ELECTRICAL SPECIFICATIONS

Aerial Input Impedance	75 ohm unbalanced
Convergence	Self Converging System
Focus	Bi-potential electrostatic
Audio Power Output Rating	3.5W max.
Intermediate Frequencies	
Picture IF Frequency , , ,	36.875 MHz
Sound Carrier Trap	31.375 MHz
Adjacent Sound Carrier Trap	38.375 MHz
Power Input	240 Volts AC 50 Hz
Power Consumption	90 Watt
Speaker Size	10 cm Round Dynamic x 1 2 cm Round Dynamic x 1
Sweep Deflection	Magnetic
Tuning Ranges	VHF-Channels 0 thru 11 UHF channels 28 thru 63

The manufacturer reserves the right to vary specifications or use alternative materials as may be deemed necessary or desirable at any time, any such change or variation being of a kind as not to reduce the quality performance or appearance substantially.

SHARP CORPORATION OF AUSTRALIA PTY. LTD.

Incorporated in Victoria
64-72 Seville St., Fairfield. N.S.W. 2165, Australia
Tel: (02)-728-9111

IMPORTANT SERVICE NOTES

Maintenance and repair of this receiver should be done by qualified service personnel only.

SERVICING OF HIGH VOLTAGE SYSTEM AND PICTURE TUBE

When servicing the high voltage system, remove static charge from it by connecting a 10k ohm Resistor in series with an insulated wire (such as a test probe) between picture tube dag and 2nd anode lead. (AC line cord should be disconnected from AC outlet.)

1. Picture tube in this receiver employs integral implosion protection.
2. Replace with tube of the same type number for continued safety.
3. Do not lift picture tube by the neck.
4. Handle the picture tube only when wearing shatter-proof goggles and after discharging the high voltage completely.

X-RAY

This receiver is designed so that any X-ray radiation is kept to an absolute minimum. Since ceratin malfunctions or servicing may produce potentially hazardous rediation with prolonged exposure at close range, the following precautions should be observed:

1. When repairing the circuit, be sure not to increase the high voltage to more than 28kV, (at beam 1.1mA) for the set.
2. To keep the set in a normal operation, be sure to make it function on 25.0 kV \pm 1.5 kV (at beam 1.2 mA) in the case of the set. The set has been factory-adjusted to the above-mentioned high voltage.
 \therefore If there is a possibility that the high voltage fluctuates as a result of the repairs, never forget to check for such high voltage after the work.
3. Do not substitute a picture tube with unauthorized types and/or brands which may cause excess X-ray radiation.

BEFORE RETURNING THE RECEIVER

Before returning the receiver to the user, perform the following safety checks.

1. Inspect all lead dress to make certain that leads are not pinched or that hardware is not lodged between the chassis and other metal parts in the receiver.
2. Inspect all protective devices such as non-metallic control knobs, insulating fishpapers, cabinet backs, adjustment and compartment covers or shields, isoiation resistor-capacity networks, **mechanical** insulators etc.

SERVICE ADJUSTMENT

Step	Adjust point	Procedure
1	P-detector coil (T201)	Connect sweep generator's output to TP202. <ul style="list-style-type: none"> • Sweep central frequency: 36.875 MHz • Sweep width center: +3 MHz ~ -7 MHz • Sweep output: 80 dB
2		Connect the response lead of oscilloscope to TP207. <ul style="list-style-type: none"> • Oscilloscope range: 1V_{p-p}
3		Connect bias box to AGC (TP203). Note: The bias supply to AGC must be 4.3 to 4.6V and should not exceed 7V.
4		Adjust AGC voltage so that the waveform on oscilloscope becomes 1V _{p-p} .
5		Adjust T201 so that the waveform peak on oscilloscope becomes aligned with P marker. See Fig. 1.

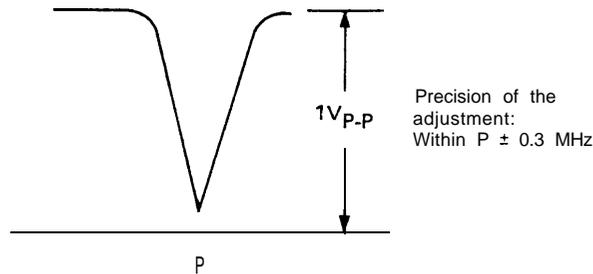

Figure 1.

Step	Adjust point	Procedure
1	Overall waveform	Receive 1 O-ch. signal.
2		Connect sweep generator's output to the tuner's test point across a resistor of 2.7 khoms. <ul style="list-style-type: none"> • Sweep output: 70 dB
3		Connect the response lead of oscilloscope to TP207. <ul style="list-style-type: none"> • Oscilloscope range: 1V_{p-p}
4		Connect a resistor of 100 ohms to both ends of R216.
5		Short-circuit both ends of C235.
6		Apply DC voltage of about 5V to AGC (TP203) and adjust so that the waveform on oscilloscope is 1V _{p-p} .
7		Make sure that the overall waveform is as shown in Fig. 2. If not, adjust it with the aid of IF transformer of the tuner.

