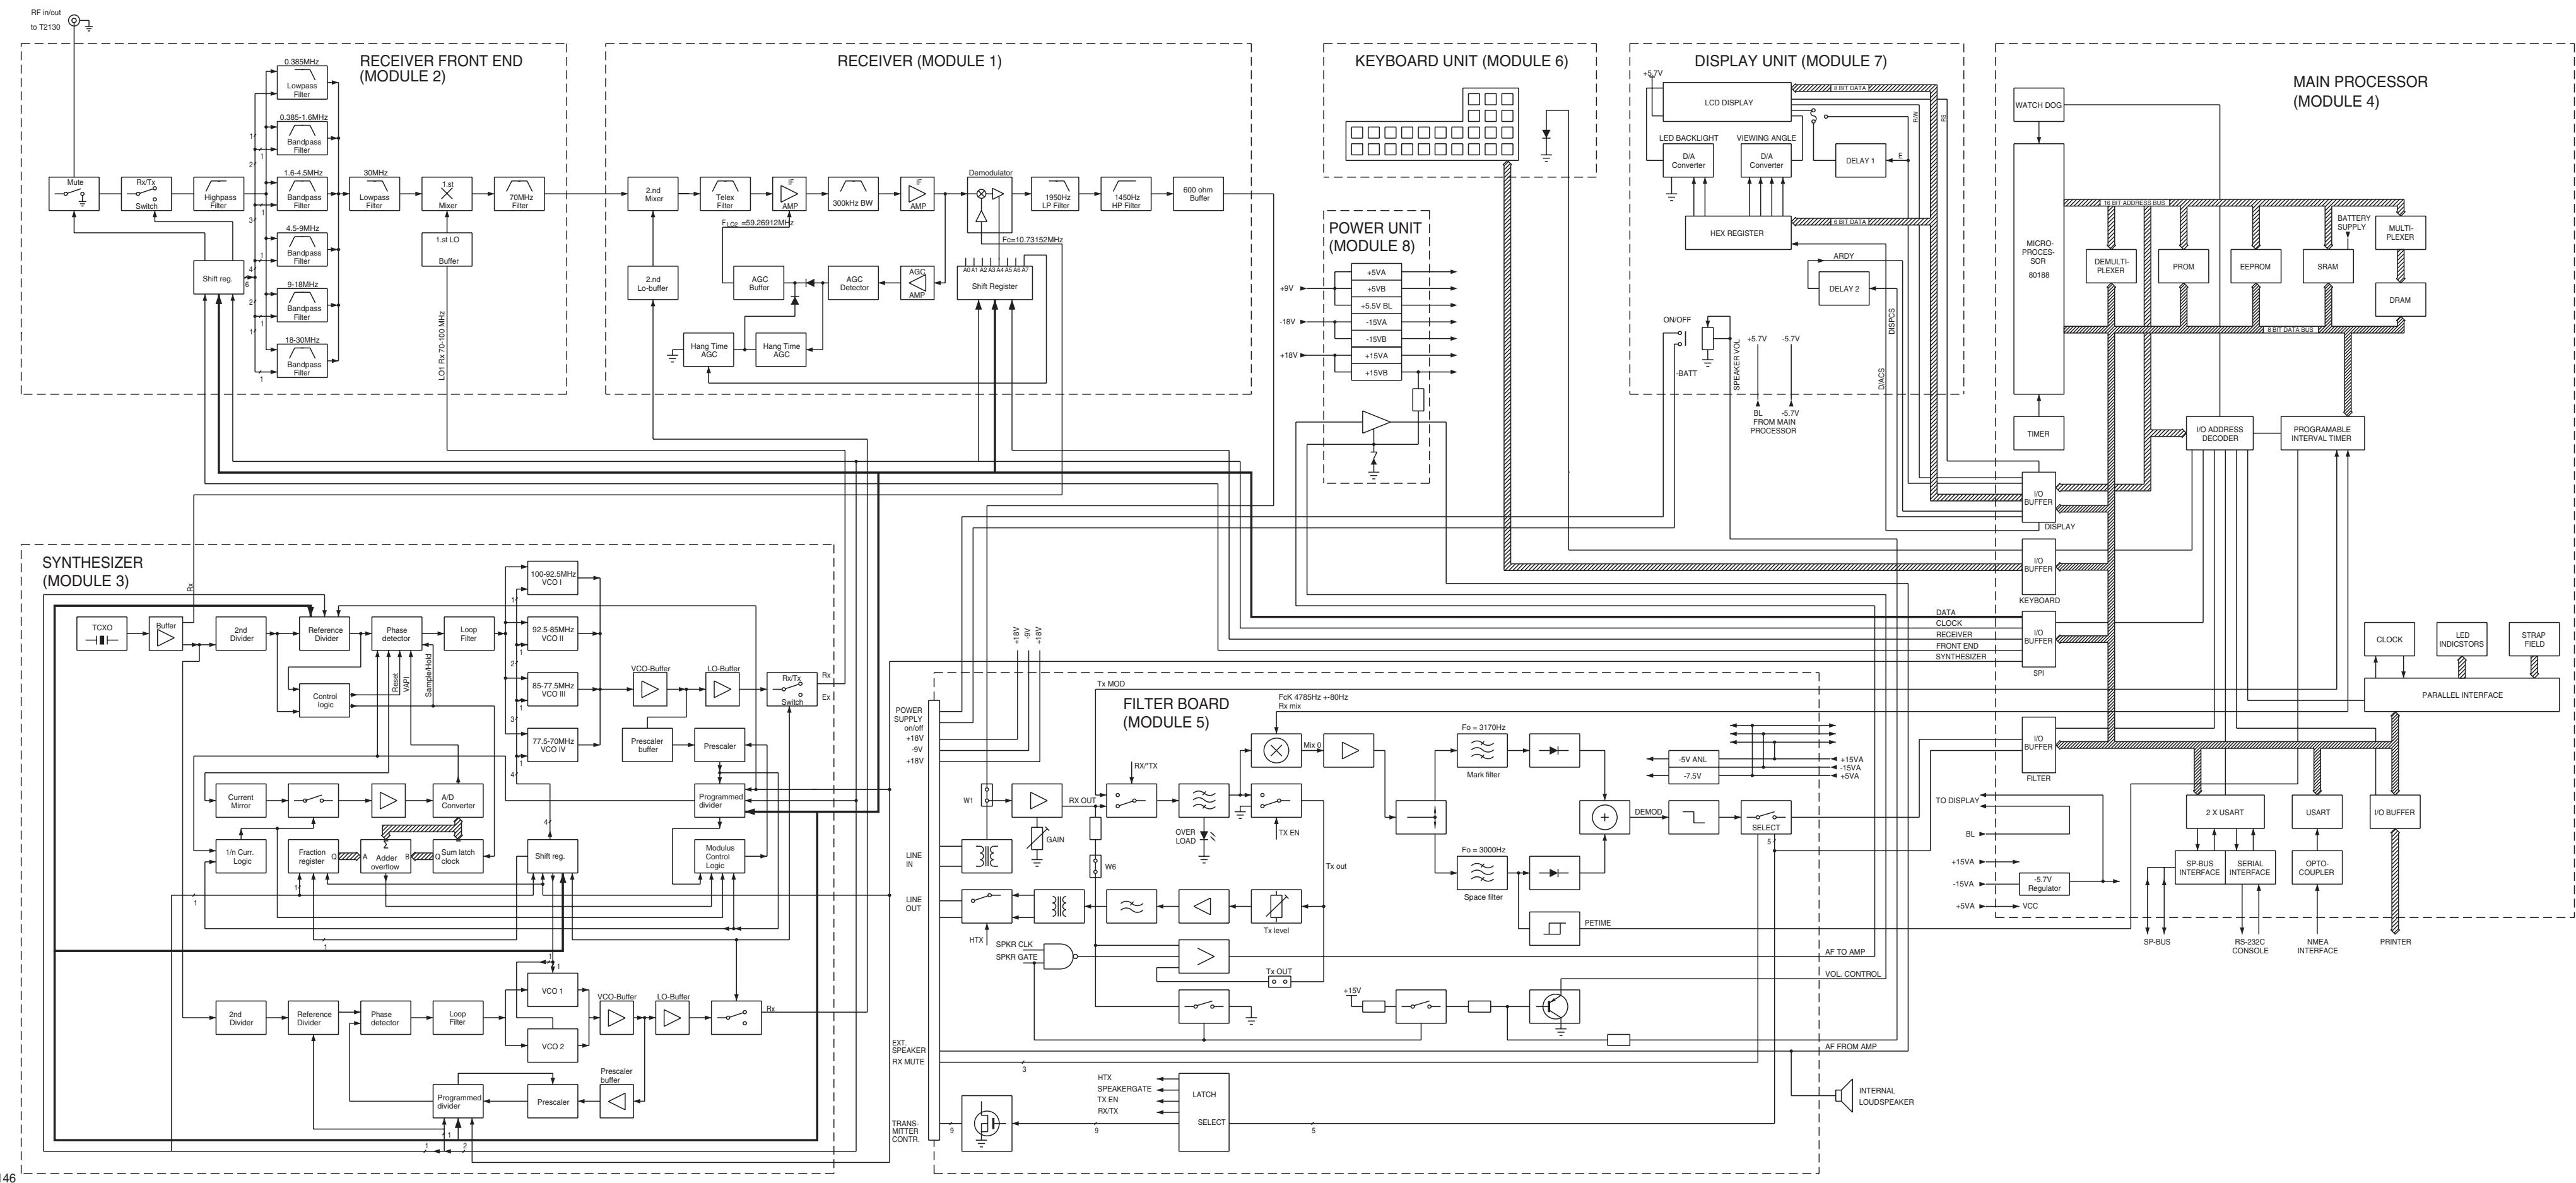

The 70 MHz IF signal from the front end is fed to the second mixer which converts the signal to a 10,73 MHz second IF signal. This 2nd IF signal is fed through a high order monolithic quartz filter to the input of the 10,73 MHz IF amplifier. The gain of this amplifier is regulated from the AGC amplifier/detector. The IF amplifier is followed by a ceramic filter to reduce the wideband noise. From the ceramic filter the signal is fed to the signal detector, which operates as an SSB demodulator. The AF signal from the demodulator is fed through a lowpass/highpass filter unit to an amplifier from which the output signal is about 0 dBm/ 600 ohm.

POWER UNIT

This unit produces all the necessary supply voltages for the modules in RM2152.

The input voltages from N2165 is +18V, -18V and +9V. These voltages pass through seven series regulators to produce the necessary supply voltages to RM2152.

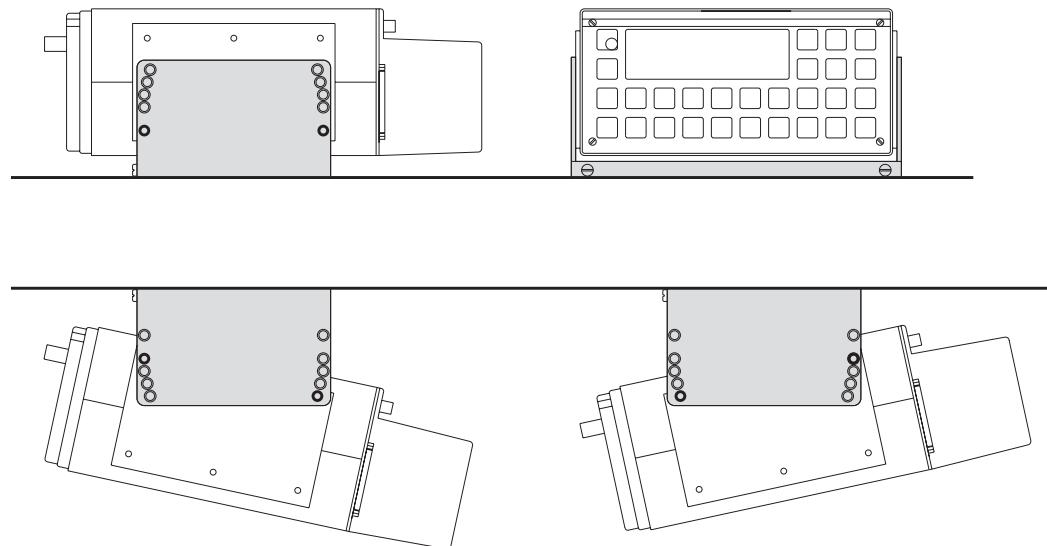

BLOCK DIAGRAMME

2 INSTALLATION

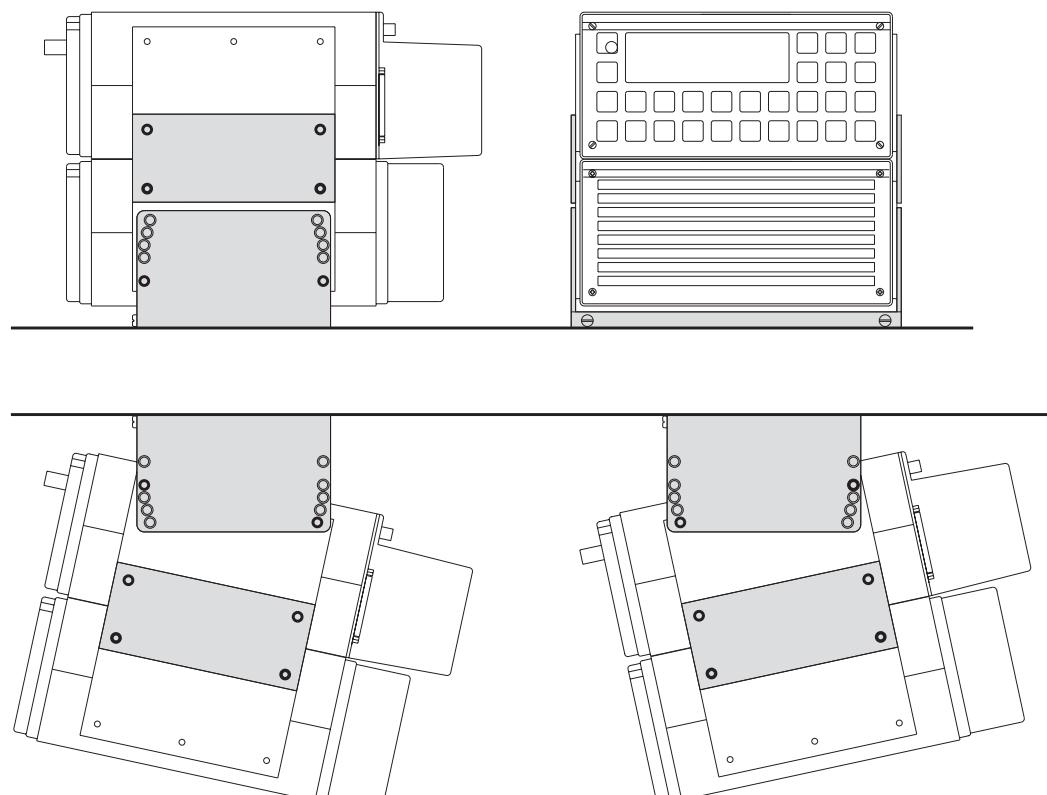

2.1 MOUNTING POSSIBILITIES

TABLETOP AND DECKHEAD

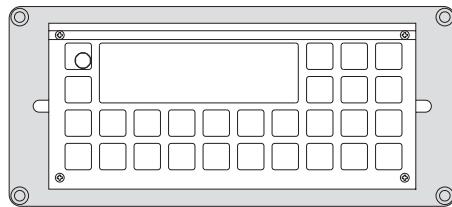

27434

Mounting bracket H2055 which offers the same possibilities for the loudspeakers H2054 and H2074.

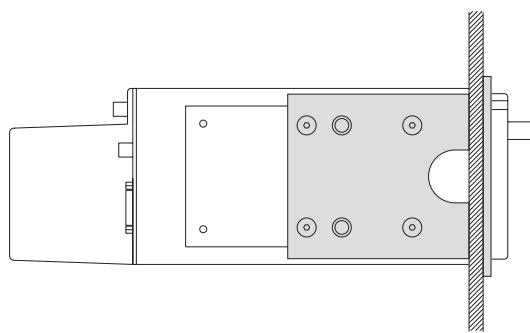

27435

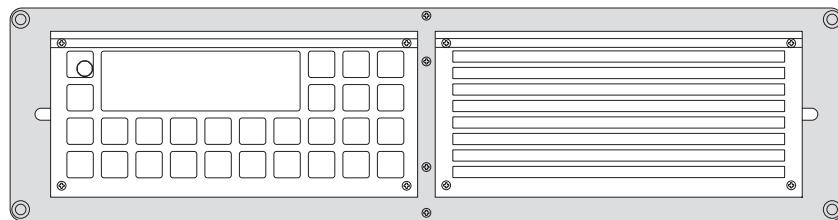

Mounting kit H2068 and H2055

BULKHEAD AND CONSOLE

27436

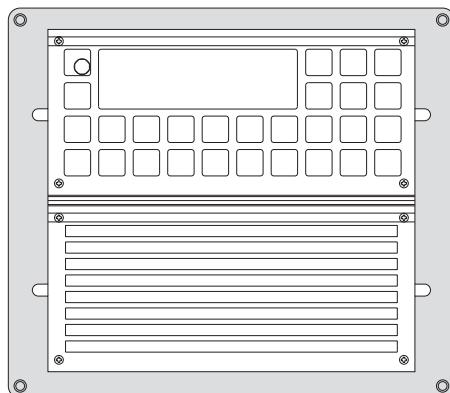

Mounting kit H2063 which offers the same possibilities for the loudspeakers H2054 and H2074.

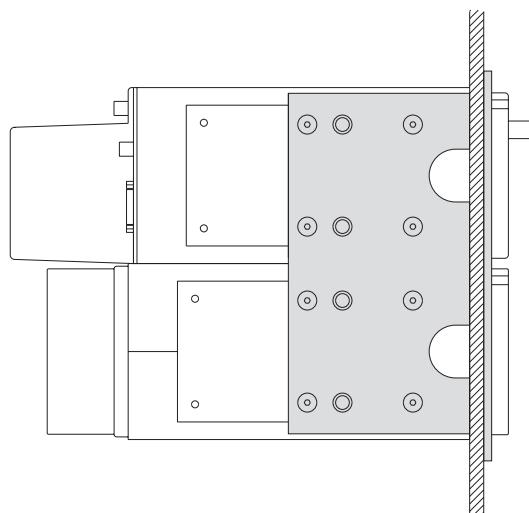

27437

Mounting kit H2062 or

27438

Mounting kit H2064.

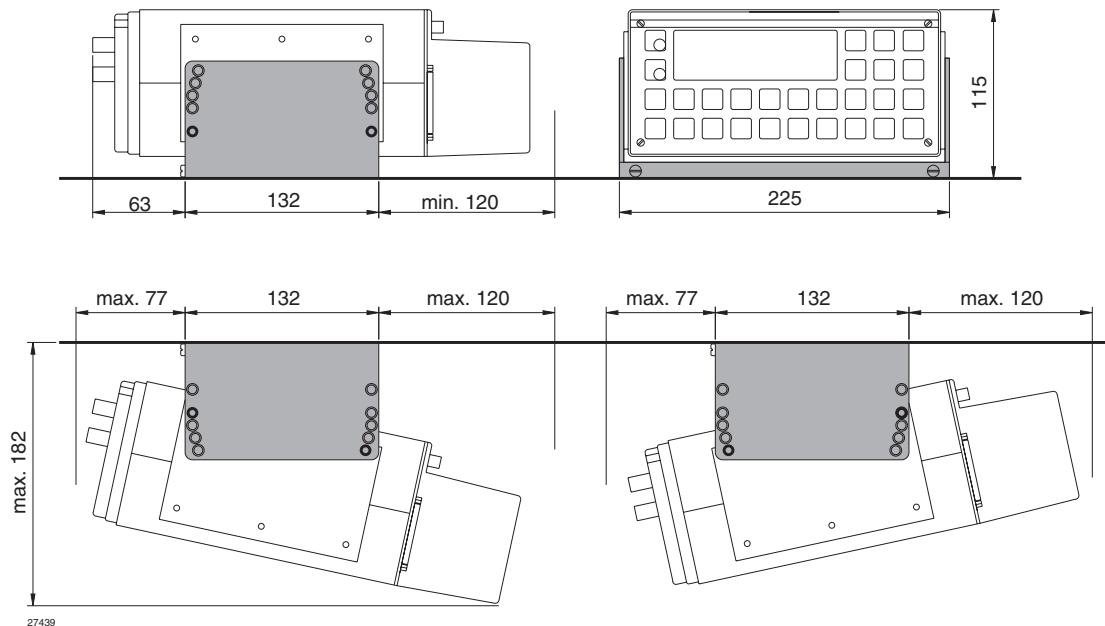

IN CONJUNCTION WITH OTHER SAILOR EQUIPMENT

Look up the INSTALLATION section for the SAILOR unit in question.

