PREFACE

About This Manual

iDCS 500, Digital Communication System, is a digital telephone system designed for small to medium-sized businesses.

iDCS 500 system provides MMC(Man Machine Communication) program. Users can configure the system using the MMC program at the digital telephone.

This manual describes how to use the MMC program.

This manual consists of the following chapters.

- **Introduction to Programming**
- **Special Applications**
- **MMCs (In Numeric Order)**
- **Blank Data Sheets**

Supporting Documents

Further detail on all of the aspects covered in this manual is included in the system General Description and Installation guide. The iDCS 500 system provides the following manuals for more information:

- **General Description Guide**

This manual provides an overview of the Samsung iDCS 500, Digital Communication System, including system structure and hardware, features and facilities and specifications.

- **Installation Guide**

This manual provides the information about installation of the Samsung iDCS 500, Digital Communication System, including information about connecting the equipments.

- **Programming Guide**

iDCS 500 system provides MMC(Man Machine Communication) program. Users can configure the system using the MMC program at the digital telephone. This manual describes how to use the MMC program.

Table of Contents

Chapter 1 Introduction to Programming	1-1~1-18
Programming Overview	1-1
STATION EQUIPMENT	1-2
iDCS SERIES EQUIPMENT	1-2
DCS SERIES EQUIPMENT	1-3
Programming Levels.....	1-4
Program List in Numerical Order	1-5
Station Programs	1-5
System Programs.....	1-6
Programming Procedures.....	1-18
Chapter 2 Special Applications.....	2-1~2-48
Voice Mail/Auto Attendant Integration	2-2
Hardware Provisions	2-2
Software Provisions	2-2
Stand-Alone Add-On Module.....	2-3
Individual Station Page.....	2-3
Caller ID	2-4
Hardware Provisions	2-4
Software Provisions	2-4
Using LCR To Insert Long Distance Pick Code.....	2-5
Using LCR With Caller ID	2-7
Auto Attendant/Uniform Call Distribution	2-9
What is the AA Card?	2-9
A sample AA Application(Step by Step)	2-9
A Sample UCD Application(Step by Step)	2-10
Customizing Recordings.....	2-11
ISDN Overview	2-12
Introduction	2-12
BRI Programming	2-12
PRI Programming	2-15
Ordering An ISDN Basic Rate Interface(BRI) Trunk Facility	2-18
Ordering An ISDN Primary Rate Interface(BRI) Trunk Facility.....	2-19
ITM3 VoIP(Voice over Internet Protocol)	2-20
Introduction	2-20
System Applications	2-21
ITM3 VoIP Features.....	2-23
ITM3 VoIP(Voice over Internet Protocol) Card	2-27
ITM3 Hardware Overview	2-28
ITM3 Card Installation	2-29
Site Applications	2-30
iDCS 500 ITM3 Programming Overview	2-33
ITM3 Programming MMC's	2-35
ITM3 Application Programming.....	2-36

Chapter 3	MMCs (In Numeric Order)	3-1~3-356
MMC:100	STATION LOCK	3-1
MMC:101	CHANGE USER PASSCODE	3-2

Chapter 1

Introduction to Programming

Chapter 1 Introduction to Programming

Programming Overview

The iDCS 500 system arrives from the factory with default data. Connect it to trunks, stations and power, turn the system on and it is fully operational. The only thing left to do is customize the data to fit the customer's needs. This is called programming the system.

MMC stands for Man Machine Code and each program is assigned a different 3 digits code. These MMC codes are used to view, create or change customer data. Programming is simply deciding what needs to be done and knowing which MMC is used to do it. For example, use MMC 601 to create a station group. System speed dial numbers are entered in MMC 705 and soft keys are assigned to individual keysets using MMC 722.

System programming may be done from any display keyset. The first thing you must do is open system programming. As a security measure, a passcode must be known to do this.

STATION EQUIPMENT

iDCS SERIES EQUIPMENT

28 Button iDCS Keyset

- 32 character display (2 x 16) with three associated soft keys and a scroll key
- 28 programmable keys with tri-colored lights
- Four fixed function keys
- Terminal Status Indicator
- Built-in speakerphone
- Eight selectable ring tones
- UP/DOWN buttons for digital control of speaker, handset and ringer volumes
- Desk- or wall-mounted
- Available in dark gray or light gray

8 Button iDCS Keyset

- 32 character display (2 x 16) with three associated soft keys and a scroll key
- 8 programmable keys with tri-colored lights
- Four fixed function keys
- Terminal Status Indicator
- Built-in speakerphone
- Eight selectable ring tones
- UP/DOWN buttons for digital control of speaker, handset and ringer volumes
- Desk- or wall-mounted
- Available in dark gray or light gray

DCS SERIES EQUIPMENT

LCD 24B Keypad

- Built-in speakerphone
- 24 programmable keys (16 with tri-colored LEDs)
- Four fixed function keys
- 32 character display (2 x 16) with three associated soft keys and a scroll key
- UP/DOWN buttons for digital control of speaker, handset and ringer volumes
- Eight selectable ring tones
- Desk- or wall-mounted
- Available in almond or charcoal

Programming Levels

There are three levels of programming: SYSTEM, CUSTOMER and STATION. System and customer levels are under passcode protection while station programming does not require a passcode.

To prevent conflicting data from being entered, only one person at a time can enter programming with the technician or customer passcode. While programming is in progress, normal system operation is not affected. For your convenience, the system displays [xxx IN PGM MODE] when another keyset is in the program mode.

A. System level

This level is entered via MMC 800 and requires the technician level passcode. It allows access to all system programs, station programs and maintenance programs.

B. Customer level

This level is entered via MMC 200 and requires the customer passcode. It allows access to station programs and system programs allowed by the technician in MMC 802. When using the customer passcode to access station programs, data for all stations can be viewed or changed.

When the system is programmed for multiple tenant use, each tenant has an individual customer passcode enabled in MMC 201. The access for tenant passcode is limited to only certain MMCs. See MMC 201 for more details.

After opening programming with the customer passcode, you must press TRSF to exit. Now press TRSF and the MMC number you wish to access.

C. Station level

All keysets can access station programs 102-117 without using a passcode. Each user can only change station data for his/her own keyset.

When the LCD 24B keyset is in programming, the display shows instructions, prompts and choices. Existing data is always displayed before it can be changed. The keystroke sequence for each MMC is detailed in the following pages.

Before you begin entering customer data, follow this important reminder.

IMPORTANT

When first installing this system, always use MMC 811 to reset and clear memory. This will ensure that you begin with clean default data.

Now begin entering customer data.

Program List in Numerical Order

Station Programs

MMC Number	Function	Default Data	Remark
100:	STATION LOCK	ALL STATIONS UNLOCKED	
101:	CHANGE USER PASSCODE	ALL STATION PASSCODES = 1234

Programming Procedures

The following instructions for each MMC assume that you have already opened programming.

When you are finished programming in MMC codes 100~860 and have other programming to do, press SPK to exit the MMC but stay in the programming mode and use one of the following methods.

1. Dial another MMC code directly and continue programming.
2. Press VOLUME UP and DOWN keys to scroll through all MMC codes. When the desired MMC code is reached, press SPK and continue programming.

Pressing TRSF will always save changes and exit the programming mode.

Chapter 2

Special Application

Chapter 2 Special Applications

This part of the technical manual is titled “Special Applications” because it provides information about interfacing with customer-provided equipment or using a feature in a different way than it was intended. Perhaps an application may require a combination of CPE, creative programming, unusual feature operation or all of the above.

Because these applications require installation instructions and a combination of programming sequences, there is no obvious place to put this information; therefore, we created this part of the manual. As additional special applications are reported from the field, we will include them in this section.

Voice Mail/Auto Attendant Integration

Because of the increased popularity of voice mail and auto attendant use, the iDCS 500 system includes many programmable options to address this demand. Obviously the degree of integration that can be achieved depends on the abilities of the voice mail/auto attendant (VM/AA) system as well as the telephone system.

This list details the capabilities provided by the iDCS 500 system for voice mail integration.

Hardware Provisions

- a. The VM/AA system must be connected to single line circuits on any SLI card.
- b. Each port on a 4 port SLI is equipped with a dedicated DTMF receiver for detecting DTMF signaling from the VM/AA.
- c. VMAA ports will also provide an instant break in loop current when the calling party hangs up. This is called a disconnect signal.

Software Provisions

- a. SCREENED OR UNSCREENED TRANSFER
There are no special codes needed to transfer a call. Simply hookflash, receive transfer dial tone and dial the destination.
- b. DIRECT IN LINES
Any C.O. call can be assigned to ring at an individual station or a station hunt group assigned to the VM/AA.
- c. CALLS OR RECALLS TO THE OPERATOR
Dialing 0 will always result in a ringback signal. If the operator is busy, the call continues to ring in queue to the operator. This prevents a caller from dialing 0 and reaching another mailbox because the operator is busy.
- d. MESSAGE WAITING
A VM/AA port can leave a message at any station or group of stations. The message waiting indication can be set or canceled at any station or station group with or without the stations ringing.
- e. IN BAND SIGNALING
The iDCS 500 system can be programmed to send the calling station's extension number after the voice mail system answers. These DTMF signals may include a leading digit to indicate the type of call and additional information about the original caller. DTMF signals may also be substituted for call progress tones to speed up voice mail call processing. This program allows call forwarding to a mailbox and bypassing of the main greeting for automatic message retrieval. Blind transfers may be performed because the recall will be correctly identified.

The effectiveness of this program depends on the ability of the voice mail system to make use of this information.

- f. STATION HUNT GROUP WITH OVERFLOW
Each station groups can have an individual overflow destination with an individual overflow timer. The overflow destination will ring whenever a call to the group is not answered. If the voice mail system becomes inoperative, calls are automatically routed to the overflow destination.

g. INTERNAL CALL FORWARDING TO VOICE MAIL

This option in MMC 300 will allow or deny intercom calls from following call forward to voice mail. This feature conserves disk drive space by only storing calls originating outside the iDCS 500 system.

h. ONE TOUCH VOICE MAIL ACCESS

One Touch speed dial keys can be programmed to automatically dial, log into and retrieve messages from voice mail.

i. CALL PROGRESS TONES

The only tones sent to a VM/AA port are dial tone, busy and ringback. To eliminate confusion, busy tone is substituted for DND or error tones on voice mail ports only.

Stand-Alone Add-On Module

To make a DCS 32 button add-on module operate as a stand-alone unit, perform the following steps in the order they are listed.

MMC 103 With the technician or customer passcode, assign answer mode as Voice Announce, Auto Answer or ring.

MMC 105 Assign speed dial numbers for the AOM.

MMC 606 Advance to the extension number of the AOM you want to use as stand-alone. Assign blocks of speed dial numbers to the AOM.

1. Transferred calls cannot be camped-on to a busy DCS 32 Button AOM. If a station attempts to do so, the transferred call will ring back to the station immediately.

2. Busy station camp-on will not work when calling a busy DCS 32 Button AOM.

Individual Station Page

The system was not designed to permit page announcements to individual keysets. However, a forced auto answer key (FAUTO) can be used to accomplish this objective.

1. Program a keyset for RING in MMC 103.
2. Assign an FAUTO key to each keyset that is allowed to page individual keysets.
3. Call another station. When you hear ringback tone, press the FAUTO key. The ringing will stop and an Auto Answer call is set up.

To prevent the use of this feature from getting out of control, only assign FAUTO keys to those keysets needing to page individual keysets.

Caller ID

The iDCS 500 is compatible with both types of Caller ID as defined by BELLCORE. These are the single message format or “Number Only” sometimes referred to as standard Caller ID and the multiple message format or “Name and Number” sometimes referred to as Deluxe Caller ID. In the case of Number Only delivery, there is a translation table available that may be used to add names to the delivered number.

Hardware Provisions

In order to install Caller ID on a iDCS 500 system you must have the following equipment available:

- An RCM daughter board mounted on one of the processor cards.
- A Trunk B1 or Trunk C1 card

Software Provisions

The MMCs related to Caller ID are listed below with a short description of their use. They are listed in the recommended order in which they should be programmed. This sequence is suggested so that the installer gets a better understanding of how the feature works. There is no technical reason to follow this sequence.

- **MMC 414 CALLER ID TRUNKS** This MMC is used by the technician to determine which trunks will receive Caller ID data.
- **MMC 312 ALLOW CALLER ID** This MMC is used by the technician to determine which keysets are allowed to receive Caller ID displays.
- **MMCs 722 and 723** These MMCs have keys related to Caller ID features added to them. It is strongly recommended that all keysets allowed Caller ID in MMC 312 are programmed with a CID key.
- **MMC 728 CID TRANSLATION** This MMC allows the technician to create a list of names that correspond to numbers received from the Central Office. These names will be displayed when a call rings in that has NUMBER ONLY data provided by the CO.
- **MMC 725 SMDR OPTIONS** The ability to print Caller ID data and abandoned calls is determined by this MMC.
- **MMC 119 CALLER ID DISPLAY** This MMC is used by the end user to determine which piece of Caller ID data is displayed when a call rings at the user’s station.
- **MMC 501 SYSTEM TIMERS** This MMC has two new timers related to Caller ID. The only timer that may need adjustment is the CID DISPLAY TIME. This is the length of time that CID data is displayed after the CID key is pressed.
- **MMC 415 TRK. ABANDON** This MMC is used by the technician to determine which trunks will record data in the Call Abandon list and print with an Abandon “A” flag on SMDR.
- **MMC 608 ASSIGN REV BLOCK** This MMC is used by the technician to assign CID Review blocks to keysets to allow the user to review CID data for

previous calls.

- **MMC 701 ASSIGN COS** All of the Caller ID features have been added to this MMC to enable the technician to allow or deny them.
- **MMC 724 NUMBER PLAN** The Caller ID features have been added to this MMC to allow a technician to assign an access code where necessary.

In addition to the above MMCs, it is necessary to have LCR programmed on the system to enable certain features with a DIAL/REDIAL option to be used. This is because the number format provided by the Central Office contains the area code. This area code must be stripped off in the LCR modified digits section to allow a local number to be correctly dialed.

For example, if the system is located in the 305 area code, the LCR digit table points the entry 1305 to a modified digits entry that deletes the first four digits of the CID number. Of course, this is a much simplified LCR scheme. As there are long distance calls to be made within the home area code, additional entries are required to identify these.

For example, if 1305-426 is a local call, the area code has to be stripped, but if 1305-858 is long distance, the area code has to remain to allow the number to be dialed. There are two ways of doing this. You can either enter all of the local office codes and tell the system to strip the area code from them or you can enter the long distance codes and tell them to ignore the modify digits entry.

A list of all of the local office codes can be found at the front of the local telephone directory.

Using LCR To Insert Long Distance Pick Code

One of the more common uses for LCR is to use this feature to automatically insert the long distance access code for long distance calls within your own area code. This will allow these calls to be processed by the selected long distance carrier instead of the local telephone company. The following example is based on an area where all long distance calls must be preceded by 1 + area code as this is the most common scenario.

In MMC 710, program the following entries:

MMC 710 LCR DIGIT TABLE			
INDEX	LCR DIGIT STRING	LENGTH	ROUTE
001	1	11	1
002	2	7	1
003	3	7	1
004	4	7	1
005	5	7	1
006	6	7	1
007	7	7	1
008	8	7	1
009	9	7	1
010	411	3	1
011	911	3	1
012	0	1	1
013	1AAA	11	2

AAA is your home area code.

In MMC 711, program the following entries:

MMC 711 LCR TIME TABLE								
TIME CHANGE BANDS								
	A		B		C		D	
	HHMM	LCRT	HHMM	LCRT	HHMM	LCRT	HHMM	LCRT
DAY								
SUN	0001	1						
MON	0001	1						
TUE	0001	1						
WED	0001	1						
THU	0001	1						
FRI	0001	1						
SAT	0001	1						

In MMC 712, program the following entries:

MMC 712 LCR ROUTE TABLE				
LCR ROUTE	TIME CHANGE	LCRCOS	TRK GROUP	MOD DIGITS
1	1	1	80	
2	1	1	80	001

In MMC 713, program the following:

MMC 713 LCR MODIFY DIGIT TABLE			
INDEX	NO. OF DELETE DIGITS (15)	NO. OF INSERT DIGITS (14)	NO. OF APPEND DIGITS (14)
001		10XXX	

10XXX is the access code for the long distance carrier of your choice.

- In MMC 603, move all of the C.O. lines from trunk group 9 to trunk group 80. You will have to delete the line numbers from trunk group 9 as trunks can be in more than one group.
- In MMC 724, assign 9 as the LCR access code. This will delete 9 from the first trunk group automatically.
- In MMC 210, turn on LCR.

Setting LCR up like this will not prevent C.O. lines from being accessed by Direct Trunk (DT) keys but it does mean that speed dial numbers will have to be reprogrammed to allow them to access LCR.

Using LCR With Caller ID

It is necessary to have LCR programmed on systems with Caller ID to enable certain features with a DIAL/REDIAL option to be used. This is because the 10 digit CID number format provided by the Central Office always contains the area code. This area code must be stripped off in the LCR modified digits section to allow a local number to be correctly dialed. To make this task easier, the system inserts a 1 in front of the received digits. This makes it look like a normal 11 digit telephone number so LCR can process the number and modify the digits.

For example, if the system is located in the 305 area code, the LCR digit table points the entry 1305 to a modified digits entry that deletes the first four digits of the CID number. Of course, this is a much simplified LCR scheme. As there are long distance calls to be made within the home area code, additional entries are required to identify these calls. This is illustrated in the sample table for MMC 710 below where entries 013 to XXX are the local area code (305 in the previous example) followed by the local CO prefixes. This will tell the system which calls need to have the first four digits stripped off using the modify digits table.

In MMC 710, program the following entries:

MMC 710		LCR DIGIT TABLE	
INDEX	LCR DIGIT STRING	LENGTH	ROUTE
001	1	11	1
002	2	7	1
003	3	7	1
004	4	7	1
005	5	7	1
006	6	7	1
007	7	7	1
008	8	7	1
009	9	7	1
010	411	3	1
011	911	3	1
012	0	1	1
013	1AAALLL	11	2
↓	↓	11	2
XXX	1AAALLL	11	2

AAA is your home area code and LLL is a local prefix. For example, at STA, AAA= 305 and one LLL = 426. To operate correctly, all of the local prefixes must be entered in this table. These prefixes can be found at the front of the local telephone directory.

In MMC 711, program the following entries:

MMC 711 LCR TIME TABLE								
TIME CHANGE BANDS								
	A		B		C		D	
	HHMM	LCRT	HHMM	LCRT	HHMM	LCRT	HHMM	LCRT
DAY								
SUN	0001	1						
MON	0001	1						
TUE	0001	1						
WED	0001	1						
THU	0001	1						
FRI	0001	1						
SAT	0001	1						

In MMC 712, program the following entries:

MMC 712 LCR ROUTE TABLE				
LCR ROUTE	TIME CHANGE	LCRCOS	TRK GROUP	MOD DIGITS
1	1	1	80	
2	1	1	80	001

In MMC 713, program the following:

MMC 713 LCR MODIFY DIGIT TABLE			
INDEX	NO. OF DELETE DIGITS (15)	NO. OF INSERT DIGITS (14)	NO. OF APPEND DIGITS (14)
001	4		

The deleted digits are the 1 + AAA from the LCR digit table in MMC 710.

- In MMC 603, move all of the C.O. lines from trunk group 9 to trunk group 80. You will have to delete the line numbers from trunk group 9 as trunks can be in more than one group.
- In MMC 724, assign 9 as the LCR access code. This will delete 9 from the first trunk group automatically.
- In MMC 210, turn on LCR.

Setting LCR up like this will not prevent C.O. lines being accessed by Direct Trunk (DT) keys but it does mean that speed dial numbers will have to be reprogrammed to allow them to access LCR.

Auto Attendant/Uniform Call Distribution

What is the AA Card?

The AA card is an optional iDCS 500 circuit card capable of answering calls, playing recorded messages to callers and routing calls based on digits dialed by the caller. Because it is integrated, it is important to understand the following.

There is no hook-flash/DTMF process to transfer a call. All switching is done internally. There are no connections on the front of the card and no unnecessary delays during transfer.

The AA card has constant communication with the iDCS 500 system processor. When the AA card answers a call, it has all the information about the call, for example, whether the call is from a station, a C.O. or a transfer. When a port on the AA card answers a call, it can respond differently depending on the call. The same port can play different messages or greetings and respond to differently to dialed options.

The same group of AA ports can answer as auto attendant and UCD, with the appropriate response for each. Or multiple UCD groups can be overflowed to the same AA group and each UCD group will have its own specific messages, timers and routing instructions.

The following step by step examples demonstrate how to create an automated attendant or UCD application.

A sample AA Application(Step by Step)

To set up a simple automated attendant application, you must have at least one AA card installed in the iDCS 500 phone system. The first step is to make the C.O. lines ring the AA card.

1. Decide how many different greetings you need. For this example, we use one. It is "Thank you for calling ABC Company, please dial 1 for sales and 3 for service, or dial an extension number now."
2. Using the method described at the end of this section (Customizing Recordings), record message 01. If you need a different night greeting, record it as message 02. If you need an alternate greeting, record it as 03. The numbers 01, 02 and 03 have been chosen arbitrarily.
3. Decide how many AA ports you want to answer. In this example, we use the first four, 3951–3954.
4. In MMC 601, create a group (we use 528) defined as an AA group and containing 3951, 3952, 3953 and 3954. It is not necessary to program any other options (overflow, next, etc.).
5. In MMC 406, make the C.O. lines that are to be answered by the AA card ring group 529.
6. In MMC 735, assign each port (3951–3954) to answer with Plan 01.

So far, we have made our C.O. lines ring 528, an AA group that answers with Plan 01. In Step 7, we set the AA plan options.

7. Plan Programming: Step through each option in MMC 733.
 - DAY MESSAGE: This will be message 01.
 - NIGHT MESSAGE: If used, this will be message 02.
 - ALTERNATE MESSAGE: If used, this will be message 03.
 - OTHER MESSAGES: Assign these as needed; default values are usually sufficient.
 - CAMP ON: Assign the camp-on option as required.
 - ANSWER DELAY: Program the answer delay for this plan. We have it answer after one ring.
 - RETRY COUNT: Set the retry count. Three attempts are normal.
 - TRANSLATION TABLE: Select a translation table. In this case, we use translation table 01 (programmed in step 8).
 - DESTINATIONS: Enter destinations for each condition (busy, no answer, etc.).

In Step 8, we program the translation table.

8. Program the translation table in MMC 732. Enter a “secret passcode” if greeting changes are needed (see below). The contents of this table must conform to the instructions in Step 1. Entry number 001 has the first field programmed with a 1 (the digit dialed by the caller) and the second field programmed with the station group number for sales (let’s say 525). Entry number 002 is for the service department. The first field is 3 and the second field is the service department station or station group number. Entry number 003 is for station numbers dialed by the caller. The first field is 200 (0 = wild card/any digit). The second field is a “B” (special key B). The B is for “buffer” and transfers the call to the station number dialed. Entry number 004 is for the change greeting option. Enter 4581 in the first field (4581 is the secret passcode) and enter “C” in the second field. C is entered using special key C and represents “change greeting.”

For more complex applications, the plan programming destinations and translation table destinations can contain other plans.

A Sample UCD Application(Step by Step)

To set up a simple Uniform Call Distribution application, you must have at least one AA card installed in the iDCS 500 phone system.

1. Decide how many AA ports you are going to use for UCD. In this example, we use the last four of the first card, 3955–3958. Define these ports as an AA group. We call this group 505. The ring type should be sequential. Do not use the overflow, GRP TRSF or NEXT.
2. In MMC 601, create a group (we use 525) defined as an UCD group and containing the station numbers for the UCD agents. Set the group options as follows:
 - a. Set the ring type to DISTRIBUTED.
 - b. Set the overflow to ten seconds (creates a ten second ringback “grace period” in case all agents are busy before the call overflows to the UCD module).
 - c. Set NEXT to 505.
 - d. Set the wrapup timer. This is an optional timer to allow UCD agents to finish the work associated with a call before receiving the next call.
3. Decide what C.O. lines are to go to the UCD group and assign them to ring 525 in MMC 406.

If this example is used in conjunction with the AA example above, callers will also be able to reach the sales UCD group from an auto attendant selection.

4. In MMC 607, program the UCD options. These consist of the following:

Message 1: This is a recording that informs the caller that all agents are busy. It can be changed by following the instructions in “Customizing Recordings” at the end of this section.

Message 2: This is a recording that informs the caller that all agents are *still* busy. It can be changed by following the instructions in “Customizing Recordings” at the end of this section. This message will repeat at the UCD recall interval.

Exit Code: This is an option that allows the caller to exit UCD by dialing this digit.

Retry Count: This is the maximum number of times that a caller will be recalled to the UCD message before being transferred to the final destination.

Final Destination: The destination the caller will reach if the exit digit is dialed or the retry count is exceeded.

Ring Next: This timer determines how long an unanswered call will ring a UCD agent before that station is logged out and the next station in the UCD group rings.

UCD Recall: This timer determines the interval between UCD messages played to the caller.

MOH: This determines the MOH source that the caller will be connected to while the UCD recall timer is running.

You have now completed the UCD programming.

Customizing Recordings

Recording Messages

There are 64 messages that can be custom-recorded. The messages are numbered 01–48. Messages 49–64 also exist in the AA card but are stored on ROM and cannot be changed. They are used as default messages for specific call handling conditions.

Customize messages 01–48 by using a keyset programmed with an AAREC (Auto Attendant Record) key. The message input can be either the keyset handset or the BGM source. 120 seconds of custom messages are available. This messaging is stored on non-volatile RAM and is protected during a power outage.

Although adding extra AA cards increases the time for messages, a card can only use the message RAM on its own card. Messages can be combined to create more messages. ([See MMC 734, Message Match](#)).

Recoding Using the Handset

1. Press the AAREC key on the designated keyset.
2. At the “enter passcode” display, dial the passcode assigned in MMC 202.
3. Lift the handset.
4. Select the HANDSET option.
5. Enter any AA port number on the card you wish to program.
6. Enter the recording number you wish to record.
7. You will hear a beep.
8. You are now recording. If you pause for more than five seconds, the iDCS 500 will begin to record the next messages (although this will not be apparent from the display).
9. A useful countdown timer shows time remaining. Press the AAREC key to finish recording.

Recoding Using BGM

To record using BGM, you need to have all your recordings on a cassette tape and connect the tape player to the first BGM source. The recordings on the tape must be separated by at least five seconds of silence. When silence is detected, the iDCS 500 will begin recording the next message (although this will not be apparent from the display).

1. Connect a tape recorder containing the message you want to record to the first BGM source on a MISC card.
2. Press the AAREC key on the designated keyset.
3. At the “enter passcode” display, dial the passcode assigned in MMC 202.
4. Select the BGM option.
5. Enter any AA port number on the card you wish to program.
6. Enter the recording number you wish to record.
7. You will hear a beep.
8. You are now recording. A useful countdown timer shows time remaining. Press the AAREC key to finish recording.

Call Status

The Call Status (CS) key may be programmed on each agent keyset to provide an indication of waiting calls at the UCD group.

This key has no effect when pressed, but will flash amber or red to indicate that calls are waiting.

There are two levels that can be programmed for this key, they are CS level 1 and CS level 2.

By default these levels are 05 for level 1 and 10 for level 2. This means that when there are 5 or more calls in queue at the UCD group the CS key will flash amber, when there are 10 or more calls in queue at the UCD group the CS key will flash red. These levels can be changed by your service company.

If you are not using a professionally recorded tape or high quality record/playback unit, you should record each message and play (not record) the tape for at least five seconds. This will ensure the best possible silence level between recordings. If you record all of the AA recordings and simply remain quiet for the five seconds period, it is possible that the tape may pick up some ambient room noise that the AA card will not interpret as silence. This will cause more than one recording to be recorded as a single announcement.

Messages are stored in a linear fashion on the AA card RAM. This means that a message or multiple messages are recorded and then assigned message numbers. Assigning these messages takes a short time, so immediately following a recording session, you may find the AA ports busy when called. This should only last a few seconds.

Because of this storage method, if any message is rerecorded, you will have to record all messages after the newly recorded one. For example, if you have messages 1-10 and rerecord message 7, you will also have to rerecord 8, 9 and 10. Loading messages from a cassette tape helps alleviate this inconvenience.

ISDN Overview

Introduction

Programming ISDN Basic Rate Interface (BRI) and Primary Rate Interface (PRI) circuits into the iDCS 500 system is different from working with analog facilities but does not have to be overly frightening or complicated to do. To reduce the amount of document study and reading necessary to install ISDN in the iDCS 500 system, this overview section includes flow chart diagrams that show the sequence of operations, with examples, necessary to program BRI and PRI service. Hopefully, this should make working with ISDN in the iDCS 500 easier for the average installation technician.

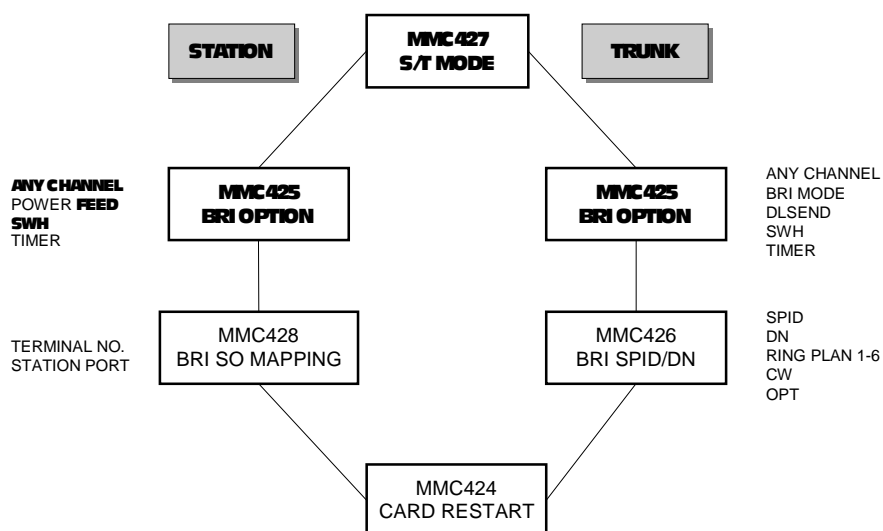

BRI Programming

1. ISDN BRI boards have four (4) 2B+D circuits. Each individual BRI circuit can be configured as either a trunk or as a station appearance. Figure 1, the BRI Setup Method flow chart, shows the MMCs involved and the correct sequence to apply them in. Next to each MMC box on the flow chart is a list of the parameters in each MMC which must be programmed to make the BRI operate. Detailed explanations of the various parameters is shown in the individual MMC descriptions contained in the Programming Section of the iDCS 500 Technical Manual.
2. It should be understood that in ISDN BRI, there is no relationship between telephone numbers and

“B” channels. This means that either BRI telephone number can be active on either “B” channel at any time (i.e., “B” channels don’t have telephone numbers specially assigned to them).