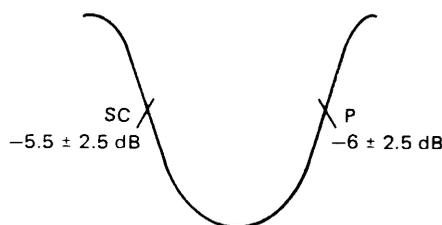

Figure 2.

Step	Adjust point	Procedure
1	RF AGC cut-in control (R213)	Receive sequential colour bar signal.
2		Adjust the signal input level to 57 dB.
3		Connect CR oscillator to TP204 across a capacitor (10 μ F/16V). <ul style="list-style-type: none"> • Oscillation frequency: 1 kHz • Output voltage; 0.15Vp-p (Output voltage available at TP204)
4		Connect oscilloscope to TP207.
5		Adjust R213 so that 1 kHz signal output on oscilloscope disappears.
6		Set the sequential colour bar signal input to 60 dB, and make sure that 1 kHz signal output appears on oscilloscope. Without such signal appearance on oscilloscope, set the sequential colour bar signal input to 57 dB and perform the step 5 again.

Step	Adjust point	Procedure
1	AFT (T203)	Receive sequential colour bar signal.
2		Connect 36.875 MHz oscillator to TP202 across a capacitor of 1 pF.
3		Connect oscilloscope to TP207. <ul style="list-style-type: none"> • Oscilloscope range: 0.5V/cm AC, horizontal sync.
4		Adjust the output of 36.875 MHz oscillator to have the waveform beating on oscilloscope be observable.
5		Turn off AFT switch and adjust the tuning control so that the waveform on oscilloscope is free from beating. See Fig. 3.
6		Turn on AFT switch and adjust T202 so that the waveform on oscilloscope is free from beating. See Fig. 3.

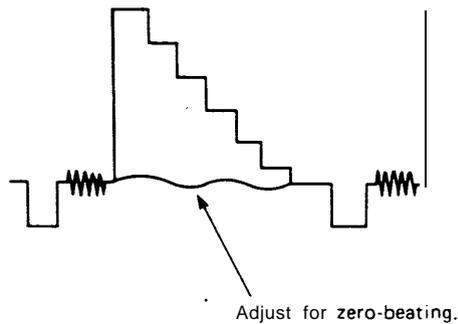

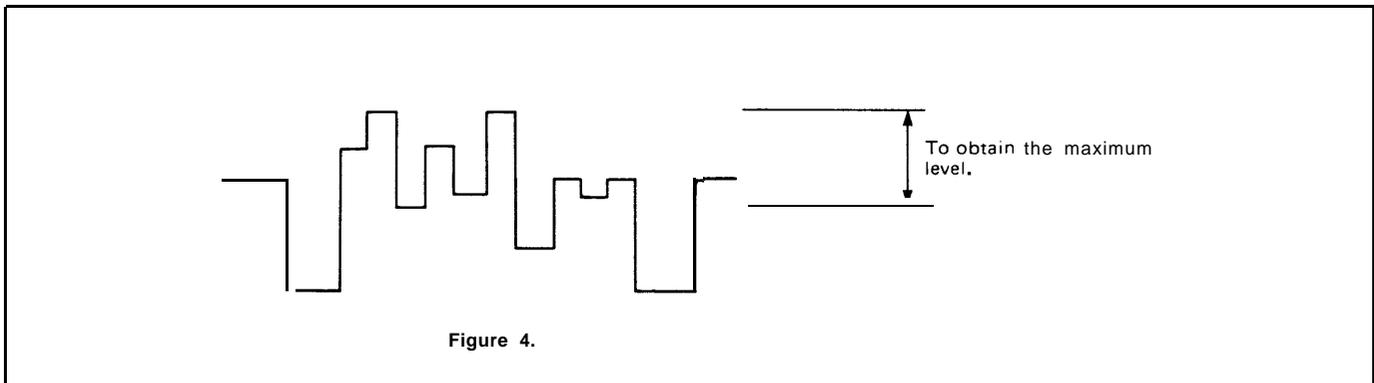

Figure 3.