2.2 DIMENSIONS AND DRILLING PLAN

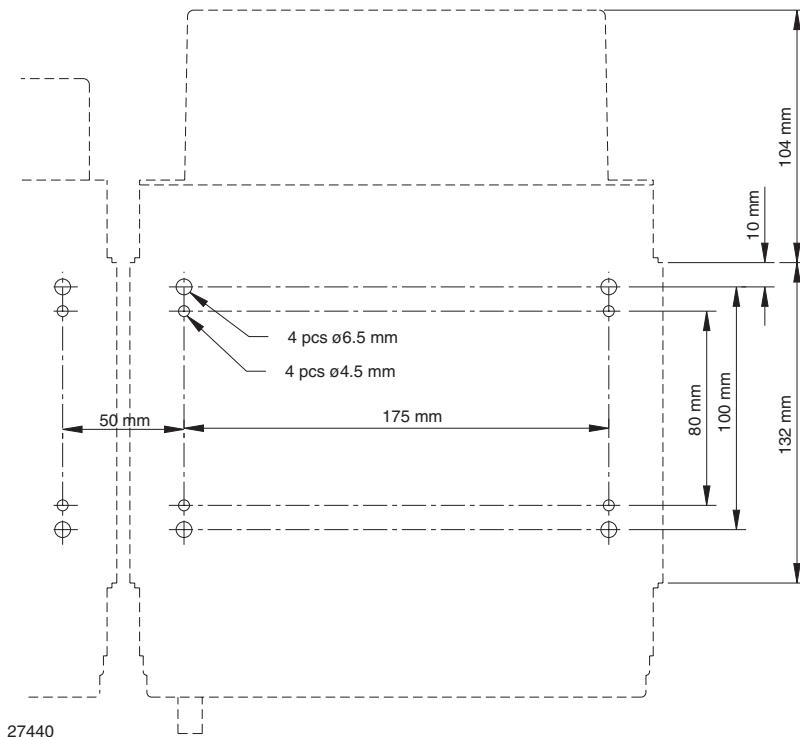

UNIVERSAL MOUNTING BRACKET H2055

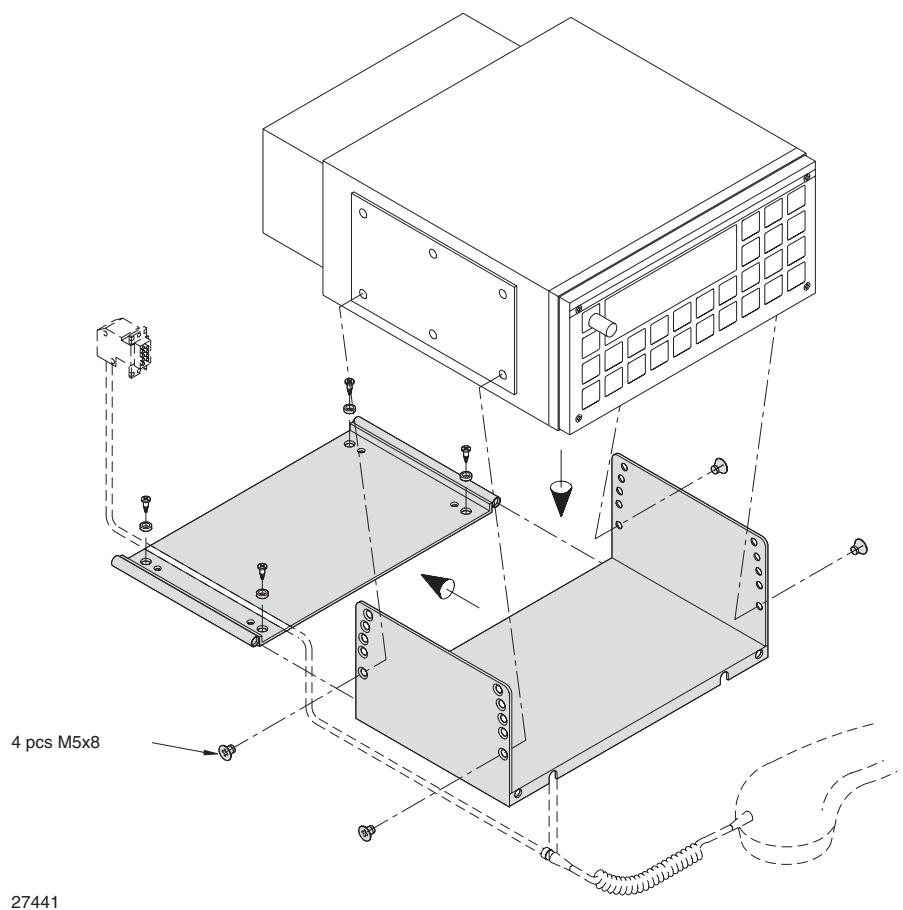

permits a wide variety of installation possibilities, such as tabletop, bulkhead or deckhead. For other possibilities such as console installation, the 19" rack or all units in the Compact programme assembled on the bulkhead, see special information concerning installation of the Compact programme.

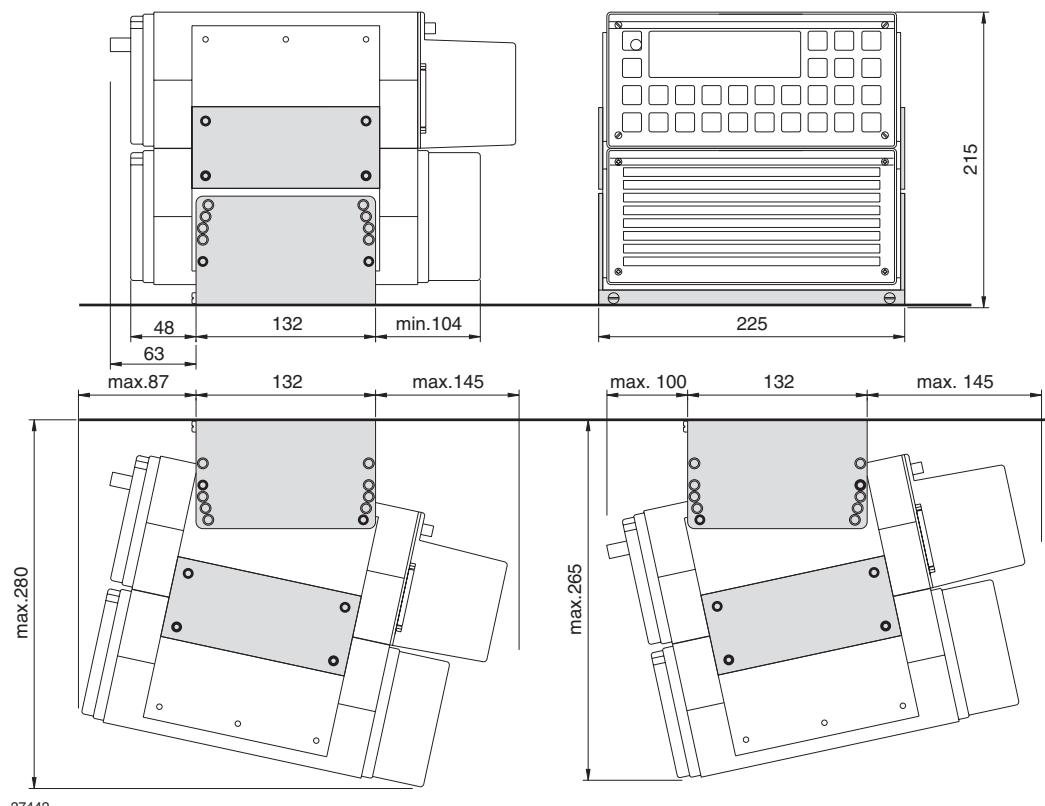

WEIGHT

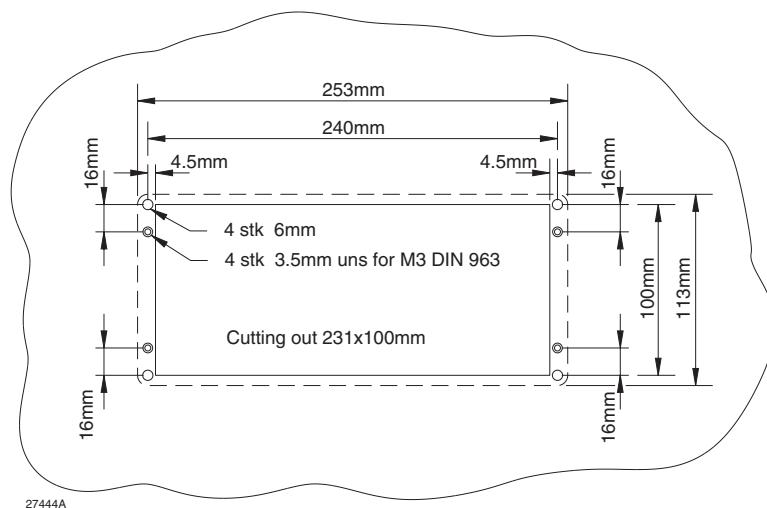

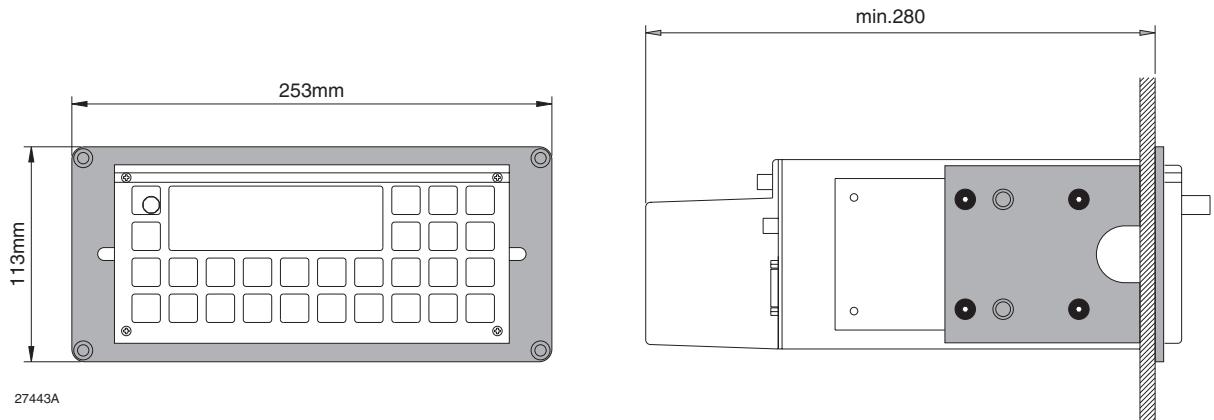

Mounting kit H2055:	1.5 kg
Loudspeaker H2054:	5.5 kg
Loudspeaker H2074:	4.0 kg
HF SSB RM2152:	4.0 kg

**WEIGHT**

Lashing kit H2068:	1.5 kg
Mounting kit H2055:	1.5 kg
Loudspeaker H2054:	5.5 kg
Loudspeaker H2074:	4.0 kg
HF SSB RM2152:	4.0 kg

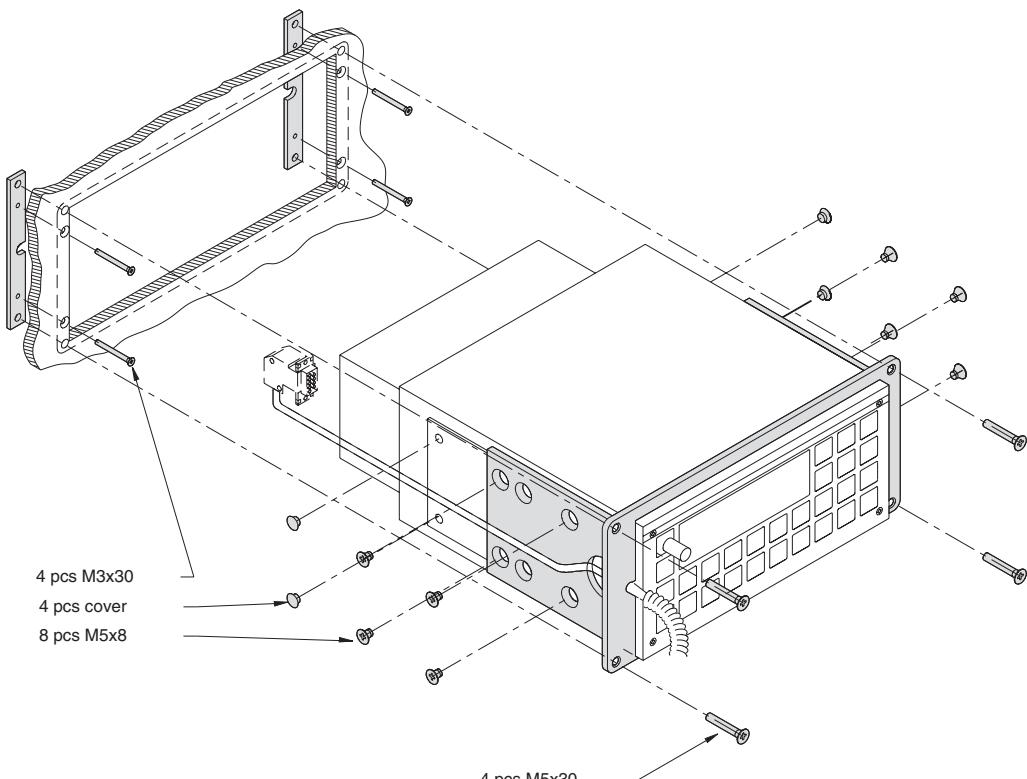

MOUNTING KIT H2068 AND H2055

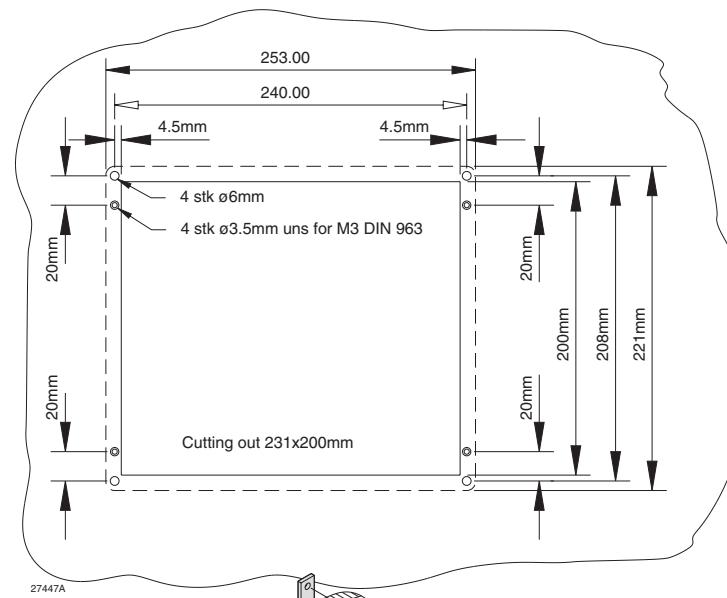

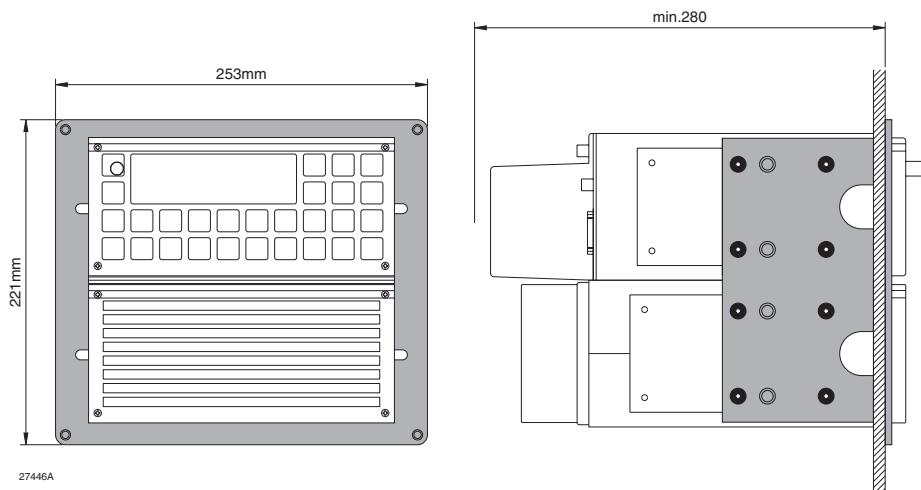

MOUNTING KIT H2063

Free distance must be kept to allow free air circulation ambient temperature max. 40°C.

WEIGHT

Mounting kit H2063:	1.0 kg
Loudspeaker H2054:	5.5 kg
Loudspeaker H2074:	4.0 kg
HF SSB RM2152:	4.0 kg

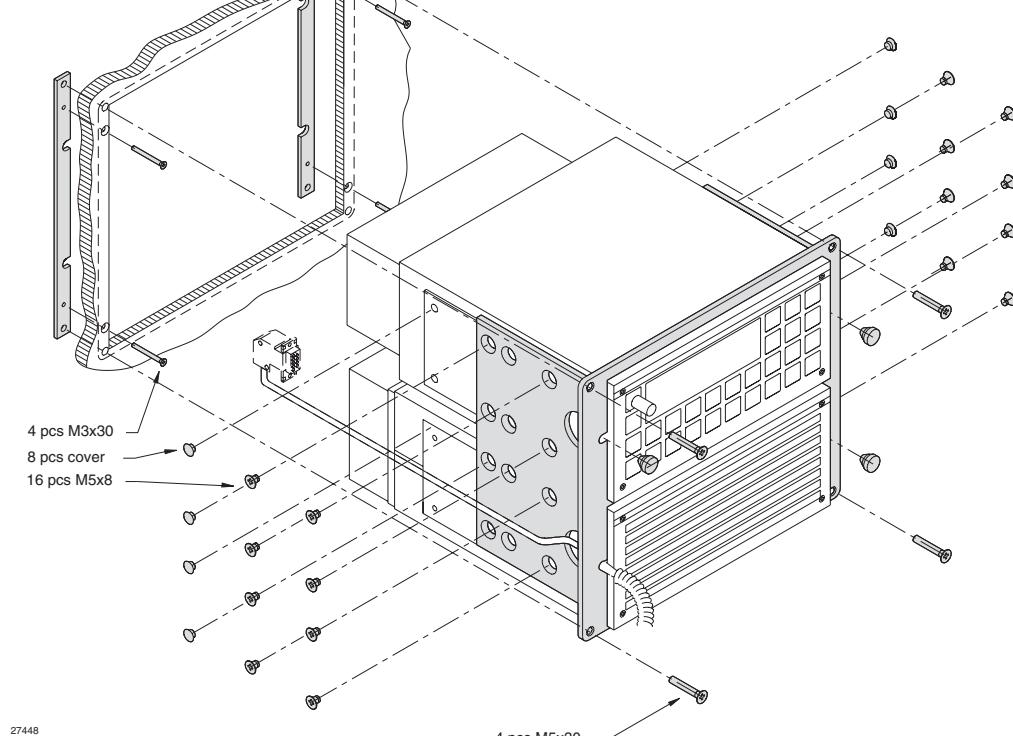

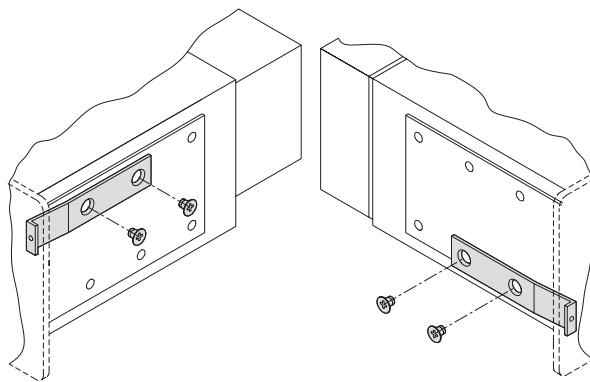

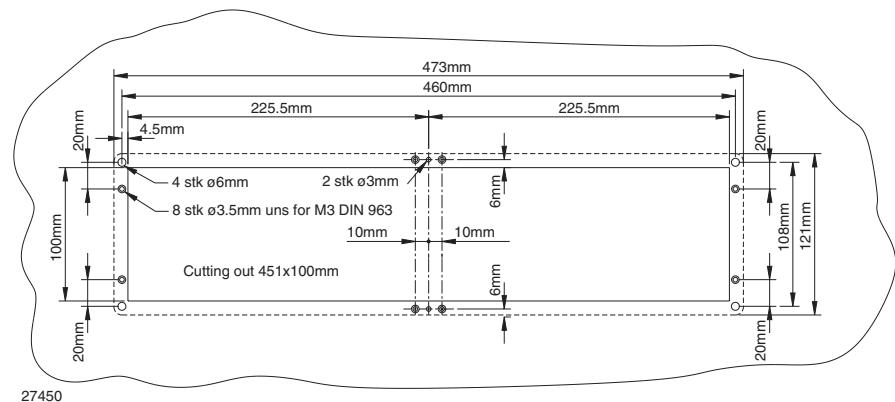

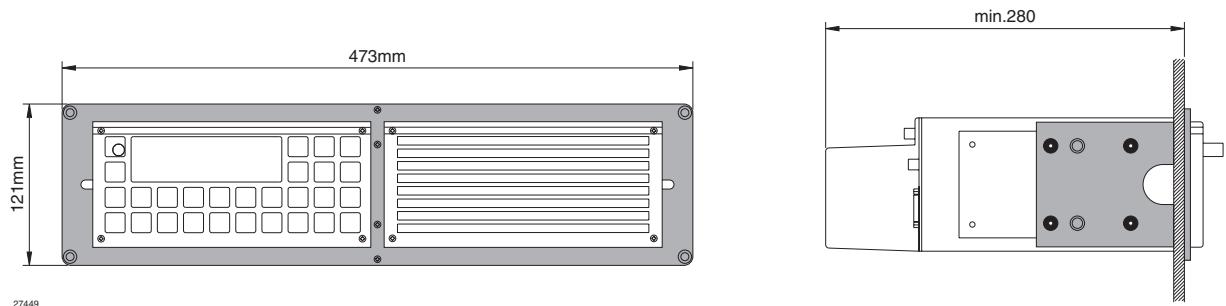

MOUNTING KIT H2064

Free distance must be kept to allow free air circulation ambient temperature max. 40°C.