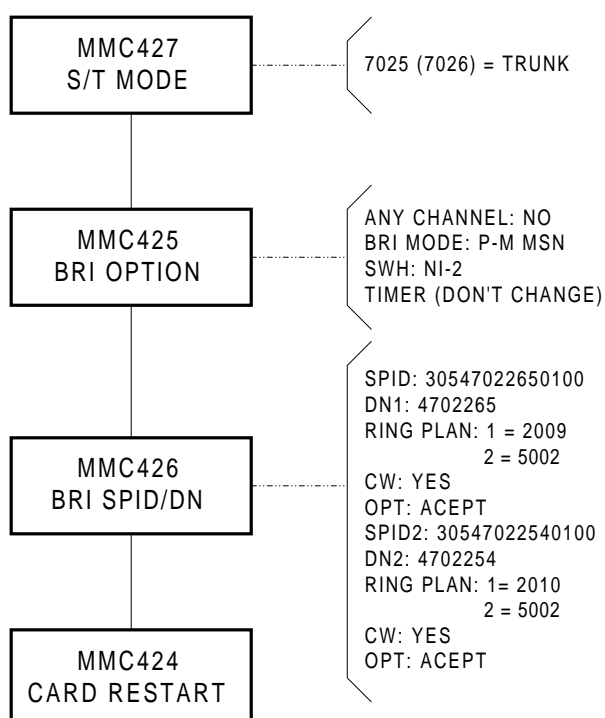

BRI Setup Method

The following shows a step by step approach to programming a BRI circuit as either a trunk or station appearance in the system. Please consult the individual MMCs for specific details on the various parameters used.

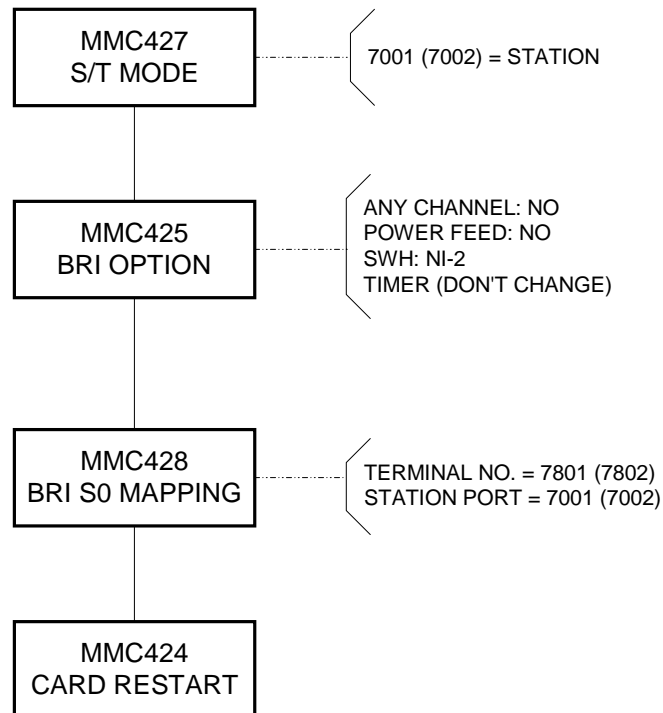

Example 1 : Programming A BRI Trunk

The following shows a step by step approach to setting up a typical BRI trunk circuit. Please note that BRIs are handled as a pair of "B" channels each having a trunk number in the iDCS 500 system. Also, notice that programming incoming call destinations for the BRI trunks is similar to analog or T1 trunks with the exception that destination programming is done in MMC 426 and not MMC 406. Any time changes are made to BRI trunk programming, MMC 424 (Card Restart) must be used to make the changes take effect.

Example 2 : Programming A BRI Station Appearance

The following shows a step by step approach to setting up a typical BRI station appearance. This would normally be done to accommodate connection of an "ISDN Modem" from a desktop PC used to provide Internet access or video teleconferencing service. Again, remember to use MMC 424 once programming is finished to enable these changes to take effect. Since a BRI by default is considered as a trunk, one of the steps of programming a BRI circuit as a station appearance involves assigning a station number to the default trunk number initially assigned to that system port (MMC428). System default station numbers are 7801, 7802, etc. However, these can be changed to 2xxx or 3xxx numbers using MMC724 (Number Plan).

PRI Programming

1. ISDN PRI uses the IDCS 500 T1 capability as the basic transport media. However, unlike a normal T1, signaling for each call is handled on a Common Channel (i.e., the ISDN “D” channel) basis. The PRI uses the 24th T1 channel as the “D” channel with the other 23 channels serving as the “B” or Bearer channels. Then, each ISDN PRI can have from one (1) up to a maximum of twenty-three (23) “B” channels.
2. In ISDN PRI, there is no relationship between telephone numbers and actual “B” channels. Thus, calls to any pre-subscribed PRI telephone number can arrive on any free “B” channel. From this standpoint, PRI acts very similar to T1 Direct Inward Dialing (DID) service. As with DID service, incoming call routing is programmed relative to the received “Called Party” telephone number rather than the “B” channel that the incoming call arrived on. Like DID trunks, the PRI uses MMC 714 to find the ring destination for the dialed telephone number. Therefore each telephone number must be programmed into MMC 714. However, MMC 714 has been modified to accept the longer digit string provided with a PRI call (i.e., the Called Party telephone number) as opposed to the shorter number of DID digits (i.e., typically three or four digits).
3. When making outgoing PRI calls, it is possible to send a “Calling Party” telephone number other than the main billing number for the PRI circuit. The iDCS 500 has two methods to determine the number that is sent.

METHOD 1: Per Channel Programming The first method is by using MMC 405. MMC 405 is used to program the “Calling Party” telephone number that will be sent on each call on a specific “B” channel of the PRI. Normally, all PRI channels would have the same calling party telephone number (e.g., the facility Billing number) assigned. However, any valid telephone number assigned to this PRI can be used as the calling party number. These telephone numbers are purchased from the Telephone Company. Only numbers purchased for a specific PRI can be used as a calling party number for that PRI (i.e., you can’t use numbers from other facilities). The Telephone Company screens the calling party telephone number on all outgoing PRI calls and checks for valid numbers. If an invalid number is found, the Telephone Company will generally send the facility Billing number instead on this call).

This policy may vary on a state by state basis.

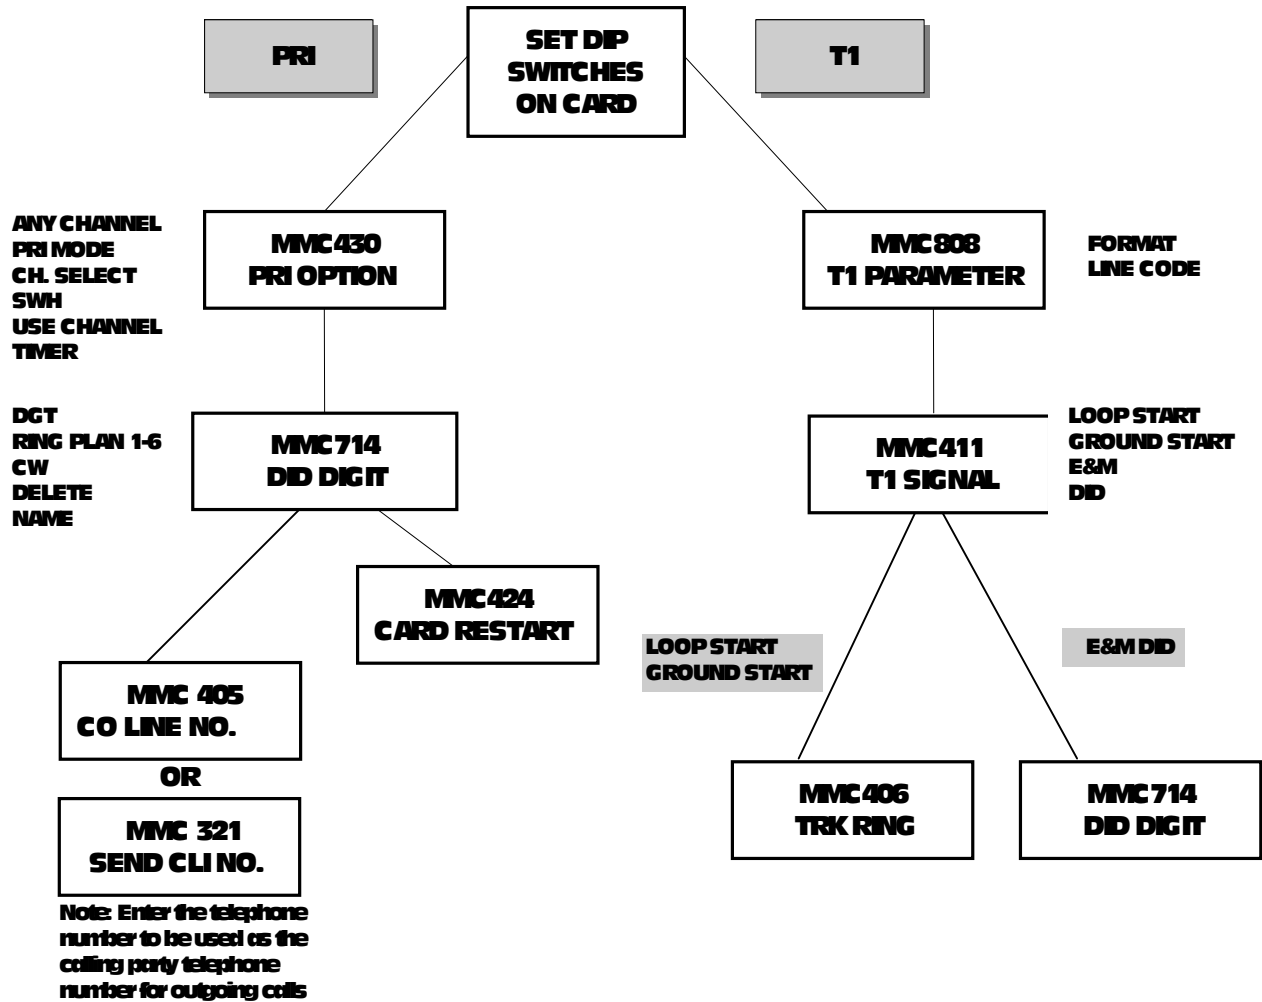

METHOD 2: Per Station Programming The second method is to use the CLI tables in MMC 321. These tables allow up to 3 calling party numbers to be assigned to each station on the system. Each table is then assigned to a PRI circuit in MMC 430 and when an outbound call is made over a PRI then the number assigned to that station for that PRI will be sent. Any valid telephone number assigned to this PRI can be used as the calling party number. These telephone numbers are purchased from the Telephone Company. Only numbers purchased for a specific PRI can be used as a calling party number for that PRI (i.e., you can’t use numbers from other facilities). The Telephone Company screens the calling party telephone number on all outgoing PRI calls and checks for valid numbers. If an invalid number is found, the Telephone Company will generally send the facility Billing number instead on this call

This policy may vary on a state by state basis.

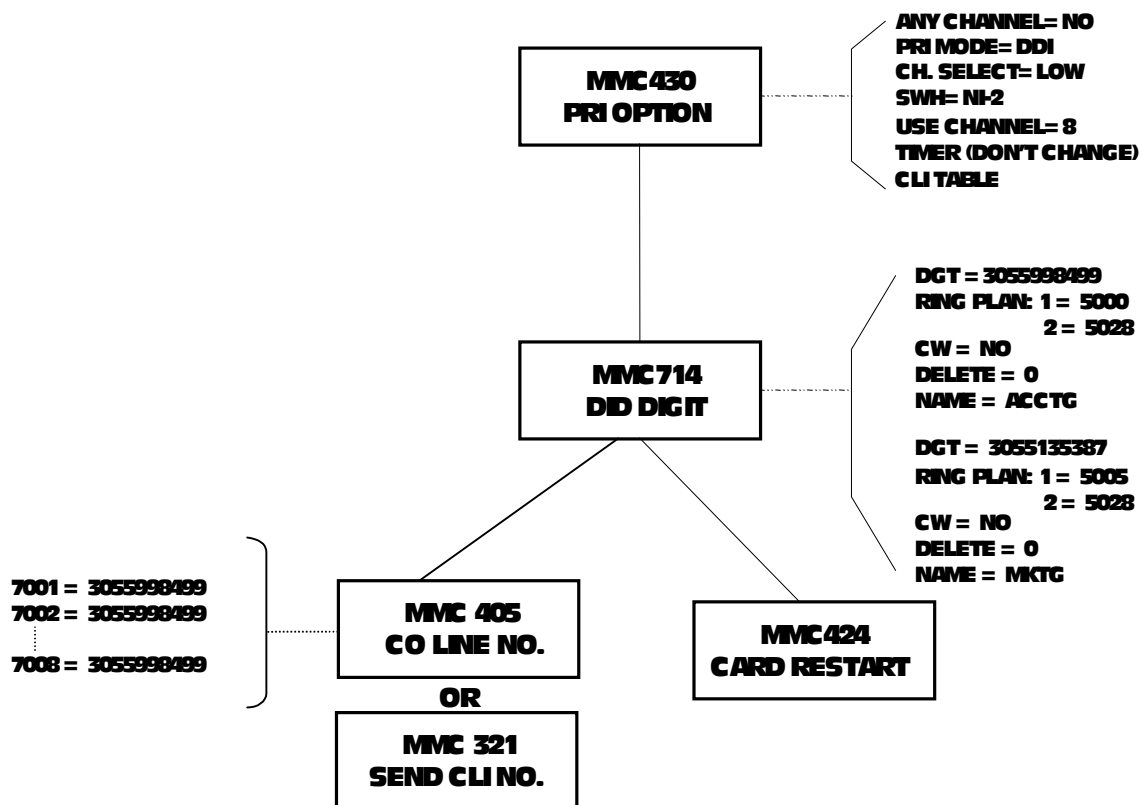

TEPRI Setup Method

The following shows a step by step approach to programming a TEPRI board as either a T1 or as a PRI circuit. Please consult the individual MMCs for specific details on the various parameters used.

Example 1 : Programming A PRI Trunk

The following shows a typical step by step approach to programming a ISDN PRI.

Ordering An ISDN Basic Rate Interface(BRI) Trunk Facility

Ask the Telephone Company Service Order Representative or Customer Account Manager questions to determine the following:

1. What are the various types of BRIs that the Telephone Company can provide service to the desired site with. If you have a choice, tell the Telephone Company that you prefer a National ISDN 1 or 2 (NI-1 or NI-2) BRI. If this is not available, the iDCS 500 will support either the #5ESS Custom or DMS-100 BRI protocols. However, the NI-1 or 2 BRI is most desirable because it is generally the easiest one to work with.
2. Typically, the Terminal Type for the BRI you require should be Type A. Other types (e.g., C or D) are used when connecting to an ISDN telephone set and provide extra functionality called "Supplementary Services" that the simple BRI trunk does not require. The iDCS 500 does not support Central Office based "Supplementary Services" and therefore it is best (and cheaper) if these services are not ordered. However If a Type A circuit is not available then one of the other circuit types will work for incoming and outgoing calls but the supplementary services (call waiting etc.) will not work. The BRI trunk functionality is limited to simple incoming and outgoing calls while the Station side can be used for example for high speed Internet Access (or other forms of dial up networking between computers) and Video Teleconferencing applications. It is the equipment that is connected to a BRI station that determines the use and functionality of the ISDN circuit.
3. The two "B" channels should be requested optioned for switched voice/data service. This will allow both voice and data calls.
4. The iDCS 500 BRI trunk card provides an S/T interface (i.e., 4 wires). The Telephone Company delivers a BRI with a U interface (i.e., 2 wires). Consequently, an NT-1 device must be provided to terminate the U interface and convert it to an S/T interface so that it can be connected to the iDCS 500 BRI interface card.
5. The BRI should be requested provided with two SPIDs (i.e., Service Profile Identifiers) and two telephone numbers. This is automatically provided for a National ISDN BRI but must be requested for a #5ESS Custom or DMS-100 BRI.
6. BRI circuits configured as ISDN trunks will work with normal "trunk hunting" service provided by the Central Office. Hunting may be provisioned by the Telephone Company, at extra cost, between the two "B" channels of a single BRI trunk and/or over a number of "B" channels provided by multiple BRI trunks. Please check with your local telephone company as to whether 1) they provide hunting service for BRI circuits and 2) as to what types of hunting they have available for you to use. Some telephone companies have no problem in properly implementing the Central Office translations for hunting while others do have problems. If you have ordered hunting and your BRI does not work properly, ask the Central Office craftsman to remove hunting. If your BRI works properly with hunting removed, you know that the Central Office did not have their hunting translation installed properly.

Ordering An ISDN Primary Rate Interface(BRI) Trunk Facility

Ask the Telephone Company Service Order Representative or Customer Account Manager questions to determine the following:

1. What are the various types of PRIs that the Telephone Company can provide service to the desired site with. If you have a choice, tell the Telephone Company that you prefer a National ISDN 2 (NI-2) PRI. If this is not available, the iDCS 500 will support either the #5ESS Custom or DMS-100 PRI protocols. However, the NI-2 PRI is most desirable because it is generally the easiest one to work with. In addition to the normal calling party number delivery, the iDCS 500 will support calling party name delivery on a #5ESS Custom or on a NI2 PRI. Name delivery is not supported on a DMS 100 type circuit.
2. The Telephone Company will usually ask about High/Low Selection. Typically, to avoid glare conditions, the Telephone Company and the iDCS 500 need to start searching from opposite ends of the "B" channel list when each attempts to select a "B" channel for call handling purposes. For example, let's say that you have a PRI with eight (8) "B" channels. The channels are numbered 1 through 8. The Telephone Company suggests that in completing incoming calls to the PRI that they will start hunting from the highest numbered "B" channel (i.e., 8) to the lowest numbered "B" channel (i.e., 1) while attempting to find an idle "B" channel to use for a specific call. This means that the system, when looking for an idle "B" channel to service an outgoing call attempt, should start hunting from the lowest "B" channel (i.e., 1) to the highest "B" channel (i.e., 8). This agreement needs to be established between the Telephone Company equipment and the iDCS 500 customer premises equipment for service to be provided.
3. The "B" channels should be requested optioned for switched voice/data service. Thus, they will be able to handle both voice (e.g., speech) and data (e.g., Internet access) traffic.
4. The iDCS 500 presently supports a single "D" channel for from 1 to 23 "B" channels. The iDCS 500 does not presently support NFAS (i.e., Non-Facility Associated Signaling which allows a single "D" channel to control "B" channels on more than one PRI T1 digital span) nor does it presently support a "backup D-Channel".
5. The Telephone Company will ask the number of "B" channels and telephone numbers you want to have provided. There is no relationship between telephone numbers and "B" channels. The number of "B" channels desired is proportional to the facility traffic handling capability similar to a DID trunk group on a T1. The PRI can support any number of telephone numbers since the telephone number simply allows a specific terminating destination in the iDCS 500 when a call is placed to that specific telephone number. Again, this is similar to DID service on a T1. Typically, the Telephone Company charges for both the number of "B" channels provided and for each telephone number provided.
6. As indicated in item 5, incoming calls on a PRI act in a manner very similar to DID service over a T1. Now, the Telephone Company can send you a 3, 4, 7, or 10 digit telephone number as the "Called Party Number" when an incoming call is received. This information must be known and agreed upon by both the Central Office (CO) and Customer Premises equipment (CPE) since the "Called Party Number" must be programmed in MMC714 for routing calls for this number to a specific station, station group, etc. Further, the Telephone Company can transmit a 7 or 10 digit "Calling Party Number" to the premises equipment. This is another point that must be agreed upon by both the CO and CPE so that CPE users can identify where the call was placed from. Typically, a 10 digit "Calling Party Number" is the normal choice of most people.

7. By definition, U.S. ISDN PRI uses B8ZS line code and ESF (i.e., extended superframe) format. This is provided automatically when a PRI is setup and is not a selectable option. The CSU (customer service unit) used to terminate the T1 span supplying PRI service should accommodate this.
8. Prior to cutting the PRI into service, the Telephone Company may ask you to “loop” the CSU (i.e., place the CSU in loopback mode) for test purposes. Only do this if the Telephone Company asks you to do this. You should never loop a PRI with an active “D” channel unless instructed to do so by the Telephone Company since this can cause a problem condition (i.e., the ISDN “D” channel will try to communicate with itself in a “looped” PRI situation).

ITM3 VoIP(Voice over Internet Protocol)

Introduction

The **iDCS 500 ITM3 VoIP**(Voice over Internet Protocol) card is a standards based Voice over Internet Protocol option card that provides toll quality voice and seamless integration in the iDCS 500 via an IP network. VoIP converts voice and signaling into IP packets, which can be transmitted over any TCP/IP network so that voice looks like data. VoIP provides the solution for desktop accessibility in the enterprise business environment. The iDCS ITM3 VoIP option card provides up to eight simultaneous voice conversations over an IP network. An additional eight VoIP channels can be added via a daughterboard installed on the ITM3 card. The easy addition of the ITM3 VoIP board in the iDCS 500 system requires no integration into a server or desktop personal computer. VoIP calls can be established from desktop telephone instruments without complex integration of software or hardware. VoIP eliminates the cost of maintaining a separate network for voice communications in the Intranet environment.

VoIP Overview

VoIP is transported by the iDCS 500 ITM3 card utilizing the ITU standards based H.323 protocol. This standard addresses the means of transferring voice, data, and images through IP (Internet Protocol) networks. IP is the accepted protocol standard for transporting data. With VoIP certain compression standards have also been adopted to represent each second of voice with an amount of bandwidth. The iDCS 500 ITM3 utilizes G.711, G.729A or G.723 standards voice compression codec's. This allows for a selectable 64kbps, 8Kbps or 6.3Kbps bandwidth use when preparing voice compression for IP transport. Compression is used to reduce the digitized voice into a smaller bandwidth that can be carried in smaller packets. The ITM3 H.323 gateway determines the compression method for each call setup. There is also a certain amount of frame/packet overhead in each compression channel. 64K of bandwidth can support 6~7 calls simultaneously. This can vary depending on efficiency features like Silence Suppression and multiframe counts. Unlike switched networks, VoIP connections consist of a sequence of numbered of data packets. Since voice conversation is usually considered “real time” these packets need to be delivered in a consistent manner with minimal delay. This can be controlled via a Gatekeeper which tracks and monitors voice packets. Gatekeepers are part of the H.323 standard but are not required. The iDCS 500i ITM3 is Gatekeeper compliant.

In any Ethernet environment, packet transfers are subject to delays and/or loss. If these delays are greater than 200ms the voice quality will deteriorate. The Ethernet data traffic and network topology should be a consideration when applying the iDCS 500 ITM3 VoIP feature. Network congestion does affect call quality in any VoIP application.

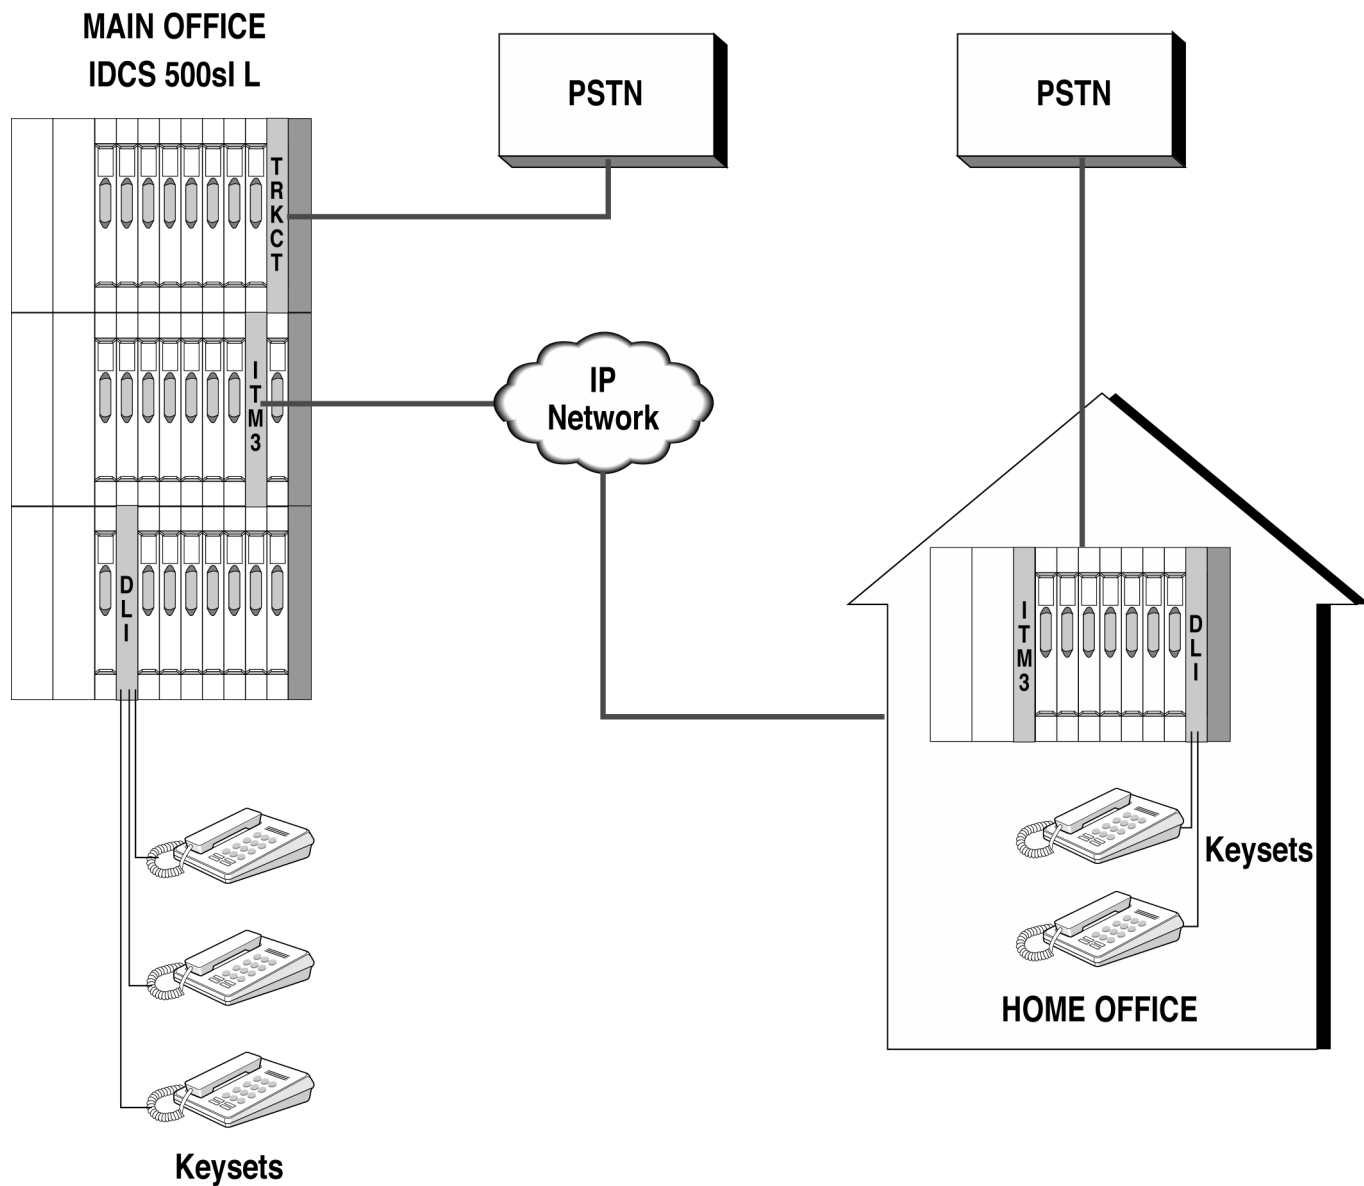

System Applications

Example 1 shows the topology of a Branch Office application. The iDCS 500 system coupled with the corporate wide area network (WAN) allows branch offices to function as part of the main office network while maintaining a local presence. In this configuration the VoIP (Voice over Internet Protocol) feature can be used to allow voice communications with the main office via the corporate WAN (wide area network) from the desktop stations.

Example 2 is similar to the topology of a Home Office application. The iDCS 500 system coupled with the corporate wide area network (WAN) or a Local Area Network (LAN) allows the home office to function as part of the main office.

Main Office - Home Office

Example 2

ITM3 VoIP Features

- Automatic Number Identification
- Automatic Routing to PSTN
- Access Code Control
- Audio Codec Selection
- Digit Conversion
- DTMF ON/Off Programmable Time Duration
- DTMF Transport Selection
- Echo Cancellation
- Facsimile over IP
- Fast Start
- Gatekeeper Support
- Gatekeeper Alias Name
- Gateway Caller ID
- H.323 V2
- Input Gain Adjustment
- IP Caller ID
- Jitter Optimization Factor
- PCM Input Gain
- RTP Multiframe Counter
- RTP Delay Limits
- RTP Loss Limits
- RTP Packet Loss Check Period
- RTP Over Limit Count
- Silence Suppression
- SMDR Output
- Status Sending
- Voice Gain/Volume Control
- VoIP Address Setting
- Voice Volume Control

Automatic Number Identification

Automatic Number Identification (ANI) provides the calling station number from the calling iDCS 500.

Automatic Routing to the PSTN

When establishing an ITM3 Voice over Internet Protocol type call, if the IP network is busy the iDCS 500 can route the call to the local trunk facilities to complete the call.

Access Code Control

The ITM3 VoIP programming allows control of the digits within the dialing string. This allows the insertion, deletion or modification of digits sent over an IP network.

Audio Codec Selection

The ITM3 VoIP programming allows the selection of three types of audio codec's. These codec's control the amount of voice compression when preparing a voice packet for transport. The three selectable codec standards on the ITM3 card are G.711, G.729A and G.723. The G.711 codec standard compresses the voice into 64Kbps of data. The G.729A codec standard compresses the voice into 8Kbps of data. The G.723.1 codec standard compresses voice 5.3 ~6.3 Kbps of data.

Digit Conversion

The iDCS 500 VoIP programming allows for digit conversion. This method allows users to dial specific codes that are deleted or substituted with other digits to match digits required in an opposite ITM3 gateway. With digit conversion trunk access codes can be inserted to access an outgoing trunk or trunk group at the opposite ITM3 system location.