Step	Adjust point	Procedure
	SIF	Requires no adjustment.
	+B voltage setting	If 115V line voltage is 116V or above, cut off R7 15. On the contrary, if the line voltage is 114V or below, cut off R714. Perform voltage measurement by setting the controls at the following positions: <ul style="list-style-type: none"> • Beam control; Minimum • Contrast control; Minimum • Brightness control; Minimum • Screen control; Minimum

Step	Adjust point	Procedure
1	Background adjustment	Receive lion head pattern signal.
2		Set the controls at the following positions: <ul style="list-style-type: none"> • Sub-brightness control; Minimum • Brightness control; Minimum • Contrast control; Minimum • Screen control; Minimum • G/B drive control; Center • R/G/B bias control; Minimum
3		Short-circuit between TP401 and TP402 and also between TP501 and TP502.
4		Adjust the screen control so that either of the three colours (red, green and blue) appears dimly on screen.
5		Adjust the bias controls except for dimly appearing colour to let the picture on screen be white.
6		Adjust the screen control to obtain cut-off point of CRT.
7		Remove the short-circuit between TP401 and TP402 and between TP501 and TP502.
8		Set the brightness control to the center position and the contrast control to the Maximum position.
9		Adjust the sub-brightness control to have the best black level of the reproduced lion head pattern signal. At that time, also adjust it to let the colour sequence be linear.
10		Adjust the drive control to obtain 7300°K of the white balance. x = 0.303, y = 0.310