WEIGHT

Mounting kit H2064:	1.5 kg
Loudspeaker H2054:	5.5 kg
Loudspeaker H2074:	4.0 kg
HF SSB RM2152:	4.0 kg

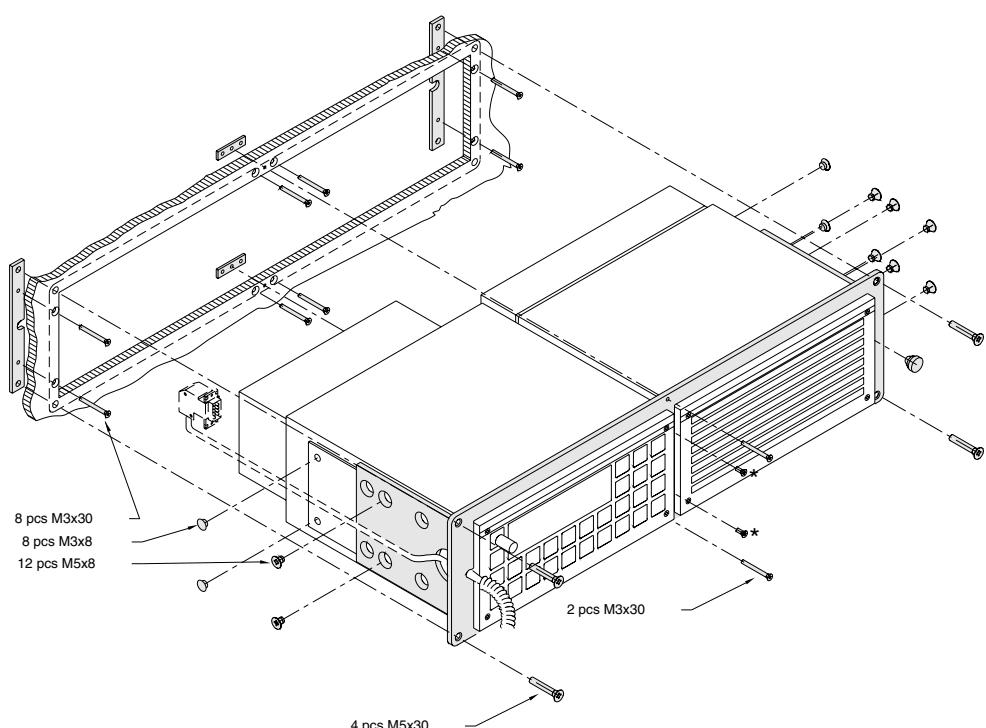

MOUNTING KIT H2062

Free distance must be kept to
allow free air circulation ambient
temperature max. 40°C.

WEIGHT

Mounting kit H2062:	1.5 kg
Loudspeaker H2054:	5.5 kg
Loudspeaker H2074:	4.0 kg
HF SSB RM2152:	4.0 kg

2.3 INSTALLATION INSTRUCTION

The electrical installation of the DSC/Telex modem RM2152, can be carried out as an installation with the power supply N2165, or as an installation using an existing possibility for power supply.

To see what kind of installation you have to use, identify your system among the three following possibilities:

- System that incorporates the 250W transmitter T2130.
Use the power supply N2165.
- System that incorporates the 600W or 1200W transmitter T2131/T2135.
Use the internal power supply inside the transmitter.
- System that incorporates the 600W or 1200W transmitter T2131/T2135, but where the capacity of the internal power supply inside T2131/T2135 is already used.
Use the power supply N2165.

The above mentioned systems are described on the following pages in further details.

An installation guide is given below, and it is advisable to use this guide to make a no problem and proper installation. The installation guide is divided into two different chapters - one for installations including the power supply N2165, and one for installations without the N2165.

If the installation of the DSC/Telex modem RM2152, is carried out in an existing transmitter system please read the chapter 2.3.1 "INSTALLATION OF DSC/Telex modem RM2152 IN EXISTING TRANSMITTER SYSTEMS".

2.3.1 INSTALLATION OF DSC/TELEX MODEM RM2152 IN EXISTING TRANSMITTER SYSTEMS

The Control unit RE2100 and the transmitter T2130 has gone through some changes during the period it has been produced. It is therefor possible that an old installation will not support a system with a DSC/Telex modem RM2152. Depending the ages of the equipment some modifications has to be done in the control unit RE2100 and the transmitter T2130.

There is no change in transmitters T2131 and T2135.

Further information on software and pc. board versions, please refer to part 3 of this manual "Service" chapter "SOFTWARE AND PC. BOARD SUMMARY".

RE2100 UPDATE

The key to find out whether the RE2100 has to be modified or not, is the software version used. There is some overlapping where it is necessary to know the version of the receiver module and the processor module. The table below will give you the information needed.

Present version of RE2100		Necessary changes of RE2100				Ordering information	
SOFTWARE	RECEIVER MODULE PART NO. 625631	EXCITER MODULE PART NO. 625634	PROCESSOR MODULE PART NO. 625635	SOFTWARE EPROM U06-5	KIT DESCRIPTION	PART NO.	
1084-1084D	Change to version H or higher	Change to version E or higher	Change to version H or higher	Change software to 1086S or higher	Remote control update kit "1A" and 2A for RE2100	726655 and 726656	
1085-1085F							
1086-1086D							
1086E-1086F							
1086H-1086R	No change		No change		Remote control update kit "2A" for RE2100	726656	
1086S		No change		No change	No change		

T2130 UPDATE

The key to find out whether T2130 has to be modified or not, is the software version used. There is some overlapping where it is necessary to know the version of the connection module. The table below will give you the information needed.

Present version of T2130		Necessary changes of T2130			Ordering information	
SOFTWARE EPROM U01-3	CONNECTION BOARD PART NO. 625646	CONNECTION BOARD PART NO. 625646	SOFTWARE EPROM U01-3	KIT DESCRIPTION	PART NUMBER	
1083-1083E	Versions A,B,C,D,E & F	Change to version G or higher	Change to version P or higher	Remote control update KIT ""1A"" for T2130	726665	
1083G-1083O	Versions G or higher	No change		EPROM U01-3 with software 1083P or higher	726103	

If the connection board 625646 contains 4 connector strips with the writing ST1, ST2, ST3 and ST7, it is version G, and therefore it is only the software at the processor module which must be changed.

2.3.2 INSTALLATION GUIDE FOR RM2152 USED AS DSC WATCH RECEIVER

Cable and wiring is illustrated in chapter “2.4 ELECTRICAL CONNECTIONS AND ASSEMBLING”.

1. In an installation with a 250W transmitter T2130 the radiointerface, plug at the back of RM2152 shall be connected to the power supply N2165, and from the power supply the wires:

S.P. BUS-interrupt
AF to TX
AF to TX com.
TX-KEY
GND

Shall be connected to the transmitter T2130 connection board.

In an installation with a 600/1200W transmitter T2131/T2135 the radiointerface plug at the back of RM2152, can be connected directly to the connection board in the transmitter. the following connections are necessary:

S.P. BUS-interrupt
AF to TX
AF to TX com.
TX-KEY
+18V
-18V
+9V
GND

If the installation consist of a watch receiver and a radiotelex modem only one of this units can be connected directly to the transmitter. The other radio unit shall be connected through a power supply N2165. Further information concerning cabling please consult the chapter 2.4 “ELECTRICAL CONNECTIONS AND ASSEMBLING”.

2. The S.P.BUS shall be connected to RE2100 or to the transmitter T2130. The serial S.P.BUS must be terminated with 50 Ohm in each end of the cable. In all units there is a strap, which terminates the cable with 50 Ohm, in case the strap is fitted. A 50 Ohm strap is always mounted from factory, this strap must therefore be removed in case the unit is not mounted in the end of the S.P.BUS cable.
In RM2152 the 50 Ohm strap is placed at the main processor module and is called W5.
3. The handset holder to RE2100 shall have a switch to indicate whether the handset is placed in the holder or not. The handset holder has SP No. 726233.
4. The RX antenna input terminal shall be connected to a separate antenna, through the receiver protection unit H1223.
5. The NMEA navigation interface can be connected to a GPS unit.
6. The printer interface can be connected to a printer
Check the software version, check if the versions are in agreement with the list in part 3 of this manual "Service" chapter "SOFTWARE AND PC. BOARD SUMMARY".
There shall be agreement between the software versions of RE2100. the transmitter (T2130/T2131/T2135) and DSC modem RM2152.
7. Is a GMDSS ALARM UNIT C2149 connected to the system, it shall be connected to the power supply N2165 or to the connection board in T2131/2135.

Check that the software in the C2149 have the right version number, this information can be found in part 3 of this manual "Service" chapter "SOFTWARE AND PC. BOARD SUMMARY".

8. The Watch receiver RM2152 is from factory set to work with S.P. BUS-address number 2. This has to be programmed into RE2100.

Turn on RE2100.

On RE2100 Press **0** and **1** simultaneously.

The display show:

Key in **0** **7** and **2**

The display show:

Key in **1**

The display show:

Activate **STOP**
ENT

The display show:

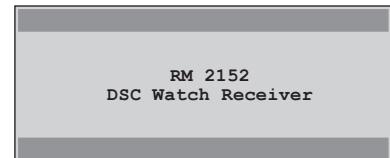

This SP-menu **07-2** can be entered at any time and be used to control that the SP-BUS works properly. The zero in the TX display line is changed to a one if the SP-BUS works

On RE2100 activate the **TUNE** key to leave the SP menu.

CLARIF

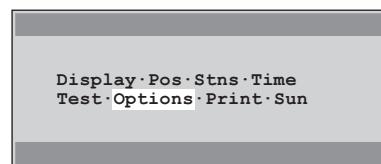

9. Switch on the watch receiver RM2152 and control that the display menu after the initializing menu show the following menu.

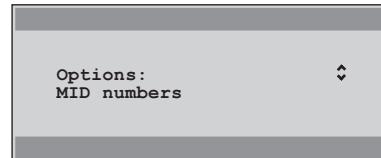

Is the indication of type different from RM2152 then please refer to part 3 of this manual "Service" for information how to change to type RM2152.

10. Verify that the SP-BUS setting in the watch receiver RM2152 is correct.
Turn on the RM2152 and wait until the displaymenu show the scan running menu.

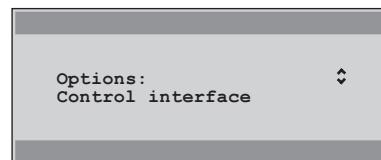

Activate **FUNC**: and the displaymenu change to.

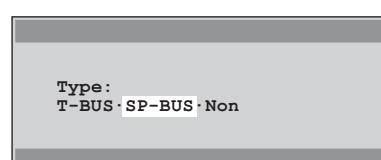

Select the Options menu and activate the **NEXT** key,
the display menu change to.

Use the up/down arrow key until the displaymenu show.

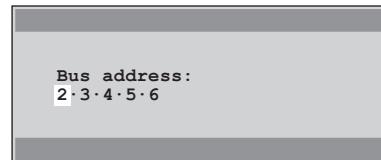

Activate the **NEXT** key, the displaymenu change to.

The SP-Bus is chosen for serial communication

activate the **NEXT** key, the displaymenu change to.

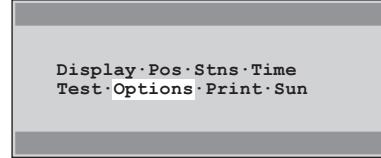

The SP-Bus address number 2 is blinking, indicating that SP-Bus address 2 is chosen.
Is another type or address choosen, it is necessary to correct this, please refer to part 3 of this
manual "Service" " for information how to change to SP-Bus and to address 2.

11. The Self-identification number (**MID**) has to be programmed into the watch receiver RM2152.
Please refer to part 3 of this manual "Service" " for information how to programme the ships
identifications number.

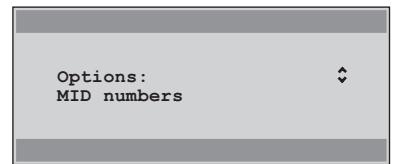

Control the ships identifications as illustrated below.

Turn on the RM2152 and wait until the display menu show the scan running menu.

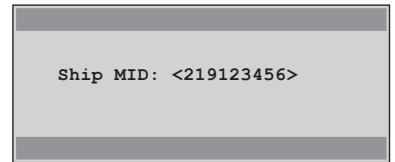

Activate **FUNC** and the displaymenu change to.

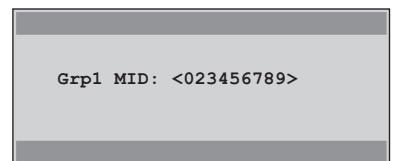

Select the Options menu and activate the **NEXT** key,
the displaymenu change to.

Activate the **NEXT** key, the displaymenu will show
the ships identification number.

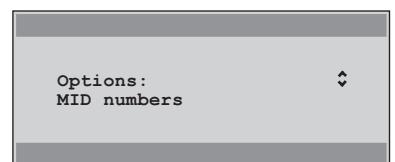

Activate the **NEXT** key, the displaymenu will display
the ships group call number

Activate the **NEXT** key the displaymenu change to a
menu which display the second group call number.
The ship can have up to four group call numbers and
you can display this numbers in the next three menus,
before the displaymenu again change to

The set up of the DSC watch receiver is now completed.

12. To make sure that the system works again:

Use the external test function to send a DSC test call to a coaststation. The called coaststation
shall be enclosed into the stations table.

2.3.3 INSTALLATION GUIDE FOR RM2152 USED AS DSC/TELEX RECEIVER

Cable and wiring is illustrated in chapter “2.4 ELECTRICAL CONNECTIONS AND ASSEMBLING”.

1. In an installation with a 250W transmitter T2130 the radiointerface plug, at the back of radiotelex
modem RM2152 shall be connected to the power supply N2165, and from the power supply the
wires:

S.P. BUS-interrupt
AF to TX
AF to TX com.
TX-KEY
GND

Shall be connected to the connection board in transmitter T2130.

In an installation with a 600/1200W transmitter T2131/T2135 the radiointerface plug at the back of RM2152 can be connected directly to the connection board in the transmitter. the following connections are necessary:

S.P. BUS-interrupt
AF to TX
AF to TX com.
TX-KEY
+18V
-18V
+9V
GND

If the installation consist of a watch receiver and a radiotelex modem only one of them can be connected directly to the transmitter. The other radio unit shall be connected through a power supply N2165. Further information concerning cabling please consult the chapter 2.4 "ELECTRICAL CONNECTIONS AND ASSEMBLING".

2. The S.P.BUS shall be connected to RE2100 or to the transmitter T2130. The serial S.P.BUS must be terminated with 50 Ohm in each end of the cable. In all units there is a strap, which terminates the cable with 50 Ohm, in case the strap is fitted. A 50 Ohm strap is always mounted from factory, this strap must therefore be removed in case the unit is not mounted in the end of the S.P.BUS cable.
In RM2152 the 50 Ohm strap is placed on the main processor board and is called W5.
3. The handset holder to RE2100 shall have a switch to indicate whether the handset is placed in the holder or not. The handset holder has SP No. 726233.
4. The RX antenna input terminal shall be connected to a separate antenna, through the receiver protection unit H1223.
5. The console plug on the RM2152 shall be connected to the message terminal H2098 console plug (COM.1).
6. The NMEA navigation interface can be connected to a GPS unit.
7. The printer can be connected to the radiotelex modem or the message terminal.
For safety reasons the printer shall be connected to the radiotelex modem.
The Keyboard shall be connected to the message terminal.
8. The message terminal and the monitor shall be connected to a 24VDC power supply and the message terminal and the monitor shall be interconnected.
9. Check the software version, check if the versions are in agreement with the list in part 3 of this manual "Service" chapter "SOFTWARE AND PC. BOARD SUMMARY".
There shall be agreement between the software versions of RE2100, the transmitter (T2130/T2131/T2135), the DSC/radiotelex modem RM2152 and the Message terminal H2098A to get the system to work properly.
10. Is a GMDSS ALARM UNIT C2149 connected to the system, it shall be connected to the power supply N2165 or to the connection board in T2131/2135.

Check that the software in the C2149 have the right version number, this information can be found in part 3 of this manual "Service" chapter "SOFTWARE AND PC. BOARD SUMMARY".
11. The radiotelex modem RM2152 has to work with S.P. BUS address number 3, this has to be programmed into RE2100.

Turn on RE2100.

On RE2100 Press **0** and **1** simultaneously.

The display show:

Key in **0** **7** and **3**

The display show:

Key in **2**

The display show:

Activate **STOP**
ENT

The display show:

This SP-menu **07-3** can be entered at any time and be used to control that the SP-BUS works properly. The zero in the TX display line is changed to a one if the SP-BUS works.

On RE2100 activate the **TUNE** key to leave the SP menu.

CLARIF

12. Switch on the Radiotelex modem RM2152 and control that the display menu after the initializing menu show the following menu.

If the indication of type different from RM2152 then please refer to part 3 of this manual "Service" " for information how to change to type RM2152.

13. The Radiotelex modem RM2152 is from factory set to work at SP-BUS address number 2. This has to be changed to SP-BUS address 3. For information how to change the SP-BUS address please refer to part 3 of this manual "Service" ".
14. The Self-identification numbers for **DSC** (**MID**), **TELEX** as well as the **answerback** has to be programmed into the Radiotelex modem RM2152. For information how to programme the Self-identification numbers into the Radiotelex modem RM2152, please refer to part 3 of this manual "Service" ".
15. To control that the setting of the radiotelex modem RM2152 is done correct, the settings can be displayed.

Activate the key **F3** and the Radiotelex menu will be displayed.

Select the **OPTION** menu and activate the **Enter** key, the OPTION menu will be displayed.

Select the **TERMINAL MODE** menu and activate the **Enter** key. the TERMINAL MODE menu will be displayed.

Write **set-a** and activate the **Enter** key, the CRT show now the settings of the radiotelex modem.

The set up of the radiotelex modem is now completed.

16. To make sure that the system works:

1. Use the external test function to send a DSC test call to a coaststation. The called coaststation shall be enclosed into the stations table.
2. Check that the stations table works correct.
3. Send a telex prepared in the editor.
Remember to check your answerback.

2.5 APPENDIX

2.5.1 ANSWERBACK CHARACTER SETTING

2.4 ELECTRICAL CONNECTIONS AND ASSEMBLING

Cables between RE2100 and the transmitter T2130, the transmitter T2130 and the Antenna coupler AT2110 can be found in the TECHNICAL MANUAL for T2130.

The connection cables for the REMOTE ALARM UNIT C2149 can be found in the TECHNICAL MANUAL for C2149.

The printer interface cable for RM2152 is equal to the printer cable used for RM2152.

CABLES BETWEEN CABINETS:

HF SSB 250W DC WITH DSC WATCH RECEIVER RM2152 and N2165.

CABLE 1: RM2152-N2165.

Factory supplied: Multicable: 10 metres 21 * 0,5 mm²

Part no. 164.192

Max. length 30 metres.

CABLE 3-4: BATTERY TO N2165.

cable: 2,5 mm². Max. length 30 metres.

CABLE 5: RM2152 to RM2152 SP-BUS.

cable: RG58C/U coax cable.
Factory supplied: 1 metre RG58C/U coax cable marked blue. Part no. 527115

The total length of the SP-BUS cable from RE2100 to RM2152 must not exceed 100 metres.

CABLE 6: RM2152 to T2135 SP-BUS.

cable: RG58C/U coax cable.
Factory supplied: 10 metres RG58C/U coax cable marked blue. Part no. 527082

The total length of the SP-BUS cable from RE2100 to RM2152 must not exceed 100 metres.

CABLE 7: RM2152 to H1223 RF INPUT

cable: RG58C/U coax cable. Max. length 10 metres.
Factory supplied: 3 metres RG58C/U coax cable marked red. Part no. 506090

CABLE 8: RH1223 to RF ANTENNA.

cable: Triaxial cable H1213. Max. length 200 metres.

CABLE 9: RM2152 to GPS unit (NMEA 183).

cable: RG58C/U coax cable. Max. length 30 metres.

CABLE 10: MAINS TO N2165.

cable: 3 * 1,0 mm². Max. length 30 metres.

CABLE 11-12: BATTERY TO C2149.

cable: 2,5 mm². Max. length 30 metres.

CABLE 14-15-16: 24V DC/BATTERY SUPPLY TO PRINTER (H1253B), MONITOR (H1253B), AND MESSAGE TERMINAL H (2098A).

cable: 3*0.75 mm². Max. Length 10 metres.
Factory supplied: 2 metres 3*0.75 mm². Part no. 56.066

CABLE 17: RM2152 TO H2098A RS232 cable.

cable: 7*0,22 mm². Max. length 4 metres.
Factory supplied: 1 metre 7*0,22 mm². Part no. 56.071
The radiotelex modem can be connected to a personal computer (PC) for this use a cable:
Factory supplied: 2 metre RS232 cable with 9/25 (SUB-D). Part no. 56.063

3 SERVICE

3.1 MAINTENANCE

PREVENTIVE MAINTENANCE

If the HF SSB RM2152 has been installed in a proper way the maintenance can, dependent on the environments and working hours, be reduced to a performance check at the service workshop at intervals, not exceeding 12 months. A complete performance check list is enclosed in this manual, chapter 3.5 PERFORMANCE CHECK.

Inspection of the antenna, cables, and plugs for mechanical defects, salt deposits, corrosion, and any foreign bodies shall be done at regular intervals not exceeding 12 months.

Along with each RM2152 a test sheet is delivered in which all the measurements, made in the test department of the factory, are listed. If the control measurings made in the service workshop should not show the same values as those listed in the test sheet, the set must be adjusted.

3.2 ALIGNMENT INSTRUCTIONS

INTRODUCTION

The measuring values indicated in chapter 5. CIRCUIT DESCRIPTION AND SCHEMATIC DIAGRAMS are typical values and as indicated it will be necessary to use instruments in absolute conformity with the below list:

3.3 PROPOSAL FOR NECESSARY TEST EQUIPMENT

OSCILLOSCOPE:

Bandwidth	DC-35 MHz
Sensitivity	2mV/div
Output Impedance	1 Mohm//20 pF
E.g. Philips type	PM3050

HF SIGNAL GENERATOR:

Frequency Range	100 kHz - 100 MHz
Output Voltage:	0dB/ μ V - 120 dB/ μ V
Output Impedance	50 ohm
Type of Modulation	AM
Modulation Frequency	External
E.g. Marconi type	2019

PASSIVE PROBE:

Attenuator	20 dB
Input Impedance	10 Mohm//15 pF
Compensation Range	10-30 pF
E.g. Philips type	PM8936/091

LF SIGNAL GENERATOR:

Frequency Range	10 Hz - 10 kHz
Output Voltage	20 mV _{RMS} - 1V _{RMS}
Output Impedance	600 ohm
Output Waveform	sine wave
E.g. Philips type	PM5110

MULTIMETER:

Sensitivity DC (f.s.d.)	100 mV
Input Impedance	10 Mohm
Accuracy DC (f.s.d.)	1.5%
E.g. Philips type	PM2505

LF DISTORTION METER:

Frequency Range	$\square f = 1200$ Hz
Distortion Range (f.s.d.)	1-10%
Input Impedance	100 kohm
Accuracy (f.s.d.)	3%
E.g. Hewlett-Packard	HP 8903B

FREQUENCY COUNTER:

Frequency Range	100 Hz - 120 MHz
Resolution	1 Hz at $\square f = 100$ MHz
Accuracy	1×10^{-7}
Sensitivity	100 mV _{RMS}
Input Impedance	1 Mohm/30 pF
E.g. Philips type	PM6669/031

5 CIRCUIT DESCRIPTION AND SCHEMATIC DIAGRAMS

5.1 RECEIVER UNIT (MODULE 1) PART NO. 626301

The receiver unit consist of a 70.0 MHz to 10.7 MHz mixer followed by a TELEX filter and a gain regulated amplifier. From the gain regulated amplifier the signal is fed to the detector and to the AGC amplifier. From the detector the low frequency signal is fed through a low/high pass filter to the 600 ohm output buffer.