DTMF On/Off Programmable Time Duration

The ITM3 VoIP programming allows control of the duration of DTMF digits when additional digits are dialed during a VoIP call. When DTMF is used inband, the DTMF digits are recognized as voice packets instead of data packets. These digits sometimes need a longer duration to be recognized by the end equipment. The end equipment may be a voicemail or IVR type system that requires longer duration DTMF digits. The DTMF can also be transported via IP and regenerated at the far end.

DTMF Transport Selection

The ITM3 VoIP programming allows control of the transport method of DTMF digits. DTMF selection permits the use of Inband, Q.931, H.245 signal or H.245 numeric DTMF transport.

Echo Cancellation

Echo cancellation is used on traditional circuit switched system and VoIP packet switched system. Echo Cancellation is a process of removing echo from conversations. Echo Cancellers store a voice sample it sends and extracts the voice from the returned voice in the reverse direction.

Facsimile over IP

T.38 is the accepted H.323 facsimile standard. The iDCS 500 ITM3 uses the T.38 IP facsimile standard. Up to 8 channels of the ITM3 card can be used for facsimile. The number of channels to be used for facsimile can be programmed as needed.

Fast Start

Fast Start can be enabled or disabled in the ITM3 programming to allow compatibility with other VoIP gateway products. H.323 Fast Start exchanges connection information at the connection stage of the H.323 standard and is more widely used than the slow start method. Fast Start uses Q.931 protocol connection to the media. Slow Start uses Q.931 and H.245 protocols to connect to the media.

Gatekeeper Support

The ITM3 VoIP programming allows the support of a Gatekeeper. An H.323 Gatekeeper is usually an additional PC type server connected to the LAN or WAN that monitors and manages VoIP services such as address translations, bandwidth management, authentication, authorization, registration, billing (SMDR type accounting). A Gatekeeper is not required and is most often used in large "managed" networks where large amounts of VoIP traffic is transported.

Gatekeeper Alias Name

Gatekeeper Alias name can be input with a maximum of 15 characters. The Gatekeeper Alias is a name given to each host to distinguish it from another in an H.323 VoIP network. This is used when there are multiple gatekeepers.

Gateway ID

The ITM3 is considered a gateway between the iDCS 500 switched system and the IP network. To determine which node or location is calling the ITM3 can insert a four-digit gateway ID to identify where the call originated. Gateway ID's are used for billing purposes.

H.323

H.323 is a standard approved by the International Telecommunication Union (ITU) in 1996 to promote compatibility in videoconference transmissions over IP networks. H.323 was originally promoted as a way to provide consistency in audio, video and data packet transmissions in the event that a local area network (LAN) did not provide guaranteed quality of service (QoS). Although it was doubtful at first whether manufacturers would adopt H.323, it is now considered to be the standard for interoperability in audio, video and data transmissions as well as Internet phone and voice-over-IP (VoIP) because it addresses call control and management for both point-to-point and multipoint conferences as well as gateway administration of media traffic, bandwidth and user participation. H.323, which describes how multimedia communications occur between terminals, network equipment and services, is part of a larger group of ITU recommendations for multi-media interoperability called H.3x. The H.323 standard is evolving to different versions that improve the standard. H.323 V1 was the first accepted standard. Subsequent standards improve connections and provide services such as call forwarding, call waiting etc. The ITU recommends that each newer version is to be compatible with the earlier versions. The H.323 protocol stack includes many other protocols that support media standards, security, peripherals, transmission, signaling, and speech compression.

Input Gain Adjustment

Input gain control allows adjustment for specific network conditions by adjusting the gain from the iDCS 500 to the ITM3 VoIP DSP's. This is useful in "balancing" network VoIP calls.

IP Caller ID

IP caller ID is a selectable option that will display the calling ITM3 IP address.

Jitter Optimization Factor

Jitter is the deviation of the transmission signal in time or phase. Jitter can cause the degradation of voice quality and loss of signal. The optimization factor on the ITM3 sets the standard for buffering that is required in the PCM voice process when receiving packets from the network.

PCM Input Gain

The PCM input gain allows the adjustment of the PCM value to the ITM3 DSP codec. The range of adjustment is -31dB to +31dB.

RTP Mutframe Counter

The RTP (Real Time Transport Protocol) mutframe counter on the ITM3 sets the number of frames that do not require the header information. This allows packets with the same header information to not send multiple repeat headers. These packets are buffered and sent as a single packet.

RTP Delay Limit

RTP (Real Time Transport Protocol) delay limit is a "watermark" to determine when there is a network error.

RTP Loss Limit

The RTP (Real Time Transport Protocol) percentage of packet loss that will be considered a network error.

RTP Loss Check Period

The base line period to determine RTP (Real Time Transport Protocol) packet loss.

RTP Over Limit Count

When the RTP delay or RTP loss limits is exceeded this counter sets the accumulated frequency to be used as a basic index to consider network error.

Silence Suppression

Silence suppression detects non-voice periods and prevents the transmission of voice packets that do not contain noise. The average English conversation is idle 50% of the time during the conversation. The non-voice periods do not need to be transmitted. To adjust for the silence suppression period most gateways produce a “comfort” noise to simulate non-voice periods.

SMDR Output

The iDCS 500 reports VoIP calls on the iDCS 500 SMDR report.

Status Sending

Status Sending is a cyclic check of the status of the remote ITM3 card(s) to determine network quality.

VoIP Address

The iDCS 500 permits modification to the ITM3 IP address via KMMC or PCMMC.

Voice Volume Control

The iDCS 500 permits modification to the ITM3 voice volume control when the voice packet is processed to the iDCS 500 system. The adjustments range from -31dB to +31dB.

ITM3 VoIP(Voice over Internet Protocol) Card

The iDCS 500 ITM3 VoIP card supports up to eight voice calls over an IP network connection using the industry standards based H.323 protocol. An additional eight VoIP channels can be added by installing an eight-circuit daughterboard for a total of sixteen channels of VoIP. The ITM3 cards fit into any universal iDCS 500 card slot. The iDCS 500i supports a maximum of two ITM3 cards per cabinet.

ITM3 Hardware Overview

The iDCS 500 ITM3 VoIP trunk gateway controller is a Motorola MC68EN360 processor. 3 Megabytes of FLASH store the program and 16 Megabyte of DRAM is used for the ITM3 operational database. VoIP is integrated into the system via HDLC (High-level Data Link Control) protocol which is an industry standard of data link communications.

The ITM3 card is encased in a static dissipative ABS plastic shell for added protection during handling.

The iDCS 500 ITM3 has eight LED's on the front of the card to show the operational status of the ITM3. The ITM3 LED's are arranged on the face of the ITM3 card to provide a visual indication of the operational status of the ITM3 card. The LED layout is as follows:

ITM Card Labeling

PWR	LED1	LED2	IP
SW 1	LED3	LED4	SW 2
SW 3	LED5	LED6	SW 4
RX	LED7	LED8	SW 6

LED 1 When is ON when power is applied to the ITM3 card

LED 2 Indicates VoIP traffic.

LED 3 Is ON when booting and will flicker at a very high rate when the ITM3 card is running.

LED 4 Indicates the initialization of the ITM3 DSP's and is ON after initialization is complete

LED 5

LED 6 Is ON when the ITM3 is booting. After booting this LED will turn OFF. When ITM3 initialization is complete this LED will turn ON again.

LED 7 Is labeled RX and indicates an Ethernet connection.

LED 8 Will flicker at a high rate after complete initialization indicating the ITM3 card is running

The RJ 45 10/100BaseT RJ 45 female data jack on the front of the ITM3 card connects to the LAN. A RJ 45 UTP data cable "straight" data cable is used to connect to a LAN.

The ITM3 card has a recessed RESET button that will initialize the ITM3 card manually if required. To load the flash memory of the ITM to the DRAM after power up or after resetting the system takes approximately 3 minutes.

The RS232 DB 9 connector on the face of the ITM3 card allows trace monitoring of the ITM3 functions. This is used for engineering purposes only.

ITM3 Card Installation

The ITM3 card can mount in any iDCS 500 universal card slot. The ITM3 is supported with iDCS 500 M or L version software. There is a processor on the ITM3 card and it is not recommended to insert this card with system power on. Insert up to two ITM3 cards per cabinet. Push firmly in the middle of both card ejectors on each card to ensure that it is fully inserted into the backplane connector.

ITM3 VoIP 8 Channel Expansion Daughterboard

The ITM3 basic 8 channel VoIP Trunk Gateway can be expanded to a total of 16 VoIP channel by adding an 8-channel daughterboard. To install the daughterboard the card ejectors must be removed and the card cage screws removed. A protective anti-static ground strap should always be used when handling electronic printed circuit boards. Remove the ABS plastic cover. With the component side facing up the keyed daughterboard can then be inserted onto the daughterboard connectors.

Site Applications

The ITM3 card connects directly to an IP network via the RJ45 UDP jack located on the front of the card. This network can be a local area network (LAN) or a wide area network (WAN). ITM3 applications would more aptly use the WAN application to assist in toll bypass and main office to branch office connectivity. Data traffic on LAN and WAN environments is more predictable as compared to Internet traffic. WAN applications have a gateway that allows computer users to leave the local area network (LAN) to reach another network. The gateway acts as a “bridge” to other networks. Example 3 shows the typical connection of the ITM3 to a WAN with gateway routers.

The cable needed to connect the ITM3 to a LAN is a standard “straight” 8 conductor data cable. This cable is sometime referred to as a LAN UTP category 5 ,4 pair RJ45 male to male data patch cable. Connection to the LAN can be via a patch panel or hub device. The data patch cable is not provided with the ITM3 card and must be purchased separately though a data equipment supplier. Example 3 shows ITM3 connection to a LAN with hub devices.

The ITM3 VoIP programming has several layers that allow greater flexibility to perform tandem VoIP iDCS 500 station to station calls or VoIP iDCS 500 station to trunk calls. Example 4 shows the call paths for these types of calls.

Station call in system B to the PSTN in system A

Station call in system A via ITM to ITM to a station in system B

ITM3 to LAN HUB

Example 3

iDCS 500 to iDCS 500 Station Call

Example 4

iDCS 500 ITM3 Programming Overview

ITM3 Operational Concept

The iDCS 500 ITM3 functions as a VoIP trunking gateway. The iDCS 500 software considers the ITM3 ports as trunk ports. The iDCS 500 ITM3 card programming is similar to installing or adding other cards in the iDCS 500 system. Each ITM3 card has ports assigned that are comparable to the system trunk ports. In a default system the iDCS 500 will automatically identify that an ITM3 card is present and assign trunk numbers to the available ports. The trunk numbers will be in the 7XX range. If an ITM3 card is to be added to an existing system it is recommended to power off the cabinet that the card is going to be installed in.

Programming ITM3 trunks are similar to programming traditional trunks. The ITM3 VoIP trunks can be in trunk groups (MMC 603 Assign Trunk Groups) or ITM3 VoIP trunks can be individually assign as Direct Trunk Keys (MMC 722, MMC 723 Key Assignments). ITM3 VoIP trunks can also be included in LCR programming to provide alternative routing of outgoing calls. Station calls between iDCS 500 systems via VoIP can also be accomplished via ITM3 trunks. An ITM3 or other compatible VoIP gateway must be present on the LAN or WAN to place VoIP calls to and from the ITM3 card.

VoIP Call Routing Concept

VoIP calls via the ITM3 use routing tables to determine where to route the call based on digits dialed. Digits can be added or removed as part of the call and be transparent to the calling station. The digits dialed then reference a table that has the destination IP address then repeats the digits needed at the far end.

Programming of the ITM3 follows an LCR type of programming where the tables are used to reference the dialed number and send the call to the right IP destination. It is not necessary to have LCR programmed to use the ITM3 VoIP facilities. Incoming calls on the ITM3 perform similarly to DID service where incoming digits are translated to determine the destination in MMC 714, DID Digit Translations or to the operator group.

A basic example of the direct station to station dialing string in an iDCS 500 directing a call over an ITM3 card to another iDCS 500 ITM3 card is as follows:

80 0 201

- 80 is the trunk group access code to the ITM3 trunks.
- 0 is the access code that references an IP address table.
- 201 is a station in the distant 500 system.

In the above example the station caller will hear a second dial tone when 80 is dialed. After dialing 0 and station number 201 the ITM3 program looks up the corresponding IP address with the access code 0. IP communications are established and the access code 0 is deleted then the digits 201 are sent in an IP packet and repeated by the far end ITM3. The caller will hear station ringback tone and is able to converse when the called party answers. The access code can also be imbedded in the sent digit string information allowing more transparent dialing.

Another scenario is where the ITM3 can be optioned via programming to support inband or out of band DTMF transmission. An example is if the far end station is answered by a voice mail system and the calling party wishes to navigate a voice mail system the digits sent can be sent "out of band". These digits are sent as data messages as opposed to transporting via the "voice" connection. The far end receives the DTMF digit data and repeats the received data as analog DTMF. This reduces bandwidth use and possible DTMF digit distortion during transport.

IP(Internet Protocol) Addressing

To program the ITM3 VoIP it must be known where to route IP based calls. A basic knowledge of Internet Protocol (IP) networking should be understood to program IP addresses and IP gateway addressing. The iDCS 500 must have an IP address associated with each ITM3 card installed. This can be programmed only after the ITM3 card(s) are installed in the system. The IP address can match the existing LAN addressing scheme or it can be a totally different IP address level. It is suggested to match the existing LAN IP address plan to permit ease of administration. Also required will be an IP subnet mask and a gateway address.

Subnet addresses allow connectivity in the same network and determines if the data needs be forwarded to a router.

Gateway is a term used as a junctor or the meeting point of two networks. This meeting point can be a router or an ITM3 card. When a request is made by a PC or other IP device (ITM3) and the address is not in the local network the gateway IP address is where the next search is performed. The gateway then looks outside the local network for a response to the request. This all happens within milliseconds. Once a response is obtained the LAN gateway router acts as the bridge between the two networks. The information can be strictly data or it can be voice data. In the iDCS 500 ITM3 programming the gateway is equivalent to the router address to leave the local LAN and access another network.

ITM3 Programming Responses

The ITM3 will not update while programming. The update of ITM3 data changes take effect after programming has been exited and closed. This can be observed by the IPC message activity on the PMCP card.

If the IP address of the ITM3 card is changed the ITM3 must be restarted to update the new IP address information. The update takes about 3 minutes to write to and then retrieve from flash memory. Also during this updating process, if an SCP or LCP is mounted the corresponding LED will flicker as off-line until the card is on-line.

ITM3 Programming MMC's

There are six MMC's directly related to the operation of the ITM3 card.

MMC 831 VoIP Parameters

Assigns IP addresses, Facsimile channels, CLIP tables and VoIP mode.

MMC 832 VoIP Code Programming

Assigns VoIP access codes, access code length, the number of digits to delete or insert, remote end trunk access code and IP selection tables

MMC 833 VoIP Address Table

Allows assignment of IP addresses in specific tables to route calls to remote destinations

MMC 834 VoIP Options

This MMC programs the VoIP companding, call set up and signaling types and other parameters associated with VoIP signaling

MMC 835 VoIP DSP Options

Assigns the individual parameters associated with the VoIP DSP operation. Codec type, filtering, input gain, voice volume and RTP (real time transport protocol) parameters.

MMC 836 VoIP Gatekeeper Options

This MMC allow the setup parameter to allow the ITM3 to operate with a network supported by VoIP Gatekeeper(s).

ITM3 Application Programming

When applying VoIP to an IP network there are several areas that must be taken into consideration. The installation must be looked at fully to first understand the topology and routing of VoIP calls. In this programming example the concept used will be in an Intranet environment for simplicity. This will also allow a better understanding of the ITM3's call capabilities within a corporate environment.

The areas to consider when programming the ITM3 are:

- ITM3 programming. (trunk groups, LCR overflow, etc.)
- ITM3 incoming use. (routing to station or groups)
- ITM3 routing of outgoing calls.
- IP network addresses.
- LAN or WAN utilization before voice is added

In our programming example there will be 3 iDCS 500 systems connected to the network. All sites have distinctive 3 digit numbering plans for easy identification and are on the same WAN network separated by routers. There is a common connection to the Internet via a Firewall which is not shown here. The programming examples shown are DPAP program displays for ease of understanding but the programming can also be accomplished via KMMC. This example is showing the use of individual access codes for each location. Programming can allow transparent station dialing between locations by deleting and inserting digits.

MMC 831: VoIP Parameters, provides a means to apply the Internet Protocol (IP) addresses to the ITM3 card. This MMC also assigns the number of channels that can be used for IP facsimile capabilities. The CLIP tables allow the calling station number to be received at the far end ITM3 location.

- **IP ADDRESS:** Specifies the IP address for the ITM3 card. When changing the address via KMMC three digits must be input for each field. Example (Default: 168.219.76.101).

If the ITM3 IP address is changed the ITM3 card must be restarted.

- **SUBNET MASK:** Specifies the IP subnet mask. When changing the address via KMMC three digits must be input for each field. (Default: 255.255.255.0)
- **GATEWAY:** Specifies the LAN gateway address when leaving the local network. When changing the address via KMMC three digits must be input for each field. (Default: 168.219.76.1)
- **STS Period:** Status Send Period designates the timed message cycle to check the remote IP status (Range: 0~60 sec.) STS is related to the RTP overcount limits to determine if a network error exists. STS also determines when the second choice IP routing when first choice network has an error condition.
- **MAX FAC CH:** Maximum facsimile channels. Specifies the maximum number of ITM3 channels that will accept IP T.38 protocol IP facsimiles (Default: 0). Only the first 8 channels on the ITM3 can be selected for fax use.
- **CLIP:** Calling Line Identification Presentation. This provides the calling station number when calling from one ITM3 location to another ITM3 location. Three options are available: NONE, Table 1 or Table 2. MMC 321 Send CLI Number, determines what number identification will be sent.
- **VoIP MODE:** The three options available are Follow Incoming Digits, Follow Trunk Ring or Follow DID Translation Tables. Follow Trunk Ring provides service for VoIP calls that do not have an incoming number associated with the call so the call is sent to the default location.

MMC 831 VoIP PARAMETERS Programming

System A

Cabinet	Slot No	IP Address	Subnet Mask	Gateway	STS Period	Fax Count	CLIP Table	VOIP Mod

System B

Cabinet	Slot No	IP Address	Subnet Mask	Gateway	STS Period	Fax Count	CLIP Table	VOIP Mod
1	1	105.52.9.203	255.255.255.0	105.5.9.1	5	2	1	DDI

System C

Cabinet	Slot No	IP Address	Subnet Mask	Gateway	STS Period	Fax Count	CLIP Table	VOIP Mod
1	1	105.52.8.204	255.255.255.0	105.52.8.1	5	2	1	DDI

MMC 832: VoIP Code, provides an access code that corresponds to an IP address when the access code is dialed. The access code points toward an IP reference table that has the far ends corresponding IP address. The digits can be modified by deleting or inserting digits to manage the digits sent and received at the far end.

If access codes are not removed they will be sent with the dialed digits. This allows the possibility of transparent dialing to the station user which is used in our example.

- **ACCESS CODE:** This is the access code once the ITM3 is accessed directs a call based on the routing tables. An access code table is references an access code. A maximum of 8 digits are available with 63 access code entries (00~62).
- **CODE LENGTH:** This field requests the number of digits that are expected to be received to make up the access code.
- **DEL LENGTH:** This is the number of digits to delete after receiving the access code. If no digits are deleted the access code will be sent as part of the call to the destination to continue routing at the far end destination.
- **INSERT CODE:** This is the code to insert for routing at the destination. This can be used when different numbering plans exist or if a dial 9 access is needed to be inserted in the dialed digits.
- **IP TABLE 1:** This is the first table referenced for routing the access code to an IP address The 500si has 31 IP tables (00~30) with 32 entries (00~31) in each table.
- **IP TABLE 2:** This is the second table referenced as a look up for an IP address to route the call based on the access code.
- **IP START:** This entry indicates where in a table to start looking for an IP code to associated with the access code. This can be used to manage where to start looking for an IP address in high traffic ITM3 applications. Example: If IP address routing to the desired destination is known to be in the last 7 entries of a table the IP START location would be 25. IP address searching would start looking at table entry 25.

The following is an example of MMC 832 VoIP Code programming:

The access codes here are default and can be changed as needed

This denotes the number of digits in the access code

How many digits to delete from access code to not to sent to remote site

If required, this inserts digits to replace deleted digits

This references which IP table used in MMC 833. For simplicity, it is suggested to use a different IP index for each access code

The Table column is actually an entry number

Table No	Access Code	Length	Delete	Insert Code	IP Index1	IP Index2	IP Start
0	0	1	1		0		0
1	1	1	1		0		0
2	2	1	1		0		0
3	3	1	1		0		0
4	4	1	1		0		0
5	5	1	1		0		0
6	6	1	1		0		0
7	7	1	1		0		0
8	8	1	1		0		0
9	9	1	1		0		0
10			0				
11			0				
12			0				
13			0				
14			0				

This is the second choice IP table look up. If the entries are unavailable in IP Table 1 the system refers IP Table 2. This is normally not used unless there is a very large VoIP network requiring traffic

This table designates where to start looking in the IP Table entries in MMC 833. If all entries are set to start at entry 00 and the network is erred based on the STS conditions the system will look at the next available entry in that table. For simplicity, it is suggested that each IP Index has it's own access code and then a Start entry of 0 is all that is required.

MMC 832 VoIP Code Programming

System A

Table No	Access Code	Length	Delete	Insert Code	IP Index1	IP Index2	IP Start
0	3	1	0		0		0
1	4	1	0		1		0
2	2	1	0		2		0
3		1	0				0
4		1	0				0
5		1	0				0
6		1	0				0
7		1	0				0
8		1	0				0
9		1	0				0
10			0				
11			0				
12			0				
13			0				
14			0				

Access code for same or "self" system included for testing purposes. Suggested to always include for self testing

Note that there are no delete entries. This allows the access code to be included and sent with the dialed digits. Calling party only dials trunk group access code and three digits to reach far end destination.

System B

Table No	Access Code	Length	Delete	Insert Code	IP Index1	IP Index2	IP Start
0	2	1	0		0		0
1	4	1	0		1		0
2	3	1	0		2		0
3		1	0		0		0
4		1	0		0		0

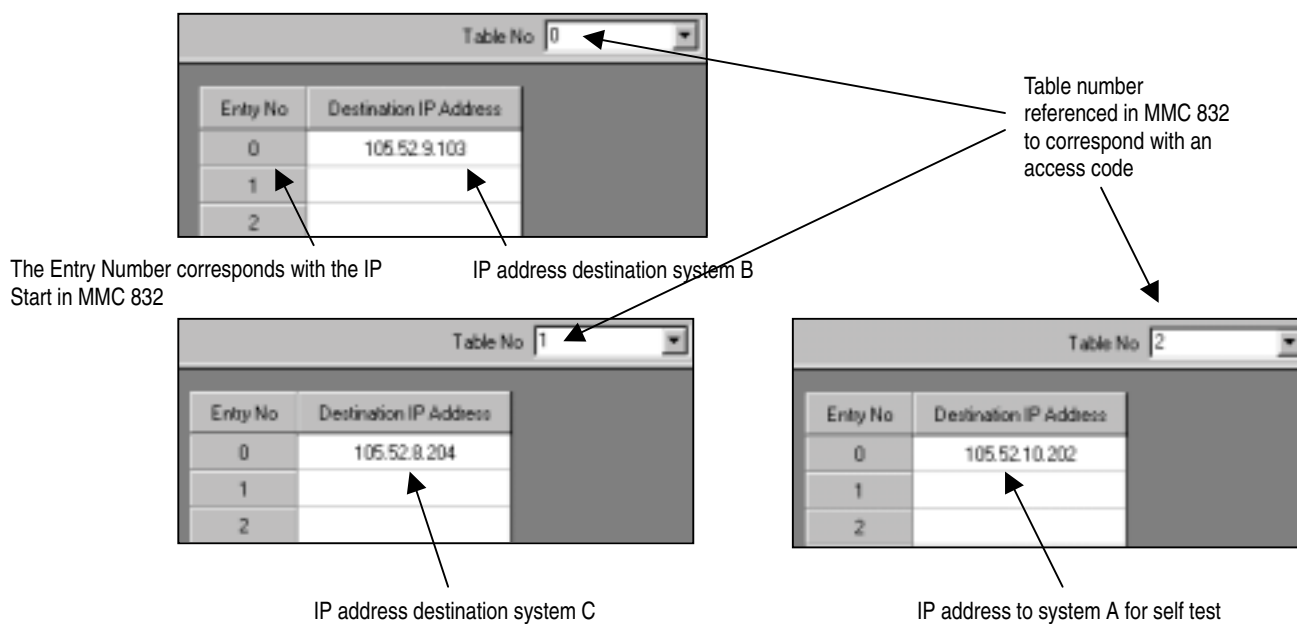

System C

Table No	Access Code	Length	Delete	Insert Code	IP Index1	IP Index2	IP Start
0	2	1	0		0		0
1	2	1	0		1		0
2	4	1	0		2		0
3		1	0		0		0
4		1	0		0		0

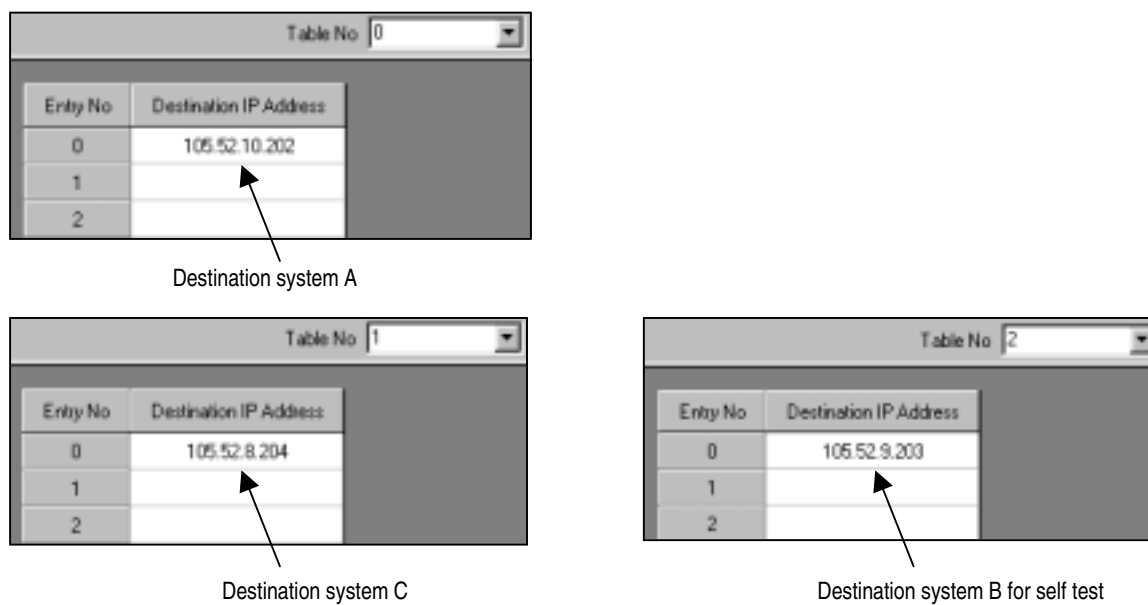

MMC 833: VoIP IP Table, provides the IP address destinations in tables that the access code is directed to in MMC 832. There are 31 tables with up to 32 entries each. The destination IP address is required to route dialed digits based on the access code and digits dialed. The IP entry field in the KMMC mode is divided into 4 sections allowing modification of separate IP address fields.

In the examples there are 3 access codes corresponding to 3 Tables (0,1 and 2).

System A

MMC 834: VoIP Options, provides various VoIP support options. The options set in this MMC are system wide to all ITM3 cards.

- **PCM COMPANDING:** Select U-law or A-law PCM. Default U-law for the USA. ITM3 cards must have matching companding to the system they are mounted in.
- **H.323 FAST START SETUP:** Enables or disables the H.323 Fast Start call method.
- **GATEWAY CALL ID:** This a numeric entry that identifies the iDCS 500si system via an ITM3 connection. The maximum entry is 4 digits.
- **CALLER ID TYPE:** This option controls the calling party identification type. There are 3 possible selections. ANI which shows the calling station number when the call is an ITM3 to ITM3. IP which shows the calling ITM3 IP address. Gateway ID which is a 4 digit preprogrammed ID.
- **INCOMING CHANNEL SELECTION:** This option selects whether the incoming channel is Sequential or Distributed.
- **DTMF GENERATION:** This option allows 4 different transport types of DTMF. Inband, Q931, H.245 Signal, H.245 Numeric are the available selections.
- **FAX SIGNAL TYPE:** This option selects the facsimile standard to use when transporting facsimiles via the ITM3. Selections are T.38 or the proprietary Samsung formats. Default is the T.38 facsimile standard.
- **SWITCH TO H.245:** This option enables switching to the H.245 protocol at the time of Fast Start
- **DEFAULT DIL:** This allows programming of the default DIL number when a digits are not included on an incoming call.
- **SNMP SERVER ID:** This allows entry of the SNMP server IP address when connected to network management equipment.

- **SIGNALLING PORT:** Indicate the port number for H.323 signaling and sets a range of numbers allowed by firewall equipment. The IP path or port used is 10000
- **STATUS PORT:** Port number for the exchange of status information between ITM3 cards. The IP path or port used is 20000
- **WCS PORT:** Proprietary Samsung Web Call Service. The IP path or port used is 20010
- **SIGK ACCESS PORT:** Samsung Internet Gatekeeper. The IP path or port used is 20020.
- **MAKE DEFAULT DB:** Defaults the ITM3 card(s).