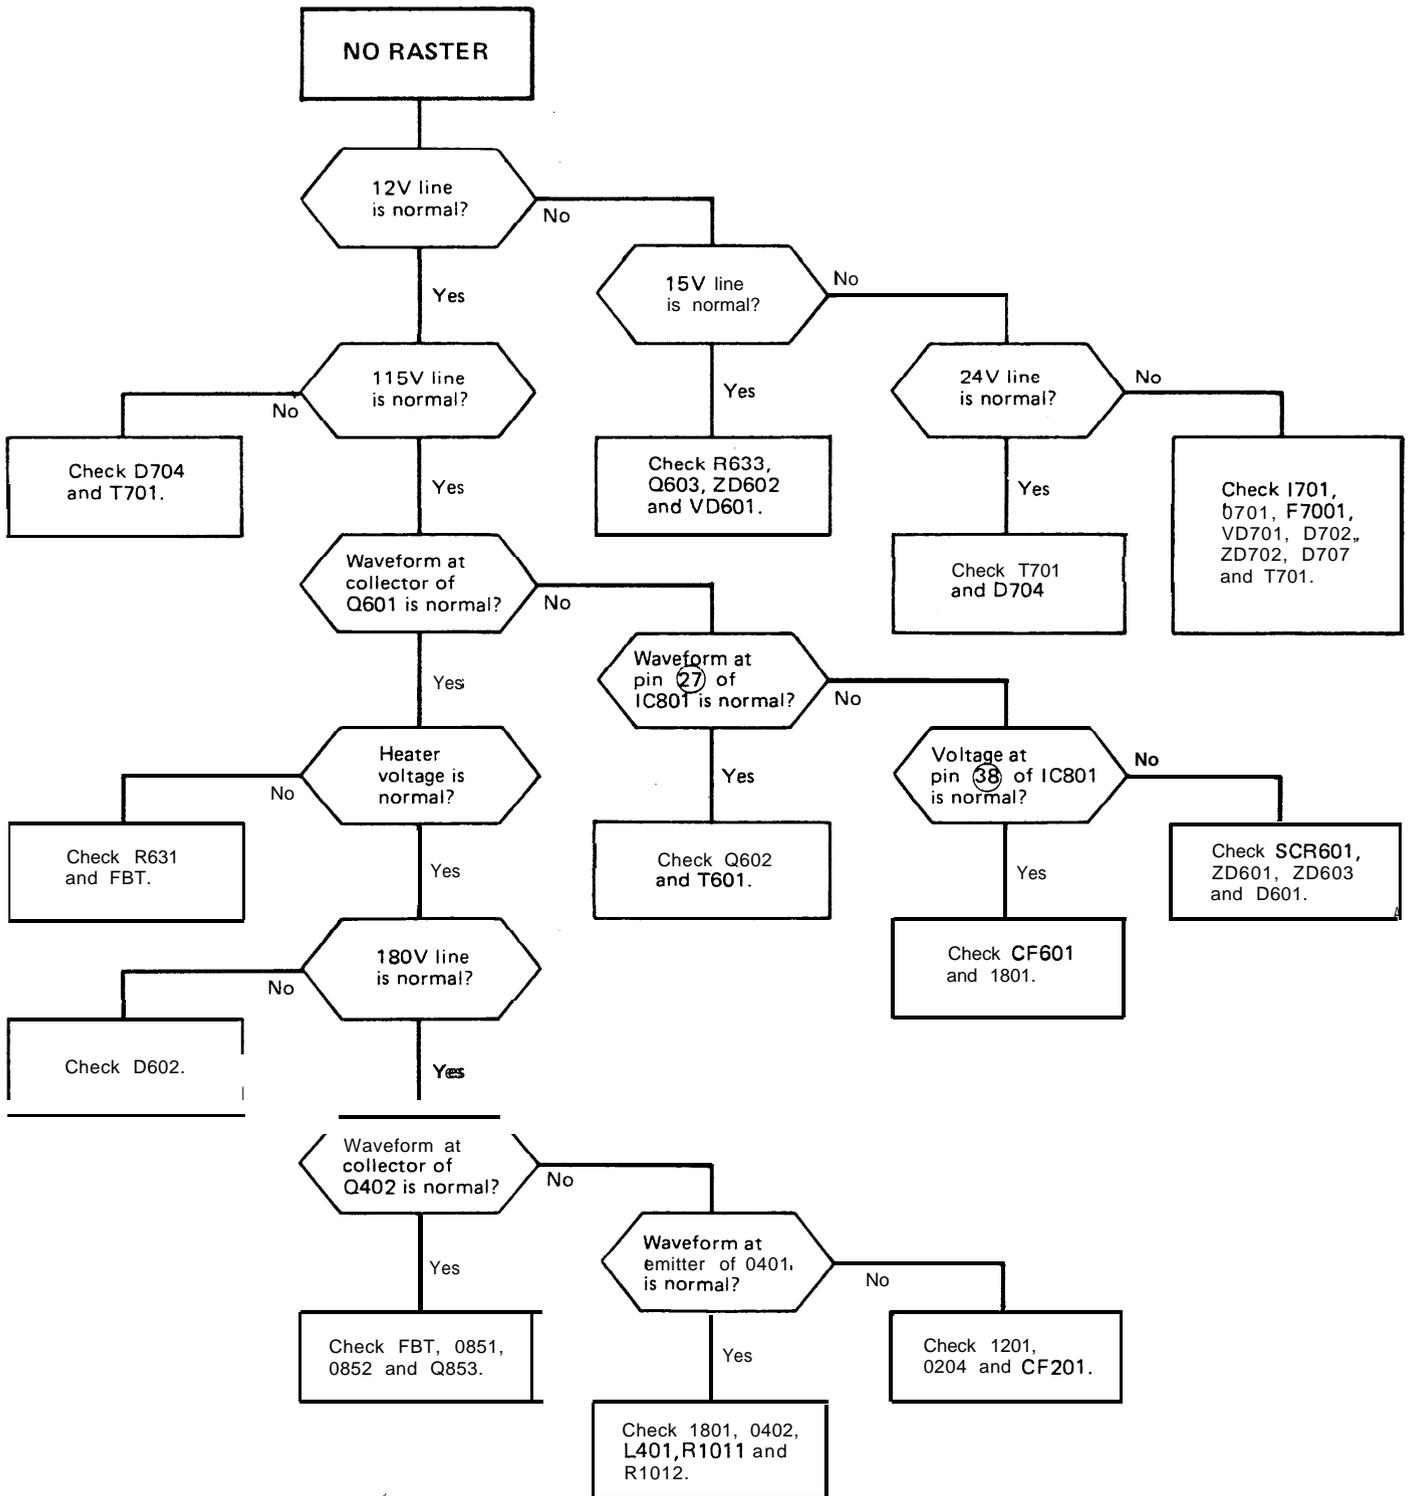

Step	Adjust point	Procedure
1	Sub-colour control (R829)	Receive sequential colour bar signal
2		Set the controls at the following positions: <ul style="list-style-type: none"> • Brightness control; Center • Contrast control; Center • Colour control; Center
3		Connect oscilloscope to the collector of Q85 1.
4		Adjust the sub-colour control so that the red output level is equal to 75% of the white output level.