SECOND MIXER AND CRYSTAL FILTER.

The signal from the 70 MHz selectivity (module 2) is led through the balanced transformer TR01 to the gates of the J-FET mixer transistors Q01 and Q02.

The second LO signal 59.3/80.7 MHz from the frequency synthesizer (module 3) is led through the amplifier transistor Q03 and the band pass filter (L03, L07, L10 and C07, C09, C15) to the sources of mixer transistors Q01 and Q02. The LO signal level at the sources of the mixer transistors is approx 17 dBm.

The mixer 10.7 MHz output signal from the drain's is fed through a balanced transformer TR02 to the crystal filter. The capacitor C26 controles the resonans frequency of TR02.

IF AMPLIFIER.

The 10.7 MHz signal from the crystal filter is fed to the input of the IF amplifier.

The 10.7 MHz IF amplifier consists of the transistors Q04, Q05, Q08, Q10, Q11 and the filter FL02 in cascade. Q04, Q05, Q08 and Q10 are dual gate MOS-FET's with the IF signal fed to gate 1. Gate 2 of the transistors Q04, Q05 and Q08 is connected to the output of the AGC detector. The output voltage from the AGC detector is used to control the gain of the IF amplifier which is necessary to protect the signal detector from overload.

From the drain of Q08 the IF signal is amplified in Q10 and fed through the ceramic filter FL02, which reduces the noise bandwidth to about 300 kHz, to the emitter follower Q11. From the emitter of Q11 the IF signal is fed to the signal detector and to the AGC amplifier.

AGC GENERATOR

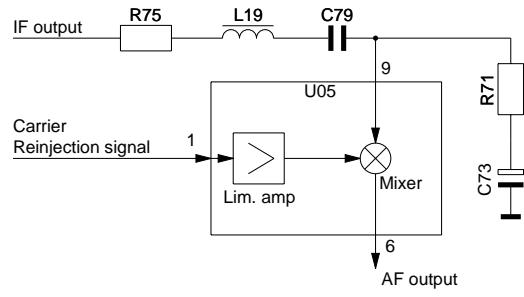

The IF signal is fed through the common emitter amplifier Q09 to the AGC detector consisting of the transistor Q07 and the network R42, R48 and C54 which together is a voltage detector. The voltage gain of Q09 and the detector level of Q07 controls the output level of the IF amplifier, the level at the emitter of Q11.

The output voltage from the AGC detector is via the diode D04 and the buffer amplifier U1.2 fed to gate 2 of Q04, Q05 and Q08 as a fast gain control voltage. A slow gain control of the IF amplifier is obtained by supplying the AGC detector output voltage to the amplifier U1.1. U1.1 buffers the charging of C91 through the diode D08 and the resistor R99. The voltage on C91 is fed through the diode D07 to the input of the amplifier U1.1, where it is added to the AGC detector voltage. The charging and discharging of C91 is slow compared to the charging and discharging of C54 this means that the network C54, R42 and R48 ensures noise immunity and the network C91, R99 and R98 will decrease distortion.

The transistor Q12 is when conducting discharging the capacitor C91 which means that the slow AGC is inoperative, this is used when the receiver is channing. Q12 is controlled by the signal at (U03/pin7).

SIGNAL DETECTOR

The signal detector U02 consist of a limmiting amplifier and a signal mixer.

29039

A 10.73152 MHz signal, the synthesizer reference signal, is connected to (U02/pin1), this signal is fed through the limmiting amplifier to the injection port of the mixer. The IF signal is from the emitter of Q11 fed to the signal port (U02/pin9) of the mixer. The output signal (U02/pin6) from the mixer contain an audiofrequency component which is fed to the AF FILTERS.

The signal detector can be muted by a 5 volt dc signal from (U03/pin4) supplied to (U02/pin5).

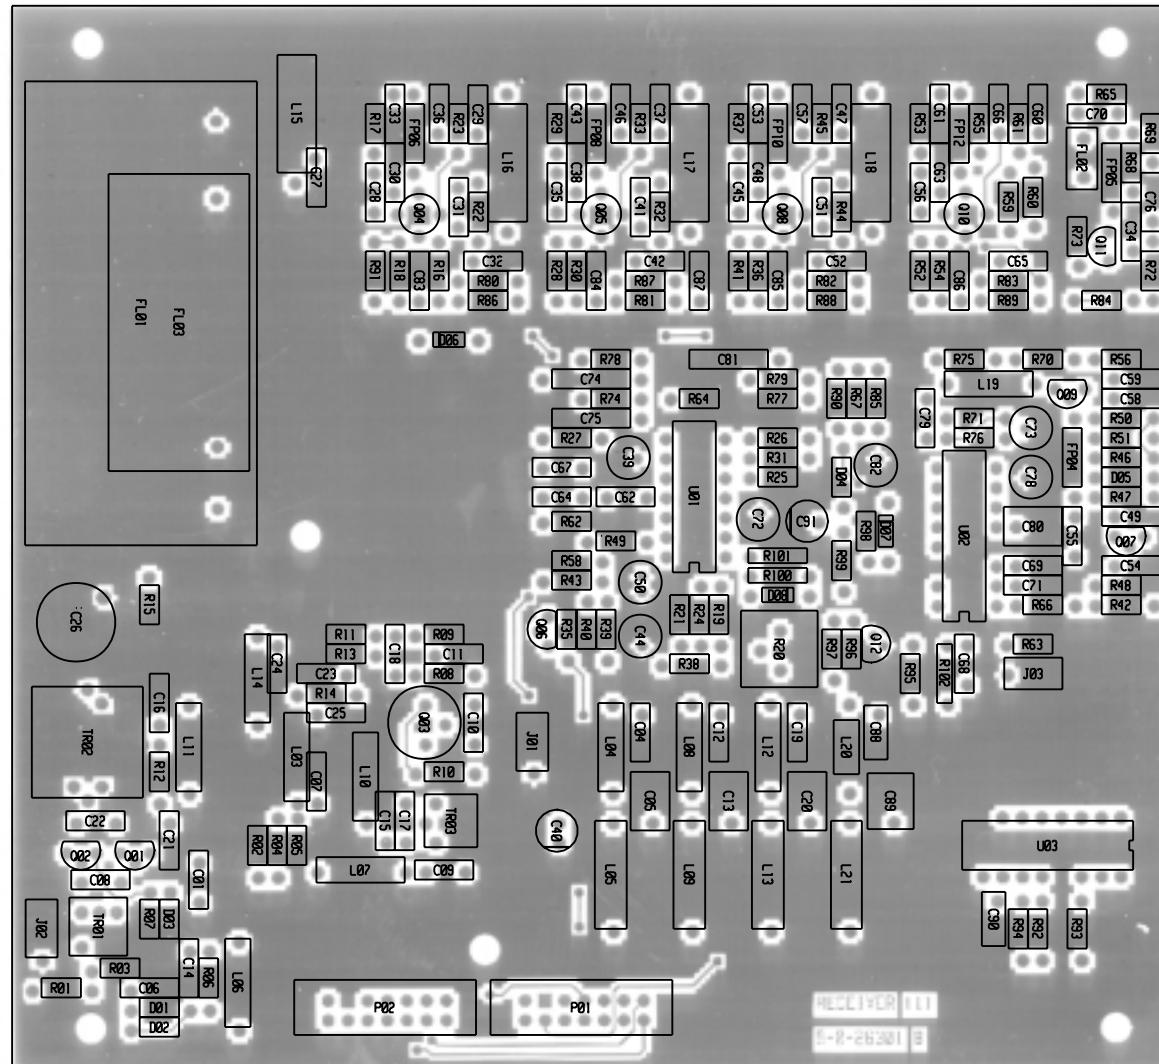

AF FILTERS AND AF BUFFER AMPLIFIER.

To reduce noise from the non-tuned IF amplifier, the AF signal from the signal detector is led through two active filters in cascade.

The AF filters are build as two 3th order filters, one low pass filter with a 3 dB cut off frequency at 2250 Hz. and one high pass filter with a 3 dB cut off frequency at 1200 Hz.

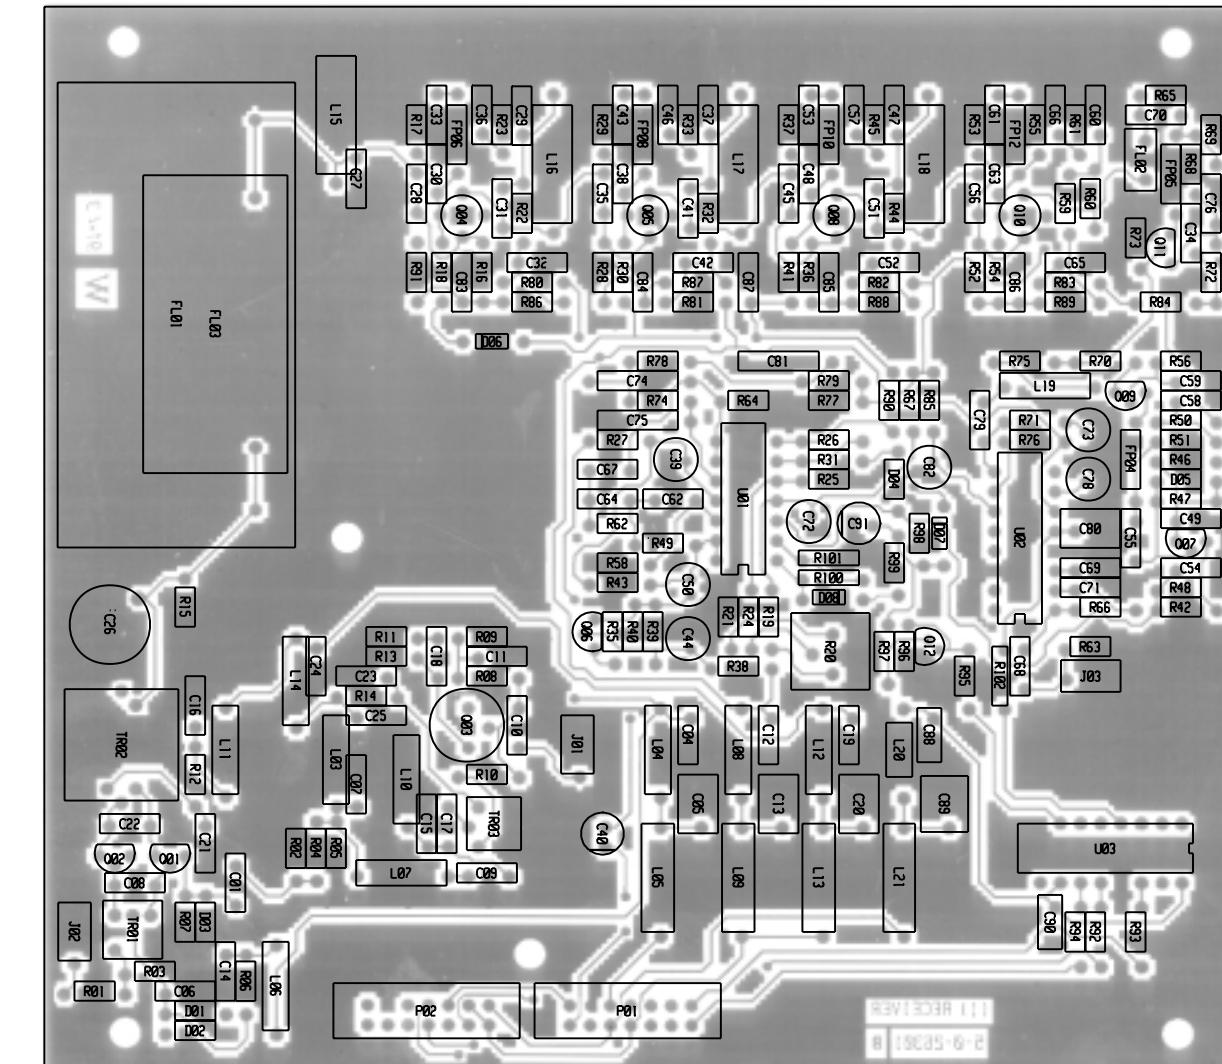

The output from the AF filters is fed through the buffer transistor Q06, which buffers the 0 dBm AF signal to a 600 ohm load.

PCB rev. 26301B

View from component side with lower side tracks.

RECEIVER UNIT MODULE 1

This diagram is valid for PCB rev. 26301B

5.2 FRONT END UNIT (MODULE 2) PART NO. 625632

This module consists of a transmit/receive relay and the receiver front end. The front end consists of a receiver input protection circuit, a radio frequency filter unit, a radio frequency to first intermediate frequency (70 MHz) mixer, and a first IF (70 MHz) filter unit.

AERIAL/EXCITER SWITCH

The aerial signal enters the receiver through the aerial/exciter socket J01, when relay RE02 is in RX position. The exciter signal from the power module (8) is connected to relay RE02 through the EX socket J04. When relay RE02 is in TX position the exciter signal will pass through the aerial/exciter socket J01 and a coax cable to the HF power amplifier in T2130. Switching between RX and TX with RE02 is controlled from the microprocessor through register U01 and Q02.

INPUT PROTECTION

Protection of the pre-filters and the first mixer is done with R02, R03, TR01 and the circuit around D05, and it guarantees that the voltages to the pre-filters cannot be higher than about 4.5V. In addition the RX input is grounded with relay RE01 when the transceiver is switched off.

PRE-FILTERS

The pre-filters consists of the following units:

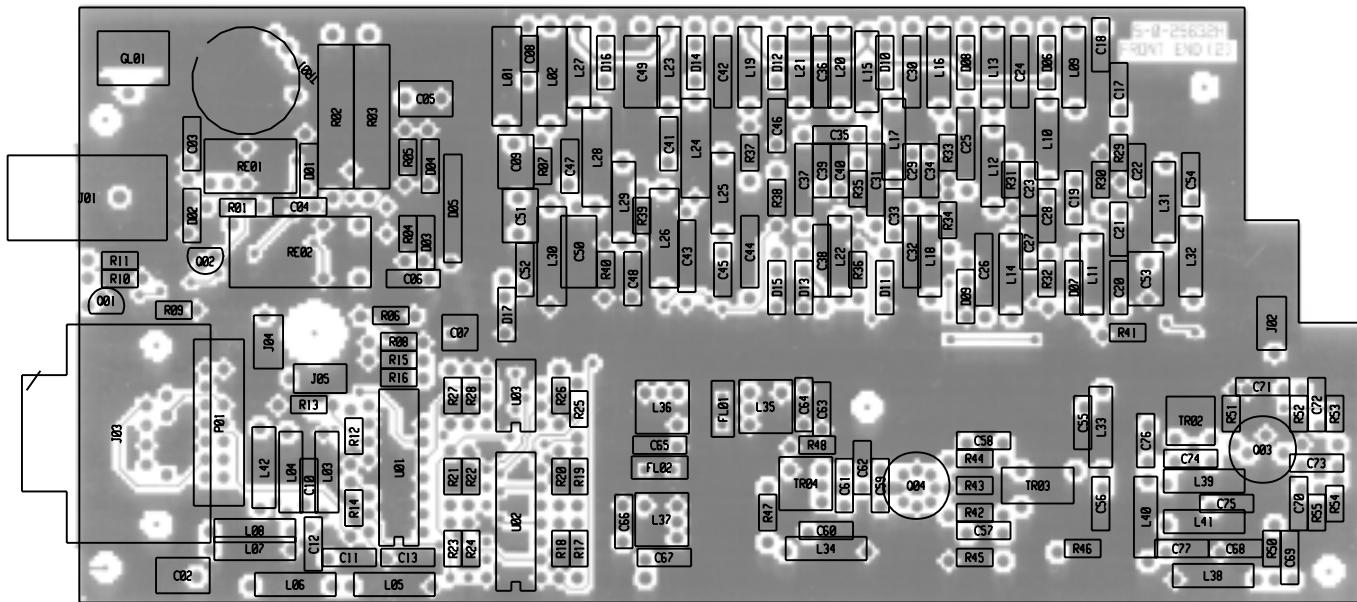

-	100 kHz	HPF	consisting of L01-L02 and C08
-	385 kHz	LPF (1)	consisting of L29, C49-C50 and D16-D17
-	385 kHz - 1.6 MHz	BPF (2)	consisting of L24-L26, C42-C44 and D14-D15
-	1.6 MHz - 4.5 MHz	BPF (3)	consisting of L20-L22, C36-C38 and D12-D13
	4.5 MHz - 9 MHz	BPF (4)	consisting of L16-L18, C30-C32 and D10-D11
-	9 MHz - 18 MHz	BPF (5)	consisting of L12-L14, C24-C26 and D08-D09
-	18 MHz - 30 MHz	BPF (6)	consisting of L09-L11, C18-C20 and D06-D07
-	30 MHz	LPF	consisting of L31-L33, and C54-C56

The switching between the filters is controlled from the microprocessor through U01, U02 and U03.

FIRST MIXER AND IF-FILTER

The first mixer is an active J-FET mixer with good, large signal properties and low noise factor. The signal is led through the balanced transformer TR03 to the sources of the dual J-FET Q04. The first LO signal from the frequency synthesizer (module 3) is led through the LO buffer (Q03) to give about +17 dBm signal to the gates of the two J-FET transistors. The mixed signals are fed through the balanced output transformer TR04 to the two high order bilitich crystal filters FL01 and FL02 where the wanted 70 MHz signal is selected. The selected signal is then fed on to the receiver PCB (module 1).

COMPONENT LOCATION FRONT END MODULE 2

PCB rev. 25632H

FRONT END MODULE 2

TEST CONDITIONS

Receiver Frequency: $f_{RX} = 2058.24$ kHz
 Receiver Mode: J3E/USB
 Generator frequency: $f_G = 2059.24$ kHz
 Generator level: $V_G = 117$ dB/ μ V $P_G = 4$ dBm
 Generator mode: CW

The generator signal must be fed to the aerial socket at the Front End Unit.

5.3 SYNTHESIZER UNIT (MODULE 3) PART NO. 625633

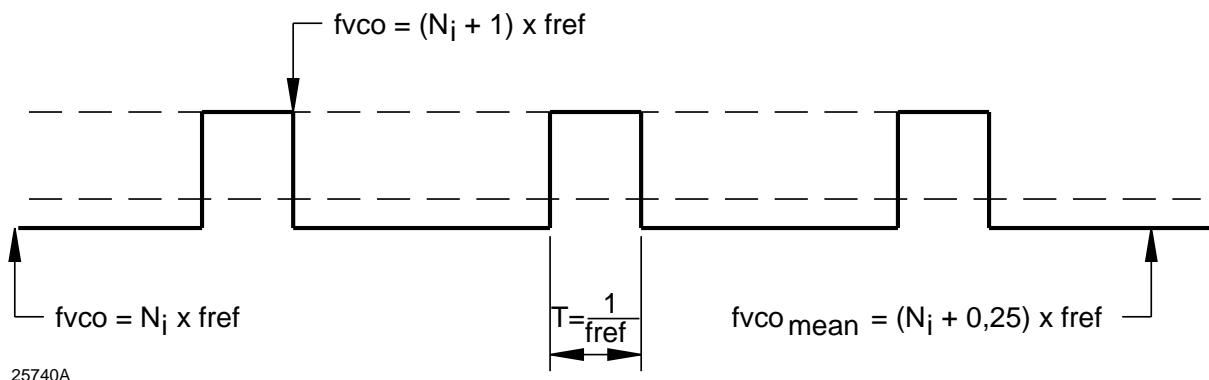

The synthesizer unit consists of two phase locked loops. Phase locked loop 1 generates the signal used as injection to the first mixer in the front end module and as the injection to the second mixer in the exciter unit. The PLL1 signal has a frequency range from 70 MHz to 100 MHz in steps of 10 Hz.

Phase locked loop 2 generates the injection signal to the first mixer in the exciter unit and the injection signal to the second mixer in the receiver unit. The PLL2 signal changes between two frequencies 80.7 MHz and 59.3 MHz when the transmitted or received sideband is changed between upper and lower sideband.

PHASE LOCKED LOOP 1

PLL1 operates as a fractional synthesizer. This means that the dividing figure in the loop can be set to a non-integer number, making it possible to get a frequency resolution at the VCO output which is smaller than the reference frequency in the loop. The reference frequency is 40.96 kHz and the frequency resolution is 10 Hz. The reference frequency is derived from a TCXO, which oscillates at 10.73152 MHz. Furthermore the TCXO signal is used as carrier signal for both detector in the receiver and SSB generator in the exciter.

The principle in a fractional synthesizer is that the integer number dividing figure N_i in the loop is changed at particular times to $(N_i + 1)$ determined by the value of fraction number F . By this method the mean frequency of the VCO is increased as illustrated in the example below:

In the example the integer dividing figure is changed every fourth reference cycle implying an increase in mean VCO frequency.

Because of the change in the integer number, dividing figure spurious sidebands occur at the VCO output. These sidebands have to be reduced and this is done through a correction signal fed to the phase detector. The correction signal is generated in the API (Analog Phase Interpolator) circuit.