MMC 834 VoIP Options

Item	Value	
PCM Coding	µ-law	PCM CODING must match coding type of the system the ITM3 card is in. Example: In the USA µ-law is used in the iDCS 500 and in the UK A-law is used. Subsequently, in the USA the ITM3 should be set for µ-law
Fast Setup	Disable	Fast Setup = Q.931 → Connection to media
GW CID	1234	ID of ITM3 card must be numeric
Bill Type	SAMSUNG	Billing type Samsung is a proprietary method and should be changed to NORMAL for use in the USA
CID Type	ANI	
Incom Type	Sequential	
DTMF Type	INBAND	MMC 503 controls DTMF duration when INBAND is used
FAX Signal	T.38	
H245 Switch	Disable	H.245 Enable is used when Fast Start is enabled and DTMF generation is set to H.245
DCP Number		DIL number when only an IP address is received
SNMP Server		Used when connected to a network with management equipment using SNMP
Signal Port	10000	Port number for H.323 when using firewall equipment
Status Port	20000	
DTMF Port	20010	
TFTP Port	20020	

MMC 835: VoIP DSP Options, provides the accessibility to set various ITM options. These settings are system wide and apply to all ITM3 cards in the system. MMC 835 provides the following:

- **AUDIO CODEC:** Selects which audio codec compression to use. Selections are 1. G.711 (64K), 2. G.723.1 (5.3K~6.4K), 3. G.729A (8K). Audio codec settings should match far end ITM3 codec settings.
- **ECHO CANCELLATION:** Enables or disables echo cancellation (0: disable, 1: enable). This function removes echo that is generated by voice reflection and packet delay.
- **SILENCE SUPPRESSION:** This parameter determines whether silence suppression is used (0: disable, 1: enable). This prevents transmission during the silence period of a call.
- **INPUT FILTER:** This option select input filtering of the DSP (0: disable, 1: enable). This should be set as ON.
- **OUTPUT FILTER:** This option select output filtering of the DSP (0: disable, 1: enable). This should be set as ON.
- **INPUT GAIN:** PCM input gain value of DSP. The range is -31dB~31dB (0~63). This sets the quality of PCM voice from the system's PCM to the VoIP DSP on the ITM3. This is set to the site's environment.
- **VOICE VOLUME:** This selects the voice volume from the ITM3 DSP to the system. This is set to the site's environment. The range is -31dB~31dB (0~63).

- **MULTI FRAME COUNTER:** This option selects the number of frames the ITM3 will consolidate the packet header message. The voice packets are buffered to the set number and sent as a single packet. The range is 1~12.
- **JITTER OPTION:** This selects the dynamic jitter specific value. Value determines whether the focus is on packet loss or packet delay. The range is 00~12.
- **VOICE PROMPT SWAP:** Decides the adjustment of the byte order of the voice announce data. (0:disable ,1:enable)
- **RTP DELAY LIMIT:** This is the value of the delay limit. The status will change when this limit is exceeded. The value is measured in milliseconds (ms). This is used to determine network error with other ITM cards.
- **RTP LOSS LIMIT:** This is the value of the loss limit value. The status will change when this limit is exceeded. The value is measured in percentages (%). The range is 00~25%. This is used to determine network errors with other ITM cards.
- **RTP CHECK PERIOD:** This is the packet loss estimated base period measured in seconds. The range is 00~25 seconds. This is used to determine network errors with other ITM cards.
- **RTP OVERCOUNT LIMIT** This limit /loss limit excess count. The range is 0~3. This is used to determine network errors with other ITM cards.
- **DTMF ON:** The DTMF ON time in milliseconds (ms) when received via H.245.
- **DTMF OFF:** The DTMF OFF time in milliseconds (ms) when received via H.245.

DTMF ON/OFF duration's affect incoming DTMF when sent via H.245. Changes to these parameters require the ITM3 to be reset to take effect.

MMC 835 VoIP DSP Options default data.

Item	Value	
Audio Codec	G.723.1	
Echo Cancellation	Enable	
Slence Suppression	Enable	
High Pass Filter	Enable	
Post Filter	Enable	
Input Gain	23	Input Gain is the adjustment of gain or loss from the system to the VoIP DSP on the ITM3 and may have to be adjusted depending on the network environment
Voice Volume	34	Voice Volume is the gain or loss as the voice is processed from the VoIP DSP to the system and may have to be adjusted depending on the network environment
Multiframe Counter	3	
Jitter Option Factor	7	
Voice Prompt Swap	Disable	
RTP Delay Limit (ms)	600	RTP options work in conjunction with the STS period and are only used between ITM3 cards
RTP Loss Limit (%)	10	
RTP Loss Check (sec)	10	
DTMF On (100ms)	1	The DTMF duration timers here relate to converting the received IP DTMF messages to audible DTMF to the system when using H.245 DTMF transport
DTMP Off (100ms)	1	

MMC 836: VoIP Gatekeeper Options allows programming of the ITM3 for identification to a network gatekeeper. The settings are selectable for each ITM card installed.

- **GK CONNECT** This determine if the ITM3 is to connect to a gatekeeper. The option are disable or enable.
- **GK TYPE** This determines if connected to a Samsung SIGK or Other type of gatekeeper.
- **GK IP** This is gatekeepers IP address.
- **GK NAME** This is the name identifier of the gatekeeper. The name can be alphanumeric. An entry of 9 alphanumeric character with a space followed by an additional 6 alphanumeric characters can be input.
- **GW H.323 ID** This is the H.323 identifier of the ITM3 that is registered with the gatekeeper. This can be up to 16 characters.
- **GW E.164 NUMBER** This is the E.164 identifier of the ITM3 that is registered with the gatekeeper and can be up to 16 digits in length.
- **KEEP ALIVE** This is the timer that the ITM3 uses to acknowledge the presence of the gatekeeper. The range is 000~999 seconds.

Chapter 3 MMCs (In Numeric Order)

MMC:100

STATION LOCK

DESCRIPTION:

Allows the system administrator or technician to lock or unlock an individual station or all stations simultaneously. The three options are as follows:

0	UNLOCKED	Unlocks a locked station.
1	LOCKED OUT	The keyset cannot make calls outside the system. It can however make and receive intercom calls and receive incoming C.O. calls. When in this mode the HOLD key of the keyset will flash slow RED.
2	LOCKED ALL	The keyset cannot make or receive any calls. When in this mode the HOLD key of the keyset will light steady RED.

PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPK	Used to store data and advance to next MMC
HOLD	Used to clear previous entry
ANS/RLS	Used to select ALL

ACTION

1. Press TRSF 100
Display shows
2. Dial station number (e.g., 205)
OR
Press UP or DOWN to select station and use RIGHT soft key to move cursor

OR
Press ANS/RLS to select all stations
3. Enter 0 to unlock or 1 to lock (e.g. 1)
OR
Press UP or DOWN key to make selection and press RIGHT soft key to return to step 2
4. Press TRSF to save and exit
OR
Press SPK to save and advance to next MMC

MMC:101

CHANGE USER PASSCODE

DESCRIPTION:

Allows the system administrator or technician to reset any keyset's passcode to its default value of "1234." This MMC cannot display station passcodes; it can only reset them to default.

Keyset users can set or change their individual passcodes. The passcode is used to lock or unlock the keyset for toll restriction (call barring) override and to access the DISA feature.

 **NOTE**

Default passcodes cannot be used for toll restriction override or for DISA access.

PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right

MMC:102

CALL FORWARD

DESCRIPTION

Allows the system administrator to program the call forward destinations for other station users. This MMC also allows call forward to be set after the destination has been entered.

iDCS 500 allows six types of call forwarding: FORWARD ALL, FORWARD NO ANSWER, FORWARD BUSY and FORWARD EXTERNAL. There is an additional option, FORWARD BUSY/NO ANSWER, that allows both of these options to be activated at the same time, provided that destinations have been entered for both.

0 = FORWARD CANCEL	4 = BUSY/NO ANSWER
1 = ALL CALL	5 = Not Available
2 = BUSY	6 = EXTERNAL FORWARD
3 = NO ANSWER	7 = FORWARD DND

Forwarding options 8, 9 and * are only available on a iDCS 500 system with networking enabled.

8 = CALL FORWARD UNCONDITIONAL (Across Network)
 9 = CALL FORWARD BUSY (Across Network)
 * = CALL FORWARD NO ANSWER (Across Network)

PROGRAM KEYS

MMC:103

SET ANSWER MODE

DESCRIPTION

Allows the system administrator to change the answer mode of any keyset. Each keyset can have its answer mode set to one of the following options:

- 0. RING:** The keyset will ring in one of eight custom ring patterns. Calls are answered by pressing the ANS/RLS key or by lifting the handset.
- 1. AUTO:** After giving a short attention tone, the keyset will automatically answer calls on the speakerphone. When a C.O. line is transferred to a keyset in Auto Answer, the screened portion of the call will be Auto Answer, but the keyset will ring when the transfer is complete if the user has not pressed the ANS/RLS key or lifted the handset.
- 2. VOICE:** The keyset will not ring. After a short attention tone, callers can make an announcement but the ANS/RLS key or handset must be used to answer calls.

STATION NAME

DESCRIPTION

Allows the system administrator or technician to enter an 11-character name to identify an individual station.

Names are written using the keypad. Each key press selects a character. Pressing the dial pad key moves the cursor to the next position. For example, if the directory name is "SAM SMITH," press the number "7" four times to get the letter "S." Now press the number "2" once to get the letter "A." Continue selecting characters from the table below to complete your message. Pressing the bottom left programmable key will change the letter from upper case to lower case.

When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0
DIAL 1	Space	?	,	!	1
DIAL 2	A	B	C	@	2
DIAL 3	D	E	F	#	3
DIAL 4	G	H	I	\$	4
DIAL 5	J	K	L	%	5

STATION SPEED DIAL

DESCRIPTION

Allows the system administrator or technician to program the personal speed dial locations assigned to a station. This must be done for single line telephones because these stations cannot access programming. Each station may have up to 50 locations or bins assigned to it in MMC 606 Assign Speed Block. The speed dial bins are numbered 00 ~49. Each speed dial number consists of a trunk or trunk group access code followed by a separator and up to 24 digits to be dialed. These dialed digits may consist of 0 ~9, * and #. If the system recognizes a valid trunk or trunk group access number, it will automatically insert the separator.

PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPK	Used to store data and advance to next MMC
HOLD	Used to clear previous entry
B	Used to insert a flash code "F"
C	Used to insert a pause code "P"
D	Used to insert a pulse/tone conversion code "C"
E	Used to mask/unmask following digits (shows as "[" or "]")
F	Used to enter name for speed dial bin (see MMC 106)

ACTION

1. Press TRSF 105
Display shows
2. Dial station number (e.g. 205)
OR
Press UP or DOWN to select station and press RIGHT soft key to move cursor
If selected station has no speed dial bins, the display will be as shown and a new station may be selected.
3. Dial location number (e.g., 05)
OR
Press UP or DOWN to select location and press RIGHT soft key to move cursor
4. Enter trunk access code (e.g., 9) followed by the number to be dialed (e.g., 4264100)
OR
Press the RIGHT soft key to return to step 2
OR
Press the LEFT soft key to return to step 3
Press HOLD button to clear an entry

MMC:106

STATION SPEED DIAL NAME

DESCRIPTION

Allows an 11-character name to be entered for each personal speed dial location. This name enables the speed dial number to be located when the directory dial feature is used. The directory dial feature allows the display keyset user to select a speed dial location by viewing its name.

Names are written using the keypad. Each key press selects a character. Pressing the dial pad key moves the cursor to the next position. For example, if the directory name is "SAM SMITH," press the number "7" four times to get the letter "S." Now press the number "2" once to get the letter "A." Continue selecting characters from the table below to complete your message. Pressing the bottom left programmable key will change the letter from upper case to lower case.

 **NOTE**

When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0

MMC:107**KEY EXTENDER*****DESCRIPTION***

Use this program to view the programmable keys assigned to keyset station. In addition, it allows the system administrator to assign key extenders to some keys that will make a general access feature key more specific. The feature keys that can have extenders are listed below.

FEATURE	EXTENDER
AB	Absence (extension number)
ACC	Account code bin (000–999) – Available in iDCS 500-L only
BOSS	Boss and Secretary (1–4)
CR	VM Call Record
CS	UCD Call Status (UCD group number)
DIR	Directory dial by name type (1–3)
DP	Direct Pickup (extension or station group number)
DS	Direct Station Select (station number)
FWRD	Call Forward (0–7)
GPIK	Group Pickup (01–20:M version, 01–99:L version)
IG	IN/Out of Group (station group number)
MMPG	Meet Me Page (0–9, *)
MW	Message Waiting (station group number) – Available in iDCS 500-L only
PAGE	Page (0–9, *)
PARK	Park Orbits (0–9)
RP	Ring Plan (1–6)
RSV	Room Status View (1–5) – Available in Hotel/Motel enabled only
SG	Station Group (500–549)
SP	UCD Supervisor (UCD group number)
SPD	Speed Dial (00–49, 500–999)
VM	VM Memo (extension or station group number)
VG	SVM-800 Group Message (station group number)
VT	Voice Transfer (VM Station Group Number)
PMSG	Programmed Station Text Messaging (01–20)

MMC:110**STATION ON/OFF*****DESCRIPTION***

Allows the system administrator to set any of the keyset features listed below.

00 AUTO HOLD	Automatically places an existing C.O. call on hold if a CALL button, trunk key or trunk route key is pressed during that call.
01 AUTO TIMER	Automatically starts the stopwatch timer during a C.O. call.
02 HEADSET USE	When ON, this feature disables the hookswitch allowing a headset user to answer all calls by pressing the ANS/RLS button.
03 HOT KEYPAD	When ON, this feature allows the user to dial directory numbers without having to first lift the handset or press the SPK button.
04 KEY TONE	Allows the user to hear a slight tone when pressing buttons on keyset.
05 PAGE REJOIN	Allows the user to hear the latter part of page announcements if keyset becomes free during a page.
06 RING PREF.	When OFF, requires the user to press the fast flashing button to answer a ringing call after lifting the handset.
07 CALL COST	When ON, the cost of the call in progress will show in the upper right corner of the keyset display instead of duration of the call.
08 AUTO CAMPON	When ON, keyset users can allow intercom calls to camp-on to other keysets without having to press a CAMP-ON key. - Available in iDCS 500-L only
09 AME BGM	This feature selects whether a station using Answer Machine Emulation will hear their personal greeting or BGM while callers are listening to the personal greeting. A BGM source must be selected for this to work.
10 AME PASSCODE	When ON, station users who have AME set must enter their station password to listen to messages being left.
11 DISP SPDNAME	When ON, the speed dial name associated with a speed dial number is displayed on a keyset equipped a LCD display when using speed dial. - Available in iDCS 500-L only.
12 CID REVW ALL	When ON, saves information on all calls that ring at an extension, When OFF, saves information only on calls that were not answered at the extension or by voice mail. - Available in iDCS 500-L only.
13 SECURE OHVA	When ON, OHVA announcements will be heard on the handset. When OFF, OHVA announcements will be heard over the keyset speaker. - Available in iDCS 500-L only.
14 NOT CONT.CID	When OFF, the Caller ID will be continue display after the keyset user answered call.

ALARM REMINDER

DESCRIPTION

Allows the system administrator or technician to set or change the alarm clock/appointment reminder feature for any station. This must be done for single line telephones, as they cannot access programming. Three alarms may be set for each station and each alarm may be defined as a one-time or TODAY alarm or as a DAILY alarm, as described below. The TODAY alarm is automatically cancelled after it rings, while the DAILY alarm rings every day at the same time. Alarm numbers are 1, 2 and 3. In the case of Secondary Pair assignments (MMC 220) the alarm only rings the station that is programmed and does not ring the paired station.

Entry	Alarm Type
Dial 0	NOTSET
Dial 1	TODAY
Dial 2	DAILY

VIEW MEMO NUMBER

DESCRIPTION

Allows a station user the ability to view a memo left by the user. A memo can be left by entering it via the dial keypad using the table below. MMC 116(Alarm and Message) can be programmed to remind the user to read the memo. A memo of up to and including 13 characters can be entered. For example, using the dial keypad, press "6" once to enter the letter "M", and press "3" twice for an "E". Pressing the "A" key will change the letters from upper case to lower case.

When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

ALARM AND MESSAGE

DESCRIPTION

Allows the system administrator or technician to set or change the alarm clock/appointment reminder feature for any station. This must be done for single line telephones because they cannot access programming. Three alarms may be set for each station and each alarm may be defined as a one-time or TODAY alarm or as a DAILY alarm, as described below. The TODAY alarm is automatically cancelled after it rings, while the DAILY alarm rings every day at the same time. It is also possible to set a message to display when the alarm is sounded.

ENTRY	ALARM TYPE
DIAL 0	NOTSET
DIAL 1	TODAY
DIAL 2	DAILY

Names are written using the keypad. Each key press selects a character. Pressing the dial pad key moves the cursor to the next position. For example, if the directory name is "SAM SMITH," press the number "7" four times to get the letter "S." Now press the number "2" once to get the letter "A." Continue selecting characters from the table below to complete your message. Pressing the bottom left programmable key will change the letter from upper case to lower case.

When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0
DIAL 1	Space	?	,	!	1
DIAL 2	A	B	C	@	2

ASSIGN VM/AA PORT

DESCRIPTION

Enables SLI ports to be designated as NORMAL or VMAA. VMAA ports receive digits designated in MMC 726 VM/AA Options and also receive a true disconnect signal upon completion of a call. Only SLI cards, not key daughter boards, support disconnect signal. Do not make VMAA ports data; this will return them to a single line port and stop voice mail integration. VMAA ports have the equivalent of data protect written in the program and are protected against tones.

 **NOTE**

This MMC is not used to assign voice mail card ports. Voice mail card ports are assigned as voice mail ports automatically when the iDCS 500 detects a CADENCE card.

PROGRAM KEYS

ASSIGN RING TYPE

DESCRIPTION

Provides the flexibility to program single lines to have ICM ringing, C.O. ringing and data secure. With the many types of external ringing devices, all configurations can be met. All devices will also have a positive disconnect signal. Do not make VM/AA ports data; this will return them to a single line port and stop voice mail integration.

CUSTOMER ON/OFF PER TENANT

DESCRIPTION

Allows the system administrator to set in system features on a per-tenant basis. Each system option has a corresponding dialing number, as listed below. All options toggle ON/OFF.

OPTIONS	DESCRIPTION
00 DISA PAWD	When ON, a caller must enter extension number and DISA password when they call a DISA trunk. When OFF, extension number and DISA password are not required and the caller has full access to all features allowed on this trunk.
01 LCR ENABLE	This option determines whether the system will or will not route outgoing calls based on the information in the LCR routing tables
03 PERI UCD RPT	Periodic UCD Information provider. Enables UCD Statistics data on a per UCD group basis to print out on the IO port which has been set as PERI UCD in real time (every 3~99 seconds). This allows the information to be interfaced and manipulated by an external package or third party provided software.
04 CID CODE INS	When ON, the system will insert the country code when receiving CID information. This feature can use the CID display call back feature.
05 DISA MOH	When ON, outside parties will hear trunk MOH instead of dial tone from the time the system answers a DISA trunk until the caller dials a digit.
06 TRANSFER MOH	When ON, outside parties will hear trunk MOH instead of ring back tone from the time a transfer is completed until the call is answered by an internal party.
07 DSP SSPDNAME	When ON, the system speed dial name associated with a system speed dial number is displayed on a keyset equipped with an LCD display when using system speed dial. - In case of iDCS 500-L, this option is not available use MMC110. DSP SPD NAME
08 DID BSY ROUT	When ON, a DID call directed to a busy station will re-route to the operator if camp on is set to OFF in MMC 714. If the camp on option is set to ON the call will re route to the destination in MMC 406 for that trunk.
12 CONF TONE	When ON, provides conference tone every conference tone time. - Available in Italy only
13 RECALL PIKUP	When ON, a call recalling to a station can be picked up using Direct Call Pickup, Pickup Group and My Group features. This applies to held calls recalling and transferred calls recalling to a station.
14 ICM EXT FWD	When ON, call forward external is allowed when intercom calls are placed to a station that has Call Forward External programmed and set.
15 SEC 2 BOS AA	This option can stop calls from the secretary to the boss from being auto answered by the boss station. The default setting is ON allowing auto answer when a secretary calls a boss via an assigned boss key.
16 DID ERR TONE	This option was added to provide error tone when an invalid DID number is received.
18 KTS DISC ALM	When ON, generates system alarm when a keyset plug out or in.
19 OFF HOOK ALM	When ON, generates system alarm when a phone maintains off hook condition longer than timer.

20	SL SELF RING	When ON, generates ring during 10 seconds when a single line phone dials self number and hang up.
21	SGR INC BUSY	When ON, generates busy tone when all station group member busy for group call.
24	TRSF CANCEL	When OFF, a single line phone will be able to handle 2 calls simultaneously. Using the hook-flash to toggle between them. When ON, a single line telephone will be able to connect to the second call, but pressing the hook flash will not toggle between the two calls it will disconnect the second call and reconnect the single line telephone to the first call.
26	RECALL DISC	When ON, the system disconnects a call when transfer recall.
29	ARD TONE CHK	When OFF, the system use time for checking destination is busy when auto retry.
30	VPN ENABLE	When ON, the Australia type VPN enabled.
31	IN TOLL CHK	When OFF, the system doesn't toll restrict when incoming call.
32	ISDN PROGCON	When OFF, the system ignores ISDN progress message.
33	INCLUDE VAT	When OFF, not printed VAT total line when Hotel Report. - Available in Hotel/Motel enabled only
34	LCR DIALTONE	When ON, generates different dial tone when LCR dial mode.
36	DSS KEY DPU	When ON, directed pick-up the call when press ringing DS key.
37	BEGN DGT DSP	When ON, an outside call is made via speed dial or LNR where more than 11 digits are dialed then only the first set of digits dialed are shown on the keyset display. - Available in iDCS 500-L only
38	ONE TCH FACC	When OFF, the forced account mode user can not use one touch account code (ACC) key. - Available in iDCS 500-L only
39	SGR ALL OUT	When ON, the last of station group member can out of group.
40	CHAIN FWD	When ON, a call is directed to a station that may be forwarded to another station that is call forwarded to a VMAA, then the caller will be directed to the last station's mailbox it reached. When OFF, the caller will be directed to the first station's mailbox instead of the last.- Available in iDCS 500-L only
41	TRK MONITER	When ON, can override to trunk and a call is connected override extension when a original caller hang on. When OFF, can override to extension only and a call is disconnected when a original caller hang on.
42	VOIP MFRALOC	When ON, a MFR assigned for VoIP tandem call when a call incoming from VoIP trunk to another trunk outgoing.
43	NTWK AUTOTMR	When OFF, a call duration timer disabled via networking intercom call. - Available in Networking enabled only
44	USE EURO	When ON, a euro currency unit of 'E' will be shown to keyset when call cost is displayed and shown to SMDR.

TRAFFIC REPORT PRINTOUT

- Available in with LAN module only

DESCRIPTION

This MMC is used to print a traffic report and select options. The traffic report can be printed upon demand, every hour, at a programmed time of each day, or up to three separate timed shifts. Automatic printing will always clear the totals.

When report MANUAL PRINT OUT is selected, the options are:

PRINT AND CLEAR	A report is printed and all totals are reset to 0.
PRINTOUT ONLY	A report is printed and all the totals are saved.
CANCEL PRINTOUT	The program return to previous menu if no report is ended.

When AUTO PRINT OPTN is selected, the options are:

AUTO PRINT OFF	Automatic print feature is disabled.
DAILY	A report is printed at a programmable time every day and all the totals are reset to "0."
EVERY HOUR	A Traffic report will be printed every hour
TIME SHIFTS	Up to three separate Start and End times may be programmed to report traffic within certain times of a day. A report is printed at the end of each End time and all totals are reset to "0."

When a report is printed, the totals represent call statistics accumulated from the date of the last report stated as BEGINNING: D & T up to the date of this printout stated as ENDING D & T. See the sample report at the end of this MMC.

If there are no trunks in a group, the trunk group report for that group will not print.

PROGRAM KEYS

This MMC programming sequence is designed to be used by the end user and does not require the usual programming key strokes.

EXTENSION TYPE

- Available in Hotel/Motel enabled only

DESCRIPTION

This MMC enables station ports to be defined for a specific use. Each telephone can be designated as being one of the five (5) following types. These types can be changed by dialing the type number or by scrolling through the types and pressing the right soft key to select the type desired.

NORMAL STATION	This is the default setting. The station will operate in the normal manner associated with this type of station. Ports designated as VMAA in MMC 207 must be designated as normal in this MMC.
GUEST SMOKING	When a station is designated as this type it will appear in room status and check in features as a smoking room.
GUEST NO SMOKING	When a station is designated as this type it will appear in room status and check in features as a non smoking room.
MEETING ROOM	Stations designated as Meeting room stations will have the same attributes as guest rooms with regard to cleaning and occupied status but will not show up while scrolling through room status lists.
ADMINISTRATOR	Only stations designated as administrator stations can use the hotel motel features such as check in etc.

WAKE-UP ANNOUNCEMENT

- Available in IDC5 500-L or Hotel/Motel enabled

DESCRIPTION

This MMC is a new feature designed to enhance Wake Up feature. The system will play a recorded message when a Wake Up call is answered by the user. The Wake Up Announcement feature will require an Automated Attendant (AA) card be installed in the system. When a Wake Up call is answered, the system will access the customized Wake Up message (1-48) that has been recorded in the AA card. The end user will record this message and have the ability to change it when desired Auto Attendant operation. The Wake Up message will have no default ROM message assigned to it. However a ROM message (49-64) may also be assigned as the Wake Up message if desired.

This MMC has three options.

AA GROUP	Determines which AA group will be connected when a Wake Up call is answered. This destination can be a any AA groups.
MESSAGE NO	Determines which message will be played when a Wake Up call is answered. This destination can be a custom recorded message (1-48) or one of the pre-programmed messages (49-64).
GROUP BUSY	Determines which tone source will be connected when a AA group members are all busy. This destination can be a NONE, TONE or extern music on hold. If NONE set then dial tone connected, if TONE set then hold tone connected.

MMC:300**CUSTOMER ON/OFF PER STATION*****DESCRIPTION***

Allows the following features to be enabled on a per-station basis.

00 ACCESS DIAL	Determines whether a user can select a trunk or trunk group by dialling its directory number (DN). This selection should be turned to off when using LCR.
01 MICROPHONE	Allows all 12 and 24 button keysets to be used in the speakerphone mode.
02 OFF-HOOK RING	Will allow a short burst of ring tone to indicate another call.
03 SMDR PRINT	When the station is set for no C.O. calls to and from this station, the station will not print on SMDR. This includes transferred calls or calls picked up from hold or park.
04 TGR ADV.TONE	When this feature is set to ON, a warning tone will be heard each time LCR advances to the next route.
05 VMAA FORWARD	This feature selects whether C.O. calls can be forwarded to voice mail. ON = Permits forward to voice mail. OFF = No forward to voice mail.
08 INTRCOM SMDR	When the station is set to OFF, the station will not print intercom calls on SMDR.
09 FWD DLY USE	When the station is set to ON, if the station has no answer forward number without no answer forward set then a call both ringing original extension and no answer forward number when a incoming call is directed to the station and the station does not answer until no answer forward time.

ASSIGN FORCED CODE

DESCRIPTION

This MMC allows only one of the four options to be selected; the assignment of account code with verification, account code without verification, authorization codes, or none on a per-station basis or on an all-station basis. The system supports 500 authorization codes for a iDCS 500-L system and 250 for others system. It has 999 account codes for a iDCS 500-L system and 500 for a others system that are verified when account codes verified is selected. If account codes without verification is selected, then there will be no table used.

- | | |
|---------------------------|---|
| 0 NONE | No Account or Authorization code required (NOT forced strictly voluntary). |
| 1 AUTHORIZE | Forces user to enter a valid over four digit Authorization code listed in AUTHORIZATION CODE. Table (MMC 707). |
| 2 ACCT VERIFIED | Forces user to enter a valid account code listed in ACCOUNT CODE Table (MMC 708). |
| 3 ACCT NO VERIFIED | Forces user to enter an account code but this code is NOT verified. User can make up any code (any account code up to 12 digits including #). |

ASSIGN BACKGROUND MUSIC SOURCE

DESCRIPTION

Assigns a background music source to the keysets. There are 6 possible music selections depending on the number of MISC (daughter) boards that are installed in the system.

You may also select an Auto Attendant (AA) port to provide continuous play of a specific recording. The AA port selected must be the last port on the card. If selected, the BGM source will be the message defined in MMC736 from the port defined in this MMC.

For example, if this MMC selects 201's music source as 3966 (the last port on the second AA card) and MMC 736 selects Message 20 for the second AA card, when extension 201 is placed on hold, 201 will hear message 20 from the second installed AA card.

If you have a CADENCE Voice Mail System installed you may also select a CADENCE recording as a music. The recording must already been defined in MMC 756 and will show up here as the CADENCE port assigned with the recording.

CUSTOMER SET RELOCATION

DESCRIPTION

Customer Set Relocation allows System Administration level or Technician level access to relocate or exchange similar stations in the iDCS 500 without wiring changes (see Allow Table below). This program is a one for one exchange with like stations. ie. Single line to single line, 6 button keyset to 6 button keyset, etc. All individual station assignments such as trunk ring, station group, station COS, station speed dial, button appearances, etc. will follow the Customer Set Relocation program. 12 button keysets and 24 button keysets can be exchanged. 48 button modules and 64 button modules can also be exchanged. Single line stations numbers can be exchanged. If incompatible set types are selected the iDCS system will provide an ERROR: NO MATCH message. If 48 or 64 button module units are to be exchanged the Master assignment must be removed prior to using Customer Set relocation. If the 48 or 64 button module Master station is not removed the error code ERROR: NOT ALONE will appear on the LCD display. A station must be in the idle state (on hook) to perform Customer Set Relocation. If a wired location has a station port connected but no telephone instrument the Customer Set Relocation program will allow set relocation as long as the station types are similar.

12 button and 24 button key assignments should be taken in consideration when relocating these types of sets due to the button configurations of the instruments. If a 12 button set and a 24 button set are exchanged using the Customer Set Relocation program the first twelve buttons on the 24 button set will have the button programming of the 12 button set. The 12 button set will then have the programming of the first twelve buttons of the 24 button set. In other words, when exchanging 12 and 24 button set only the first twelve buttons will swapped.

**NOTE**

Customer access to this feature is default OFF in MMC 802.

DISTINCTIVE RINGING

DESCRIPTION

Allows the technician to select the ring tone heard at a keyset when called by a specific station or when a specific trunk rings that keyset. There is also a cadence control option to perform a similar function for single line sets. There are eight ring tones available along with a Follow Station (F-STN) option for the keysets. There are 5 cadences and a follow station option for SLT's.

TONE OPTIONDESCRIPTION

F-STN	Calls will ring with the keyset users choice of ring frequency.
1 ~ 8	Calls from the programmed station or trunk will ring keysets with this ring frequency.

CADENCE OPTIONDESCRIPTION

F-STN	Calls will ring with the normal SLT ring cadences.
1	Calls from the programmed station or trunk will ring SLT's with the intercom ring cadence.
2	Calls from the programmed station or trunk will ring SLT's with the CO ring cadence.
3	Calls from the programmed station or trunk will ring SLT's with the DOOR ring cadence.
4	Calls from the programmed station or trunk will ring SLT's with the ALARM ring cadence.
5	Calls from the programmed station or trunk will ring SLT's with the CALLBACK ring cadence.