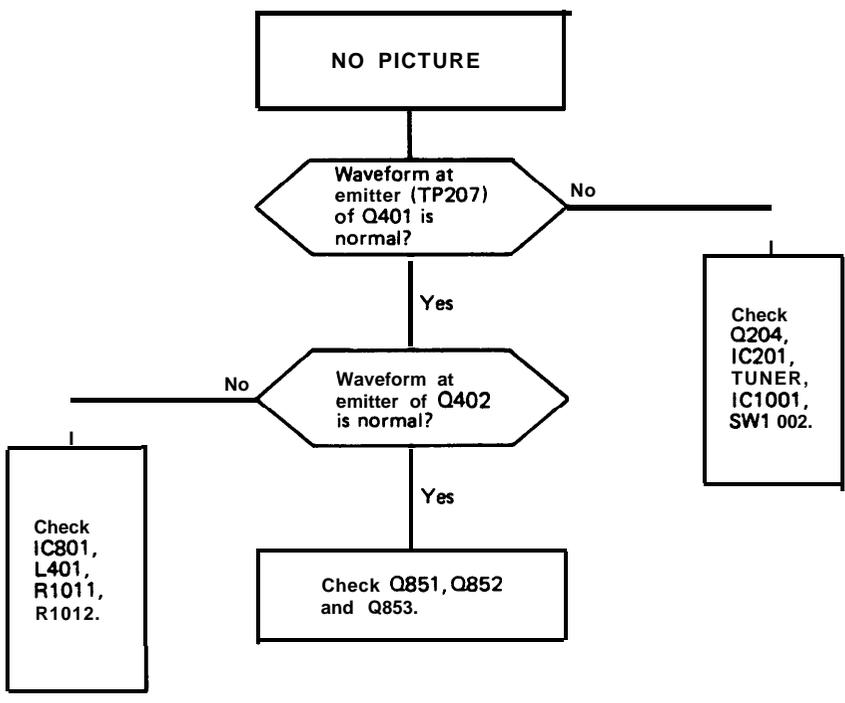

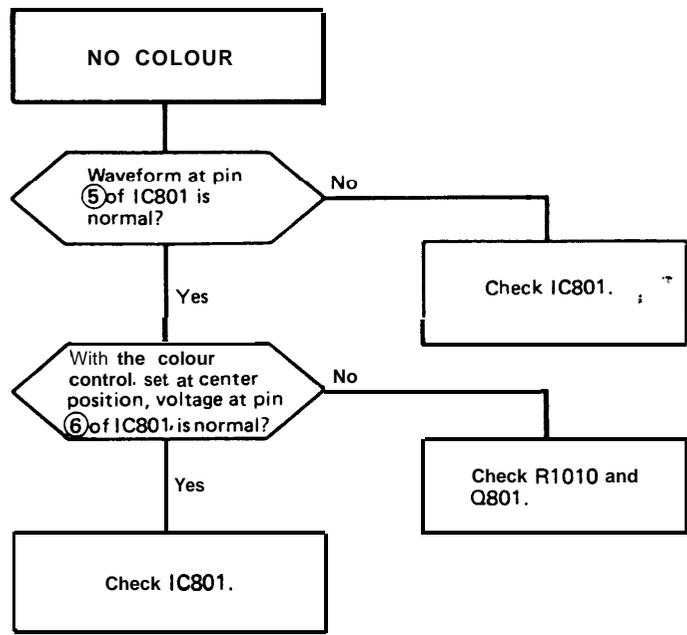

Step	Adjust point	Procedure
1	Phase control (R827)	Receive sequential colour bar signal.
2		Connect oscilloscope to K3 terminal.
3		Adjust the phase control so that B-Y output waveform on oscilloscope becomes maximum as shown in Fig. 4.