VOLTAGE CONTROLLED OSCILLATORS

The frequency range from 70-100 MHz is covered with four independent oscillators:

VCO I:	70.0 - 77.5 MHz
VCO II:	77.5 - 85.0 MHz
VCO III:	85.0 - 92.5 MHz
VCO IV:	92.5 - 100 MHz

The oscillators are in principle identical and each of them is built-up around an earthen drain FET amplifier, where the output signal is fed back to the input by means of two capacitors. The ratio of the capacitors determines the amount of feed-back in the oscillator. The oscillator frequency is determined by the LC circuit located on the gate of the FET, and the tuning of oscillator frequency is done by means of variable capacitance diodes.

The output signal from the VCO's is led through switch diodes D2, D5, D7, and D10 to a common buffer amplifier Q13, which buffers the VCO signal for prescaler buffer and LO buffer respectively.

Selection of the wanted VCO circuit is done by Q1, Q3, Q4, Q6, Q7, Q9, Q10, and Q12. The control of these transistors is done by serial to parallel register U1.

PASSIVE LOOP FILTER

The components R28, R31, C11, C51, C54, and L22 constitute a chebychev lowpass filter with cut-off frequency equal to approximately 10 kHz.

The major task of the passive filter is to prevent spurious signals, arise from the phase detector and divider circuit, to modulate the VCO and generate sidebands to the VCO output signal.

ACTIVE LOOP FILTER

The filter consists of U16, C66, R33, and R38. The filter secures stabilization in the loop system and is of vital importance in determination of the loop system bandwidth.

PHASE DETECTOR

The phase detector is of the sample and hold type. The detector consists of a sequential phase detector followed by the current switch, the ramp generator and the sample and hold circuit.

U26 together with U27 form the sequential phase detector which converts the phase difference between the reference signal and the signal from the programmable divider to a square wave signal measurable on U26 pin 6. The duty cycle of the square wave signal is inverse proportional to the phase difference. The sequential phase detector controls the current switch, which is built-up around Q25, D17, R93, D16, and D15. When the signal on basis of Q25 is at high state, D16 is switched on, the potential on the cathode of D15 is increased, and D15 is switched off.

When the signal on basis of Q25 is at low state, D16 is switched off, the potential on the cathode of D15 is decreased, and D15 is switched on. The amount of current flowing through D15 and D16 respectively is determined by the current mirror circuit described elsewhere.

The ramp generator, built-up around U21 and C112, integrates the current drawn from U21 pin 2 in regard to time. The ramp generator output voltage is then linear in regard to the size of current flowing through the switch diode D15 and the period of time the diode is switched on.

Q24 connected in parallel to C112 constitutes a switch, which resets the ramp generator by discharging C112.

The switch is open when the gate voltage is at low state and vice versa.

The ramp generator and current switch connected with the sequential phase detector imply a phase detector where the output voltage, in a certain period of time in every reference cycle, is linear in regard to the phase difference between the reference signal and the signal from the programmable divider. In this period the output voltage has to be sampled and held and this is done by the sample & hold circuit, consisting of U19, R64, C95, Q19, and R77.

Q19 functions as the switch, which carries out the sampling. The switch is open when the gate voltage is at low state and vice versa.

C95 is charged to the phase detector voltage through R77 when the sample switch is closed, and carries out the hold function when the sample switch is open.

The voltage on C95 is led to the active loop filter through the voltage follower U19.

CURRENT MIRROR

The current mirror is built-up around transistor array U20 and the circuit generates reference circuit for the phase detector and the API-circuit.

The current mirror is so designed that the ratio between reference current for phase detector and API-circuit respectively will be kept as a constant regardless of the temperature. A change in one of the currents will be reflected or mirrored into the other.

The nominal value of reference current for the API circuit can be adjusted by means of potentiometer R88.

CONTROL SIGNAL LOGIC

The circuit is built-up around one 8-bit counter U32, which is clocked by the input signal to the reference divider. The clock frequency is 5.36576 MHz.

The counter is reset by the output signal from the reference divider.

The control logic delivers reset signal to the ramp generator and sample signal for the sample & hold circuit. The output signals from the circuit are generated through detection of which state the 8-bit counter is in, and the detection is done by means of the logical circuitry formed by U25 and U29.

API CIRCUIT

The circuit delivers signal to the modulus control logic and correction signal (API voltage) for the phase detector. The circuit is built-up around a 12-bit digital accumulator constituted by U2, U3, U4, U7, U8, U9, and U12 containing a fraction register, a binary adder, and a sum latch.

Overflow information from the binary adder is led to the modulus control logic and implies a change in the integer number dividing figure in one reference cycle.

In every reference cycle the contents of the accumulator is renewed by clocking the sum latch, the clocking is controlled by the control logic circuit.

The output from the binary adder is led to a 12-bit D/A converter U14, which in connection with OP. AMP U18 generates the API voltage.

The reference current to the D/A converter is derived from the reference current to the phase detector by means of the current mirror and is led through the current switch and current buffer & filter to the D/A converter.

D11, D12, Q16, and Q15 constitute the current switch, which adjusts the mean value of the reference current to the D/A converter as a function of the integer number dividing figure in the loop.

When the signal on basis of Q15 is at high state, D11 is switched on and D12 off and vice versa, and by changing the duty cycle of a square wave signal on basis of Q15 the mean value of the current to the D/A converter can be adjusted.

Control of the current switch is carried out by the 1/N correction logic, which as a function of the output from the programmable divider and the output from the prescaler produces a square wave signal measurable on U13 pin 13 where the duty cycle is varied as function of the integer number loop dividing figure so that the duty cycle increases for decreasing VCO frequency and vice versa.

From the current switch the current is led to buffer & filter constituted by Q14, C84, and C85, which buffers and filters out the reference current to the D/A converter.

MODULUS CONTROL LOGIC

The modulus control logic is constituted by U28 and U23, which as a function of overflow signal from the accumulator, prescaler output, modulus control signal from the programmable divider and output from the 1/N correction logic, generates modulus control signal for the prescaler.

The circuit does not effect the modulus control signal from the programmable divider when the loop dividing figure includes a fraction part, the prescaler modulus shall be changed in one prescaler output period from 32 to 33, if there is a reference cycle where overflow signal is given from the digital accumulator. This change of prescaler modulus implies the needed change of dividing figure to increase the mean frequency of the VCO with a fraction of the reference frequency, and the change is timed through the modulus control logic.

DIVIDER CIRCUITS

The programmable divider consists of a dual modulus prescaler U22 dividing by 32/33 and a programmable divider included in U24. The integer number dividing figure is latched into U24.

The reference divider consists of a D-FF U31 followed by the programmable reference divider U30. The division ratio of U31 is 2 and the division ratio of U30 is 131. This implies a total division ratio of 262.

BUFFER CIRCUITS

The VCO signal is led from the VCO buffer into LOI buffer and prescaler buffer.

The LOI buffer consists of Q17 and Q22 and the buffer generates the necessary power level for both receiver and exciter modules.

The output of the buffer is led to relay RE01, which feeds the signal to receiver and exciter respectively, dependent upon whether the transceiver is in transmit or receive mode.

The control of RE01 is carried out by serial to parallel register.

The prescaler buffer consists of Q18 and Q21 and the major task of the circuit is to prevent spurious signals created in the prescaler from being added to the VCO signal and through that imply spectral impurity of the LOI signal.

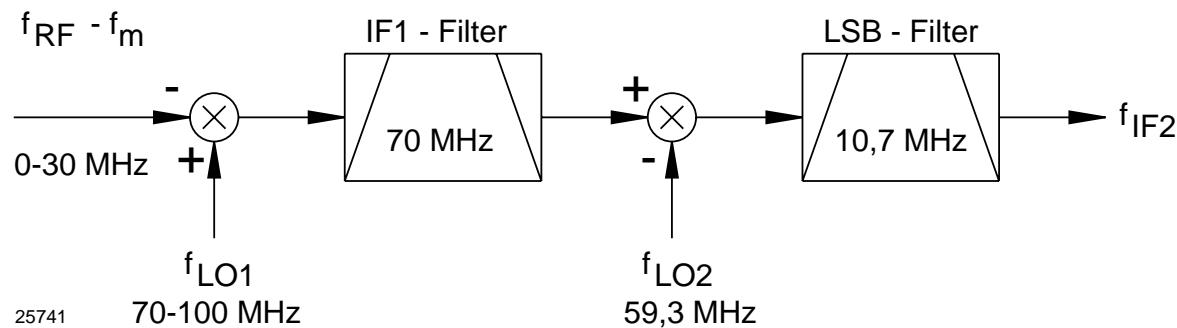

The TCXO signal is led to the TCXO buffer, which consists of Q27 and Q26.

The buffer delivers signal for the reference divider and carrier reinjection signal for both receiver and exciter modules.

PHASE LOCKED LOOP 2

The change between transmitted and received upper and lower sideband is generated by a frequency change in PLL2 as illustrated below.

USB Receiver

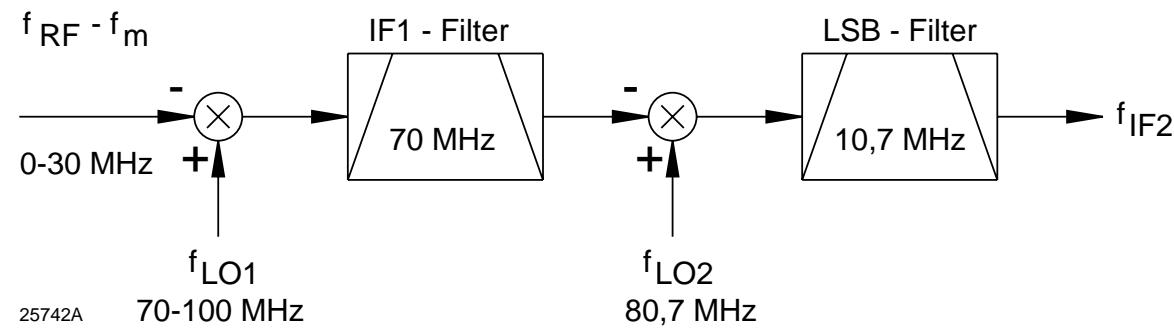

f_m = Modulation frequency

f_{IF2} = $f_{LO1} - f_{LO2} - f_{RF} - f_m$.

The modulation frequency f_m changes sign meaning that a received upper sideband signal will pass through the 10.7 MHz lower sideband IF-filter.

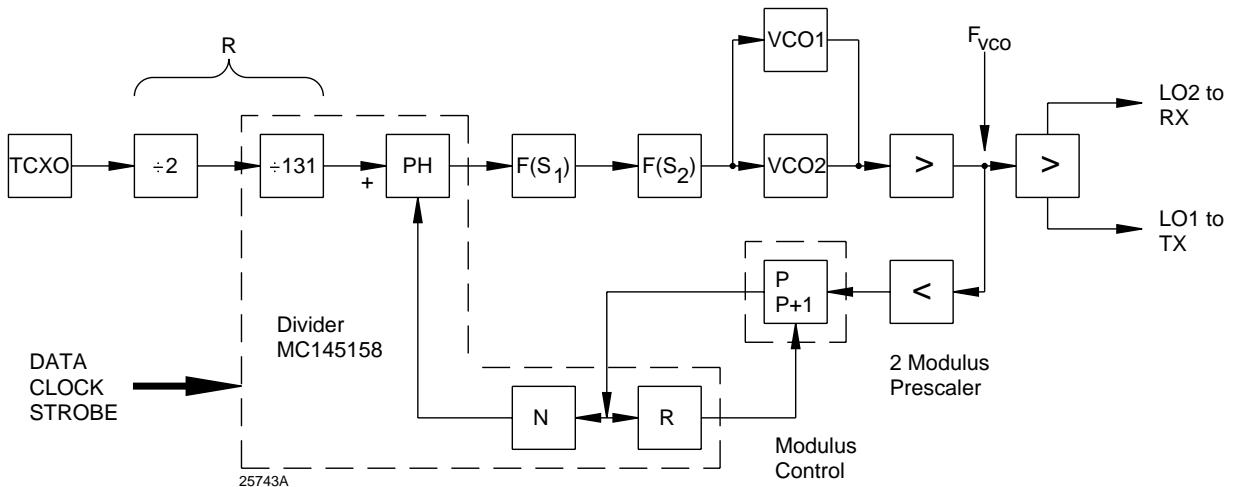

LSB Receiver

f_m = Modulation frequency

f_{IF2} = $f_{LO2} - f_{LO1} + (f_{RF} - f_m)$

The modulation frequency f_m does not change sign meaning that a received lower sideband signal will pass through the 10.7 MHz lower sideband IF filter.

BLOCK DIAGRAM OF USB/LSB SYNTHESIZER

From the block diagram it can be shown that the output frequency f_{VCO} has the following function of f_{TCXO} :

$$f_{VCO} = f_{TCXO} \frac{1}{R} (N * P + A) \quad P \text{ chosen to } 32.$$

$$f_{TCXO} = 10.73152 \text{ MHz}$$

When upper sideband is chosen the following counts are read into the divider U35. $R = 2 * 131$, $N = 45$, $A = 7$, this gives $N * P + A = 1447$ and the lock frequency is $f_{VCO} = 59,269.120$ MHz.

When lower sideband is chosen the following counts are read into the divider U35. $R = 2 * 131$, $N = 61$, $A = 19$, this gives $N * P + A = 1971$ and the lock frequency is $f_{VCO} = 80,732.160$ MHz.

VOLTAGE CONTROLLED OSCILLATOR

The circuit contains two similar VCO's. One is active in LSB mode and the other is active in USB mode. The oscillator which is active in the LSB mode is built around the transistor Q30. Coil L31, parallelled with C130 and C129 in combination with the variable capacitor D19 form the main part of the frequency determining elements.

D20 and R120 which are connected to the gate of the oscillator transistor prevent the gate source voltage from becoming positive which will cause the oscillator noise to increase.

To activate the oscillator U01 - pin Qg is "LOW" which means that transistor Q28 is off and the transistors Q29, Q31 are on supplying the oscillator transistor with DC voltage.

The oscillator which is active in the USB mode is built around the transistor Q33. Coil L37 parallel with C150 and C149 in combination with the variable capacitor D22 form the main part of the frequency determining elements.

D23 and R133 which are connected to the gate of the oscillator transistor prevent the gate source voltage from becoming positive which will cause the oscillator noise to increase.

To activate the oscillator U01. Pin Qg is "high" which means that the transistors Q32 and Q35 are on supplying the oscillator transistor with DC voltage.

When one oscillator is supplied with DC voltage the other is off.

The DC supply to the oscillator switches the diode D21 or D24 on and thereby supplies DC voltage to the oscillator buffer transistor Q36. From this transistor the local oscillator signal is fed to the prescaler buffer and to the output local oscillator buffer.

PRESCALER BUFFER

From the oscillator buffer transistor Q36 the signal is fed through the network consisting of R159 and C180 to the grounded basis transistor Q38. The local oscillator signal is amplified here and fed through the attenuator R168/R170 and the amplifier transistor Q40. The result is an amplitude stabilized signal which is fed to the prescaler U36.

PRESCALER AND DIVIDER

The programmable divider consists of a dual modulus divider U36, dividing by 32/33 and a programmable divider included in U35.

The division ratio is determined by the number latched into U35 and together with U36 the divider works as a conventional dual modulus divider with the modulus control from U35 controlling the prescaler U36. The reference frequency divider is included in U35.

The reference frequency input on pin 1 has the frequency 5,365.760 MHz and the reference division ratio R read into U35 is 131 leading to a reference frequency of 40.96 kHz which can be monitored on pin 13. This 40.96 kHz signal is used as the reference signal to the phase detector. The variable frequency to the phase detector is the VCO frequency divided with the read in "division ratio". This ratio is 1447 when USB mode is chosen, and by LSB mode 1971 leading to the two phase lock frequencies in USB of 59,269.120 MHz and in LSB mode 80,732.160 MHz.

PHASE DETECTOR AND LOOP FILTER

The phase detector is an integrated part of U35. The input reference frequency fR is 40.96 kHz which can be monitored on pin 13 and the input variable frequency fV can be monitored on pin 3. The three-state output of the phase detector produces a loop error signal which is used with the loop filter to control the VCO. The phase detector output is for frequency fV > fR or fV leading, negative pulses. For frequency fV < fR or fV lagging, positive pulses and for fV = fR and phase coincidence, the output is in high impedance state.

The loop filter consists of two parts. The first part of the loop filter built around the amplifier U34 and the R/C network R118 and C131 take care of the loop characteristic. The second part of the filter consisting of L34, L35 and C141/C143/C146 is a passive lowpass filter which removes the remaining part of the 40.96 kHz reference signal from the VCO control signal.

OUTPUT LOCAL OSCILLATOR BUFFER

From the oscillator buffer transistor Q36 the VCO signal is amplified in transistor Q34 and filtered in the lowpass filter consisting of C176, L40, and C177. Before the signal is fed to the output terminal it is amplified in transistor Q37 and fed through the relay RE2.

When the relay is activated the VCO signal is fed into the first mixer on the transmitter module. The diode D26 is conducting and thereby grounding the remaining part of the signal to the receiver module. When the relay RE2 is not activated the diode D26 is reversed and the VCO signal is fed to second mixer on the receiver module.

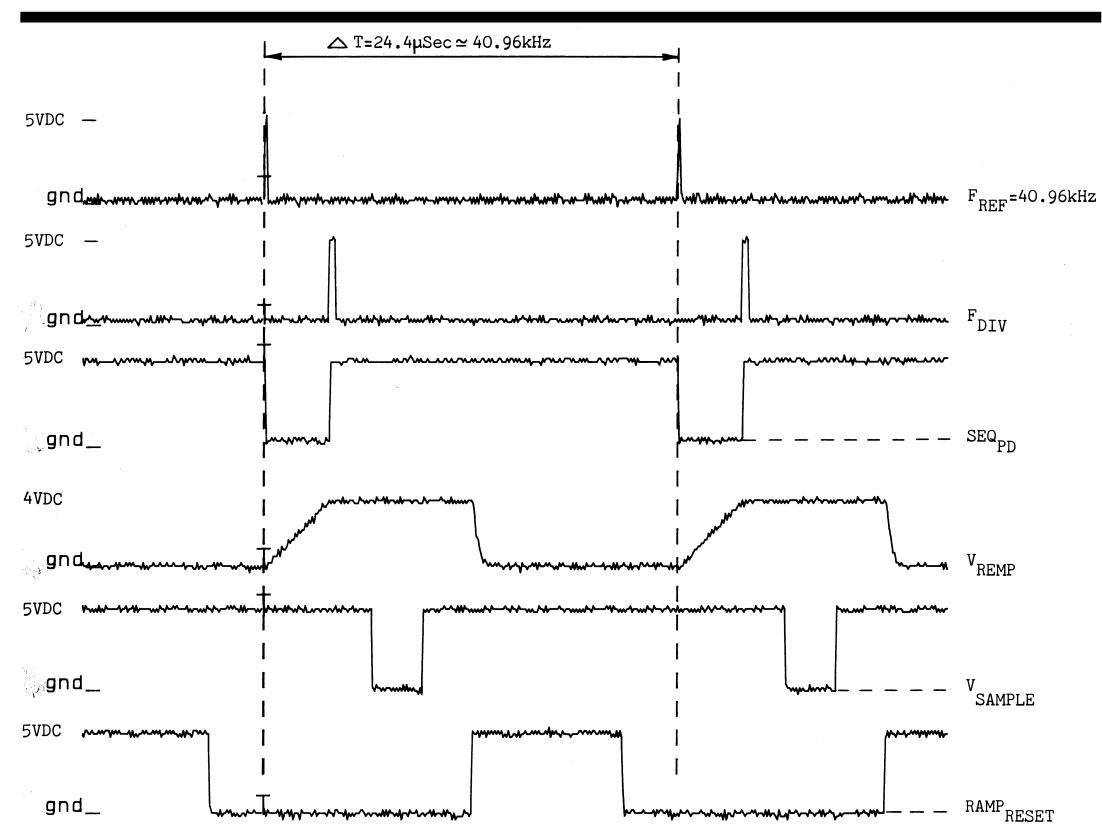

SYNTHESIZER WAVEFORMS

The below waveforms are identified with a signal name, which can be found in the diagram of the Synthesizer module (3).

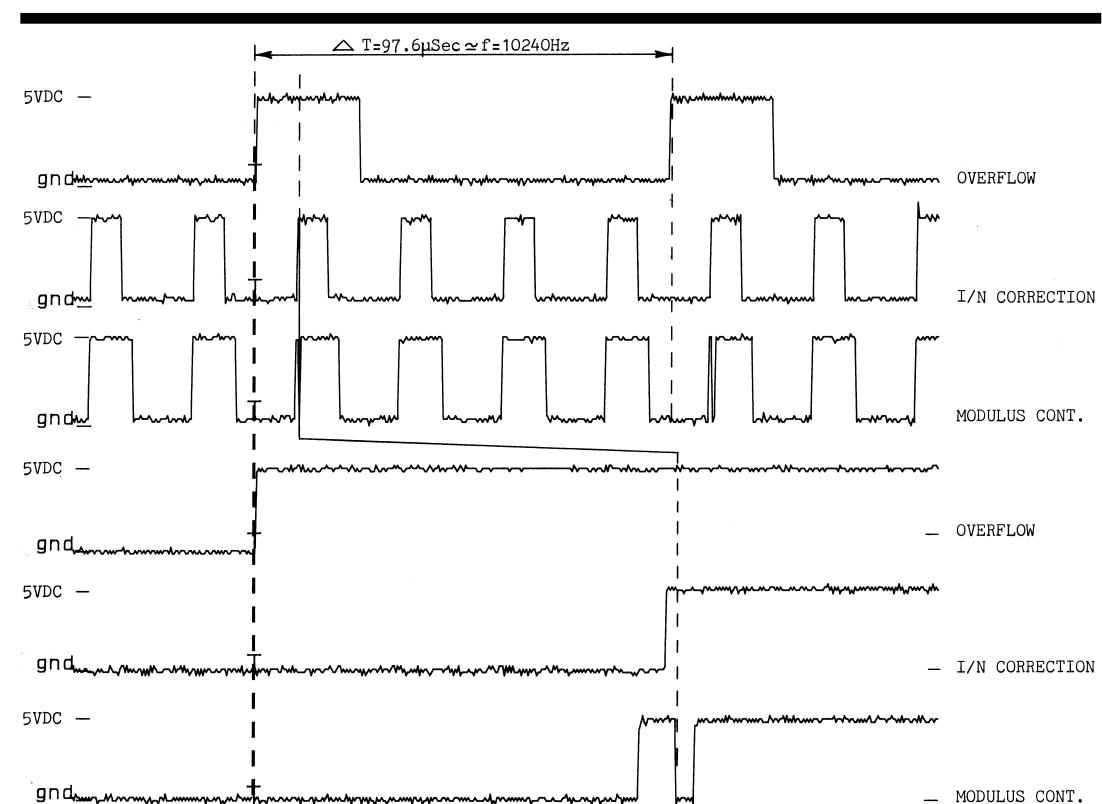

TEST CONDITIONS

Frequency setting $f_{RX} = 2058.24$ kHz

5.4 MAIN PROCESSOR UNIT (MODULE 4) PART NO. 55.150

INTRODUCTION

The following part gives a description of the circuit principles on the CPU board and the Filter board, referring to the schematics and component lists.