PRESET FWD NO ANSWER

DESCRIPTION

Allows a technician to assign a default destination for FNA to each station on the system. These destinations may be different for each station or they may be the same. The preset FNA destination will be temporarily overwritten if the station user enters a different FNA destination. If the user cancels the new destination, the preset destination will once more be in effect. Preset Forward No Answer time follows the station no answer forward timer.

CALLING PARTY NUMBER

DESCRIPTION

Allows a maximum 16 digits number to be entered and associated with a station number on a per PRI/BRI basis. When this station makes an outgoing call on this PRI, the maximum 16 digits number entered will be the Calling Party Number sent on this outgoing PRI call. There are 4 tables for a iDCS 500-L system and 2 for others system.

In case of empty, system used MMC 405: CO TRUNK NUMBER for the Calling Party Number.

PROGRAM KEYS

TRUNK NAME

DESCRIPTION:

Allows an 11-character name to be entered to identify an individual trunk.

Names are written using the keypad. Each key press selects a character. Pressing the dial pad key moves the cursor to the next position. For example, if the directory name is "SAM SMITH," press the number "7" four times to get the letter "S." Now press the number "2" once to get the letter "A." Continue selecting characters from the table below to complete your message. Pressing "A" button will change the letter from upper case to lower case.

When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0
DIAL 1	Space	?	,	!	1
DIAL 2	A	B	C	@	2
DIAL 3	D	E	F	#	3
DIAL 4	G	H	I	\$	4
DIAL 5	J	K	L	%	5
DIAL 6	M	N	O	^	6
DIAL 7	P	Q	R	S	7
DIAL 8	T	U	V	*	8
DIAL 9	W	X	Y	Z	9
DIAL *	:	=	[]	*

The # key can be used for the following special characters: #, space, &, !, :, ?, ., ,, %, \$, -, <, >, /, =, [,], @, ^, (,), _, +, {, }, |, ;, ", →, ` , and \.

TRUNK NUMBER

DESCRIPTION:

Allows an 11-digit number to be entered to identify an individual trunk.

Numbers are written using the keypad. Each press of a key selects a digit. Pressing the desired key moves the cursor to the next position. For example, if the directory number is 426-4100, press the number 4 once to get the number 4. Now press the number 2 once for number 2. Continue selecting characters from the table below to complete your number.

When the number you want appears on the same dial pad key as the previous number, press the UP key to move the cursor to the right or the DOWN key to move the cursor left. A space can be entered by using these keys.

COUNT	1	2	3	4	5
DIAL 0	0	<	>	.)
DIAL 1	1	Space	?	,	!
DIAL 2	2	A	B	C	@
DIAL 3	3	D	E	F	#
DIAL 4	4	G	H	I	\$
DIAL 5	5	J	K	L	%
DIAL 6	6	M	N	O	^
DIAL 7	7	P	Q	R	S
DIAL 8	8	T	U	V	*
DIAL 9	9	W	X	Y	Z
DIAL *	*	:	=	[]

The # key can be used for special characters: #, space, &, !, :, ?, ., %, \$, -, , , /, =, [,], @, ^, (,), _, +, {, }, |, ;, \, " and ~.

ASSIGN TRUNK MOH SOURCE

DESCRIPTION

Allows the system administrator to select which Music on Hold (MOH) source can be heard on each trunk. For the five types of selections, see below.

OPTIONS

TONE:

An intermittent tone is played to the caller.

NONE:

No Music on Hold selection.

37X:

If internal MOH port number, a chime tune is played. If another MOH port number, an external source from a MISC (daughter) board is played.

39XX (when AA is used):

The MOH source is provided by the AA card. See MMC 736.

CADENCE / SVMi PORT NUMBER:

If you have a CADENCE Voice Mail System installed you may also select a CADENCE / SVMi recording as a music source. The recording must already been defined in MMC 756 and will show up here as the CADENCE port associated with the recording.

ASSIGN DISA TRUNK

DESCRIPTION

Allows the system the ability to have Direct Inward System Access (DISA). Because there is a possibility that unauthorized calls will be made via this feature, several safeguards have been added. The end user must be informed of these to prevent unnecessary service calls. DISA can lockout when a predetermined number of invalid consecutive calls are attempted. Callers will then receive error tone until the programmable timer has expired. The * key may be used to initiate new dial tone while in a station to station call. The # key may be used to terminate the DISA call and disconnect the central office line. DISA lines must be assigned to the Ring Plan(s).

ASSIGN TRUNK SIGNAL

DESCRIPTION

Allows for the assignment of analog DID or E&M cards for proper signalling. This MMC is only for analog types of DID/E&M trunks. These trunks can also use the translation tables in MMC 714. The signalling condition types are as follows:

IMMEDIATE
 DELAYED
 WINK

PRS SIGNAL

DESCRIPTION

Used on a per-trunk basis to define if a C.O. line is to be either a Metering Pulse (MPD) or a Polarity Reversal Signal (PRS) trunk.

A Meter Pulse Trunk will detect a C.O provided meter pulse. A Polarity Reversal trunk will detect the line reversal signal which may be provided by the C.O. When the other party answers the outgoing call or the outside party clears the call. If the trunk is designated as PRS detection, the call duration timer will be started and the results printed on the SMDR record. PRS detection is also essential for dropping a trunk-to- trunk conversation which is unsupervised by an internal party.

There are three types of PRS mode: PRS 1, PRS 2 and PRS 3.

- PRS 1** When first PRS is detected, call duration is started. When second PRS is detected, call duration timer stopped. The call is not released until hanging-on.
- PRS 2** When first PRS is detected, call duration timer is started. When second PRS is detected, call duration timer is stopped and call is released.
- PRS 3** The call duration timer starts based on the timer. When first PRS is detected, call duration timer is stopped and call is released.

REPORT TRUNK ABANDON DATA

DESCRIPTION

Allows the system administrator or technician to enable or disable the reporting of abandoned C.O. calls for which CLIP information has been collected on a per-trunk basis. There are two options for this MMC as follows:

- 0 REPORT: NO** Abandoned call records for incoming calls with CID information will not be printed on SMDR or stored in the system call abandon list. These records will continue to be stored in the station review list.
- 1 REPORT: YES** Abandoned call records for incoming calls with CID information will be printed on SMDR and stored in the system call abandon list. These records will also be stored in the station review list.

In order for these abandoned call records to print on SMDR, MMC 725 SMDR OPTIONS Option 11 Print Abandoned Call Records must be set to YES.

ASSIGN E&M/DID RINGDOWN

DESCRIPTION

This MMC defines which ring destination table an E&M or DID trunk will follow for incoming calls. There are three options for each trunk as defined below.

0. FOLLOW INCOM DGTWhen a trunk is set to this option calls will ring at the destination that matches the digits received from the CO. This is the same as the previous UNUSE DID TRANS option.
1. FOLLOW DID TRANS When a trunk is set to this option calls will ring at the destination defined in MMC 714 that matches the digits received from the CO. This is the same as the previous USE DID TRANS option
2. FOLLOW TRK RING If this option is selected, press the right soft key and “NO. RCV DIGIT:” will appear on the display. Here is where the number of incoming digits from C.O. must be entered (0 through 4). When a trunk is set to this option calls will ring at the destination defined in MMC 406 for that trunk. If the destination defined in MMC 406 is a VMAA port or group then the system will repeat the digits received from the CO to the port when it answers.

MMC:421

MSN DIGIT

DESCRIPTION

Provides a method of assigning an incoming MSN call to a specific station. If any entry in MSN DIGIT TABLE matches an incoming call's called party number, either the specific station is alerted, if it is programmed to accept the call, or the call is cleared if it is programmed to reject the call.

If the incoming called party number does not have a matching entry in the MSN table, MMC 406 ringing destination is alerted or the call is released by option.

You can give each MSN number to a specific station and you can select call waiting option: when a destination is busy, the incoming call must be cleared or camped-on to the station (which is alerted to the call).

There is a total of eight entries on a trunk basis and each entry consists of the following fields:

DIGIT	DIGIT Digits to be received. There is a maximum of 12 digits
1-6	These numbers correspond to the six ring plan destinations for this MSN. The destinations can be either stations or station groups.
CALL WAIT	Toggles YES or NO: if YES then the call will be camped-on at busy destination while NO gives busy indication.
OPTION	Accept: The selected destination party will be alerted. Reject: The call will be cleared.

For each BRI access, two adjacent ports are assigned. You need only change the value for one of the two ports; the value for the other port will be changed automatically

ASSIGN CALLER ID TRUNKS

DESCRIPTION

Allows the system administrator or technician to activate analog loop trunk Caller ID on a per-trunk basis. Activating Caller ID will delay the incoming ring indication at the operator by two ring cycles to allow for the collection of the calling party data.

Each trunk has the following options:

- | | | |
|---|-----------|--------------------------------|
| 0 | NORMAL | This is not a Caller ID trunk. |
| 1 | CID TRUNK | This is a Caller ID trunk. |

iDCS 500 support Bellcore type data only for Caller ID, others type will not supports. - Available in Australia and Israel only.

MMC:426

TRUNK GAIN CONTROL

DESCRIPTION

Allows loss levels to be adjusted on a per trunk basis. There are two adjustments available in this MMC. "TX" is the transmit level adjustment of the trunk to the station. "RX" is the receive level adjustment of the station to the trunk. See the Trunk Gain Setting Tables for level option definitions.

MMC:433

COST RATE

DESCRIPTION

In this MMC, the TRUNK COST RATE flags are entered for each trunk. DIAL PLANs are defined in MMC 746 Costing Dial Plan. RATE CALCULATION TABLES are defined in MMC 747. Each trunk may be defined with up to eight cost rates. Enter one or more of the eight COST RATES per trunk. If an entry is left blank, no call costing will be calculated for that particular DIAL PLAN.

Call type 8 is fixed for incoming. Apply a cost rate under type 8 only to a trunk if you want incoming call costing.

MMC:434

CONNECTION STATUS

DESCRIPTION

This read only MMC will confirm the connection status of stations or trunks. Display status actually displays the status of a station or trunk at the time requested. If a conference is in progress with the selected trunk or station the display will show one of the conference parties and an arrow (•). The technician or system administrator can then display the next parties in the conference. If a station or trunk is in an idle state the display will show "IDLE". If the station or trunk selected is not a valid selection the display will show "INVALID DATA". If the station or trunk is made busy by the CPU the display will show "MADE BUSY". If the station is in busy state with no other connection, the display will show "BUSY" only.

PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPK	Used to advance to next MMC

MMC:500**SYSTEM-WIDE COUNTERS*****DESCRIPTION***

Used to set the values of the system counters. The counters are listed below with a brief description of each.

- | | | |
|----------|---------------------------|--|
| 0 | ALARM REM. COUNTER | The number of times that an alarm reminder will ring a station before cancelling. RANGE = 1-99. |
| 1 | AUTO RDL COUNTER | The number of times the system will redial an outside number after the auto redial feature has been activated. RANGE = 1-99. |
| 2 | DISA CALL COUNTER | Sets the maximum number of intercom calls that can be made after accessing a DISA line. RANGE = 1-99. |
| 3 | DISA LOCK COUNTER | Number of attempts the system will allow to incorrectly access a DISA line before locking out the DISA line. RANGE = 1-99. |
| 4 | NEW CALL COUNTER | Number of times the system will allow a user to signal New Call on a C.O. line during one call. RANGE = 1-99. |
| 5 | UCDS VISUAL ALARM | Used to set the Visual alarm threshold. It is triggered when the number of calls waiting to be answered in the UCD group reaches this value. RANGE = 0-25. |
| 6 | UCDS AUDIO ALARM | Used to set the Audio alarm threshold. It is triggered when the number of calls waiting to be answered in the UCD group reaches this value. RANGE = 0-25. |
| 7 | UCD CS LEVEL 1 | Provides call wait indication level 1 if number of calls waiting to be answered in UCD group reaches this value. RANGE = 0-25. |
| 8 | UCD CS LEVEL 2 | Provides call wait indication level 2 if number of calls waiting to be answered in UCD group reaches this value. RANGE = 0-25. |

TIMER DESCRIPTIONS

AA INT DGT TIME	When the AA card is installed, this timer determines the inter digit time for AA call processing. If this timer expires before valid digits are received by the AA card, the call will be routed to the AA invalid digits destination.
AA NO ACT TIME	When the AA card is installed, this timer determines the time that the AA card will wait for a first digit for AA call processing. If this timer expires before a digit is received, the call will be routed to the AA no action destination.
AA TRANS TIME	After this timer, the system will compare received digits from AA card with the AA translation table entry and transfer to the proper destination.
ALARM TIME	This is the time the system alarm key will start ringing after the alarm key has been silenced.
ALERT TONE TIME	This timer sets the duration of the attention tone preceding a call to a keyset in the Voice Announce or Auto Answer mode. This tone will also precede a forced Auto Answer call.
ALM REM.INTERVAL	This timer controls the time length between ring attempts at a station when alarm reminder is set.
ALM REM RING OFF	This timer controls the length of the ring cycle duration when alarm reminder is set at a station.
ATT RECALL TIME	This is the length of time a transfer recall will ring at a station before recalling the operator.
AUTO REDIAL INT	This timer controls the time between attempts after RETRY dialing is set on a station.
AUTO REDIAL RLS	This timer controls the duration of a Ring No Answer condition on a retry number dialed before the auto redial is automatically canceled.
CALLBACK NO ANS	This timer controls the time before the callback is automatically canceled when a callback detects Ring No Answer.
CAMP ON RECALL	This timer controls the duration of time a camped on call will stay at a destination before recalling to the transferring station.
CID DISPLAY TIME	The amount of time that the Caller ID information remains on the keyset's display.
CID MSG RECEIVE	The amount of time that the system will allow a valid message from the C.O.
CO CONFIRM TIME	According to MMC 314 CO CONFIRM type, the outgoing call will be disconnected after this timer or the outgoing caller will hear the confirm tone every this time.
C.O. C.O. DISCONNECT	This timer monitors the duration of an unsupervised conference; when it expires, both trunks are disconnected.
CONFIRM TONE TM	The tone heard when a feature is activated or deactivated.
CRD TONE INT TM	This timer controls the timing of intervals between the tone which indicates the call is recorded by Voice Mail Card.
DIAL PASS TIME	This timer monitors the duration of time before connecting the transmit of the keyset to the trunk side of an outgoing call.
DISA DISCONNECT	This timer controls the maximum duration of a DISA call.
DISA LOCK OUT TM	This timer controls the duration of time a DISA call is not allowed to be made after the DISA error counter has expired (MMC 500).

DISA NOANS DISC.	This timer controls the duration of time a DISA call is disconnected by force when called party does not answer.
DISA PASS CHECK	This timer defines the time period before the system clears the incorrect passcode counter.
DISPLAY DELAY TM	This timer controls the duration a display is shown in the LCD display. This timer also controls the duration of time that error tone is heard.
DOOR LOCK RELES.	This timer controls the duration of time the door lock relay will be activated.
DOOR RING DETECT	This timer controls the duration of time before a call is answered by the door phone.
DOOR RING OFF TM	This timer controls the duration of ringing at the door ring destination before automatically canceling.
E HOLD RECALL TM	This timer controls the duration of time a call is held exclusively at a station before recalling.
FIRST DIGIT TIME	This timer controls how long the system will wait for dialing to begin before dropping the dial tone and returning the user to error tone.
HOK FLASH MAX TM	This timer monitors the duration of a hookswitch flash to ensure that the flash is valid and not a line noise or an accidental hookswitch bounce (LONGEST DURATION).
HOK FLASH MIN TM	This timer monitors the duration of a hookswitch flash to ensure that the flash is valid and not a line noise or an accidental hookswitch bounce (SHORTEST DURATION).
HOOK OFF TIME	This timer controls the time before dial tone is sent to a single line station.
HOOK ON TIME	This timer sets the minimum amount of time that the system will recognize as an SLT hang up.
INQUIRY RELEASE	This timer monitors the duration of the interaction of the soft key to determine when to return the LCD back to a normal status. This timer affects only display phones.
INTER DIGIT TIME	This timer controls the grace period between dialing valid digits before dropping the call and returning the user back to error tone.
ISDN INT DGT TM	This timer controls the grace period between dialing valid digits and the end of the dialing string on an ISDN call.
KMMC LOCK OUT TM	This timer controls the grace period between programming actions while in a programming session. The timer automatically returns the system to secure programming status.
LCR ADVANCE TIME	This timer controls the duration of time before selecting the next allowable route when a station is allowed to route advance.
LCR INTER DIGIT	This timer controls the grace period between dialing valid digits before dropping the call and returning the user back to error tone during LCR.
OFF HOOK RING	This timer controls the duration of time between ring bursts to a user who has a camped on call.
OHVA ANSWER TIME	This timer controls the time duration of an OHVA call before automatic rejection.

PAGE TIME OUT	This timer controls the duration of a page announcement.
PAGE TONE TIME	This timer controls the duration of tone burst heard over the page prior to the page announcement.
PARK RECALL TIME	This timer controls the duration of time a call is parked before recalling to the call park originator.
PC MMC LOCK OUT	This timer monitors the PCMMC activity, drops the link if no action is created by PCMMC and returns the system back to secure program status.
PERI UCD REPORT	This timer is the interval that a periodic UCD report is provided to an SIO port.
POWER DOWN TIME	This timer controls the duration of power down when SLT which is assigned to VM/AA port is going to idle status by the call release of opposite party.
RECALL DISCONNECT	This is the time an attendant recall will ring before being disconnected.
RECALL WAIT TIME	This is the time any recall (hold or transfer) continues to recall at your station before it recalls to the operator.
SMDR START /DP	This grace period timer starts SMDR recording for rotary PULSE (ROTARY) dialing. This timer also controls the LCD duration timer on the keysets. The duration time displayed and the SMDR time duration will be the same.
SMDR START /DTMF	This grace period timer starts SMDR recording for touchtone dialing. This timer also controls the LCD duration timer on the keysets. The duration time displayed and the SMDR time duration will be the same.
SYS HOLD RECALL	This timer determines the time calls can be left on hold before recalling back to the holding station. This is a system wide timer. Setting timer to 0 will defeat this feature and no recalling will take place.
TRANSFER RECALL	This timer determines the time transferred calls ring before recalling. This is a system wide timer.
UCDS AUDIO ALARM	When an AA card is installed and the digital UCD package enabled, this counter determines the maximum number of seconds a call has been waiting at the UCD group before the UCD group's SP key begins to flash along with an audio alarm. For more UCD alarm conditions, see MMC 500.
VOICE DIAL DELAY	This timer monitors the duration of interaction between main software and Voice Dialler. If there is no response from Voice Dial card within this time, the system decide the voice dialing is fail.
ROUTE OPTIMISE	When the call is made via Q-SIG signalling, the route optimization is activated after this time.

MMC:502

STATION-WIDE TIMERS

DESCRIPTION

Allows certain station timer values to be changed on a per-station basis or for all stations.

- 0

NO ANS FWD

This timer controls how long the station will ring before Forward on No Answer takes place. (Range: 001- 250 sec.)
- 1

DTMF DUR.

This timer governs the duration of DTMF digits which are transmitted to an external VMS system port. This can be used when a VMS system fails to recognize the default DTMF digit duration being transmitted from the SLT port. (Range: 100-9900 ms)
- 2

F-DGT DELY

This timer will be valuable for the system administrator to insert a suitable delay before generating DTMF digits for In Band integration. (Range: 100-9900 ms)
- 3

OFFHK SEL.

This timer controls the grace period before placing an internal/external call as programmed in MMC 306. (Range: 0-250 sec)
- 4

EFWD DELAY

This timer controls the External Call Forward feature which will allow a station to ring before the call is placed on external call forwarding. (Range: 1-250 sec)

MMC:503**TRUNK-WIDE TIMER*****DESCRIPTION***

Allows certain trunk timer values to be changed on a per-trunk basis or for all trunks. It is not advisable to change these values, with the exception of trunk Flash Time, without assistance from Technical Support.

TIMER	DESCRIPTION
ANS.BAK TM	ANSwer BAcK TiMe. This timer is used for certain types of E&M signaling and does not affect normal CO lines.
CLEARING	This timer ensures that a call is fully disconnected at the CO by preventing CO access outgoing or receiving incoming ring between a disconnect and the expiration of this timer.
CO SUPV TM	CO SUPerVision TiMe this is the minimum length of loop open disconnect received from the CO that will be seen as a valid hang up on the system.
DTMF DUR.	DTMF DURATION This is the length of the DTMF digits that will be sent to the CO on this line.
F-DGT DELY	First DiGiT DELaY This is the length of time the system will wait for CO line conditions to stabilize after seizure before sending DTMF digits.
FLASH TIME	This is the duration of the momentary open sent on a circuit when FLASH key is pressed.
NO RING TM	This is the length of time the system will wait after detecting a ring burst on a line before deciding the call has disconnected.
PAUSE TIME	This is the length of time the system will wait before sending the next digit for a pause in a speed dial bin.
PRS DET TM	This means the duration of PRS signal pulse. If the PRS signal is reversed when opposite party is answered and maintain the status before the opposite party disconnect the call, the PRS DET TM must be set to 0.
RNG DET TM	RiNG DETect TiMe This is the minimum length of ring signal the system will regard as a valid ring.
WINK TIME	This is the duration of the acknowledgement signal that the system will send on an E&M circuit
MF/DP INT	This is the interval between sending digit. In case of DTMF signal, over the 500ms will be serviced as 100 ms.
MFR DLY TM	This is a delay time to allocate the MFR after incoming trunk is detected. This is to prevent the wrong detection of DTMF signal by noise.

TONE CADENCE

DESCRIPTION

Provides the ability to customize the tone cadence on a system-wide basis. The system can provide eleven types of tone and three types of tones provided from Central Office or PBX system can be detected. Please call Technical Support before changing any cadences as some systems may require default settings.

TONE NAME	DESCRIPTION
BUSY TONE	The called station is busy.
CONFM/BARGE	A feature has been successfully activated/cleared or a Barge In with Tone has been performed.
DIAL TONE	The system is ready to interpret key presses/dialed digits.
DND/NO MORE	The called station is in DND or has no free CALL buttons.
ERROR TONE	An error has been made.
HOLD/CAMPON	This is the system generated hold tone.
MSGWAT TONE	This is the dial tone heard at an SLT with a message waiting.
RGBACK TONE	The called station is ringing.
RING TONE	This is the CO ring cadence.
TRSFER TONE	This is the dial tone heard when the transfer key is pressed or an SLT hook flashes.
DID RGBACK	This is the ringback tone heard by the outside party when they dial a DID number.
CO BUSY TONE	This is used to detect the busy tone provided from Central Office or PBX system.
CO RINGBACK	This is used to detect the ringback tone provided from Central Office or PBX system.
CO DIAL	This is used to detect the dial tone provided from Central Office or PBX system.

MMC:507

ASSIGN RING PLAN TIME

DESCRIPTION

Use this MMC to program Ring Plans time settings. Ring Plans provide six separate ringing destinations based on day of the week and time of day. The start time within a plan is the time the system will switch from one ringing destination to the next. The end time is the time the system will switch from that plan to the previous plan. A RPO (Ring Plan Override) key is not needed as the system will switch automatically; however, it is helpful to have a dedicated button so the status can be manually changed if needed. If a ring plan has no time entry the ring plan defaults to ring plan 1. The ring plans correlate with all MMC's that program ring or termination destinations and station and trunk COS.

Use the following example of assigning Ring Plans:

RING LAN	START TIME	END TIME
(MON: 1)	ST: 0000	END: 23:59
(MON: 2)	ST: 0800	END: 2200
(MON: 3)	ST: 1000	END: 2000
(MON: 4)	ST: 1200	END: 1800
(MON: 5)	ST: 1300	END: 1600
(MON: 6)	ST: 1400	END: 1500

Using a 24 hour clock in the example above notice that the END time is within the same 24 hour period. The system will stay in the last active Ring Plan from the previous day until the end time which is 23:59. Monday starts the Ring Plan 1 at 00:00. The system will stay Ring Plan 1 until 08:00 and will stay in Ring Plan 2 until Ring Plan 3 starts. As each ring Plan start it will override the previous Ring Plan. If a Ring Plan ends and there are no additional Ring Plans the system will default to the Ring Plan with time that extends past the expired ring plan time.

Ring Plans must be programmed in sequence. IE. RP 1,2,3,4 etc.

A Ring Plan cannot be omitted. IE. RP 1,2,5 etc.

A higher numbered Ring Plan cannot have a START time before a lower numbered Ring Plan.

Ring Plan 1 is the default Ring Plan of each day. If no Ring Plan destination is input the operator group is the default destination.

CALL COST

DESCRIPTION

Allows the system administrator to set the Call Cost attributes generated by the system during a call. This information can be displayed on the keyphone LCD during a call or as an SMDR record.

Attributes are as follows:

- 0 UNIT COST PER MP** When the system is installed to receive MP on a C. O. outgoing call. It is used for generating total call cost by multiplying it by the number of pulses. Allows a maximum value of 9999.
- 1 CALL COST RATE** This generates additional call cost calculated by multiplying this rate by the original call cost. Ranges from 100 through 250.

Changing this value when there is a call in progress may result in an inaccurate call cost. This MPD facility requires the Meter Pulse Detection version of the trunk card.

MESSAGE WAITING LAMP CADENCE

DESCRIPTION

This MMC defines the cadence (flash rate) of single line telephone message waiting lamps on phones connected to an 8MWSLI or a 16MWSLI card. There are two main choices for the MW lamp cadence available, these being continuous and interrupted as described below.

OPTION KEYS

- 0 INTERRUPTED

The MW lamp will flash at a rate determined by the timer settings. The shortest on time is 100ms and the longest on time is 3000ms. The timer is adjusted in 100ms increments.
- 1 CONTINUOUS

When an 8MWSLI or a 16MWSLI port has a message, the lamp will be lit steady.

MMC:601

ASSIGN STATION GROUP

DESCRIPTION

This MMC is used to build all station groups. There are 30 programmable groups available in a iDCS 500-M system and 50 for a iDCS 500-L system.

The options for setting up these groups are as follows: A through F.

A. TYPE: This is the type of group you are creating and can be one of the following:

1. **NORMAL:** Used to assign stations in a ring group. The members can be stations, common bell contacts or Ring over Page relays.
2. **VMAA:** Used to group a number of voice mail port extensions. These must have been defined in MMC 207 as VMAA ports or they cannot be entered here. Check all programming in MMC 726 to ensure that the In band DTMF codes are properly set.

3. **UCD:** Used to build a UCD group. The iDCS 100 will support two methods of UCD:

- **TYPE 1 UCD**

The group OVERFLOW/N-ANS destination (see below) is defined as an SLT port to which you must connect some type of announcement device to play to callers while they are on hold.

Please note that this type of UCD group has the following limitations.

- a) The announcement device must be able to terminate the announcement with a hook flash and a transfer back to the UCD group.
- b) Only one caller at a time can hear the announcement.
- c) Each caller connected to the announcement must hear the announcement in its entirety.
- d) It is possible that a new caller may “jump ahead” in the queue if a previous caller is currently connected to the announcement device.

- **TYPE 2 UCD**

The group OVERFLOW/N-ANS destination (see below) is defined as an AA port or group. This will only work if an AA card has been installed in the system.

The digital announcer in the AA card will supply two recorded announcements to callers in queue. The first announcement is played only once, the second announcement will repeat for as long as the caller is in queue.

This type of UCD group has the following advantages:

- a) No external device need be installed to provide an announcement.
- b) Multiple callers can hear the announcement(s) simultaneously.
- c) Callers hearing the announcement will be transferred to a free UCD group member (agent) as soon as the agent becomes available.
- d) The callers place in queue is always maintained.

Additional programming for this type of UCD group is in MMC 607. There is a maximum of 10 UCD groups available on a iDCS 500-M system and 20 for a iDCS 500-L system due to availability of system resources.

4. **AA:** This is used to group a number of AA ports. An Auto Attendant (AA) card must be installed in the system to do this.
 5. **CADENCE:** This is the voice mail group for CADENCE (the built in Samsung Voice Mail Card). When a CADENCE card is installed, group 529 must be programmed as a CADENCE group on a iDCS 500-M system and group 549 must be used for a iDCS 500-L system. Group 529 and 549 are fixed for CADENCE use. If CADENCE is not installed in the system, group 529 or 549 can be used as any other group can be used.
 6. **MESSAGE:** Used to group a number of extensions to serve as a message desk or message group. When one of the stations in this type of group leaves a message to another station the messaged station will return the message to the message group so any member can answer the call. If a station is a member of more than one message group, then any message indications made by that station would be for the first numerical message group they are a member of. It is not recommended to program stations in to multiple station groups.
- B. RING MODE:** Each group can have one of the following ring modes. This will decide how calls are placed to the group.
1. **SEQUENTIAL:** The stations listed as “members” (see below) will be called on a first available basis. Calls will first go to the first member, if the first member is busy, calls will go to the second member, if the second member is busy, calls will go to the third member etc. This type of group is useful for placing the bulk of the incoming calls to a selected individual, with other members only getting the calls when the first member is busy. The number of members allowed for a sequential group is 48.
 2. **DISTRIBUTED:** The first call will go to the first member, the second call will go to the second member, the third call will go to the third member. This type of group is useful for evenly distributing the call among all group members. The number of members allowed for a distributed group is 48.
 3. **UNCONDITIONAL:** Calls are placed to all group members simultaneously. This reduces the number of members of the groups to 32. If a group member is busy, they can receive off hook ring if defined in MMC 300. This ring mode option is not available for UCD or VMAA groups. The OVERFLOW/BUSY option is not available for unconditional ring mode.
- C. OVERFLOW:** This is the timer value that will cause unanswered calls to a group to begin also ringing the NEXT PORT (see below) after this timer has elapsed. If set to 000, no overflow will take place.
- D. GRP TRANSFER:** This is a timer that will determine how long C.O. calls transferred to the group will ring at the group before recalling. If set to 000, no recall will take place.
- E. NEXT PORT:** This is the station or group number that callers will also ring at if the OVERFLOW feature has been programmed. The OVERFLOW DESTINATION can be defined as:
1. **COMMON BELL** There are up to 6 relays available in the iDCS 500 that can be defined as Common bell in MMC 218. (2 on each PMISC card)
 2. **RING OVER PAGE DN #** 362 and 363 (or 3062-3063 depending on SW5 setting on PMCP card) are the default numbers available on the PMCP
 3. **STATION OR STATION GROUP.** Any station or station group can be defined as the NEXT port.