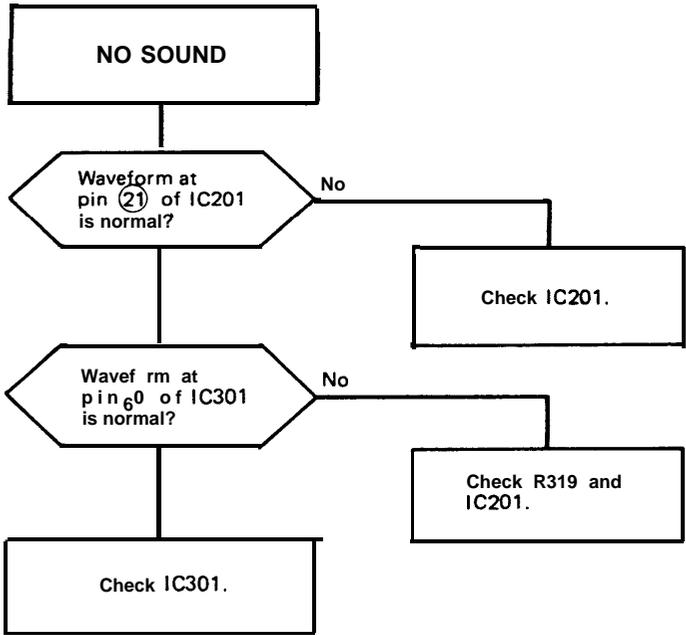

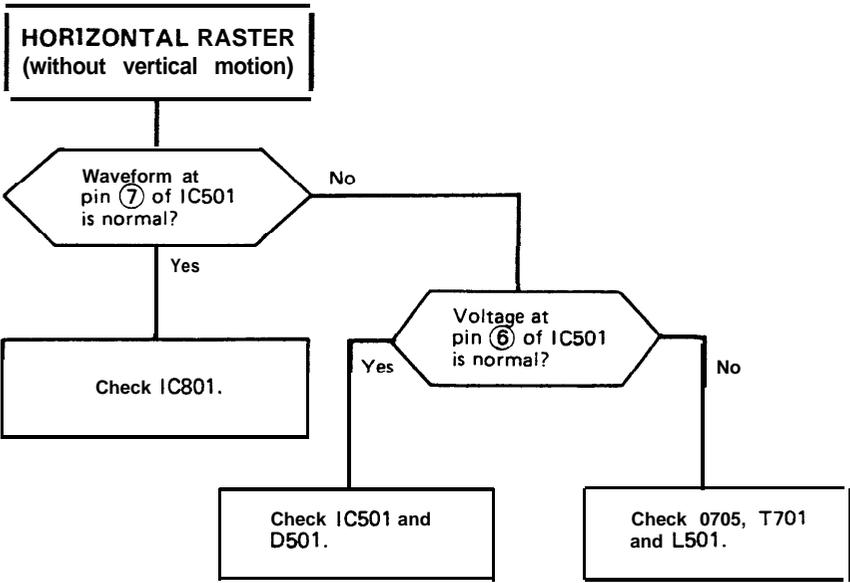

Step	Adjust point	Procedure
	H-size control	When the horizontal overscan is 8% or below, cut off R623 (0.1 μ F).
	H-center control	If the H-center is deviated to right 3mm or more, cut off R635. If the H-center is deviated to left 3mm or more, cut off R636.
	V-size control R504	Adjust the V-size control (R504) to have 10% of the vertical overscan.
	Protector check	The protector should not operate when 25V is applied to the plus side of C615: it should operate when 30V is applied to it. For this operation check, connect a resistor (10 kohm) between the base of Q604 and earth beforehand.