Control lines which are active at a logic high level, will be printed like **THIS**.

Control lines which are active at a logic low level, will be printed like **!THIS**.

TT-3820A MAIN PROCESSOR BOARD

The main processor board includes the host processor circuits for the complete control of

- Display Module
- Keyboard Module
- Filter Module
- Receiver set-up and control, SPI-BUS

Memory configuration

- 3x128 Kbyte of program memory
- 64 Kbyte RAM disk (battery backed-up)
- 32 Kbyte NON volatile system configuration memory
- 512 Kbyte scratch pad memory combined with text- and input/output buffer

memory.

Various

- CCITT V.24/V.28 serial input/output circuit
- T-BUS interface
- Parallel Centronic Printer interface,
- NMEA 0183 interface

CENTRAL PROCESSOR UNIT (CPU).

The CPU (U6) used on the Main Processor Board is a 8 bit 10 MHz 80188 processor with multiplexed data and lower address bits.

The CPU clock frequency is generated using a 20 MHz crystal connected directly to the processor.

Control signals and address bits from the CPU are buffered in U4 and U8 by means of the **ALE** signal.

The U5 and U7 forms the I/O mapped chip selects not supplied by the CPU.

The U3 is a combined watch-dog, battery switchover and chips select protection.

Battery power The voltage on VOUT (pin 2) will always be whatever is highest of the supply voltage (pin 3) and the battery voltage (pin 1).

Chip select When the supply voltage (pin 3) drops below 4.65 volts the **!CE** signal (pin 12) goes high to block chips select signals to the SRAM U26 and U27.

Watch-dog For proper software operation the **WDI** input (pin 11) needs to be toggled every 1.6 seconds. If not a 50 msec **!RESET** signal will be issued on pin 15 restarting the microprocessor.

U1A and U2A forms a circuit for controlling the watch-dog function. The first activation of the chip select signal U5 pin 15 will enable the watch-dog. The jumper W1 can disable the watch-dog function if inserted during start-up.

PROGRAMMING MEMORY AND DYNAMIC RAM.

U10, U11 and U12 forms the program memory available on the main processor board (3x128 Kbyte). The program memory layout is as follows:

U13 is a EEPROM containing system configuration and data which needs to be stored in NON volatile memory.

U7B, U9B, U14, U16A/B/C and U17A forms a circuit for protecting part of the EEPROM. To be able to write into the protected part of the EEPROM two keys on the keyboard has to be pressed simultaneously to provide the **!E2WR** signal.

The W4 strap determines which part of the EEPROM to be protected.

The dynamic RAM consists of the RAM circuits U19, U20, U21 and U22, the read/write row/column address gate circuits U15, U18 and U23, the pulse forming network U1B, U7D, U9C/D/E/F, U24A and U25.

The RAM circuits are each organized as 4x256 Kbyte. The refresh of the DRAM is done by the microprocessor using DMA. R12 and C4 ensures the right timing of the **!RAS** and **!CAS** signals to the RAM circuits and multiplexing the row/column addresses.

STATIC RAM CIRCUIT.

The static RAM consists of the RAM circuits U26 and U27 together with chip select protecting circuit U28A/B/C and U29A. U26, U27, U28 and U29 are all powered by battery power and the

CSDIS signal comes from U3 will disable the chip select signals to U26 and U27 if the supply voltage drops below 4.65 volts.

The RAM circuits are each organized as 8x32 Kbyte.

U30 is a dedicated real time clock circuit accessible on a serial basis. The U30 is battery powered to keep running continuously. The timing is based on a 32.768 KHz crystal and for fine tuning C5 can be adjusted for a 128 Hz signal in TP8.

NMEA, SP-BUS AND CONSOLE INTERFACE.

The NMEA 0183 interface consists of U31, U35 and U50. U50 provides the optically isolation and U31 is a Universal Serial Asynchronous Receiver/Transmitter (USART) in which only the receiver part is used. U35 divides the system clock by 16 before feeding the clock signal to the USART. Internally the USART divides the clock signal by 64 to achieve a baud rate of 4800.

The programmable timer U36 generates 2 auxiliary clock signals for the demodulator/modulator. The clock signals are derived from the system clock of 4.1952 MHz.

The last part of the programmable timer is used to measure the period time of the incoming space tone detected in the demodulator. U17B and U39B are converting the analog space signal to a logical TTL gate for controlling the period measurement counter.

The system clock oscillator consists of U38A/B and the frequency is based on a 4.9152 MHz crystal. The U38B serves as buffer for the oscillator signal. For fine tuning C19 can be adjusted for 4.9152 MHz in TP13.

The U37 contains 2 Serial Communications Controllers serving the console port J2 and TÄBUS port J3 and J4, and interface circuits U24C/D/E, U32 and U34A are converting between TTL levels to/from the SCC and the CCITT V.24/V.28 levels. U24B/F, U33A, Q1, Q2 and Q3 forms the network to interface between TTL levels to/from the SCC and the CCITT V.10 levels.

To ensure the output voltage on the SP-BUS to be either +5V or -5V two voltage regulators U40 and U41 are supplying +5.7V and -5.7V to the Q1 and Q3.

INPUT/OUTPUT AND CONTROL INTERFACE.

U42 contains 3 input/output ports.

Port A used as an input port reading 2x4 DIP switches.

Port B used as an input port reading the keyboard columns and the serial data line to the real time clock circuit U30.

Port C used for controlling 3 LEDs DS2, DS3 and DS4, also control of the keyboard light using U33F and Q4, selecting rows for scanning the keyboard.

U38F and U43A ensures the hardware protection for writing in the EEPROM. The **!E2WR** is only generated if a key from column 0 and column 1 are pressed simultaneously.

The Centronics printer port J6 consists of U44, U45 and part of U46. The status signals from the printer are read using the U44 buffer and the 8 data bits are latched on U45. Two outputs on the U46 latch are used for the control signals to the printer.

One output of the U46 latch is used for serial data for the real time clock circuit U30. The SPI-BUS (J7) consists of 5 outputs from U46 and 2 output from U47. The 5 outputs on U46 are select signals and 3 of these needs to be inverted (U33C/D/E). The 2 outputs on U47 are clock signal and data signal.

The rest of the outputs on U47 are used as follows:

!PECLR used for clearing the 2 flip/flops (U17B and U39A) in the period time measurement.

!E2DI, !E2EN Disable and enable signal for writing in the EEPROM.

DSRTTL, RITTL Control signals for the console port J2.

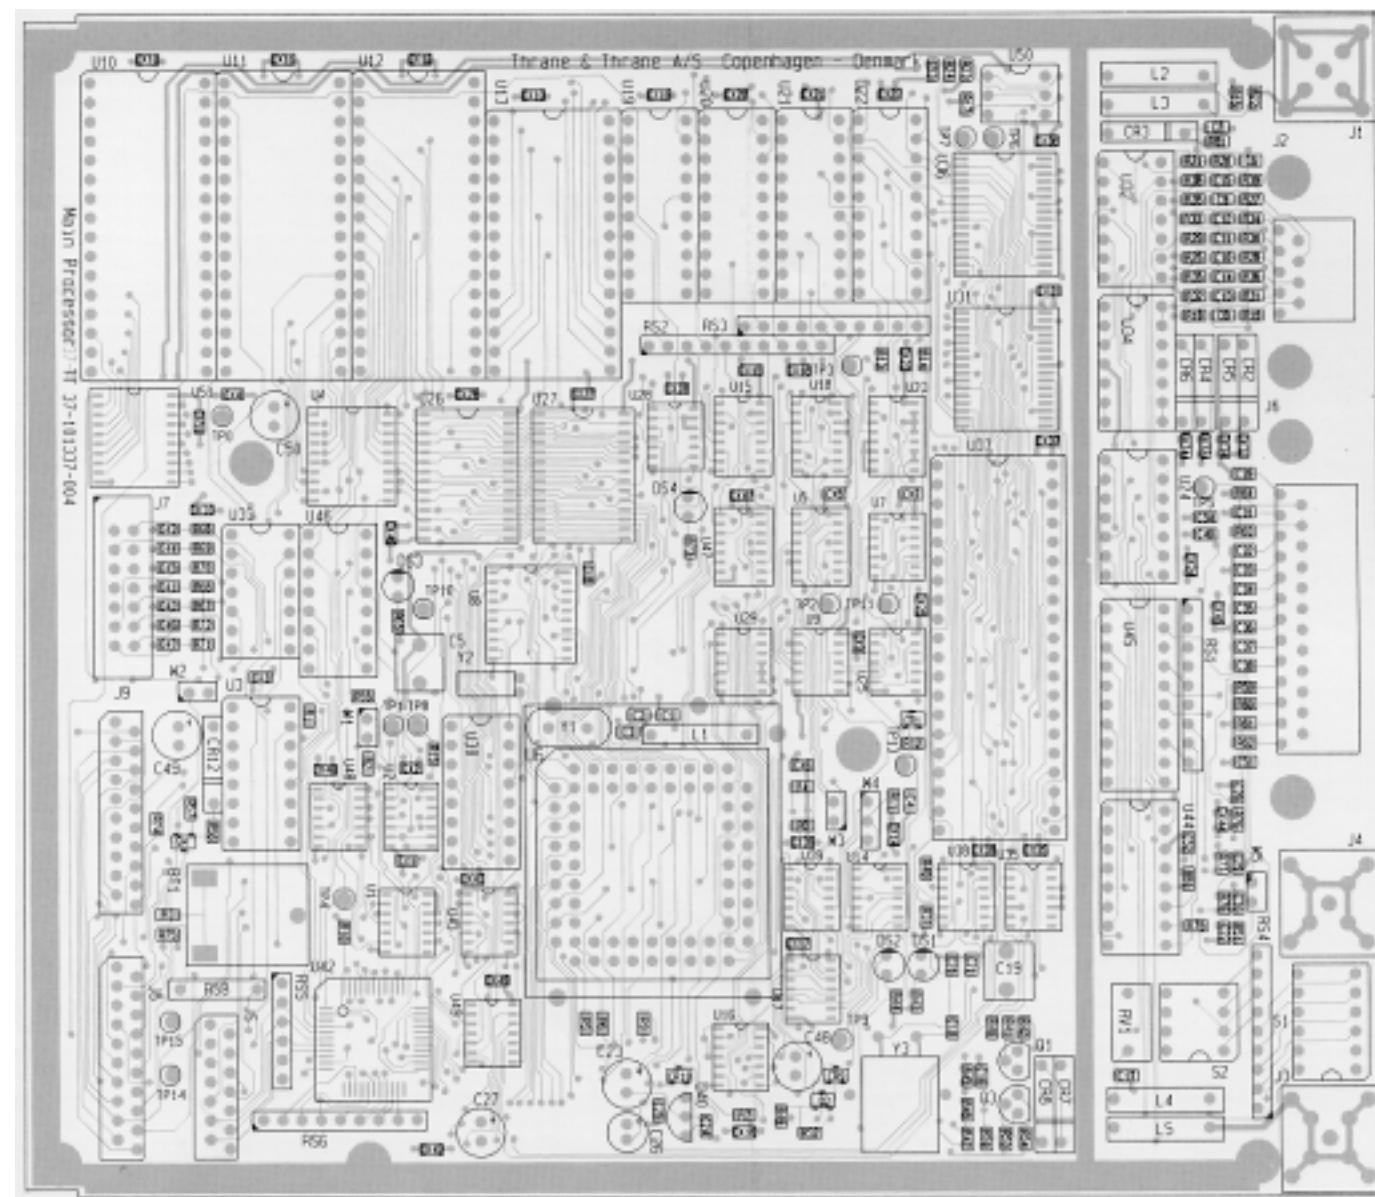

CLK_CLK Serial Clock signal for the real time clock circuit U30.

FILTER AND DISPLAY INTERFACE.

The filter port interface consists of U2B/C, U16D, U48, U49A and U43A. U16D, U48 and U49A are used to buffer the address lines **A0, A1, A2** and the control signals **!WR** and **!RD** in order to keep these lines at a constant level when not accessing the Filter Module. U43B is used for controlling the address line buffers and the bidirectional data buffer U2B/C.

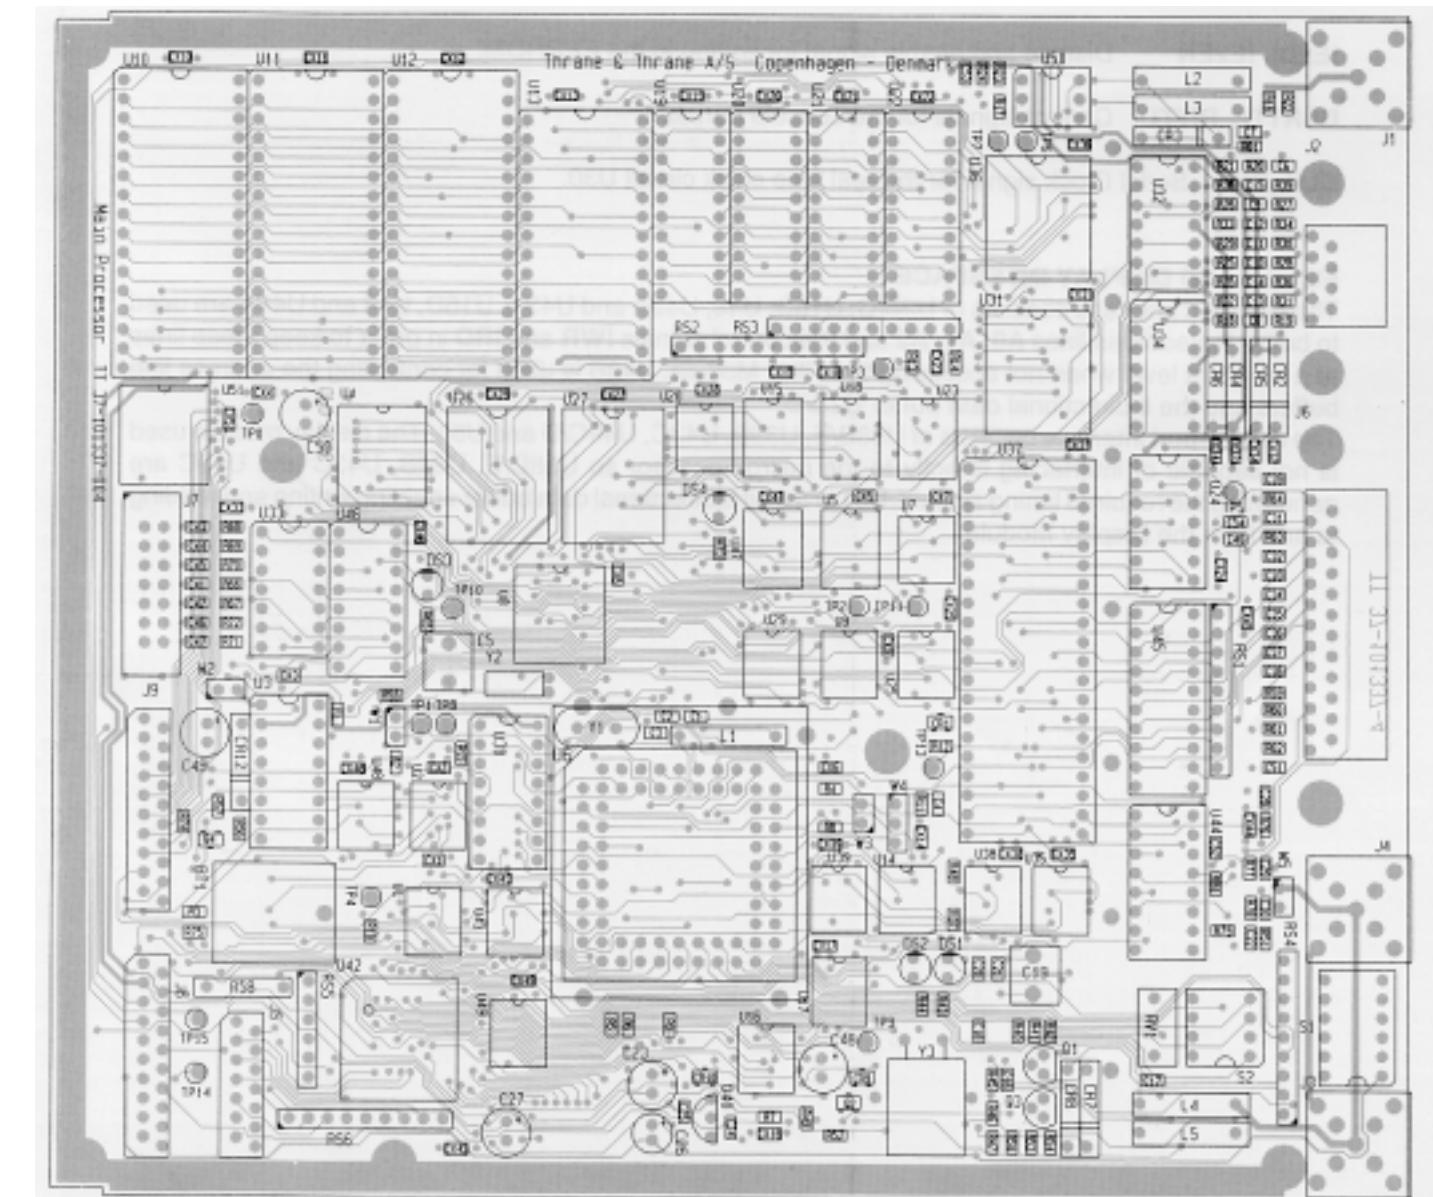

The display port interface consists of U38B/E, U39B, U43C, U49C/D and U51. The display module used is not capable of interfacing directly to the microprocessor so U38D/E, U39B, U43C and U49C are generating the required timing signals. U51 is a 8 bit bidirectional data buffer enabling writing and reading to and from the Display Module.

MAIN PROCESSOR UNIT MODULE 4

5.5 FILTER UNIT (MODULE 5) PART NO. 55.151**INTERNAL AND EXTERNAL CONTROL CIRCUIT.**

J1 is the internal connector which connects the filter board to the Main Processor Board. J2 is the radio interface plug, the control signals from and to other units and the DC supply from the external power source is supplied through this plug. P3 is the power connector which delivers power from and to the power module. Different analogue speaker control- and AF signals also pass through this connector. Two circuits, U1 and U2, provide the control signals. U1 only handles signals to the external connector J2, while U2 also handles internal control signals, for the external connector J2. Each external control signal has protective hardware circuitry to help against noise, short circuits e.t.c.. U3 handles input signals from the connector J2 and the demodulated signal DEMOD from the filters. Also here, there is protective hardware circuitry.

MODEM CIRCUIT.

Received signal modem part.

The incoming signal AF-IN from the receiver module, is fed through the power module to the amplifier circuit U6.1, and from U6.1 to the analogue mixer U5 pin 13. When U5 pin 11 the RX/TX signal, is set high, U5 pin 14 and pin 15 are selected. The incoming AF signal then passes via pin 14, through a low pass filter, U15.1, U4.2, U4.4 and U4.3, where only frequencies below 2100 Hz pass. The low pass filtered AF signal, is through the buffer amplifier U4.1 returned to the mixer U5 pin 1 where it is mixed with the RXMIX signal. This signal, which is constant 4785 Hz is connected to U5 pin 10. On the way to U5, a detector circuit checks for an overload of signal amplification. This is done via U4.1 and Q10 with DS1 being the LED overload indicator. When there is an overload the R32 potentiometer can be adjusted so U6.1 can be set correctly.

As mentioned before, the low pass filtered AF signal is mixed with the RXMIX signal in U5. The mixed signal at U5 pin 15 MIXO consist of:

Mark:	4785 Hz - 1615 Hz = 3170 Hz
Space:	4785 Hz - 1785 Hz = 3000 Hz

This two frequencies are present in the MIXO signal, deriving from U5 pin 15, depending on whether the incoming signal is 1615 Hz (mark) or 1785 Hz (space).

MIXO carries the 3170 Hz or 3000 Hz signal to the mark and space filters. The mark filter incorporates U9.1, U9.2, U9.3, U9.4 and U10.2. The characteristics of the mark filter are:

F(centre)	=	3170 Hz
F(generated)	=	1615 Hz
Band width	=	100 Hz

The space filter incorporates U9.1, U10.3, U11.1, U11.2, and U11.3. The characteristics of the space filter are:

F(centre)	=	3000 Hz
F(generated)	=	1785 Hz
Band width	=	100 Hz

At test point 18 (TP18) the output for the mark filter is between appr. -3,0 V and 0,0 V. The output for the space filter is between appr. 0,0 V and 3,0 V. U11.4 generates the correct TTL signal based on the positive or negative voltages. U11.4 generates 5,0 V for a mark signal and 0,0 V for a space signal.