- F. MEMBER:** List all members that are to be in the group. Up to 48 members are allowed in each group, but stations can be assigned to multiple station groups.
- G. NXT HUNT:** The length of time a call will ring at a station before it hunts to the next group member.

When a group is called, or a caller is transferred to a group, ringback is sent to the caller. A busy signal will not be returned even if all group members are busy. Obviously UCD is an exception to this rule.

Calls to a group do not follow the call forwarding instructions of any stations in the group.

FEATURE KEYS

0	TYPE	Group type (Normal, VM/AA, UCD, AA, CADENCE, MSG [iDCS 500-L only])
1	RING	Ring mode (Sequential, Distributed or Unconditional)
2	OVERFLOW	Overflow time (000 - 250 sec)
3	GRP TRSF	Group transfer time (000 - 250 sec)
4	NEXT PORT	Group or station number (e.g. group 502, station 221, 244)
5	MEMBER	Group members (e.g., station 202, 225, 231)
6	NXT HUNT	Hunt time (000 - 250 sec) [iDCS 500-L only]

RING MODES

0	SEQUENTIAL	The first idle station listed in the group will ring. If the first is busy, the next idle station will ring.
1	DISTRIBUTED	The first call will ring the first station listed in the group. The next call will ring the next station listed in the group.
2	UNCONDITIONAL	All the stations listed in the group will ring. Busy stations will receive off-hook ring. MAXIMUM 32 STATIONS RINGING.

STATION GROUP NAME

DESCRIPTION

Allows the system administrator or technician to enter an 11-character name to identify an individual station group.

Names are written using the keypad. Each press of a key selects a character. Pressing the next key moves the cursor to the next position. For example, if the directory name is SAMSUNG, press the number 7 four times to get the letter S. Now press the number 2 once to get the letter A. Continue selecting characters from the table below to complete your message. Pressing A button changes the letter from upper case to lower case.

 **NOTE** When the character that you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right or the DOWN key to move cursor left. A space can be entered by using these keys.

 **NOTE** When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0
DIAL 1	Space	?	,	!	1
DIAL 2	A	B	C	@	2
DIAL 3	D	E	F	#	3
DIAL 4	G	H	I	\$	4
DIAL 5	J	K	L	%	5
DIAL 6	M	N	O	^	6
DIAL 7	P	Q	R	S	7
DIAL 8	T	U	V	*	8
DIAL 9	W	X	Y	Z	9
DIAL *	:	=	[]	*

The # key can be used for the following special characters: #, space, &, !, :, ?, ., ,, %, \$, -, <, >, /, =, [,], @, ^, (,), _ , +, {, }, |, ;, ", →, ` , and \.

MMC:603

ASSIGN TRUNK GROUP

DESCRIPTION

Allows the assignment of trunks to a specific trunk group or to several trunk groups. This is very useful in the programming of LCR when more than one trunk is to be in several dialing plans. There are two different modes of operation: (1) sequential and (2) distribute. There are 11 programmable trunk groups in a iDCS 500-M system with up to 99 members per group and 50 programmable trunk groups with up to 99 members per group for a iDCS 500-L system.

One trunk can appear in more than one trunk group. If necessary, delete the trunk member from other groups to prevent accidental access.

PROGRAM KEYS

MMC:606

ASSIGN SPEED BLOCK

DESCRIPTION

Provides a means of adding or deleting speed dial blocks to the system or an individual keyset. With the ability to delete a block or blocks of speed dial, it will not be necessary to waste these on such items as voice mail, DPIMs or stations that do not require the ability to use speed dial. The Free List will show how many bins are left to be assigned.

A library of up to 1500 speed dial numbers may be allocated as needed on a iDCS 500-M system and 2500 for a iDCS 500-L system. The system list can have up to 500 numbers and each station can have up to 50 numbers. Speed dial numbers are assigned in blocks of ten. Each speed number may contain up to 24 digits.

MMC:607

UCD OPTIONS

DESCRIPTION

Sets up UCD options when an AA card has been installed. MMC 601 must have already been used to define a UCD group with an overflow destination of an AA port or group. (A group is preferred over a port because a group allows multiple paths into the AA card and therefore has greater traffic handling capabilities.) When a group overflow timer in MMC 601 expires, the caller will be routed to the AA card. It is here that the caller is played the UCD "FIRST MESSAGE" and "SECOND MESSAGE" while in queue. This will continue until an agent becomes free or the caller is transferred to a final destination.

This MMC includes options to select messages to play to a caller. These messages can be as follows:

MESSAGES 01-48

These can be created using the AAREC soft key (programmed on keysets by using MMC 722 or 723). A total of two minutes of message time is available and can be divided up into 1 to 48 messages.

MESSAGES 49-64

These are pre-programmed as follows:

- 49 "Thank you for calling, please dial your party's extension number."
- 50 "Invalid number, please try again."
- 51 "I'm sorry, there is no answer."
- 52 "I'm sorry, that station is busy."
- 53 "One moment please."
- 54 "Transferring."
- 55 "I'll transfer you."
- 56 "Good-bye."
- 57 "Thank you."
- 58 "Please hold for the operator."
- 59 "Please hold for assistance."
- 60 "Thank you, good-bye."
- 61 "I'm sorry, all stations are presently busy."
- 62 "I'm sorry, all stations are still busy."
- 63 "Please call back later."
- 64 "I'm sorry, not a valid selection."

The following program options apply:

FIRST MESSAGE

After the caller has overflowed from the UCD group, the first message will immediately play. For instructions on how to make these recordings, see the User Instructions Section, Auto Attendant and Uniform Call Distribution System Administration. The default message is #61 "I'm sorry, all stations are presently busy."

This message will only be played once for the caller.

SECOND MESSAGE

If no agent has become free after the UCD recall time (see UCD Recall), the caller will be played the second message. For instructions on how to make these recordings, see the User Instructions Section, Auto Attendant and Uniform Call Distribution System Administration. The default message is #62 "I'm sorry, all stations are still busy."

This message will be repeated for as long as the caller is in queue, at an interval specified in the UCD Recall Timer below.

EXIT CODE

While the caller is hearing a message (but not during MOH), the caller may dial the DTMF digit specified here and be transferred immediately to the final destination (see Final Destination). The exit code is optional and does not need to be used. If used, the first and second messages may be modified to provide instructions on its use.

RETRY COUNT

The UCD program is designed to route a caller to a "final destination" after a programmable number of "loops" through the UCD message. The range of this counter is 0 to 99. 00 means that there is no retry counter and the caller will remain in the UCD queue until answered. Any non zero value will route a caller through the UCD loop that many times before going to the final destination. The UCD will route calls to the final destination immediately if all members of the group are either out of group or in DND.

Example: If this counter is set to 02, callers reaching a busy group will hear the first UCD message, be placed on hold, hear the second UCD message, be placed on hold, and finally hear the second message again before being transferred to the final destination.

FINAL DESTINATION

This is the final destination for the caller if not answered by a UCD agent. This destination is only reached if (a) the caller dials an exit digit during a message or (b) the retry count has expired. The final destination can be a station number, a group number, a disconnect or another plan. Plans are entered by pressing A button plus two digits 01-12. A disconnect is entered as a destination of NONE (HOLD key).

If the final destination is a voice mail port, the port will receive a FWD from UCD group integration message. The final destination will forward or overflow. If the forward to destination is a voice mail port the port will receive FWD from UCD group integration message. If the final destination is not forwarded, the call will ring or camp on to the final destination indefinitely.

To ensure that you do not get a situation where all the call buttons are busy on the final destination it is advisable to make the final destination a group (even if the group has only one station in it.)

RING NEXT

This timer must be shorter than the overflow timer in MMC 601. If a higher value is entered, the display will show invalid entry. In the case where a UCD group has the ring next timer set at 000, an unanswered call will rotate evenly among all agents until it is answered. The UCD greetings will be heard during this routing process, but can be removed by defining the UCD messages in MMC 607 as unrecorded message numbers. This will simulate a circular hunt group.

UCD RECALL

After a caller has heard a UCD announcement, he/she will be placed on hold until an agent becomes available or the UCD recall timer expires. When the UCD recall timer expires, the caller will again hear the UCD announcement. The range is 00-99. The default is 10.

MUSIC ON HOLD SOURCE

This option determines what Music on Hold source the callers will be connected to between messages. The choice is either an external source, AA message defined in MMC 736, or a Built-In Voice Mail Card message defined in MMC 756.

WRAP UP

This option will make a UCD agent unavailable to receive additional UCD calls after hanging up from the last one. This is to allow agents to complete work associated with the previous call before the next call begins ringing. The range is 000-250. The default is 010.

AUTO LOG OUT

This YES/NO option determines if a station will automatically log out of the UCD group when the RING NEXT timer expires. This setting will be ignored if the RING NEXT timer is set to 000.

ALLOUT→FINAL

This YES/NO option determines if calls forward to the UCD final destination when all stations are logged out of the UCD group. If no UCD final destination is assigned then the call will disconnect.

MMC:701

ASSIGN COS CONTENTS

DESCRIPTION

Similar to MMC 700 but does not allow a copy command. This MMC is primarily used for creating a new class of service. If the unsupervised conference feature is allowed, a programmed CONF key must be available to allow reentry into a conference call. There are 30 classes of service available.

This MMC is divided into 4 categories.

- 0 TOLL LEVEL
- 1 USABLE FEATURES
- 2 CALL STATION GROUPS
- 3 CALL TRUNK GROUPS
- 4 CALL TO BIVMS STN (CADENCE or SVMi-8/16).

TOLL DENY TABLE

DESCRIPTION

Provides a way to make toll restriction (call barring) very easy and flexible. There are 250 entries allowed in the deny table for a iDCS 500-M system and 500 entries for a iDCS 500-L system and each entry index can be assigned to a class of service. Each index can have up to 12 digits. With the use of wild cards (MMC 704 Assign Wild Character), more flexibility can be built into toll restriction. Wild cards can be used repeatedly in the dial string, limited only to what is allowed or denied in MMC 704. There are six toll levels, B to G, that are programmable. Toll level A is set as unrestricted by default and toll level H is set as in-house only by default.

ASSIGN SYSTEM SPEED DIAL

DESCRIPTION

Enables the assignment of system speed dialling numbers. There are up to 500 entries available for programming (see MMC 606). Each speed dial number consists of a trunk or trunk group access code followed by a separator and up to 24 digits to be dialled. These dialled digits may consist of 0-9, * and #. If the system recognises a valid trunk or trunk group access number, it will automatically insert the separator.

PROGRAM KEYS

SYSTEM SPEED DIAL BY NAME

DESCRIPTION

Allows an 11-character name to be entered for each system speed dial location. This name enables the speed dial number to be located when using the directory dial feature. The directory dial feature allows the display keyset user to select a speed dial location by scanning its name.

Names are written using the keypad. Each press of a key selects a character. Pressing a different key moves the cursor to the next position. For example, if the directory name is SAM SMITH, press the number 7 four times to get the letter S. Now press the number 2 once to get the letter A. Continue selecting characters from the table below to complete your message. Pressing A key changes the letter from upper case to lower case.

When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0
DIAL 1	Space	?	,	!	1
DIAL 2	A	B	C	@	2
DIAL 3	D	E	F	#	3
DIAL 4	G	H	I	\$	4
DIAL 5	J	K	L	%	5
DIAL 6	M	N	O	^	6
DIAL 7	P	Q	R	S	7
DIAL 8	T	U	V	*	8
DIAL 9	W	X	Y	Z	9
DIAL *	:	=	[]	*

The # key can be used for the following special characters: #, space, &, !, :, ?, ., ,, %, \$, -, <, >, /, =, [,], @, ^, (,), _, +, {, }, |, ;, ", →, ` , and \.

MMC:709 TOLL PASS CODE / SPECIAL CODE TABLE

DESCRIPTION

This MMC provides a means to program three trunk code tables as described below..

PBX CODE

This table contains up to five entries and is used to identify the trunk access codes needed for toll restriction to be properly applied when the system is used either behind a PBX or with CENTREX-supplied dial tone. Toll restriction will only be applied on trunks flagged as PBX in MMC 401 if a trunk access code entered in this table is dialed. Toll restriction will be applied to the digits following the trunk access code.

SPECIAL CODE

This table identifies to the system dialling rules the special feature codes used to activate central office custom calling features such as CID Block and call waiting disable. The special feature codes can be used on a per call basis without affecting LCR or toll restriction programming. There is a maximum of ten (10) entries available each of which may be up to four digits long.

TOLL OVERRIDE

This table of eight entries is used to identify to the system numbers that will bypass all dialing restrictions. This bypass includes Toll restriction, Trunk access and forced authorization or account codes. Each entry in the table can be up to 14 digits long.

OVRD USE TRK GRP

This entry designates the trunk group that override calls will access when selected trunk access protection.

LCR DIGIT TABLE

DESCRIPTION

The LCR DIGIT TABLE contains all numerical digits for the completion of outgoing call placement. This table works in conjunction with LCR ROUTE TABLE, LCR TIME TABLE and LCR MODIFY DIGITS TABLE. There is a maximum of 1000 entries on a iDCS 500-M system and 2000 entries for a iDCS 500-L system with a digit string length of 10 numerical digits. This system automatically maintains entered digit strings in numerical order. The characters * and # are also accepted for use with feature codes.

LCR TIME TABLE

DESCRIPTION

This table gives the flexibility to the system, through the LCR ROUTES, to allow calls placed at any given time of day to use the least cost trunk route that is available. When LCR ROUTE ADVANCE is allowed, it is possible for calls to be placed on more expensive trunks on any given time of day. There are four possible time entries per day; the start time of the next time period is the end time of the previous time period.

LCR ROUTE TABLE

DESCRIPTION

The LCR ROUTE TABLE is responsible for selecting a specific trunk group in the completion of an outward bound call. This table works in conjunction with LCR DIGIT TABLE, LCR TIME TABLE, LCR COS TABLE and LCR MODIFIED DIGITS TABLE. After the user dials a valid digit string, the system uses the LCR ROUTE TABLE to select a specific predetermined trunk group. There is a maximum number of 16 routes available on a iDCS 500-M system and 32 routes available on a iDCS 500-L system. If more than one trunk group is available for call completion, the system uses the first designated trunk group and then starts to utilise succeeding trunk groups. If all trunk groups are busy in a selected route, call queue becomes active and allocates trunks as they become available.

LCR MODIFY DIGIT TABLE

DESCRIPTION

This program entry is also referred to as Outdial Rules. This will give the system the ability to add or delete a digit string or singular digit if needed to complete a call. A perfect example is the adding of a digit "1." An advantage is to insert a common carrier network access code of 1010288 (ATT®). With these digits inserted, a long distance call will be placed over a local line utilizing the common carrier network. The characters * and # can also be entered. There are 100 modify digit entries available in the iDCS 500-M system and 200 modify digit entries available in a iDCS 500-L system.

OPTION	MAXIMUM NUMBER OF DIGIT ENTRIES
Number of digits to delete	15
Insert (before dialing string)	14
Append (after dialing string)	14

DIGIT STRING KEY

Insert String + Digit String (delete) + Append String

NOTE

In case of Italy, the number of modify digit entries is 50 in iDCS 500-M and 100 in iDCS 500-L, and maximum number of digit entries are 30.

RELATED ITEMS: MMC 710 LCR DIGIT TABLE
MMC 712 LCR ROUTE TABLE

MMC:714 DID NUMBER AND NAME TRANSLATION

DESCRIPTION

Assigns an incoming DID call to a specific ring plan destination. It also provides a call waiting option, if needed, so that a second incoming DID call can be received. The table is also used to define which MOH source a caller to that DID number will hear when placed on hold. An 11 character name can be added to the number. There are a maximum of 400 entries in the iDCS 500-M and a maximum of 999 entries in a iDCS 500-L system. If there is no matching number on DID service the call is routed to the operator group when normal incoming call and provides error tone when networking in call.

Definitions of option are as follows:

1. **DGT:=** Digits to be received from CO. Up to 16 digits may be entered.
2. **MOH SOURCE:** Allows the technician to select what the calling party will hear in regards to that DID/DNIS number if the call is placed on hold. There are a total of 6 possible music selections (see below). (Available in iDCS 500-L only.)

In addition to "TONE" or a music source, you may also select an Auto Attendant (AA) port to provide continuous play of a specific recording. The AA port selected must be the last AA port on the AA card (3958). If selected, the Music on Hold will be the message defined in MMC 736.

If you have a CADENCE Voice Mail System installed you may also select a CADENCE recording as a music source. The recording must already be defined in MMC 756 and will show up here as the CADENCE port associated with the recording.

OPTIONS

- **NONE:** Follows the setting in MMC 408 for the trunk the call comes in on.
 - **TONE:** A repeated tone is played to the outside party.
 - **INTERNAL CHIME "OLD FOLKS AT HOME":** This is entered as the directory number of the music source on the MCP(371).
 - **EXTERNAL DEVICE:** Music Source or Digital announcer. This is entered as the directory number of an external music source.
 - **DIGITAL ANNOUNCEMENT ON AA CARD:** This is entered as the directory number of the last AA port of an AA card. For further details on using an AA port as an MOH source please see MMC 736.
 - **VOICE MAIL SOUND FILE:** If the iDCS 500 system has an optional CADENCE card installed, up to 100 custom recorded sound files from the Voice Mail card can be used for MOH sources. Select the CADENCE port assigned in MMC 756. For information on creating the sound files see CADENCE System Administrator Manual-Recording greeting by number. If you select this option be advised that each VMMOH source requires a dedicated CADENCE port/channel.
3. **1: XXX, 2: XXX, 3: XXX, 4: XXX, 5: XXX, 6:XXX** = ring plan and destination during each ring plan. The destination can be a station, station group, trunk or trunk group. If trunk or trunk group is selected the trunks must be programmed as E&M trunks to allow the received digits to be re-sent on the facility(s). This is referred to as DID Repeat digits over tie line.

An entry of the character "B" means to repeat the received digits.

4. **CW:** = Call waiting Yes/No . Allow a second DID call to be received
5. **DELETE:** The number of digits to delete. This is useful with Tandem switching, mixed numbering plans and DID Repeat digits over tie line. Maximum number of digits that can be deleted is 16.
6. **NAME** = Input up to 11 characters to identify call.

Names are written using the keypad. Each press of a key selects a character. Pressing the dial pad key moves the cursor to the next position. For example, if the directory name is "SAM SMITH," press "7" four times to get the letter "S." Press "2" once to get "A." Continue selecting characters from the table below to complete your message. Pressing A key changes the letter from upper case to lower case.

When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0
DIAL 1	Space	?	,	!	1

PROGRAMMED STATION MESSAGE

DESCRIPTION

Allows custom messages to be programmed or default messages to be changed.

Messages are written via the keypad. Each press of a key will select a character. Pressing a different key will move the cursor to the next position. For example, if the message is "Sunbathing," press the number "7" four times to get the letter "S." Now press the number "8" twice to get the letter "U." Continue selecting characters from the table below to complete your message. Pressing the "A" key will change the letter from upper case to lower case.

When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0
DIAL 1	Space	?	,	!	1
DIAL 2	A	B	C	@	2
DIAL 3	D	E	F	#	3

DIAL 6	M	N	O	^	6
DIAL 7	P	Q	R	S	7
DIAL 8	T	U	V	*	8
DIAL 9	W	X	Y	Z	9
DIAL *	:	=	[]	*

The # key can be used for the following special characters: #, space, &, !, :, ?, ., ,, %, \$, -, <, >, /, =, [,], @, ^, (,), _ , +, {, }, |, ;, ", →, ` , and \.

There are 20 messages in a iDCS500-M system and 30 messages in a iDCS500-L system. They fall in the following categories:

MESSAGES 01-10 (16 character default messages): These are pre-programmed default messages. Any of them can be changed.

MESSAGES 11-18 on a iDCS 500-M system are 16 character blank messages that can be created.

MESSAGES 19-20 on a iDCS 500-M system have a default message for time or date selection. These messages can be changed.

MESSAGES 11-25 on a iDCS500-L system are 16 character blank messages that can be created.

MESSAGES 26-27 (only available on a iDCS500-L system) Nine character default messages with six character user customized day/date extender: These messages are pre-programmed default messages and any of them can be changed.

MESSAGES 28-30 (only available on a iDCS500-L system) Nine character blank messages with six character user customized day/date extender: Any of these can be created.

COPY KEY PROGRAMMING

DESCRIPTION

Provides a tool for duplicating key assignment from one keyset to another. This can be done on a per-station basis or on all stations, but not on a group of stations. One limitation is that the original and target keysets must be of the same type (i.e. same number of buttons).

PROGRAM KEYS

MMC:721

SAVE STATION KEY PROGRAMMING

DESCRIPTION

Provides a service tool which will minimize the accidental loss of programmable keys on the keysets. The method of operation is simple, first the data is saved and then the station can be replaced with another station type or the keys can be reprogrammed to other features. Once testing or replacement is completed, the data can be restored to the individual station, providing the same type is in place.

This program is not to be confused with AUTO SET RELOCATE (MMC 315). This program is for saving and restoring the same electronic device type at that port.

PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections

STATION KEY PROGRAMMING

DESCRIPTION:

Allows the customizing of programmable keys on specific electronic keysets, AOM, or 64 button module on the system. For keysets, buttons 1 and 2 are set as CALL buttons by default. For AOM's and 64 button DSS box's all buttons are set as DS keys by default. Features are entered via dial pad keys by pressing the dial pad number the required number of steps to select the feature. For example, for OHVA, the number 6 is pressed three times. If the BOSS key is required, press 2 for the first letter B and then use the UP or DOWN key to change the selection from BARGE to BOSS.

MMC:723

SYSTEM KEY PROGRAMMING

DESCRIPTION

This MMC is much like MMC 722, Station Key Programming. The main difference is that this MMC is system-wide rather than on a per-station basis. Features are entered via the dial keypad by pressing numbers as shown in the table. For example, for OHVA the number 6 is pressed three times. If the BOSS key is required, press 2 for the first letter B, and then use the UP or DOWN key to change selection from BARGE to BOSS.

DIAL KEYPAD

MMC:724**DIAL NUMBERING PLAN*****DESCRIPTION***

This MMC allows the technician to change directory numbers for stations, trunks, station groups, trunk groups and feature access codes. The iDCS 500 system can be pre-programmed with a default three or four digit numbering for station, station groups and trunk numbers depending on the position of the DIP switches on the MCP card. There is an error message provided to prevent the accidental duplication of a directory number or feature access code.

DIAL	OPTION	DESCRIPTION
00	STN DIAL NUM	This is where station directory numbers are changed or assigned.
01	TRK DIAL NUM	This is where trunk directory numbers are changed or assigned.
02	AA DIAL NUM	This is where AA port directory numbers are changed or assigned.
03	MISC DIAL NUM	This is where directory numbers for relays, MOH ports and the alarm sensor are changed or assigned
04	STNG DIAL NUMBER	This is where station group numbers are changed or assigned.
05	TRKG DIAL NUMBER	This is where trunk group numbers are changed or assigned.
06	FEAT DIAL NUMBER	This is where feature access codes are changed or assigned. Dialing codes are entered via the dial pad key by pressing the dial pad number the required steps to select the feature. For example, for OHVA, the number 6 would be pressed three times.
<div>  NOTE Please remember that this program is system-wide. Please </div>		
07	S0 STN DIAL NO.	This is where directory numbers for BRI station ports. MMC 428 is to assign as stations or trunks.
08	DECT STN DIAL NO	This is where directory numbers for DECT terminals.
09	NTWK LCR DIAL NO	This is where additional LCR access codes are entered in the case when two or more iDCS 500 system are networked together.
10	VIRT EXT DIAL NO	This is where virtual station directory numbers are changed or assigned.

SMDR OPTIONS

DESCRIPTION

Allows the system administrator to select the information printed on the SMDR report. The following options may be selected to print on SMDR:

- | | |
|-----------------------------|---|
| 00. PAGE HEADER | This option determines whether a page header will print at the top of each page. This would normally be turned off if SMDR is being sent to a Call Accounting machine. |
| 01. LINE PER PAGE | This option selects the length of each page to determine when to print the SMDR header. The number of lines may be in the range 01–99. |
| 02. INCOMING CALL | This option determines whether incoming calls will print on SMDR.. |
| 03. OUTGOING CALL | This option determines whether outgoing calls will print on SMDR.. |
| 04. AUTHORIZE CODE | This option determines whether authorization codes will print on SMDR. |
| 05. SMDR START TIME | This option determines whether valid calls will include the minimum call time in total call duration. |
| 06. IN/OUT GROUP | This option allows a message, IN GROUP or OUT GROUP, to be printed in the digits dialed column each time a station enters or leaves a group. |
| 07. DND CALL | This option allows a message, IN DND or OUT DND, to be printed in the digits dialed column each time a station enters or leaves DND. |
| 08. WAKE-UP CALL | This option determines whether stations receiving an alarm reminder call will print on SMDR. |
| 09. DIRECTORY NAME | This option allows the system administrator to enter a 16 character name which will appear on the SMDR header. |
| 10. CALLER ID DATA | This option can be selected to print Caller ID data received from the Central Office on incoming calls. This option requires the use of a 132 column (wide carriage) printer or an 80 column printer set for condensed print. |
| 11. ABANDON CALL | If this option is set to YES, unanswered calls for which CID information was received will print on SMDR. |
| 13. NO. OF DIAL MASK | If this option is set to a numeric value, the selected last digits of the number dialed field will be masked as asterisks (*) on the SMDR print out. Maximum masking digits is 18. |
| 15. INCOMING ANSWER | If this option is set to YES, the duration of calls ringing before answered will print on SMDR. |
| 16. INTERCOM CALL | This option determines whether intercom calls will print on SMDR. |
| 17. KEY MMC IN/OUT | If set to YES then the SMDR record will show programming being opened and closed. (iDCS 500-L system only) |

The DIRECTORY NAME that appears on the SMDR header is programmed as follows:
Names are written using the keypad. Each press of a key selects a character. Pressing the next key moves the cursor to the next position. For example, if the directory name is SAM SMITH, press the number 7 four times to get the letter S. Now press the number 2 once to get the letter A. Continue selecting characters from the table below to complete your message. Pressing A key changes the letter from upper case to lower case.

When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0
DIAL 1	Space	?	,	!	1
DIAL 2	A	B	C	@	2
DIAL 3	D	E	F	#	3
DIAL 4	G	H	I	\$	4
DIAL 5	J	K	L	%	5
DIAL 6	M	N	O	^	6
DIAL 7	P	Q	R	S	7
DIAL 8	T	U	V	*	8
DIAL 9	W	X	Y	Z	9
DIAL *	:	=	[]	*

The # key can be used for the following special characters: #, space, &, !, :, ?, ., ., ., %, \$, -, <, >, /, =, [,], @, ^, (,), _, +, {, }, |, ;, ", →, ` , and \.

MMC:726

VM/AA OPTIONS

DESCRIPTION

This MMC is used to define all in band DTMF codes sent to voice mail ports. These in band codes can be 0-9, A, B or C, and performed two functions.

1. CALL AND TYPE INFORMATION

This is a DTMF signaling string sent to a voice mail port when the voice mail port answers a call. This DTMF information tells the voice mail port what type of call it is receiving and where the call is coming from. e.g. call has forwarded from extension 225

2. CALL PROGRESS TONES

These are sent to the voice mail system to provide information about the progress of the call. e.g. ringback, busy or disconnect.

Most Voice Mail systems can utilize DTMF in band signaling for more efficient call processing. This MMC has many parameters that can be programmed according to the type of automated attendant and/or voice mail system connected.

CALL and TYPE INFORMATION

The format of the DTMF data sent to a VM/AA port is as follows:

[CALL TYPE] + [DN1] + [SEPARATOR] + [DN2]

an example of this would be

[FORWARD ALL] from [225] on trunk [703]

Each field can be programmed individually as follows:

EXTENSION FOR DN1: If set to yes, when the voice mail auto attendant system answers a call the iDCS 500 will send data in the DN1 field indicating that a station is ringing the VMAA port.

If set to no, when the voice mail auto attendant system answers a call the iDCS 500 will not send station data in the DN1 field.

TRUNK FOR DN1: If set to yes, when the voice mail auto attendant system answers a call the iDCS 500 will send data in the DN1 field indicating that a trunk is ringing the VMAA port.

If set to no, when the voice mail auto attendant system answers a call the iDCS 500 will not send trunk data in the DN1 field.

EXTENSION FOR DN2: If set to yes, when the voice mail auto attendant system answers a call the iDCS 500 will send data in the DN2 field indicating the originating station of the call ringing the VMAA port.

If set to no, when the voice mail auto attendant system answers a call the iDCS 500 will not send station data in the DN2 field.

TRUNK FOR DN2: If set to yes, when the voice mail auto attendant system answers a call the system will send data in the DN2 field indicating the originating trunk of the call ringing the VMAA port. If set to no, when the voice mail auto attendant system answers a call the system will not send trunk data in the DN2 field.

SEPARATOR: When both DN1 and DN2 are used, a digit defined here is sent between DN1 and DN2 so the VMAA system can determine where DN 1 stops and where DN 2 starts. The separator can be DTMF 0 through 9, *, #, A, B or C

DISCONNECT: This is the call progress digit sent to the VMAA port in place of a disconnect open. The digit defined here is sent three times.

CALLER ID NUMBER: If set to yes, when the voice mail auto attendant system answers a call the system will send Caller ID data as DTMF tones to the VMAA port.

CALL TYPE ID: This is the DTMF digit that is sent first in the in band digit string and can identify any of the following call types:

- | | | |
|----|---------------------|---|
| 0. | DIRECT CALL | A call originating directly from another station in the system.0.DIRECT CALL
A call originating directly from another station in the system. |
| 1. | ALL FWD CALL | This indicates that a call was forwarded to the VM/AA port from a station with CALL FORWARD ALL set. |
| 2. | BSY FWD CALL | This indicates that a call was forwarded to the VM/AA port from a station with CALL FORWARD BUSY set. |
| 3. | NOA FWD CALL | This indicates that a call was forwarded to the VM/AA port from a station with CALL FORWARD NO ANSWER set. |
| 4. | RECALL | A call is recalling the VM/AA port after being transferred and not answered. |
| 5. | DIR TRK CALL | A C.O. call has gone directly to VM/AA (e.g., trunk 717 DIL to VM/AA). |
| 6. | OVERFLOW | A call has OVERFLOWED to the VM/AA port from a station group. |
| 7. | DID CALL | A DID call has called the VM/AA port. |
| 8. | MESSAGE CALL | A message button or message reply feature code has been used to call the VM/AA port. |

PROGRESS TONES

These are the DTMF codes that is sent to the VMAA port in place of regular progress tones. For example, when a VMAA port goes off hook to originate or transfer a call, instead of hearing normal dial tone, it will hear DTMF "BA". Progress tones can greatly increase the efficiency of a VMAA system because it is easier and quicker to detect DTMF than a busy, ringback or DND tone. Progress tones can identify any of the following.