TROUBLE SHOOTING TABLE

PRINTED WIRING BOARD ASSEMBLIES

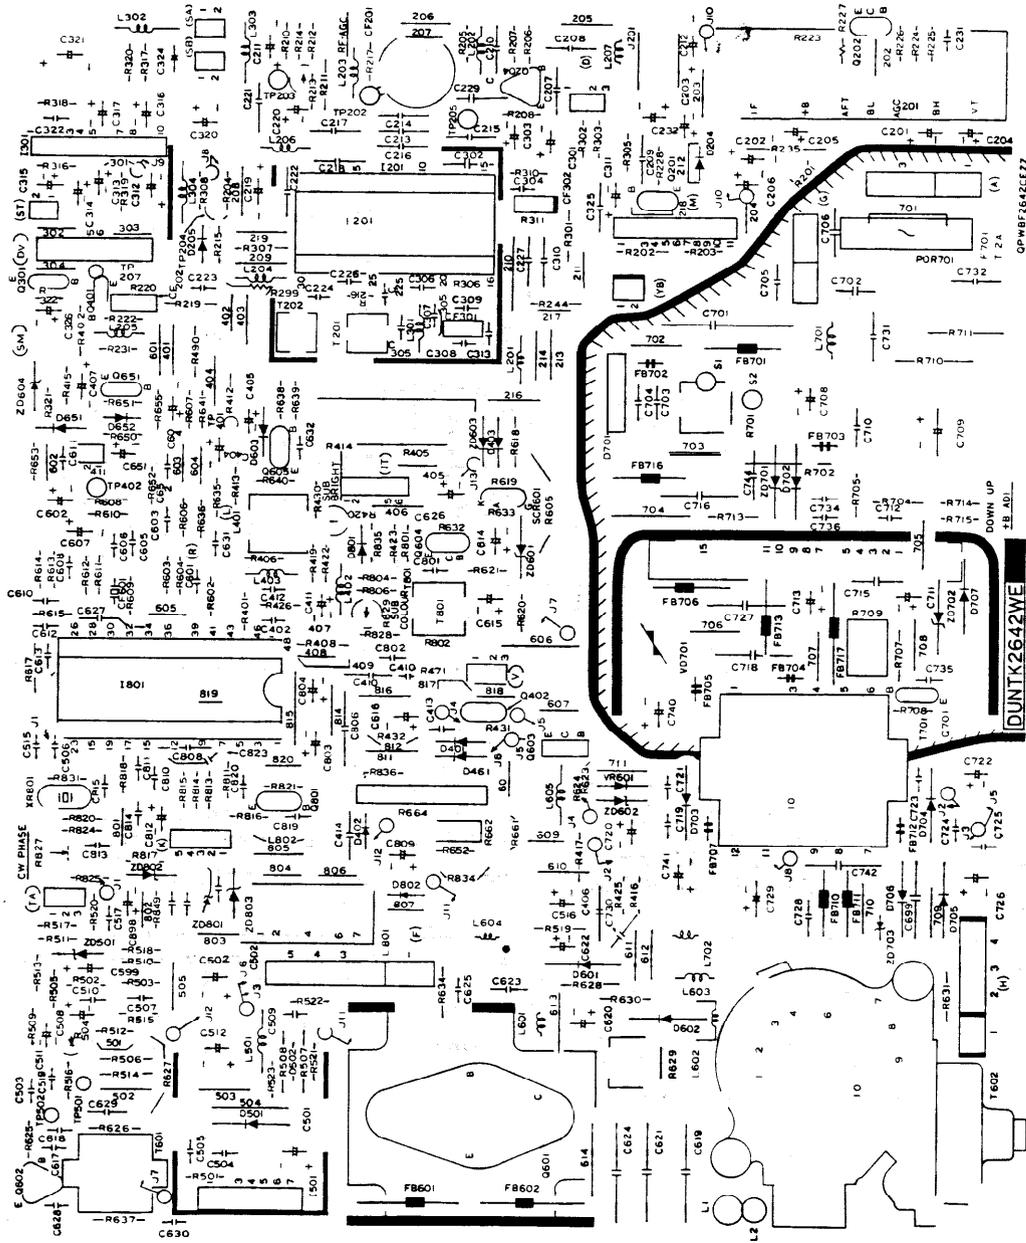

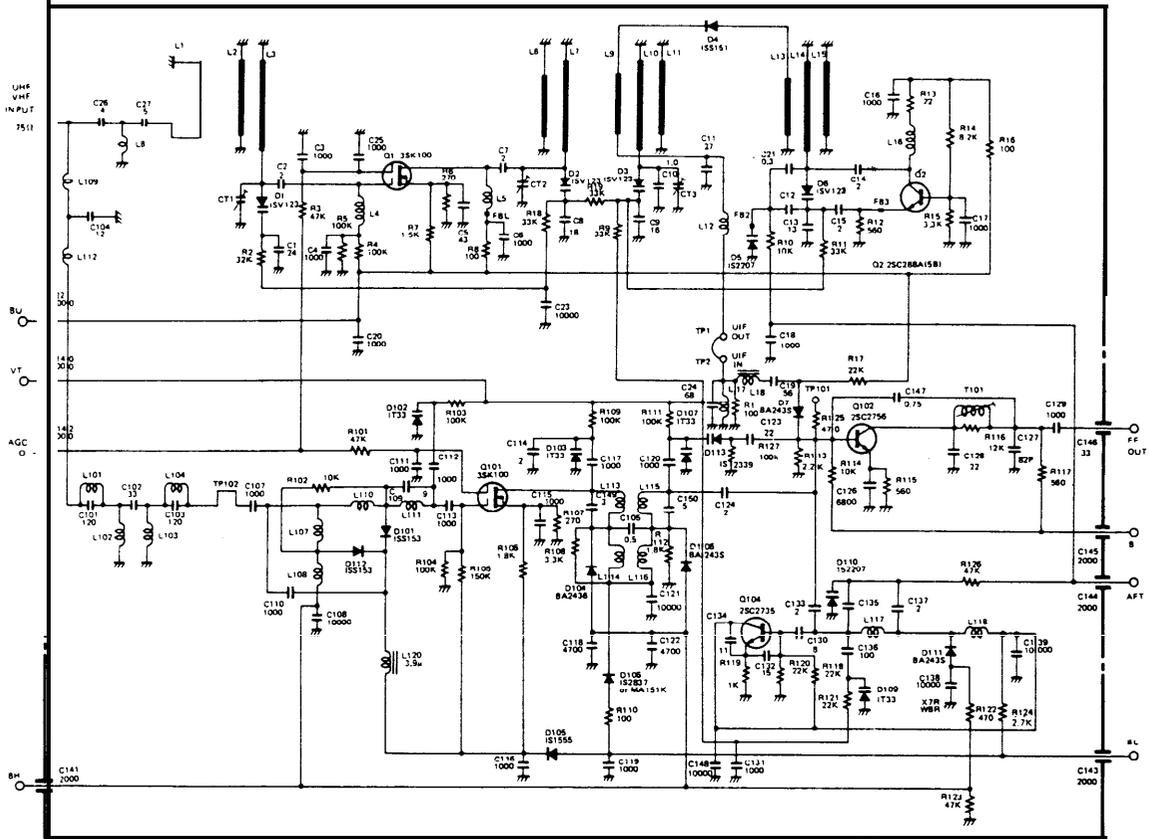

Figure 6. Mother Board (Wiring Side)

VTUVTK-7AH///

TUNER

SAFETY NOTE;

1. DISCONNECT THE AC PLUG FROM THE AC OUTLET BEFORE REPLACING PARTS.
2. SEMICONDUCTOR HEAT SINKS SHOULD BE REGARDED AS POTENTIAL SHOCK HAZARDS WHEN THE CHASSIS IS OPERATING.

PARTS MARKED WITH "△" () ARE IMPORTANT FOR MAINTAINING THE SAFETY OF THE SET. BE SURE TO REPLACE THESE PARTS WITH SPECIFIED ONES FOR MAINTAINING THE SAFETY AND PERFORMANCE OF THE SET.