Transmitter signal modem part:

The TXMOD signal is a 1615 Hz or 1785 Hz digital signal used for indicating the mark or space tone of the message sent. When the RX/TX signal connected to U5 pin 11 is set low, the TXMOD signal from the main processor module is fed through U5 to pin 14.

The same filter as the one used for reception, is applied again, using 15.1, U4.2, U4.4 and U4.3. This circuitry assures that the signal is converted to an analogue signal, where only the signal's first PAGE 5-26

harmonic is present. The signal continues through the buffer amplifier U4.1 back to U5 and becomes present on U5 pin 4 as TXOUT. The TXEN signal is high in the sending state so U5, which also is an analogue switch, Selects the right output pins. The TXOUT signal at U5 pin 4 continues through two 4th order filters, which consist of the amplifiers U8.1 and U8.2, to exclude additional harmonics and the final output signal then ends at J2 pin 18 and pin 9 LINE OUT 1 and LINE OUT 2.

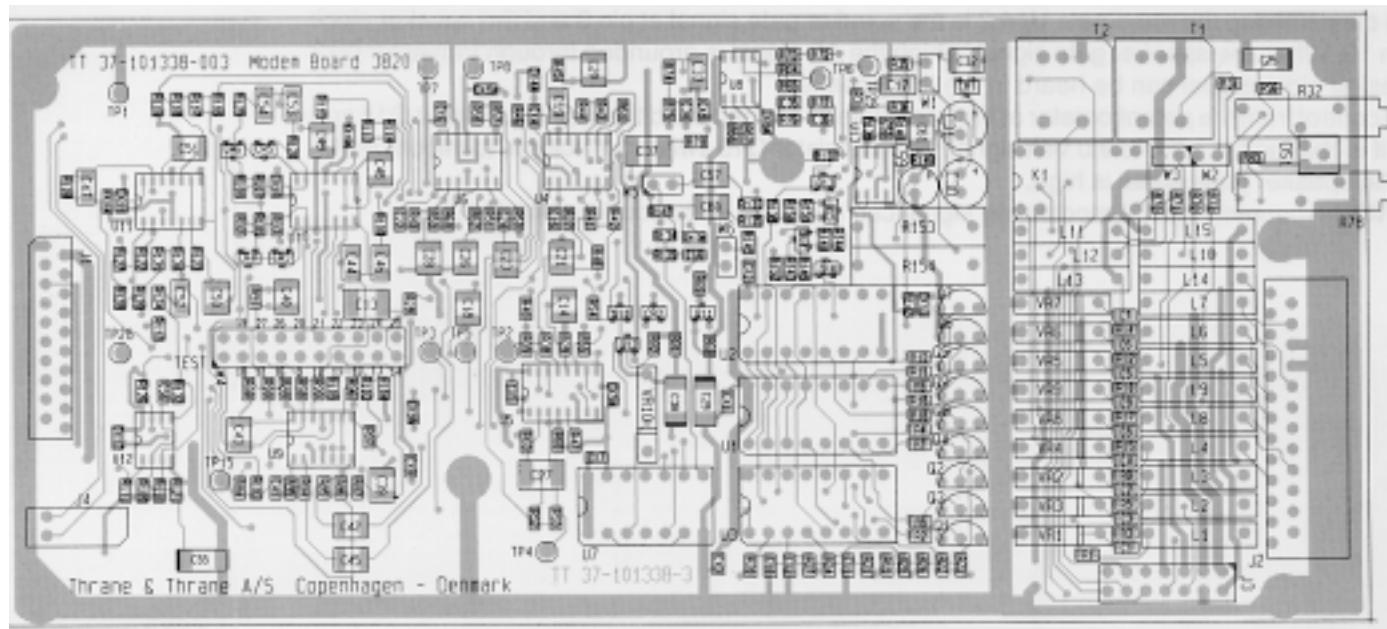

LOUDSPEAKER CIRCUIT.

The input AF signal from the receiver module is fed through the amplifier U6.1 to the amplifier U13.2. The output signal of U13.2 is fed to the power module where the signal is amplified and fed back to the filter module to the radio interface plug J2 and to the loudspeaker plug J4.

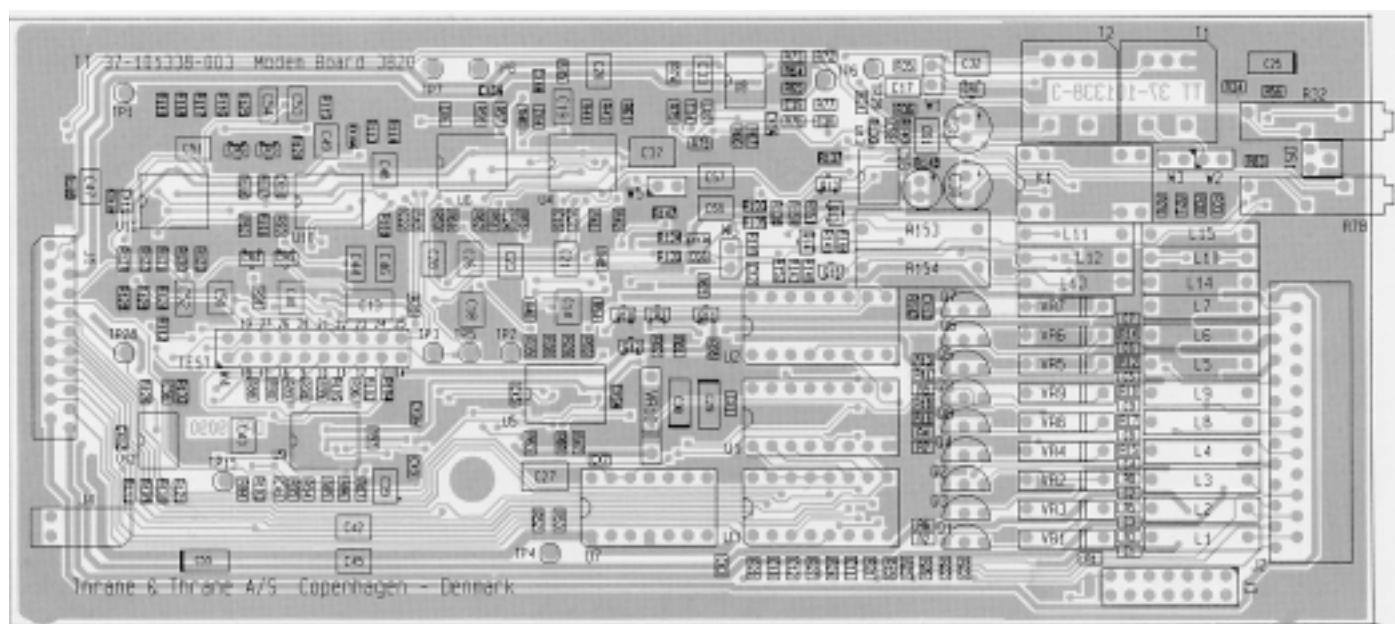

The signals connected to the nand gate U14.2 is the speaker gate signal at pin 9 and the speaker clock signal at pin 10. When the speaker gate signal is high the AF signal is grounded through transistor Q13 and the speaker clock signal can be heard in the loudspeaker.

The volume control from the potentiometer at the front plate, is connected to the transistor circuit Q14 and Q16 where it is changed to a 0.0 to 9.0 Volt signal. The transistor Q15 switch the volume to maximum AF out, when the speaker gate signal is high.

If the strap W5 is mounted the TX modulating signal can be heard in the loudspeaker too.

5.6 KEYBOARD UNIT (MODULE 6) PART NO. 636695

The keyboard consists of a 4*8 matrix of which 26 keys are used.

The 4 rows are set high alternately and by reading the output on the 8 columns it is possible to determine which key has been activated. This scanning of the keyboard takes place 100 times per second.

The keyboard can be illuminated by 13 LEDs. The voltage across the LEDs are controlled by a transistor Q04 placed on the MAIN PROCESSOR board (module 4) and the current in each LED is approx. 8,5 mA.

Seen from secondary side with secondary side tracks.

KEYBOARD UNIT MODULE 6

This diagram is valid for PCB rev. 36695B

PAGE 5-31

5.7 DISPLAY UNIT (MODULE 7) PART NO. 636696

A LCD display of 240 X 64 dots with LED backlight is used to read out information to the operator.

DISPLAY MODULE

The display module has a graphical LCD display, 240 X 64 pixels, and a CMOS LCD driver controller built in. The controller has a built-in character generator and display data RAM. All the display functions are controlled by instructions from the MAIN PROCESSOR.

DISPLAY INTERFACE

PCB 636696 interfaces the MAIN PROCESSOR unit with the LCD-display module.

The PCB is interfaced with the MAIN PROCESSOR (module 4) through the cable terminals X1.

Parallel data DD0-DD7, found in connector X1 pin 7-14 to/from MAIN PROCESSOR, is fed directly to the display connector X2 pins 11-18.

The main processor "E" signal is fed directly to the display-connector X2 pin 7.

The main processor "R/W" signal in X1 pin 15 is fed directly to the display-connector X2 pin 5 to form the display signal "*WR", and the "R/W" signal, inverted by D2-D, is fed to the display-connector X2 pin 6 to form the display "*RD" signal.

The "DISPCS" signal at pin 16 in X1 is fed through the delay circuit consisting of D2-A, D2-B, D2-E, D2-F and the resistor/capacitor R24/C5 to pin 20 in X1.

CONTRAST CONTROL

Contrast control is performed by a four (three) bit digital to the analogue converter consisting of the circuit built around D3, N1-A and N1-D. D3 is a parallel input/output latch with the output pins Q2-Q3-Q4 connected to the resistors R13, R14 and R15 (R12 is not mounted) which are connected to the inverting input of the amplifier N1-A. This circuit forms an 8 step D/A converter (16 steps if R12 had also been mounted. However, the software does not support this). The output of the D/A converter is connected to the non-inverting input of a differential amplifier built around N1-D. The inverting input of the same differential amplifier N1-D is connected to a resistor network consisting of R18, R19 and the NTC resistor R17. This circuit compensates for the display's varying contrast level in respect to temperature changes. The output of N1-D is connected to the display contrast control pin 20.

Negative supply voltage for this circuit is taken from the display module's built-in voltage inverter, X2 pin 4.

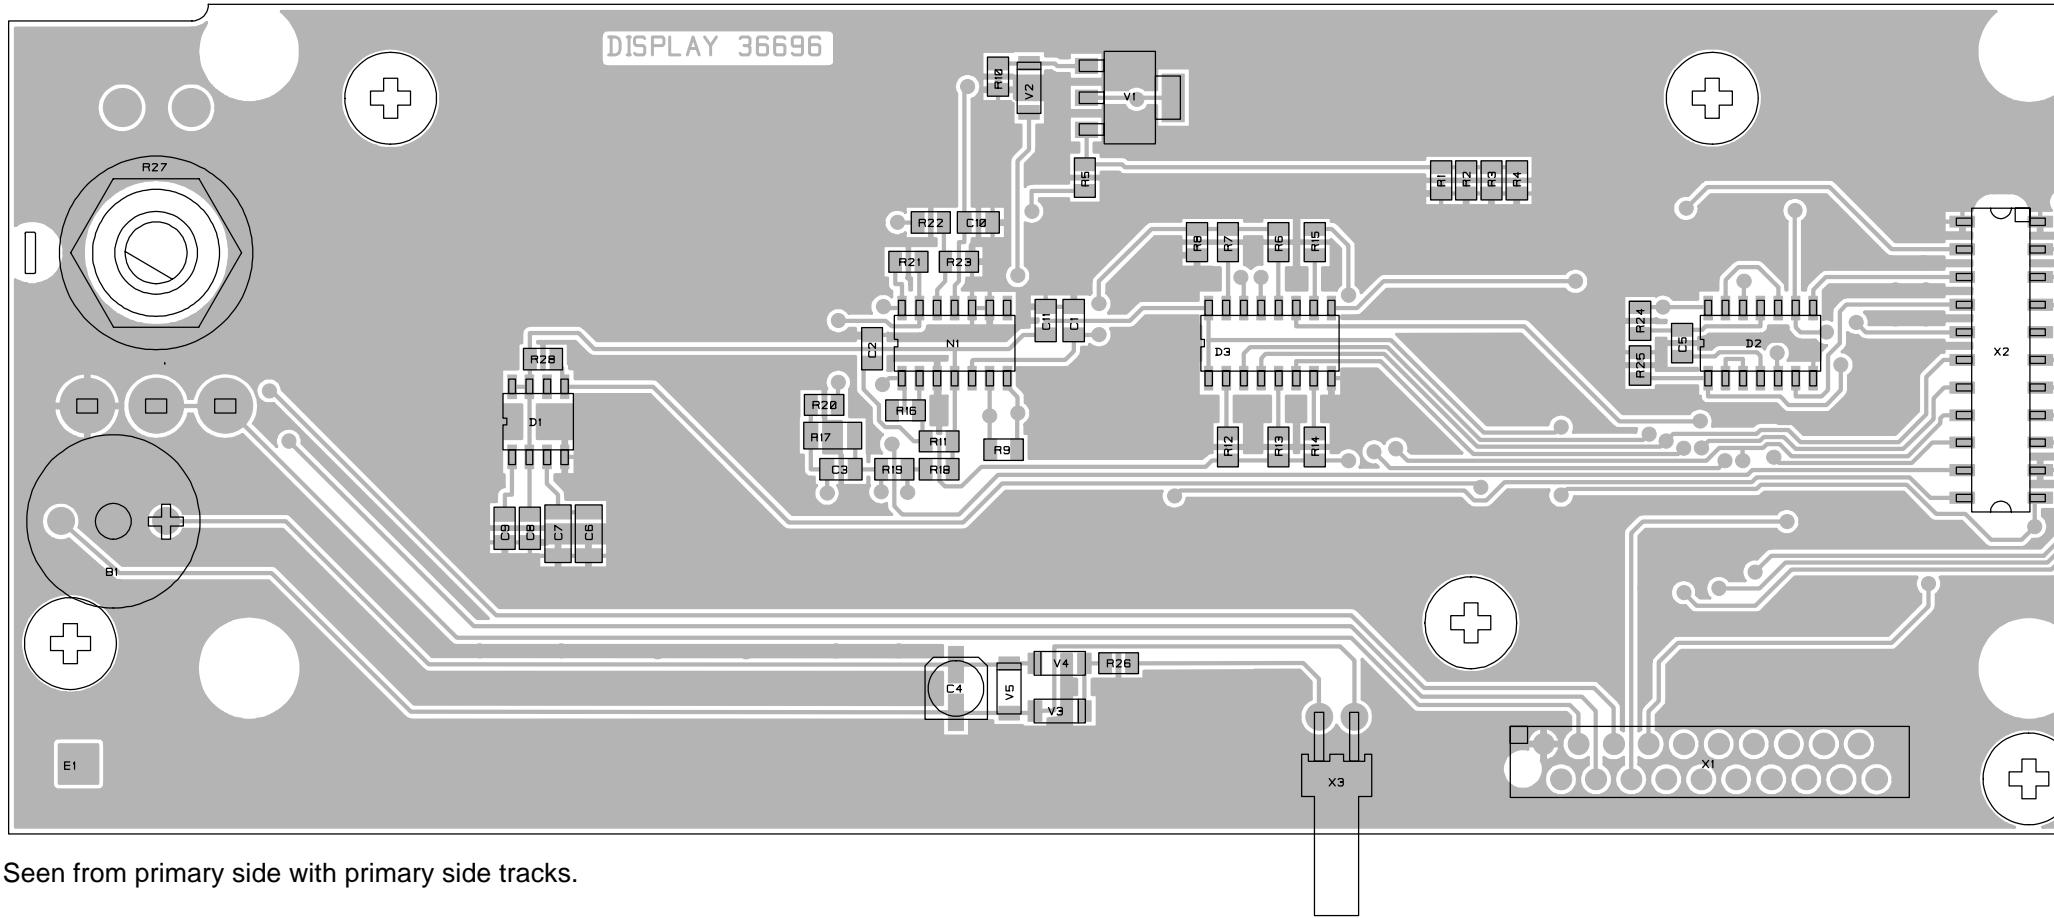

BACKLIGHT CONTROL

The current passing through the backlight LEDs are controlled by the transistor V1. Emitter of V1 is through the resistor R5 connected to the inverting input of the amplifier N1-B. The non-inverting input of N1-B is passing through the resistors R6 and R7 connected to the output of D3 (Q5 and Q6). The current passing through the backlight LEDs is the same as the current passing through the resistors R1-R4. This means that the voltage across R1-R4 is dependent on the current passing through the LEDs. The gain of the amplifier N1-B is 100. This means that the voltage across R1-R4 is the same as the voltage across R8. The voltage across R8 is controlled by the output pins Q5 and Q6 of D3. This means that the current passing through the backlight LEDs can be controlled by D3 in four steps, with step 1 as 0 mA and step 4 as approx. 350 mA. Diode D2 protects transistor V1's base input against negative voltage, which otherwise could occur briefly on power up.

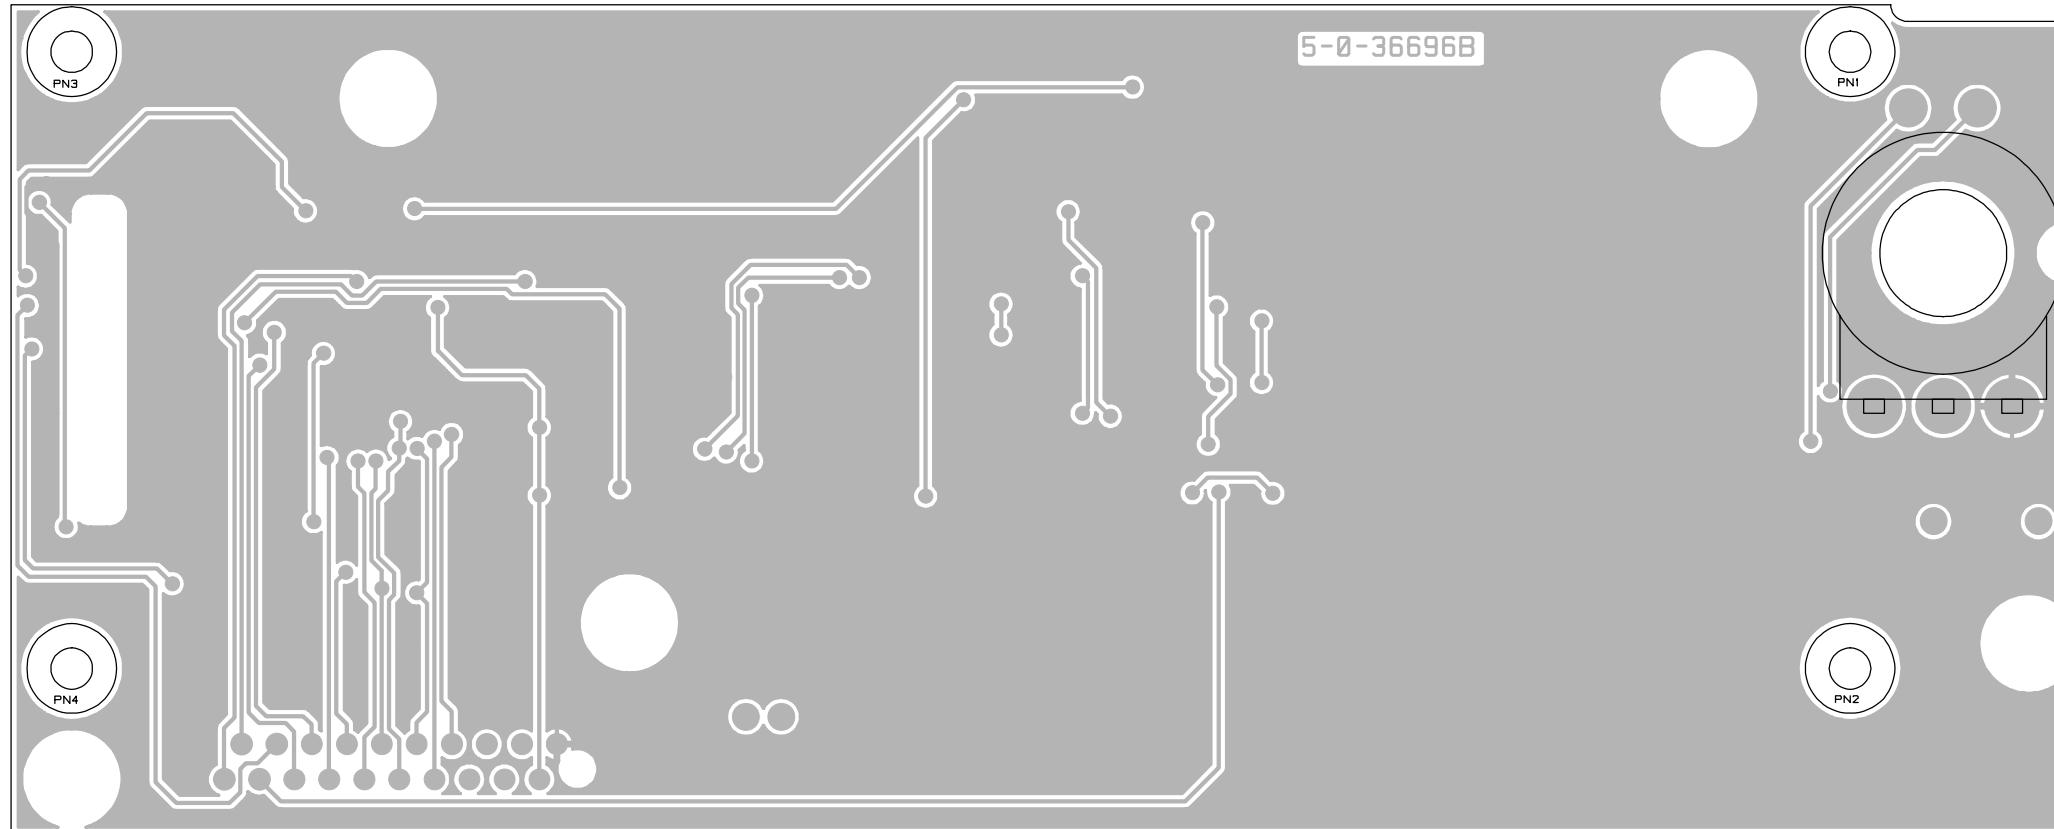

BUZZER CIRCUIT

The circuit around Buzzer B1 is a rectifier circuit, converting the normal AC loudspeaker signal into an DC-voltage which is then applied to DC-buzzer B1. A DC-buzzer is chosen in stead of a loudspeaker, because of lacking mechanical space for a loudspeaker, and because it is used only to announce received calls.