TONES	VALUE
0. DIAL TONE	BA
1. BUSY TONE	4
2. RINGBAK TONE	5
3. DND NO MORE	6
4. HDSET ANSWER	3
5. SPKER ANSWER	2

GENERAL RULES

1. 201 is talking to a trunk and presses TRANSFER plus the station number, but the station is forwarded to VM/AA and VM/AA answers. When this happens, if 201 presses TRANSFER again to return to the trunk, the VM/AA port is not on hold. It is disconnected.
2. A VM/AA port leaves a message indication for a station. When the station returns the message, any available port in the VM/AA group should ring, not only the one that left the message.
3. A VM/AA port leaves a message for a station. When the station returns the message, the MESSAGE LED is not automatically turned off. If a VM/AA system turns on the MESSAGE LED, the VM/AA system must turn it off.
4. If DTMF call progress tones are not enabled, the system sends regular call progress tones.
5. When a VM/AA port calls a station that is in the AUTO ANSWER or VOICE ANNOUNCE mode, the keyset will be forced to ring.
6. All calls to a VM/AA port or group ring with C.O. line ringing cadence, not intercom ring cadence.

EXAMPLES OF VM/AA OPERATION (IN BAND DTMF DIGIT STRING)

In the following example, all call and type data is turned on unless otherwise stated. X is the separator digit, all-default values are used in these examples and [] is not used.

DIL 701 calls a VM/AA port or group:

[*]+[701]+[]+[]

In the above example, if C.O. information is not used:

[]+[]+[]+[](Nothing is used)

DIL 701 calls a call-forwarded station (205):

[#]+[205]+[X]+[701]

In the above example, if forward information is not used:

[]+[205] +[X]+[701]

In the above example, if forward information is not used:

[]+[205] +[X]+[701]

DIL 701 calls group 501 that overflows to VM/AA:

[#]+[501]+[x]+[701]

In the above example, if overflow information is turned off:

[]+[]+[]+[](Nothing is sent)

A DID call rings the VM/AA directly:

[B]+[9999]+[]+[]

9999 are the DID digits from C.O.

In the above example, if did information is turned off:

[]+[9999]+[]+[]

A station transfers (blind or screened) a call (C.O., DID or intercom) to VM/AA group or port. When the transferring station hangs up (blind transfer):

[]+[]+[]+[] (Nothing is sent)

A station (202) transfers a C.O. call (702) to a station (225) that is Call Forward All to a VM/AA group or port. When the transferring station hangs up (blind transfer) and the VM/AA group or port answers:

[#]+[225]+[x]+[702]

A station (202) transfers a C.O. call (702) to a group (501) that overflows to a VM/AA group or port:

[#]+[501]+[X]+[702]

In the above example, if overflow information is turned off:

[]+[]+[]+[] (Nothing is sent)

A station (205) calls a VM/AA port or group :

[*]+[205]+[]+[]

In the above example, if direct information is turned off:

[]+[]+[]+[] (Nothing is sent)

A station (205) calls using MESSAGE key:

[*]+[205]+[]+[]

In the above example, if message information is turned off:

[]+[]+[]+[] (Nothing is sent)

A call (702) recalls back from station 225 to the VM/AA group:

[#]+[225]+[x]+[702]

In the above example, if recall and DN2/CO information are turned off:

[]+[]+[]+[] (Nothing is sent)

CLIP TRANSLATION TABLE

DESCRIPTION

Allows the system administrator or technician to associate a CLIP number received from the central office with a name programmed in this translation table. If there is no match between a received number and a name in this table, "no CLIP name" will be displayed.

The translation table consists of 400 entries for a iDCS 500-M system and 1500 for a iDCS 500-L system. Each entry is comprised of a ten-digit (14 digits allowed) telephone number and a 16-digit name.

Names are written using the keypad. Each press of a key will select a character. Pressing the next key will move the cursor to the next position. For example, if the directory name is "SAM SMITH," press the number "7" four times to get the letter "S." Now press the number "2" once to get the letter "A." Continue selecting characters from the table below to complete your message.

When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0
DIAL 1	Space	?	,	!	1
DIAL 2	A	B	C	@	2
DIAL 3	D	E	F	#	3
DIAL 4	G	H	I	\$	4
DIAL 5	J	K	L	%	5
DIAL 6	M	N	O	^	6
DIAL 7	P	Q	R	S	7
DIAL 8	T	U	V	*	8
DIAL 9	W	X	Y	Z	9
DIAL *	:	=	[]	*

The # key can be used for the following special characters: #, space, &, !, :, ?, ., ,, %, \$, -, <, >, /, =, [,], @, ^, (,), _ , +, {, }, |, ;, ", →, ` , and \.

AA TRANSLATION TABLE

DESCRIPTION

AA translation tables are responsible for routing calls based on digits dialed. There are 12 translation tables available. Each table can be assigned to one or more plans in MMC 733 Auto Attendant Plan Programming. A translation table consists of a number of entries. Each entry number has two fields to program: the first field is for the digits received by the caller and the second field is for the destination or action.

Translation tables 1-12 have 100 entries each. The destination field can be a station number, station group or another plan. Plans are entered by pressing special key A plus two digits 01– 12. If a voice mail group is entered, the call will be transferred to the voice mail system with the appropriate in band digit packet to indicate a Forward All call from the station number dialed by the caller.

The digits defined in the first field of this MMC [dialed digits] must be a valid station number.

If the digits programmed as a destination are a voice mail port the voice mail port will receive an in band packet of DTMF equal to [FWD from EXTENSION NUMBER DIALED].

There are a number of special characters that are used in translation tables. They are as follows:

- * = Used to represent any digit.
- P = (Special Key A) Plan. Used to assign a plan as a destination (P01–P12).
- B = (Special Key B) Buffer. When used in the destination field, transfers the call to the same extension as the digits dialed by the caller.
- C = (Special Key C) Change greeting or Ring Plan.

DESTINATION :

Consider the following entry examples.

DIGITS	DEST	COMMENTS
0	0	Caller will be transferred to 0.
2**	B	If a caller dials any three digit extension number beginning with 2, the call will be transferred to the extension number dialed.
48#2	C	If a caller dials 48#2, the current plan's greeting may be changed. 48#2 is essentially a special passcode for changing the current greeting or ring plan.
1	526	If a caller dials 1, the call will be transferred to group 526.
5	P08	If a caller dials 5, the call will be transferred to plan 08.

Number conflicts like 2 and 23 or 56 and 567 are allowed in translation table programming. In these cases, the system will compare received digits from AA card after AA TRANS time and transfer to the proper destination.

The following applies to the iDCS 500:

Entries in the translation table will also provide the following features which are useful if a mailbox owner does not have a telephone on the system, but does have a CADENCE voice mailbox.

If a caller dials # + nnn he will leave a message directly in the mailbox specified in the destination.

If a caller dials * + nnn he will log into the mailbox specified in the destination.

If the translation table contains an entry like nnn = D (D is selected using the fourth soft key) callers dialing nnn will leave a message directly in the mailbox specified in the destination.

NOTES ABOUT CHANGING RING PLANS AND ALTERNATE GREETING

MANUAL SERVICE

1. When the phone system changes ring plans, the AA greetings will also change as programmed in MMC 733.
2. When the AA alternate greeting passcode is entered the caller may input a digit to change the ring plan. This means that a customer who wants to put the system in a different ring plan can call in remotely and do it.
3. When the alternate greeting passcode is entered, the system will allow to select a ring plan. If a RP (ring plan) key is programmed on the system it will FLASH. The normal status of this light in a ring plan is on steady. A flashing RP key corresponding to the ring plan indicates the remote ring plan has been set. If a RTO key is available it will also flash.
4. If the alternate greeting is not activated but the ring plan is changed the system will remain in the selected ring plan until the next scheduled ring plan change. If the alternate greeting is activated the system will remain in the existing ring plan or the selected ring plan until the alternate greeting is manually deactivated.
5. To implement ring plan changes and /or the alternate greeting the caller must enter the number or "passcode" that implements the special key program. After the passcode is entered the caller must enter 2 digits. The first digit selects the desired ring plan to change to (1-6) or 0 for no change. The second digit activates the alternate message. 0 for no alternate message or 1 for alternate message.

Example: Caller dials into the system and is answered by the AA card. The caller then input the special code or "password" 48#2. The caller then dials 3 to select ring plan 3 and then dials 1 to turn on the alternate greeting. The system now ring according to ring plan 3. Ring plan 3 is directed to the AA card and the caller is now answered by the alternate greeting.

AA PLAN TABLE

DESCRIPTION

Used to program each AA plan. A plan is a module that processes a call. There are twelve plans available in each AA card. Each plan can route a caller to any group, extension or another plan. Each port can answer calls with a different plan as defined in MMC 735.

This MMC includes options to select messages to play to a caller. These messages can be as follows:

MESSAGES 01-48

These can be created using the AAREC soft key (programmed on keysets by using MMC 722 or 723). A total of two minutes of message time is available.

MESSAGES 49-64

(The announcement may be different according to the AA MSG ROM)

These are pre-programmed as follows:

- 49 "Thank you for calling, please dial your party's extension number."
- 50 "Invalid number, please try again."
- 51 "I'm sorry, there is no answer."
- 52 "I'm sorry, that station is busy."
- 53 "One moment please."
- 54 "Transferring."
- 55 "I'll transfer you."
- 56 "Good-bye."
- 57 "Thank you."
- 58 "Please hold for the operator."
- 59 "Please hold for assistance."
- 60 "Thank you, good-bye."
- 61 "I'm sorry, all stations are presently busy."
- 62 "I'm sorry, all stations are still busy."
- 63 "Please call back later."
- 64 "I'm sorry, not a valid selection."

PLAN MESSAGE (RING PLANS 01-06)

This is the message that will be heard by the caller when the AA port answers a call if the telephone system is in a particular ring mode or if another message has been selected by the AA administrator. This message has a default selection of AA ROM message number 49 but it can be replaced with a customized message (01-48) or with any other ROM message (49-64). For instructions on how to create these recordings see Special Applications, Auto Attendant/Uniform Call Distribution.

ALTERNATE MESSAGE

This is the message that will be heard by the caller when the AA port answers a call if this message has been selected by the AA administrator. This message has a default selection of 49 but it can be replaced with a customized message (01–48) or with any other ROM message (49–64). For instructions on how to create these recordings see Special Applications, Auto Attendant/Uniform Call Distribution.

INVALID MESSAGE

Determines what message will play if the caller dials invalid digits repeatedly until the retry counter expires. Invalid digits are digits not contained in the translation table for this plan. The invalid message will repeat for the value contained in the retry counter. This message has a default selection of ROM message 64 but it can be replaced with a customised message (01–48) or with any other ROM message (49–64). For instructions on how to create these recordings see Special Applications, Auto Attendant/Uniform Call Distribution.

NO ANSWER MESSAGE

Determines what message will play if the caller is recalled to the AA port because of a no answer. This message has a default selection of ROM message number 51 but it can be replaced with a customised message (01–48) or with any other ROM message (49–64). For instructions on how to create these recordings see Special Applications, Auto Attendant/Uniform Call Distribution.

TRANSFER MESSAGE

Determines what message will play if the caller is transferred. This message has a default selection of ROM message number 53 but it can be replaced with a customised message (01–48) or with any other ROM message (49–64). For instructions on how to create these recordings see Special Applications, Auto Attendant/Uniform Call Distribution.

BUSY MESSAGE

Determines what message will play if the caller selects a busy station. This message has a default selection of ROM message number 52 but it can be replaced with a customised message (01–48) or with any other ROM message (49–64). For instructions on how to create these recordings see Special Applications, Auto Attendant/Uniform Call Distribution.

NO STATION MESSAGE

Determines what message will play if the caller dials an invalid extension (not installed). This message has a default selection of ROM message number 50 but it can be replaced with a customised message (01–48) or with any other ROM message (49–64). This retry message will repeat for the value contained in the retry counter. See Retry Count. For instructions on how to create these recordings see Special Applications, Auto Attendant/Uniform Call Distribution.

NO ACTION MESSAGE

Determines what message will play if the caller does not act. This message has a default selection of ROM message number 59 but it can be replaced with a customised message (01–48) or with any other ROM message (49–64).

CAMP-ON

Determines if calls will be transferred to busy stations. Calls transferred to busy stations will be camped-on. The default value is OFF.

ANSWER DELAY

Sets how many rings will occur before this plan answers a call. The default value is 01 second.

RETRY COUNT

Determines how many selection errors a caller may make before being transferred to the invalid digits destination. The default value is 3.

TRANSLATION TABLE

Determines what translation table this plan will use. (see MMC 732 Auto Attendant Trans Table).

It is also common for analogue circuits to be Multiplexed on a carrier like a SLC 96 (Subscriber Loop Carrier, 96 channels - Pronounced SLICK 96) These may also lack a positive disconnect. Note that it may not be immediately apparent if an analogue line is delivered over a SLC, as they will look like regular copper tip and rings at the demark. When in doubt verify the disconnect with a meter.

BUSY DESTINATION

Determines the destination for the call if the selected destination is busy. This can be another station, station group or plan. Plans are entered by pressing A key plus two digits 01–12. The default value is 500.

NO ANSWER DESTINATION

Determines the destination for the call if the selected destination does not answer. This can be another station, station group or plan. Plans are entered by pressing A key plus two digits 01–12. The default value is 500.

NO ACTION DESTINATION

Determines the destination for the call if the caller makes no response (this is also the destination for rotary dial callers). This can be another station, station group or plan. Plans are entered by pressing A key plus two digits 01–12. The default value is 500.

INVALID DESTINATION

Determines the destination for the call if the caller dials invalid digits after the retry counter has expired. This destination can be another station, station group or plan. Plans are entered by pressing A key plus two digits 01–12. The default value is 500.

NOTE ABOUT TRUNK SIGNALLING

UCD is designed to hold a call until an agent is available. It is therefore essential that a customer gets a disconnect from the C.O. when a caller hangs up. If not the call may be held in the UCD loop until answered. This could be a long time, and when an agent finally does answer there would be no one there.

AUTO ATTENDANT MESSAGE MATCH

DESCRIPTION

It is possible to make 48 customized recordings on the AA ports of the AA card. For instructions on how to create these recordings, see User Instructions, Auto Attendant and Uniform Call Distribution System Administration.

It is important to understand the difference between recordings and messages. For example, you have customized recording 01 as “Thank you for calling” and you have customized recording #02 as “One moment please.” By default, message 01 is recording 01. When message 01 is selected as part of AA or UCD programming, the caller hears “thank you for calling” (recording 01). When message 02 is selected, the caller hears “one moment please” (recording 02). If you need a new message that says “thank you for calling, one moment please,” you can record this as recording 03 and play it as message 03 but this uses some of the RAM storage on the AA card. An easier way is to link recordings 01 and 02 to produce message 03.

This is the purpose of this MMC. We simply tell the system that message 03 equals recording 01 plus recording 02. In this MMC, the top line of the keyset display indicates a message number and the bottom line indicates the recording numbers.

MMC:737

DECT SYSTEM CODE

DESCRIPTION

Used to identify your DECT system and the handsets your register with your system.

The DECT system Code for your system is actually made up of two fields: the System ID which is three hexadecimal digits in the range 000 to 999; and the Auth Code (short for Authentication Code) which is four hexadecimal digits in the range 0000 to 9999. The default values are 000 and FFFF respectively.

You must use this MMC to change the default values for the values you have been provided with by your supplier. If you do not change the defaults you will not be able to register handsets.

Once you have entered your new System ID and Auth Code using this MMC you can then begin registering your handsets with the Auth Code. The system checks the Auth Code entered for each handset against the DECT Auth Code. If it is the same, the registration procedure continues; otherwise, the system rejects the registration procedure.

Only the system administrator and/or installer should be allowed access to change the DECT System Code and register handsets.

PROGRAM KEYS

UP & DOWN	Used to scroll through options

STATION PAIR

DESCRIPTION

Assigns a secondary station to a keyset. This secondary station can be a keyset or single line port. It is recommended that the extension number for the secondary station should be blocked from receiving direct intercom calls in MMC 31x. STN to STN USE to prevent the secondary station being accidentally called. The secondary station assumes the Call Forwarding, COS (Class of Service), LCR COS, and DND attributes of the primary station.

If the COS is changed for either station in MMC 301 the change affects both stations. Secondary stations when dialed will also ring the primary extension. Message from secondary extension will display that (secondary) extension numbers. Callback to extension (secondary) as well.

COSTING DIAL PLAN

DESCRIPTION

The COSTING DIAL PLAN is used to analyze the leading dialed digits of a dialed number and determine what DIAL PLAN it is to follow. Data entry for this program is in three fields: ENTRY, DIGITS and COST RATE table reference.

DIGITS

Up to 500 entries may be made. Each entry can be up to ten digits. These are the entries that will be searched to find a match with the digits dialed by the station making the call. This is a leading digits table and the system will look for the exact leading digits in the table that match the number dialed. For example, if a user dials 1305 and the COSTING DIAL PLAN contains 1, 1308 and 1312, the dialed digits will be matched to 1 because 1308 and 1312 do not form a complete match. When this table is created by the technician or when any new entries are added, the system automatically places all entries in numerical order.

Wild cards (*) can be used to represent any digit. The Toll Restriction Wild Character assignment (MMC 704) is common with Call Costing and Toll Restriction. When all entries are used, [LAST ENTRY] is displayed.

DIAL PLAN

This shows in the programming display as DP and represents a pattern (1-7, 8). This pattern is used by MMC 433 TRUNK COST RATE, to determine the correct billing according to MMC 747 RATE CALCULATION TABLE

When the system finds a DIAL PLAN match for the digits dialed, the system checks MMC 747 to see what RATE CALCULATION to use for costing the call.

EXAMPLES

When a station user dials a number, the system will search the COSTING DIAL PLAN to find a match. If 13056 is dialed and this MMC contains entries 1, 13, 1305 and 1401, 1305 is the closest match and this entry will be selected. If 1305 is dialed and this MMC contains entries 1, 13, 13056 and 1401, no action will be taken until the station user dials another digit. If the next digit is 6, the 13056 entry is the closest match and this entry will be selected, but if the next digit is anything other than 6, the 13 entry is the closest match.

Whenever a new entry is added, the system will sort all entries in numerical order because this is the logical order in which the system analyzes digits. Wild cards are checked after exact digits. If 1813 and 18** are entered, the system will check 1813 first. If no match is found, it will check 18**.

RATE CALCULATION TABLE

DESCRIPTION

The **RATE CALCULATION TABLE** is used to define the billing charges for each **COST RATE**. These rate tables correlate with the Trunk Cost Rate and the Costing Dial Plan. There are eight call costing rates. Each rate has the following data fields.

FIRST INTERVAL DURATION: This is the amount of time at the beginning of each call to which a fixed cost is applied. The range is from 0 to 999 seconds, for example, 180 seconds (three minutes).

FIRST INTERVAL COST: This is the dollar cost for the first interval duration. The range is from 0 to 999, for example, 345 (\$3.45).

SECOND INTERVAL DURATION: This is the amount of time for the duration of each billing increment after the first interval has expired. The range is from 0 to 999 seconds, for example, 006 seconds (six seconds).

SECOND INTERVAL COST: This is the dollar cost for each billing increment. The range is from 0 to 999, for example 100 (\$1.00).

SURCHARGE: This is a one-time charge that is applied to the call over and above the time charges. The range is from 0 to 999, for example 150 (\$1.50).

VM CARD RESTART

DESCRIPTION

This MMC is only used for the SAMSUNG Plug In Voice Mail Card.

There are two options available in this MMC:

DOWNLOAD

When the VM card starts, part of the power up procedure will download data from the system to determine time, date, what mailboxes to create, and system numbering plan. This must be done at least once, but once done this download feature can be turned OFF to save boot up time.

CARD RESTART

If this option is set to YES the VM card will immediately restart according to the download OPTION specified above.

If during any test procedures you need to run the system with a default database and power up with this MMC option set to YES the VM database will be overwritten according to the data in MMC 751 and the default numbering plan. If you plan this type of test, remove CADENCE until the procedure is finished and the customer database is reloaded.

ASSIGN MAILBOX

DESCRIPTION

This MMC is only used for the SAMSUNG Plug in Voice Mail Card. It assigns each station or group as having a mailbox (yes or no). When stations or groups are flagged as YES, during Voice Mail card power up mailboxes will be created for each directory number with a "YES" entry.

Once the Voice Mail database has been created new boxes can be added.

- a) Through Voice Mail administration,
- b) By adding a new mailbox in this system and cycling system power.

If a mailbox is to be removed it must be done through Voice Mail administration.

If a station that do not have an associated voice mailbox, call the Voice Mail system they will be answered by the Voice Mail system main greeting.

Mailboxes that are needed for people that do not have an extension must be added through Voice Mail programming.

AUTO RECORD

DESCRIPTION

This MMC is only used for the SAMSUNG Plug in Voice Mail Card.

Some specific station in the phone system can be assigned to automatically record conversations. When this option is set, all incoming, all outgoing, or all calls (incoming or outgoing) can be recorded.

When this option is selected a specific port can be assigned for each station set to automatic conversation recording or the effectiveness of this feature cannot be guaranteed.

In this MMC you can assign:

1. Which station use this feature. - Station number
2. What mailbox the conversation are recorded in. - Mailbox number
3. What type of conversations are recorded, in, out or both. - I, O or B
4. What port is dedicated to the station. - Voice mail port number

A maximum of 8 stations can this feature in the system.

The same port cannot be assigned to more than one station. Attempts to do this will result in an error message.

When a Voice Mail port is assigned here, it is automatically removed from the Voice Mail group defined in MMC 601.

Before using this feature make sure that you are not violating any state or federal laws. Some states require that the recorded party be notified. SAMSUNG is not responsible for any illegal use of this feature.

ASSIGN VM MOH

DESCRIPTION

This MMC is only used for the SAMSUNG Plug in Voice Mail Card.

This MMC is used to assign each port a Music on Hold source for the system from a sound file located on the VM hard disk drive. The 100 available sound files are defined as numbers 5000 to 5099.

Basically VM card supports various music for numbers 5000 to 5099. If you want to use default VM support music, select the number. Otherwise, make sure you record the sound file first. The next step is to assign the sound file to a VM port. For example, if you record sound file 5025 you would associate 25 with a specific VM port, e.g. 225. This will dedicate the port for use only as MOH and remove it from group 529 or 549. Now 225 will show up as a valid music source in MMC 308, 309 and 408.

Each Music on Hold source assigned here requires one VM port.

If the first VM port is used for VM MOH, it must be disabled before boot up since VM and the system use port 1 during boot up to exchange critical information. For this reason we suggest you use the last port as VM MOH ports.

ITEM COST TABLE

- Available in Hotel/Motel enabled only

DESCRIPTION

This MMC provides a means to assign a code to a billable item along with a 10 character name for the item. There are a maximum of 100 entries (00 to 99) in the table with item 00 reserved as the code for room deposits, 01 reserved as the code for phone deposits and items 89 to 99 are reserved for other PMS stream items. These item codes with the exception of codes 93 to 99 will appear on the guests bill at checkout and will serve to identify what each charge on the bill is for. The room bill, when printed will also show telephone calls with an item designation of TEL and the name field will show the number dialed. In addition to the name up to 8 of the tax codes or rates defined in MMC 761 can be applied to each item.

PRE DEFINED CODES

ITEM DESCRIPTION

00 Phone Deposit	This is the code used for pre pay phone deposits
01 Phone Deposit	This is the code used for pre pay phone deposits
02 ~ 88	User Assignable Code
89 W/UP SET	A wake up call was set
90 W/UP ANS	A wake up call was answered
91 W/UP N/ANS	A wake up call was not answered
92 W/UP CANCL	A wake up call was cancelled
93 Check In	A guest has checked into a room
94 Check out	A guest has checked out of a room

TAX RATE SETUP

- Available in Hotel/Motel enabled only

DESCRIPTION

This MMC allows the technician to set up the 8 tax rates used in MMC 760. Each tax rate may be defined as a fixed value or as a percentage of the item cost. In addition a 10 character name may be used to define the reason for the tax. The Various options are further detailed below.

TAX RATE This is the number assigned to this tax rate. The tax rates are numbered 1 to 8 to match the rate field in MMC 760 counting from left to right.

TYPE This is the type of tax and defines if the VALUE is applied as a percentage (%) of the cost of an item or is added as a fixed dollar value (\$) to an item.

VALUE This is the actual tax rate that will be applied to the item cost.

NAME This is a 10 character name that will be displayed on the room bill alongside the tax.

Names for the items are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH," press the number "7" four times to get the letter "S." Now press the number "2" once to get the letter "A." Continue selecting characters from the table below to complete your message. Pressing the A button key will change the letter from upper case to lower case.

When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

COUNT	1	2	3	4	5
DIAL 0	<	>	.)	0
DIAL 1	Space	?	,	!	1
DIAL 2	A	B	C	@	2
DIAL 3	D	E	F	#	3
DIAL 4	G	H	I	\$	4
DIAL 5	J	K	L	%	5
DIAL 6	M	N	O	^	6
DIAL 7	P	Q	R	S	7
DIAL 8	T	U	V	*	8
DIAL 9	W	X	Y	Z	9
DIAL *	:	=	[]	*

The # key can be used for the following special characters: #, space, &, !, :, ?, ., , %, \$, -, <, >, /, =, [], @, ^, (,), _ , +, {, }, |, ;, ", →, ` , and \.

SYSTEM I/O PARAMETER

DESCRIPTION:

Provides a means of assigning a system I/O port for use with one of the service types detailed below. There are up to five IO ports possibly available on the IDCS 500 with LAN module. When the LAN module is installed, the fifth IO port is used to internal MODEM control. When the LAN module is not installed on the iDCS 500, only three IO ports are available and the third IO port is used to internal MODEM control. It should be noted that system I/O ports cannot be assigned with the same service type option.

TX LEVEL AND T-SWITCH GAIN

DESCRIPTION

Allows the system administrator to set the base level of the TX volume on keysets system wide. There are eight (8) levels those are able to be controled by the VOL UP and DOWN key on keyset. And maximum controllable levels in the system are ten (10). Keyset station users can vary eight levels. So this MMC gives the most flexibility to the system administrator so he can classify any desired eight (8) levels within eleven (11).

This MMC controls for types level or gain:

- 0 TX LEVEL CONTROL**
- 1 MISC TSW GAIN**
- 2 TSW GAIN CONTROL**

This MMC should not be changed from the default levels without the assistance of the technical support department

PROGRAM KEYS

CARD PRE-INSTALL

DESCRIPTION

Allows the pre-programming of a card slot for a specific board type. A board inserted into a system will not be recognized by the system until it is ENABLED using this MMC. Cards installed using MMC 806 will NOT be assigned in the system numbering plan. You must then use MMC 724 to assign the desired directory numbers to extensions, trunks, AA, ports or miscellaneous functions. This MMC also shows which PSU is powering the card selected.

If a card is removed and a different type card is inserted and this MMC is performed, the memory associated with that card (i.e. key programming, etc.) will be erased.

CUSTOMER DATABASE COPY

DESCRIPTION

Provides a means to copy the customer database to the SMDB (iDCS 500 Smart Media card Data Base). This enables the on board database (SRAM) to be copied to the SMDB and also allows the SMDB database to be copied to the on board database. A daily save can be programmed to automatically save the on board data base to the SMDB. This insures that an up to date database is always available in the case of a catastrophic failure. A daily save time of 00:00 means there are no save performed. It is recommended to CLEAR the SMDB before the SRAM is copied to it. When the SRAM is copied to the SMDB there is no interruption in service. If the SMDB is copied to the SRAM the system will reset to accept the new data.

NOTE A Smart Media Card of 8 Mega Bytes or above must be installed in order to copy the on board database (SRAM) on to the Smart Media card (SMDB).

DATABASE IDENTIFICATION

SMDB	iDCS 500 Smart Media card database
SRAM	iDCS 500 MCP On-Board database
S:mm/dd/yy hh:mm	Indicates the time the database was saved to the SMDB or the time the SRAM was last saved
DAILY SAVE hh:mm	The time the SRAM will be saved to the SMDB

MMC:824

NETWORK DIAL TRANSLATION

DESCRIPTION

Assigns the digit translation table used for Q-SIG networking. Generally under networking condition, the user must dial the node ID and extension number to call the another node extension. It's not convenient. In this MMC, the system provides the easy digit translation of NETWORK LCR DIAL number. The translated digits are works like as LCR plus translated digits. Using this MMC, the user only dial the another node extension number and call the another node extension simply. The iDCS 500-L system provides 96 entry of network dial translation table and the iDCS 500-M system provides 8 entry of network dial translation table.

MMC:831

VOIP PARAMETERS

DESCRIPTION

Provides a means to apply the Internet Protocol (IP) address to the ITM3 card. This MMC also assigns the number of channels that can be used for IP faxes. The CLIP tables allow the calling station number to be received at the far end ITM3 location.

This MMC cannot be accessed unless there is an ITM3 card installed in the system.

IP ADDRESS	Specifies the IP address for the ITM3 card. When changing the address three digits must be input for each field. Example
SUBNET MASK	Specifies the IP subnet mask. When changing the address three digits must be input for each field.
GATEWAY	Specifies the LAN gateway address when leaving the local network. When changing the address three digits must be input for each field.
STS Period	Status Send Period designates the timed message cycle to check the remote IP status (Range: 00~60 sec.)
MAX FAX CH	Maximum facsimile channels. Specifies the maximum number of ITM3 channels that will accept IP T.38 protocol IP facsimiles. (Default: 0)
CLIP TABLE	Calling Line Identification Presentation. This provides the calling station number when calling from on ITM3 location to another ITM3 location. If set to NONE, MMC 405 TRUNK NUMBER will be sent. In other cases, MMC 323 SEND CLIP INFO entry will be sent.
VOIP MODE	Three options are available. (FOLLOW TRK RING, FOLLOW DID TRANS or FOLLOW INCOM DGT)

VOIP CODE

DESCRIPTION:

Provides a means to set the ITM3 internal numbering plan for dialing and conversion.

ACCESS CODE	This is the access code once the ITM3 is accessed directs a call based on the routing tables. An access code table is references an access code. A maximum of 8 digits are available with 63 access code entries (00 ~ 62)
CODE LENGTH	This field requests the number of digits that are expected to be received to make up the access code.
DEL LENGTH	This is the number of digits to delete after receiving the access code. If no digits are deleted the access code will be sent as part of the call to the destination to continue routing at the far end destination.
INSERT CODE	This is the code to insert for routing at the destination. This can be used when different numbering plans exist or if a dial 9 access is needed to be inserted in the dialed digits.
IP TABLE 1	This is the first table referenced for routing the access code to an IP address. The system has 31 IP tables (00~30) with 32 entries (00~31) in each table.
IP TABLE 2	This is the second table referenced as a look up for an IP address to route the call based on the access code.
IP START	This entry indicates where in a table to start looking for an IP code to associated with the access code. This can be used to manage where to start looking for an IP address in high traffic ITM3 applications. Example: If IP address routing to the desired destination is known to be in the last 7 entries of a table the IP START location would be 25. IP address searching would start at entry 25.

VOIP IP TABLE

DESCRIPTION

This MMC provides the IP addresses in tables pointed to by the access code entry. There are 31 tables with up to 32 entries each. The destination IP address is required to route dialed digits based on the access code and digits dialed. The IP entry field is divided into 4 sections allowing modification of separate IP address fields.

All IP address entries must 3 digit entries. For example: IP address 105.52.10.201 must be input as 105.052.010.201.

MMC:834

VOIP OPTION

DESCRIPTION

This MMC provides various VOIP support options. The options set in this MMC are ITM3 system wide.

PCM COMPANDING:	Select U-law or A-law PCM.
H.323 FAST START SETUP:	Enables or disables the H.323 Fast Start call method.
GATEWAY CALL ID:	This a numeric entry that identifications the system via ITM3 connection. The maximum entry is 4 digits.
CALLER ID TYPE:	This option controls the calling party identification type. There are 3 possible selections. ANI which shows the calling station number when the call is an ITM3 to ITM3. IP which shows the calling ITM3 IP address. Gateway ID which is a 4 digit preprogrammed ID.
INCOMING CHANNEL SELECTION:	This option selects whether the incoming channel is Sequential or Distributed.
DTMF GENERATION:	This option allows 4 different transport types of DTMF. Inband, Q931, H.245 Signal, H.245 Numeric.
FAX SIGNAL TYPE:	This option select the facsimile standard to use when transporting facsimiles via the ITM3. Selections are T.38 or the proprietary Samsung formats. Default is the T.38 facsimile standard.
SWITCH TO H.245:	This option enables switching to the H.245 protocol at the time of Fast Start
DEFAULT DIL:	This allows programming of the default DIL number when a digits are not included on an incoming call.
SNMP SERVER ID:	This allows entry of the SNMP server IP address when connected to network management equipment.
SIGNALLING PORT:	Indicate the port number for H.323 signalling and sets a range of numbers allowed by firewall equipment. The IP path or port used is 10000
STATUS PORT:	Port number for the exchange of status information between ITM3 cards. The IP path or port used in 20000
WCS PORT:	Proprietary Samsung Web Call Service. The IP path or port used is 20010
SIGK ACCESS PORT:	Samsung Internet Gatekeeper. The IP path or port used is 20020.

MAKE DEFAULT DB:

This option permits defaulting the ITM3 card program to he default parameters. CAUTION: This option is SYSTEM WIDE and defaults all ITM3 cards in the system!!! Card must be RESTARTED to take affect.

VOIP DSP OPTION

DESCRIPTION

This MMC provides various VOIP DSP options. The options set in this MMC are ITM3 system wide.

AUDIO CODEC:	Selects which audio codec compression to use. Selections are 1.G.711 (64K), 2.G.723.1 (5.3K ~ 6.4K), 3.G.729A (8K).
ECHO CANCELLATION:	Enables or disables echo cancellation (0: disable, 1:enable). This function removes echo that is generated by voice reflection and packet delay.
SILENCE SUPPRESSION:	This parameter determines whether silence suppression is used (0: disable, 1: enable). This prevents transmission during the silence period of a call.
INPUT FILTER:	This option select input filtering of the DSP (0: disable, 1: enable). This should be set as ON.
OUTPUT FILTER:	This option select output filtering of the DSP (0: disable, 1: enable). This should be set as ON.
INPUT GAIN:	PCM input gain value of DSP. The range is -31dB~31dB (0~63). This set the quality of PCM voice from the VOIP DSP to the site.
VOICE VOLUME:	This select the voice volume. The range is -31dB~31dB (0~63).
MULTI FRAME COUNTER:	This option selects the number of frames the ITM3 will consolidate the packet header message. The voice packets are buffered to the set number and sent as a single packet. The range is 1~12.
JITTER OPTION:	This selects the dynamic jitter specific value. Value determines whether the focus is on packet loss or packet delay. The range is 00~12.
VOICE PROMPT SWAP:	Decides the adjustment of the byte order of the voice announce data (0: disable, 1: enable)
RTP DELAY LIMIT:	This is the value of the delay limit. The status will change when this limit is exceeded. The value is measured in milliseconds (ms). This is used to determine network error.
RTP LOSS LIMIT:	This is the value of the loss limit value. The status will change when this limit is exceeded. The value is measured in percentages (%). The range is 00~25 %. This is used to determine network error.
RTP CHECK PERIOD:	This is the packet loss estimated base period measured in seconds. The range is 00~25 seconds. This is used to determine network error.
RTP OVERCOUNT LIMIT:	This limit/loss limit excess count. The range is 0~3. This is used to determine network error.
DTMF ON:	The DTMF ON time in milliseconds (ms).
DTMF OFF	: The DTMF OFF time in milliseconds (ms)

VOIP GK OPTION

DESCRIPTION

Provides a means to set the ITM3 Gatekeeper options for identification to a network gatekeeper. The setting are selectable for each ITM card installed.

GK CONNECT:	This determine if the ITM3 is to connect to a gatekeeper. The option are disable or enable.
GK TYPE:	This determines if connected to a Samsung SIGK or other type of gatekeeper.
GK IP:	This is gatekeepers IP address.
GK NAME:	This is name identifier of the gatekeeper. The name can be alphanumeric. An entry of 9 alphanumeric character with a space followed by an gatekeeper. This can be up to 16 characters.
GW H.323 ID:	This is the H.323 identifier of the ITM3 that is registered with the gatekeeper. This can be up to 16 characters.
GW E.164 NUMBER:	This is the E.164 identifier of the ITM3 that is registered with the gatekeeper and can be up to 16 digits in length.
KEEP ALIVE:	This is the timer that the ITM3 uses to acknowledge the presence of the gatekeeper. The range is 000~999 seconds.

ALARM REPORTING

- Available in with LAN module only

DESCRIPTION

This MMC is used to view, store, print or clear system alarms. There are two levels of faults displayed via alarm code, major alarms and minor alarms. Major alarms codes are usually service affecting and require a certified technician to determine the fault. A minor alarm indicates a fault that may or may not be service affecting and usually does not seriously degrade the systems operating capabilities. The alarm buffer will hold up to 100 alarms on a first in - first out (FIFO) basis. Alarms will provide a date and time stamp based on the system time. If applicable the hardware cabinet, port, and/or slot will be displayed. If an ALARM SIO port is programmed (MMC 804) alarm information can be printed on demand and also prints as alarm information is provided.

* System Alarm Reporting is only available with a LAN module installed on the MCP card.

ALARM REPORTING OPTIONS (Select one of the options)

- 0

VIEW ALARM

View alarm buffer
- 1

OVERFLOW CONTROL

OVERWRITTEN

When buffer is full, the oldest entry in buffer overwritten.

STOP RECORDING

ALARM CODE DEFINITIONS

ALM CODE	ALARM	DEFINITION
MJA01	POR Restart	MCP restart process has been executed via power on restart (POR).
MJA02	Soft Restart	MCP restart process has been executed via button reset.
MJA03	Mem Reset	The system RAM has been cleared via manual programming (PCMMC or KMMC) resulting in a system reset.
MJA04	MCP Reset	<p>The MCP has reset. Alarm data = Reason</p> <ul style="list-style-type: none"> - BUS ERR: Restart Bus Error - ADDR.ERR: Restart Address Error - ILLEGAL: Restart Illegal opcode - ZERO DIVID: Restart Zero divide - PRIVILEGE: Restart Privilege Violation - VECTOR 1: Restart Auto Vector Level 1 - DTACK RD: Restart Auto Vector Level 2 - DTACK WR: Restart Auto Vector Level 3 - VECTOR 4: Restart Auto Vector Level 4 - VECTOR 5: Restart Auto Vector Level 5 - VECTOR 6: Restart Auto Vector Level 6 - WR PROTECT: Restart Auto Vector Level 7 - ENDL LOOP: Restart Endless Loop

ALM CODE	ALARM	DEFINITION
MJA05	LCP Reset	The SCP or LCP has reset Alarm data = Cabinet (1, 2 or 3)
MJA06	PCM Switching	A fault has occurred in the Switching Control Alarm data = MCP BASE, ESM OPT:1, ESM OPT:2 or ESM OPT:3
MJB01	HDLC Com Error	Communications to Local Control Processor lost or faulty.
MJB02	Memory Alarm 1	A RAM diagnostic check error has occurred in the MCP.
MJB03	Memory Alarm 2	A RAM diagnostic check error has occurred in the SCP.
MJB04	Memory Alarm 3	A RAM diagnostic check error has occurred in the LCP 1.
MJB05	Memory Alarm 4	A RAM diagnostic check error has occurred in the LCP 2.
MJB06	IPC MSGQ Over	IPC TX queue full error has occurred in the MCP. Alarm data = IPC Queue type (MCP-LAN, MCP-SCP, MCP-LCP1, MCP-LCP2)
MJB06	IPC MSGQ Under	IPC TX queue under error has occurred in the MCP. Alarm data = IPC Queue type (MCP-LAN, MCP-SCP, MCP-LCP1, MCP-LCP2)
MJB07	Task MSGQ Over	Task MSG queue full error has occurred in the MCP. Alarm data = Error Task Kind (CNFG, ERRH, NPER, MSGH, DIGH, SMART, CALL, PPER, SMDR, TMMC, IDLE)
MJB07	Task MSGQ Under	Task MSG queue under error has occurred in the MCP. Alarm data = Error Task Kind (CNFG, ERRH, NPER, MSGH, DIGH, SMART, CALL, PPER, SMDR, TMMC, IDLE)
MJC01	DTMF Fault	An abnormal interrupt has occurred in the system DTMF resources. Alarm data = DTMF Receiver number (MCP BASE, MCP OPT:1, MCP OPT:2, MCP OPT:3, C#2 BASE , C#2 OPT:1, C#2 OPT:2, C#2 OPT:3, C#3 BASE, C#3 OPT:1, C#3 OPT:2, C#3 OPT:3)
MJC02	Tone Fault	An abnormal interrupt has occurred in the system tone resources. IE busy, ringback, error, no more calls etc. Alarm data = TONE Receiver number (MCP BASE, MCP OPT:1, MCP OPT:2, MCP OPT:3, C#2 BASE , C#2 OPT:1, C#2 OPT:2, C#2 OPT:3, C#3 BASE, C#3 OPT:1, C#3 OPT:2, C#3 OPT:3)
MJC10	AA-DTMF Fault	An abnormal fault reported in one of the systems AA card DTMF resources. Alarm data = Cabinet, Slot, Port (Cx-Syy-Pzz)
MJC11	AA-MFR Rec	An abnormal fault reported in one of the systems AA card DTMF resources has recovered. Alarm data = Cabinet, Slot, Port (Cx-Syy-Pzz)
MJC12	E911 Restart	The E911 card has restarted. Alarm data = Cabinet, Slot (Cx-Syy)
MJC13	E911 Block	The E911 card has restarted because the system detect the card does not work correctly. Alarm data = Cabinet, Slot (Cx-Syy)

ALM CODE	ALARM	DEFINITION
MJC14	VoIP Restart	The ITM3 card has restarted. Alarm data = Cabinet, Slot (Cx-Syy)
MJC15	VoIP Block	The ITM3 card has restarted because the system detect the card does not work corectly. Alarm data = Cabinet, Slot (Cx-Syy)
MJD01	Sync Failure	Clocking on TEPRI cards has become asynchronous.
MJD02	Sync Recovery	Clocking on TEPRI cards has become synchronous.
MJD03	Red Alarm	Locally detected loss of PCM carrier on TEPRI card for more than 250 ms. Alarm Data = Cabinet, Slot (Cx-Syy)
MJD04	Red Alarm Rec	PCM carrier detected locally on TEPRI cards. Alarm Data = Cabinet, Slot (Cx-Syy)
MJD05	Yellow Alarm	Remotely detected failure transmitted in frame on TEPRI card. Alarm Data = Cabinet, Slot (Cx-Syy)
MJD06	Yellow Alarm Rec	Remotely detected failure restored transmitted on TEPRI card. Alarm Data = Cabinet, Slot (Cx-Syy)
MJD07	Blue Alarm	All one's being transmitted on facility on TEPRI card. Alarm Data = Cabinet, Slot (Cx-Syy)
MJD08	Blue Alarm Rec	A blue alarm condition has been cleared. Alarm Data = Cabinet, Slot (Cx-Syy)
MJD09	Bit Error Alarm	Alarm is activated when the when error rate exceeds 1×10^{-6} errors. Note: 1×10^{-6} is threshold for minor alarm, 1×10^{-3} is threshold for major alarm errors on E1,PRI or BRI.. Alarm Data = Cabinet, Slot (Cx-Syy)
MJD10	NTWRK Event	An Implausible event has occurred on the PRI or BRI Network digital line. Protocols do not match or subscriber ID mismatch. Alarm Data = Cabinet, Slot (Cx-Syy)
MJD11	SPID Init Error	The BRI received an error from the network Alarm Data = Cabinet, Slot, Channel (Cx-Syy-czz)
MJD12	SPID Init Rec	The BRI has recovered from an error on the network Alarm Data = Cabinet, Slot, Channel (Cx-Syy-czz)
MJD13	LPBK Error	Internal on demand loopback failed. Alarm Data = Cabinet, Slot, Channel (Cx-Syy-czz)
MJD14	LPBK Recovery	Internal on demand loopback test passed. Alarm Data = Cabinet, Slot, Channel (Cx-Syy-czz)
MJD15	BRI DL Unavail	A BRI data link is out of service. Alarm Data = Cabinet, Slot, Channel (Cx-Syy-czz)
MJD16	BRI DL Recovery	A BRI data link is back in service. Alarm Data = Cabinet, Slot, Channel (Cx-Syy-czz)
MJD17	RAM Error	An error has occurred in the TEPRI or BRI card RAM. Alarm Data = Cabinet, Slot (Cx-Syy)
MJD18	E1 Restart	The E1 card has restarted Alarm Data = Cabinet, Slot (Cx-Syy)
MJD19	PRI Restart	The PRI card has restarted Alarm Data = Cabinet, Slot (Cx-Syy)

ALM CODE	ALARM	DEFINITION
MJD20	BRI Restart	The BRI card has restarted Alarm Data = Cabinet, Slot (Cx-Syy)
MJD21	PCM Loss	Loss of PCM coding on a digital facility. Alarm Data = Cabinet, Slot (Cx-Syy)
MJD22	PCM Recovery	Recovery of PCM coding on a digital facility. Alarm Data = Cabinet, Slot (Cx-Syy)
MNF01	Card Out	A circuit card mounted in a universal slot has been removed from service or is not recognized by the system Alarm Data = Cabinet,Slot (Cx-Syy)
MNF02	Card In	A circuit card mounted in a universal slot has been returned to service. Alarm Data = Cabinet, Slot (Cx-Syy)
MNF03	IPC Error	Inter processor communication error has occurred. Alarm Data = Cabinet-Slot (Cx-Syy)
MNF04	Trunk Fault	Out of service trunk detected via loop detect. Internal CODEC test. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)
MNF05	Trunk Recovery	Out of service trunk detected via loop detected as out of service is now operational. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)
MNF06	Trunk Disconnect	Out of service trunk detected via seizure of trunk. External seizure test. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)
MNF07	Trunk Connect	Out of service trunk recovered via seizure of trunk External seizure test. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)
MNF08	SIO TxQ Over	SIO Tx Queue full error has occurred in the MCP. Alarm Data = SIO number (SIO:x)
MNF08	SIO TxQ Under	SIO Tx Queue under error has occurred in the MCP. Alarm Data = SIO number (SIO:x)
MNF70	E1 Out Of Srv	E1 Digital line status has been changed to out of service. Alarm Data = Cabinet, Slot (Cx-Syy)
MNF11	E1 In Service	E1 Digital line has been restored to normal service. Alarm Data = Cabinet,Slot (Cx-Syy)
MNF12	SIO Out	IO port has lost DTR Alarm Data = SIO number (SIO:x)
MNF13	SIO In	IO port has regained DTR. Alarm Data = SIO 1 through 6
MNF14	TODC Error	Time of Day Clock in the MCP has erred.
MNF15	TSW Over Alarm	TSW has been requested to exceed the capacity of available time slots. Maximum 192 per cabinet. Alarm Data = Cabinet, Slot (Cx-Syy)
MNF 16	PSU Alarm	Indicates there are over 56 ports in a cabinet with a single PSU and more power is required. Alarm Data = Cabinet, Slot (Cx-Syy)
MNF 17	PSU Alarm Rec	A second PSU has been recognized when added after alarm condition of Alarm Data = Cabinet, Slot (Cx-Syy)
MNF 18	SLI Fault	An SLI card has been detected as out of service via an internal CODEC test. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)

ALM CODE	ALARM	DEFINITION
MNF 19	SLI Recovery	An SLI card detected as out of service has been detected as recovered and is in service via internal CODEC test. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)
MNF 20	PSUB Alarm	Indicates there are over 120 ports in a cabinet with two PSU. Alarm Data = Cabinet, Slot (Cx-Syy)
MNF 21	DSS Alarm	System capacity of 64 button DSS modules has been exceeded.
MNF 22	Phone Disconnect	Indicates the Keyset is disconnected. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)
MNF 23	Phone Connect	Indicates the Keyset is connected. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)
MNF 24	NOT USED	FUTURE USE
MNF 25	NOT USED	FUTURE USE
MNF26	SIO RxQ Over	SIO Rx Queue full error has occurred in the MCP. Alarm Data = SIO number (SIO:x)
MNF26	SIO RxQ Under	SIO Rx Queue under error has occurred in the MCP. Alarm Data = SIO number (SIO:x)

MMC:852

SYSTEM ALARM ASSIGNMENTS

- Available in with LAN module only

DESCRIPTION

This MMC allows the assignment of system alarms to ring and display the alarms on stations that have the Alarm Key assigned. The System Alarm Key is programmed in Station Key Assignments (MMC 722). System Alarm key programming is tenant wide (tenant 1 and 2). Alarms not programmed to report to the System Alarm key will still be retained in the maintenance alarm buffer for Alarm Reporting (MMC 851). The alarm buffer will hold up to 100 alarms on a First In - First Out (FIFO) basis. Pressing the System Alarm key will silence the audible alarm until another alarm is generated by the system. Alarm conditions that have multiple causes i.e. E1 errors and synchronization loss will print all associated alarm information if an SIO port is programmed as an ALARM port. The specific fault alarm data can be displayed via MMC 851 System Alarm Reporting.

* System Alarm Reporting is only available with a LAN module installed on the MCP card.

Alarm Notification Off/On (0/1) determines if the alarm provides a visual and audible notification to the System Alarm key station(s). Pressing the System Alarm key and the release key will silence the audible alarm only at the station that pressed the System Alarm key and the release key. See alarm displays table for assignments.

PROGRAM KEYS

UP & DOWN	Used to scroll through system alarms.
KEYPAD	Used to enter selections
SOFT KEYS	Enter/leave option
SPK	Used to store data and move to next MMC
TRSF	Enter/exit MMC

ACTION

- Press TRSF 852
Display shows
- Enter desired Alarm Display number (eg. 61)
OR
Press the up and down keys to select desired option and press the right soft key and to advance the cursor.
- To select if the alarm is active press 1 for YES and 0 for NO. An entry will advance the cursor to return to Step 2.
- Press UP or DOWN to select desired option
OR
Press TRSF to return to normal display OR press SPK to advance to next MMC

40 MJD08	Blue Alarm Rec	ON/OFF	A blue alarm condition has been cleared. Alarm Data = Cabinet, Slot (Cx-Syy)
41 MJD09	Bit Error Alarm	ON/OFF	Alarm is activated when the when error rate exceeds 1×10^{-6} errors. Note: 1×10^{-6} is threshold for minor alarm, 1×10^{-3} is threshold for major alarm errors on E1,PRI or BRI.. Alarm Data = Cabinet, Slot (Cx-Syy)

Display Number/ Alm Code	LCD Display	Alarm Notification ON/OFF	Display Definition
42 MJD10	NTWRK Event	ON/OFF	An Implausible event has occurred on the PRI or BRI Network digital line. Protocols do not match or subscriber ID mismatch. Alarm Data = Cabinet, Slot (Cx-Syy)
43 MJD11	SPID Init Error	ON/OFF	The BRI received an error from the network Alarm Data = Cabinet, Slot, Channel (Cx-Syy-czz)
44 MJD12	SPID Init Rec	ON/OFF	The BRI has recovered from an error on the network Alarm Data = Cabinet, Slot, Channel (Cx-Syy-czz)
45 MJD13	LPBK Error	ON/OFF	Internal on demand loopback failed. Alarm Data = Cabinet, Slot, Channel (Cx-Syy-czz)
46 MJD14	LPBK Recovery	ON/OFF	Internal on demand loopback test passed. Alarm Data = Cabinet, Slot, Channel (Cx-Syy-czz)
47 MJD15	BRI DL Unavail	ON/OFF	A BRI data link is out of service. Alarm Data = Cabinet, Slot, Channel (Cx-Syy-czz)
48 MJD16	BRI DL Recovery	ON/OFF	A BRI data link is back in service. Alarm Data = Cabinet, Slot, Channel (Cx-Syy-czz)
49 MJD17	RAM Error	ON/OFF	An error has occurred in the TEPRI or BRI card RAM. Alarm Data = Cabinet, Slot (Cx-Syy)
50 MJD18	E1 Restart	ON/OFF	The E1 card has restarted Alarm Data = Cabinet, Slot (Cx-Syy)
51 MJD19	PRI Restart	ON/OFF	The PRI card has restarted Alarm Data = Cabinet, Slot (Cx-Syy)
52 MJD20	BRI Restart	ON/OFF	The BRI card has restarted Alarm Data = Cabinet, Slot (Cx-Syy)
53 MJD21	PCM Loss	ON/OFF	Loss of PCM coding on a digital facility. Alarm Data = Cabinet, Slot (Cx-Syy)
54 MJD22	PCM Recovery	ON/OFF	Recovery of PCM coding on a digital facility. Alarm Data = Cabinet, Slot (Cx-Syy)
61 MNF01	Card Out	ON/OFF	A circuit card mounted in a universal slot has been removed from service or is not recognized by the system Alarm Data = Cabinet,Slot (Cx-Syy)
62 MNF02	Card In	ON/OFF	A circuit card mounted in a universal slot has been returned to service. Alarm Data = Cabinet, Slot (Cx-Syy)
63 MNF03	IPC Error	ON/OFF	Inter processor communication error has occurred. Alarm Data = Cabinet-Slot (Cx-Syy)
64 MNF04	Trunk Fault	ON/OFF	Out of service trunk detected via loop detect. Internal CODEC test. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)
65 MNF05	Trunk Recovery	ON/OFF	Out of service trunk detected via loop detected as out of service is now operational. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)
66 MNF06	Trunk Disconnect	ON/OFF	Out of service trunk detected via seizure of trunk. External seizure test. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)
67 MNF07	Trunk Connect	ON/OFF	Out of service trunk recovered via seizure of trunk. External seizure test. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)
68 MNF08	SIO TxQ Over	ON/OFF	SIO Tx Queue full error has occurred in the MCP. Alarm Data = SIO number (SIO:x)

Display Number/ Alm Code	LCD Display	Alarm Notification ON/OFF	Display Definition
69 MNF08	SIO TxQ Under	ON/OFF	SIO Tx Queue under error has occurred in the MCP. Alarm Data = SIO number (SIO:x)
70 MNF70	E1 Out Of Srv	ON/OFF	E1 Digital line status has been changed to out of service. Alarm Data = Cabinet, Slot (Cx-Syy)
71 MNF11	E1 In Service	ON/OFF	E1 Digital line has been restored to normal service. Alarm Data = Cabinet, Slot (Cx-Syy)
72 MNF12	SIO Out	ON/OFF	IO port has lost DTR Alarm Data = SIO number (SIO:x)
73 MNF13	SIO In	ON/OFF	IO port has regained DTR. Alarm Data = SIO 1 through 6
74 MNF14	TODC Error	ON/OFF	Time of Day Clock in the MCP has erred.
75 MNF15	TSW Over Alarm	ON/OFF	TSW has been requested to exceed the capacity of available time slots. Maximum 192 per cabinet. Alarm Data = Cabinet, Slot (Cx-Syy)
76 MNF 16	PSU Alarm	ON/OFF	Indicates there are over 56 ports in a cabinet with a single PSU and more power is required. Alarm Data = Cabinet, Slot (Cx-Syy)
77 MNF 17	PSU Alarm Rec	ON/OFF	A second PSU has been recognized when added after alarm condition of Alarm Data = Cabinet, Slot (Cx-Syy)
78 MNF 18	SLI Fault	ON/OFF	An SLI card has been detected as out of service via an internal CODEC test. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)
79 MNF 19	SLI Recovery	ON/OFF	An SLI card detected as out of service has been detected as recovered and is in service via internal CODEC test. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)
80 MNF 20	PSUB Alarm	ON/OFF	Indicates there are over 120 ports in a cabinet with two PSU. Alarm Data = Cabinet, Slot (Cx-Syy)
81 MNF 21	DSS Alarm	ON/OFF	System capacity of 64 button DSS modules has been exceeded.
82 MNF 22	Phone Disconnect	ON/OFF	Indicates the Keyset is disconnected. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)
83 MNF 23	Phone Connect	ON/OFF	Indicates the Keyset is connected. Alarm Data = Cabinet, Slot, Port (Cx-Syy-Pzz)
84 MNF 24	NOT USED	OFF	FUTURE USE
85 MNF 25	NOT USED	OFF	FUTURE USE
86 MNF26	SIO RxQ Over	ON/OFF	SIO Rx Queue full error has occurred in the MCP. Alarm Data = SIO number (SIO:x)

DIAGNOSTIC TIME

- Available in with LAN module only

DESCRIPTION

Provides a means to set the Diagnostic Time. The system diagnostics tests include memory audits, internal loopback tests on digital trunks, DSP, AA DSP tests. Additional tests include CODEC tests on analog trunk and station cards and tone tests. If the diagnostics cannot complete the tests because of system traffic, the system will abort the test and retry during the next programmed diagnostic time. It is recommended to assign the diagnostic time during non-peak traffic periods.

* Diagnostics are only available with a LAN module installed on the MCP card.

TECH PROGRAMMING LOGS

- Available in with LAN module only

DESCRIPTION

This MMC lists the date, time and entry location of the last eight times that technician programming was accessed. This will allow a technician to determine if there was unauthorised access to system programming and where this access occurred. The information stored in this log will consist of 2 elements, the date and time it occurred at and the access location.

* Tech. Programming Logs is only available with a LAN module installed on the MCP card.

There are 4 types of access location information as described below:

NNNN	This would be the extension number of a keyset that had accessed programming directly.
MODEM	This would indicate that programming was accessed by PCMMC via the integrated V90 modem attached to the IOM board of main cabinet.
LAN	This would indicate that programming was accessed by PCMMC via the LAN connection on the IOM board of main cabinet.
SIOx	This would indicate that programming was accessed by PCMMC via one of the SIO connections on the IOM board of the main cabinet where x is the number (1~4) of the SIO port that was used.

PROGRAM KEYS

See MMCs 702 and 703. Place a (1) in each box for the desired digit.

ASSIGN SYSTEM SPEED DIAL

[illegible]

MMC 706	SYSTEM SPEED DIAL BY NAME
---------	---------------------------

MMC 706	SYSTEM SPEED DIAL BY NAME
---------	---------------------------

[illegible]

AUTHORIZATION CODE

[illegible]

Enter authorization codes (four digits maximum in the M version and 4 to 10 digits in the L version)—There are 250 available entries for a iDCS 500-M system and 500 available entries for a iDCS 500-L system.

MMC 708

ACCOUNT CODE

INDEX	ACCOUNT CODE	INDEX	ACCOUNT CODE

Enter account codes (maximum four digits).

There are 500 available entries for a iDCS 500-M system and 999 available entries for a iDCS 500-L system.

LCR DIGIT TABLE

[illegible]

There is a maximum of 1,000 entries on a idcs 500-M system and 2,000 entries for a iDCS 500-L system with a digit string length of 10 numerical digits.

MMC 711

LCR TIME TABLE

TIME CHANGE BANDS								
	A		B		C		D	
	HHMM	LCRT	HHMM	LCRT	HHMM	LCRT	HHMM	LCRT
DAY								
SUN								
MON								
TUE								
WED								
THU								
FRI								
SAT								

Day reflects the day of the week for time change for LCR route selection. HHMM reflects at what time selection will occur for LCR route change. Hours are entered in 24 hour format, e.g., 1:00 P.M. = 13:00 (two digits required). Minutes are entered in normal format (two digits required). LCRT reflects the entry in MMC 712 regarding what time element will be used. Entries are 1-4.

MMC 712

LCR ROUTE TABLE

LCR ROUTE	TIME CHANGE	LCRCOS	TRK GROUP	MOD DIGITS

LCR ROUTE reflects 1-16 (M version) or 1-32 (L version) available routes assigned in MMC 710. TIME CHANGE reflects time entries (LCRT 1-4) in MMC 711. LCRCOS reflects entries in MMC 310. TRKGRP reflects entries in MMC 603. MD reflects the LCR MODIFY DIGITS TABLE entries in MMC 713.

MMC 713	LCR MODIFY DIGIT TABLE
---------	------------------------

MMC 713	LCR MODIFY DIGIT TABLE
---------	------------------------

[illegible]

There are 100 modify digit entries available in the idcs 500-M system and 200 modify digits entries available in a idcs 500-L system. The number of delete digits is the amount of digits to be removed from the dial plan (maximum 15). The number of insert digits is the amount of digits to be added to the dial plan (maximum 14). The number of append digits, is the amount of digits added at the end of the dial plan (maximum 14).

MMC 714 DID NUMBER AND NAME TRANSLATION

[illegible]

Enter index (three digits, e.g., 005). Enter C.O. DIGITS RECEIVED from operating company, e.g., 5071. Enter YES or NO for call waiting. Enter station number or station group for day destination. Enter station number or station group for night destination. Enter name for DID trunk.