5.8 POWER UNIT (MODULE 8) PART NO. 726308

From the external power supply the power unit is supplied with +9V, +18V and -18V this voltages are through the seven regulators filtered and stabilized and fed to the other units.

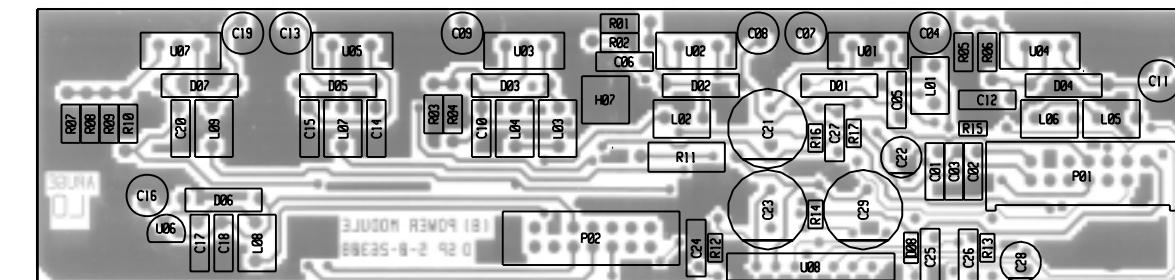

REGULATORS.

The regulators U01, U02, and U03 supply the main processor and the filter unit with +15V, -15V and +5V and the regulator U04 supply the display backlight with +5,5V. The regulators U05, U06 and U07 supply the receiver, the front end and the synthesizer unit with +15V, -15V and 5,2V. The regulator U07 can be adjusted by cutting one of the resistors R07 or R08.

1 SERVICE AND IDENTITY PROGRAMMING FOR RM2152 DSC WATCH RECEIVER

1.1 IDENTITY of RM2152

Turn on the Watch receiver and control that the displaymenu after the initializing menu show the following menu.

If you get the displaymenu indicating that the receiver is a Radio telex modem RM2151, you have to change the internal setting of the switch **S2-2**.

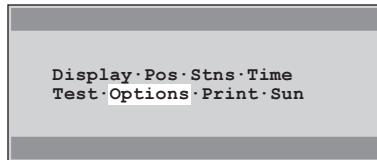

Remove the back plate and cabinet, set switch **S2-2** in on position (please see chapter 6 component location main processor module). Turn on the Watch Receiver RM2152 and check that the display menu now show the above menu. Mount the cabinet and the backplate again.

1.2 SP-BUS PROGRAMMING of RM2152

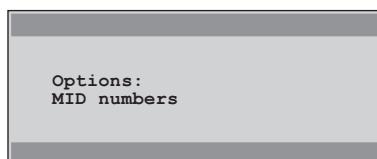

Check of right setting of control interface (**SP-BUS**) on the watch Receiver RM2152.

Turn on the RM2152 and wait until the displaymenu show the scan running menu.

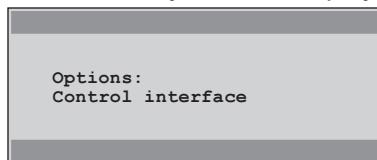

Activate **FUNC:** and the displaymenu change to.

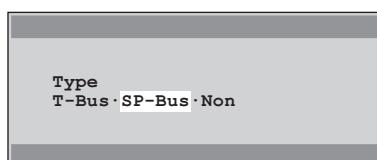

Chose the Options menu and activate the **NEXT** key, the displaymenu change to.

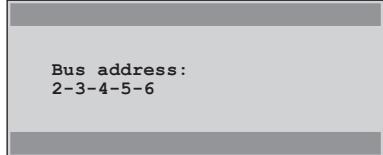

Use the up/down arrow key until the displaymenu show.

Activate the **NEXT** key, the displaymenu change to.

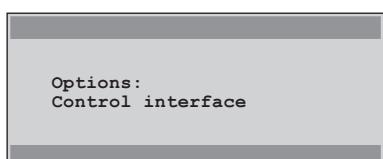

The SP-Bus is chosen for serial communication activate the **NEXT** key, the displaymenu change to.

The bus address number 2 is blinking, indicating that Bus address 2 is chosen.
Is one of the other bus addresses blinking it is necessary to change it to number 2.
Change of Control interface type or address can not be done unless the function switch **S2-4** is in on position. To set the function switch **S2-4** in on position it is necessary to dismount the backplate and the cabinet, set the switch **S2-4** on (please see chapter 6 component location main processor module). Turn the watch receiver RM2152 on and wait until the displaymenu show the scan running menu.

Activate **FUNC:** and the displaymenu change to the function menu again, find the **Options** menu, and go to the **control interface** menu. Correct the type and the Bus address and.

Activate the **NEXT** key, the displaymenu change again to.

Turn the RM2152 off, and if the function switch has been set in on position change the switch **S2-4** to off and mount the cabinet and the backplate again.

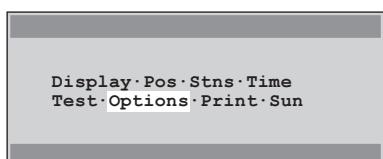

IT IS VERY IMPORTANT TO SET THE SWITCH S2_4 OFF.

1.3 PROGRAMMING of SELF-IDENTIFICATION NUMBER

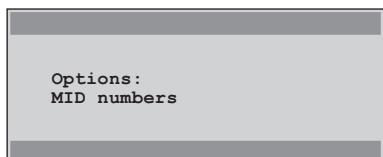

The Self-identification number (**MID**) has to be programmed into the watch receiver RM2152.

Remove the back plate and cabinet, set switch **S2-4** on (please see chapter 6 component location main processor module). Turn on the RM2152 and wait until the display menu show the scan running menu.

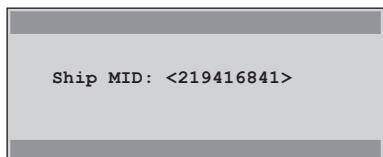

Activate **FUNC:** and the displaymenu change to.

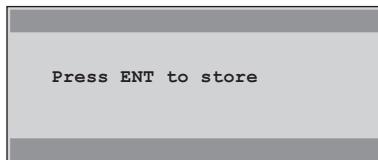

Chose the Options menu and activate the **NEXT** key, the displaymenu change to.

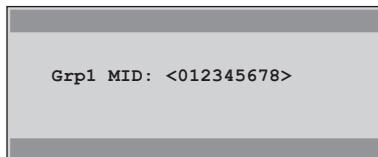

Activate the **NEXT** key, the displaymenu change to.

Key in the ships own MID number activate the **NEXT** key, the displaymenu change to.

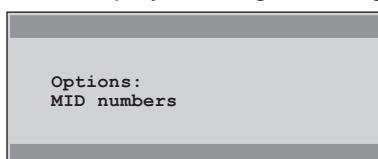

Activate **ENT** until the displaymenu change to.

The ships group number can be keyed in, activate the **NEXT** key the displaymenu change to a menu where the second group number can be keyed in.

The ship can have up to four group numbers and you can key this numbers into the next three menus, before the displaymenu again change to

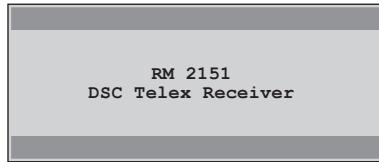

Turn the Watch receiver RM2152 off, change the switch **S2-4** to off and mount the cabinet and the backplate again.

IT IS VERY IMPORTANT TO RESET THE SWITCH S2-4.

2 SERVICE AND IDENTITY PROGRAMMING FOR RM2152 DSC/TELEX

2.1 IDENTITY PROGRAMMING of RM2152

Turn on the DSC/Radiotelex modem on and control that the displaymenu after the initializing menu show the following menu.

If you get the displaymenu indicating that the receiver is a DSC Watch receiver RM2152, you have to change the internal setting of the switch **S2-2**.

Remove the back plate and cabinet, set switch **S2-2** in off position (please see chapter 6 and 8-9). Turn on the DSC/Radiotelex modem RM2152 and check that the display menu now show the above menu. Mount the cabinet and the backplate again.

2.2 SP-BUS PROGRAMMING of RM2152

SPBUS programming using the Terminal mode on the message terminal.

To get into terminal mode activate

F3 - Options - Terminal Mode

Write **set -a** and activate the **Enter** key. The screen will show all the settings (please see page 17).

The showed settings include the settings of the connected radio modem RM2152. Find the parameter „SPADDRESS“, check whether this is set to the same as programmed into RE2100. If not, the value in „SPADDRESS“ is changed in the following way:

Write **set SPADDRESS X** and activate the **Enter** key, where X is the new value (2-6). The SPADDRESS shall in this case be set to 3.

Then check the parameter „SPBUS“, this must be set to „S“. In case the parameter has another value than „S“, this is changed in the following way:

Write **set SPBUS S** and activate the **Enter** key.

2.3 PROGRAMMING of SELF-IDENTIFICATION NUMBER

The Self-identification number (**MID**) as well as the telex numbers has to be programmed into the DSC/Radiotelex modem RM2152.

The programming of the DSC and telex number of the station using the terminal mode on the message terminal.

To get into the terminal mode.

F3 - Options - Terminal mode

Activate the **Enter** key a couple of times to make sure that the cursor > appear.

Write **st -operator** and activate the **Enter** key. A new cursor **th>** appear. The DSC and the Telex numbers can now be entered.

Nine digit DSC and Telex number.

Write: **set sel9 xxxxxxxxx** activate **Enter**.

Wait until a new cursor „**th>**“ appears on the screen.

Nine digit Telex Fec group call number. This number is normally set to the same number as the nine digit DSC and Telex number.

Write: **set fec9 xxxxxxxxx** activate **Enter**.

Five digit Telex number.

Write: **set sel4 yyyy** activate **Enter**.

Five digit Telex Fec group call number. This number is normally set to the same number as the five digit Telex number.

Write: **set fec4 yyyy** activate **Enter**.

The DSC group call numbers can be programmed in the same way.

Write: **set grp1 012345678** activate **Enter**.

The other 3 group call numbers (grp2, grp3, grp4) can be set with the same command.

When the Stations MID numbers has been set the menu st -operator can be left.

Write **exit** and activate the **Enter** key the cursor change to > and you are now in the normal operation mode.

2.4 PROGRAMMING of ANSWERBACK

Programming of the answerback of the station is done from the Message Terminal. The message terminal is still in terminal mode.

To programme the stations answerback write

Write **set answerback XX-XX-XX-XX-XX-XX-XX** where XX is the ACIII-code for max. 20 characters in the answerback text line (please see chapter 7).

The stations answerback can be programmed as illustrated below.

The five digit telex number is : 12345

The Ships call sign : OXJZ X

1 2 3 4 5 O X J Z X

Set answerback 7E-0D-0A-31-32-33-34-35-7F-20-6F-78-6A-7A-20-7E-78-0A-0D

2.5 GENERAL VIEW of SETTINGS for RADIOTELEX MODEM RM2152

To control that the setting of the radiotelex modem is done correct.

To get into terminal mode activate

F3 - Options - Terminal Mode

Write **set -a** and activate the **Enter** key, the CRT show now the settings of the radiotelex modem.

Terminal

3 GOOD ADVICE AND HELP

3.1 GENERAL INFORMATION

In brief the difference between RM2152 DSC Watchreceiver and RM2152 DSC/Telex, is that RM2152 DSC Watchreceiver only has one scanning programme where distress and calling frequencies are normally programmed.

NO CONNECTION BETWEEN RADIOTELEX MODEM AND MESSAGE TERMINAL:

The connection is an ordinary RS232 serial communication line.
IF there is no communication between the two stations, the following can be tested.

On the message terminal activate the system menu by keying **F9 - Option - Serial**.
The settings of the serial communication line in the message Terminal is opened.

Normal setting: Com1 - 4800 - N - 8 - 1.

On the radiotelex modem RM2152 the programming of the serial communication can be tested in the **FUNC.** menu.

FUNC - OPTIONS

With the up/down arrows find the menu **Terminal port settings** and check that.
Baudrate:4800 / Parity:NON / Databits:8 / Stopbits:1 / Softflow:off / Hardflow:on.

Check whether the terminal cable is connected to the Com1 gate at the back of the message terminal.

3.2 NO PRINTER RESPONSE

The printer can be installed on the radiotelex modem or on the message Terminal.
Therefore is necessary to tell the system where the printer is placed and this is done in the radiotelex option menu on the message terminal.
Normally the printer is installed on the message terminal.

F3 - Option - Printer

The printer setting menu is displayed highlight **Message Terminal** or **Modem**, all depending on where the printer is installed activate the enter key. The cursor >> in front of a word indicates that the word has been chosen.

In order to get all telexes sent and received printed out, **Save to printer** must be chosen.

F3 - Directcall - Commands

Highlight save to printer and activate the enter key. The cursor >> in front of „Save to printer“ indicates that save to printer is activated.

4 SOFTWARE AND PC BOARD SUMMARY

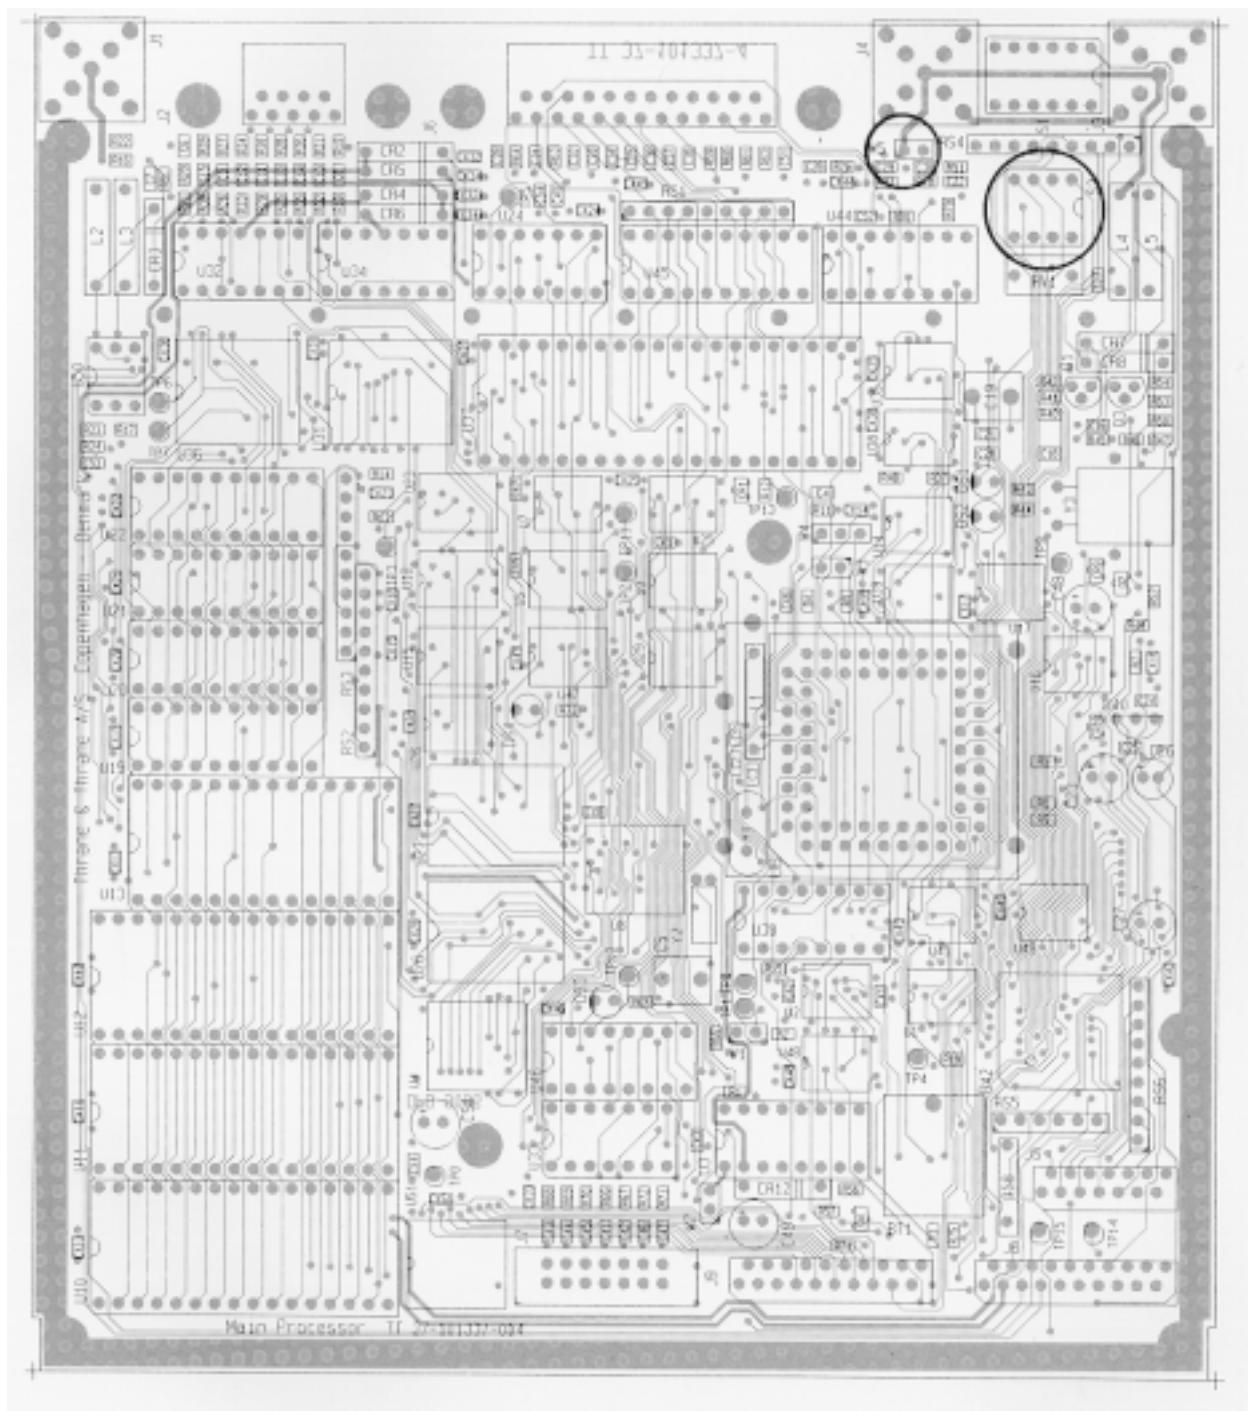

SOFTWARE AND PC BOARD SUMMARY FROM RADIOTELEX/DSC TO DUPLEX AND CW.

RE2100		UPDATE FROM EARLIER VERSION, KIT NO. 728665		T2130 UPDATE FROM EARLIER VERSION, KIT NO. 728665		AT2110		T2131/T2135		C2140		RM2152		H2098A/B		C2149		R2120	
RECEIVER MODULE 625631	EXCITER MODULE 625634	MAIN CABLE	PROCESSOR MODULE 625635	SOFTWARE	CONNECTION BOARD 625646	SOFTWARE	TX- PROCESSOR 625643	REC. LABEL	SOFTWARE	SOFTWARE	SOFTWARE	SOFTWARE	SOFTWARE	SOFTWARE	SOFTWARE	SOFTWARE	SOFTWARE	SOFTWARE	SOFTWARE

37205

IT IS ALWAYS RECOMMENDED TO UPDATE ALL SOFTWARE VERSIONS, WHEN INSTALLING ADDITIONAL EQUIPMENT.

5 COMPONENT LOCATION MAIN PROCESSOR MODULE

6 ANSWERBACK CHARACTER SETTING

The character codes used when entering the answerback sequence are based on the ASCII-code and CCITT rec. F.130.

Each character is represented by a 2-digit/letter code as follows:

Digits

Char	ASCII	Char	ASCII
0	30	5	35
1	31	6	36
2	32	7	37
3	33	8	38
4	34	9	39

Letters

Char	ASCII	Char	ASCII
A	61	N	6E
B	62	O	6F
C	63	P	70
D	64	Q	71
E	65	R	72
F	66	S	73
G	67	T	74
H	68	U	75
I	69	V	76
J	6A	W	77
K	6B	X	78
L	6C	Y	79
M	6D	Z	7A

Special characters

Char	ASCII
Carriage return	0D
Line feed	0A
Figure shift	7E
Letter shift	7F
Space	20

7 MAIN PROCESSOR MODULE VERSION 4 DIP SWITCHES

S1 VERSION 4

No	OFF	ON
1	Use of SP-BUS	Use of T-BUS
2	Use of SP-BUS	Use of T-BUS
3	Not used	
4	Dont't initialize EEPROM	Initialize EEPROM
5	Scan all distress frequencies when in Watch Receiver mode (RM2150)	Scan only 2187.5 kHz when in Watch Receiver mode. (RM2150)
6	Not used	

S2

No	OFF	ON
1	Only for factory test	Normaly used
2	DSC/Radio Telex modem (RM2151)	DSC Watch Receiver (RM2150)
3	Only for factory test	Normaly used
4	Function mode off	Function mode on

8 MAIN PROCESSOR MODULE VERSION 3 DIP SWITCHES

S1 VERSION 3

No	OFF	ON
1	Not used	
2	Dont't initialize EEPROM	Initialize EEPROM
3	Scan all distress frequencies when in Watch Receiver mode (RM2150)	Scan only 2187.5 kHz when in Watch Receiver mode. (RM2150)
4	Not used	

S2

No	OFF	ON
1	Only for factory test	Normaly used
2	DSC/Radio Telex modem (RM2151)	DSC Watch Receiver (RM2150)
3	Only for factory test	Normaly used
4	Function mode off	Function mode on