NOTE:

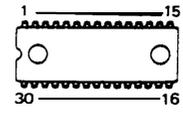

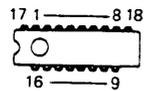

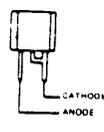

1. The unit of resistance 'ohm' is omitted (k- 1000 ohms M-1 Megohm).
2. All resistors are 1/8 watt, unless otherwise noted.
3. All capacitors μF , unless otherwise noted $\rho-\mu\mu F$.

Voltage Measurement Conditions

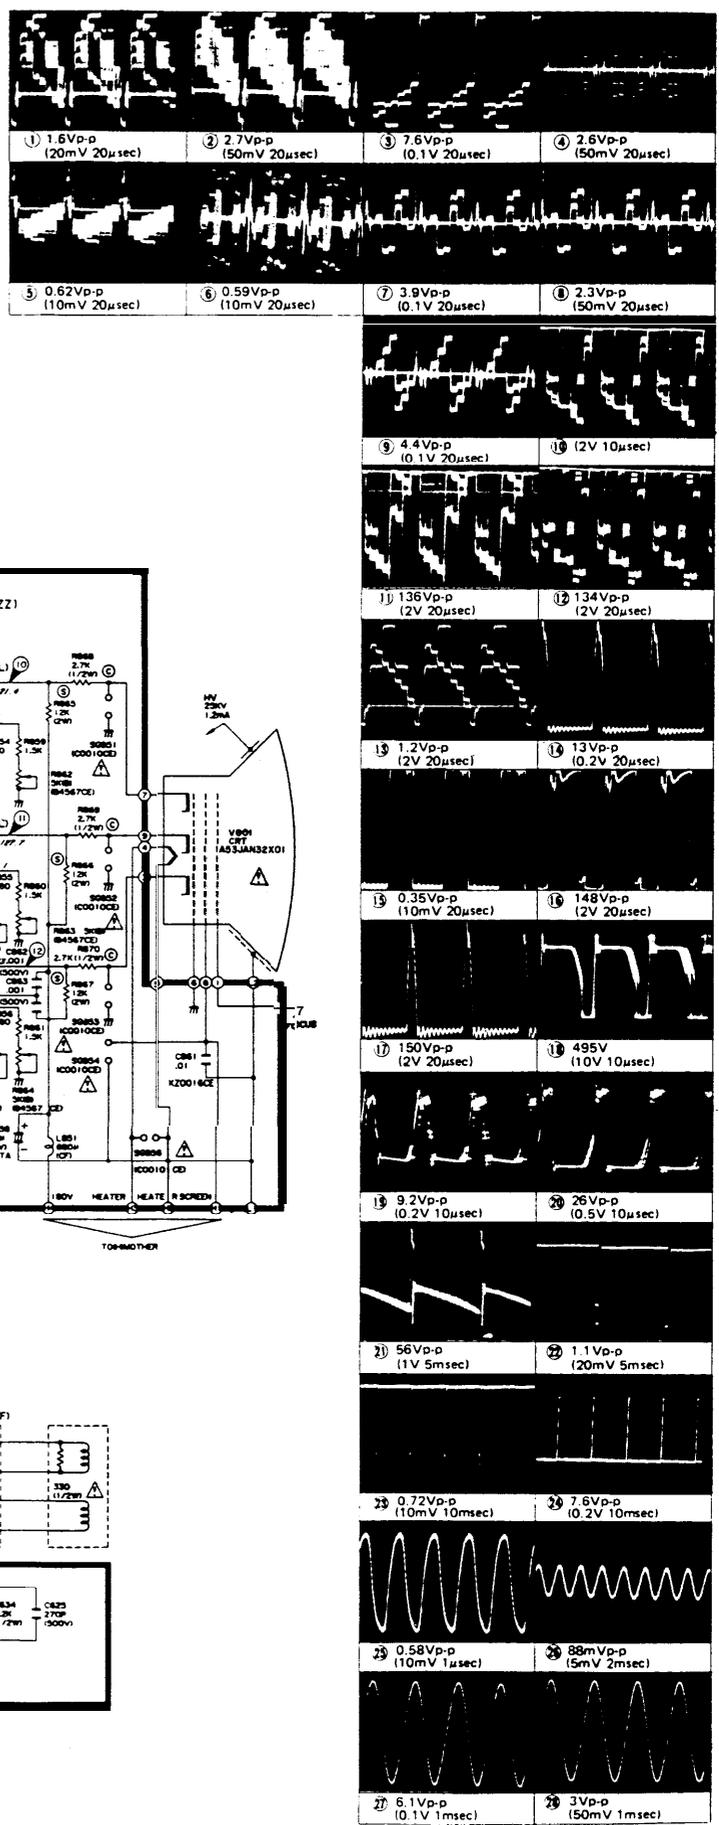

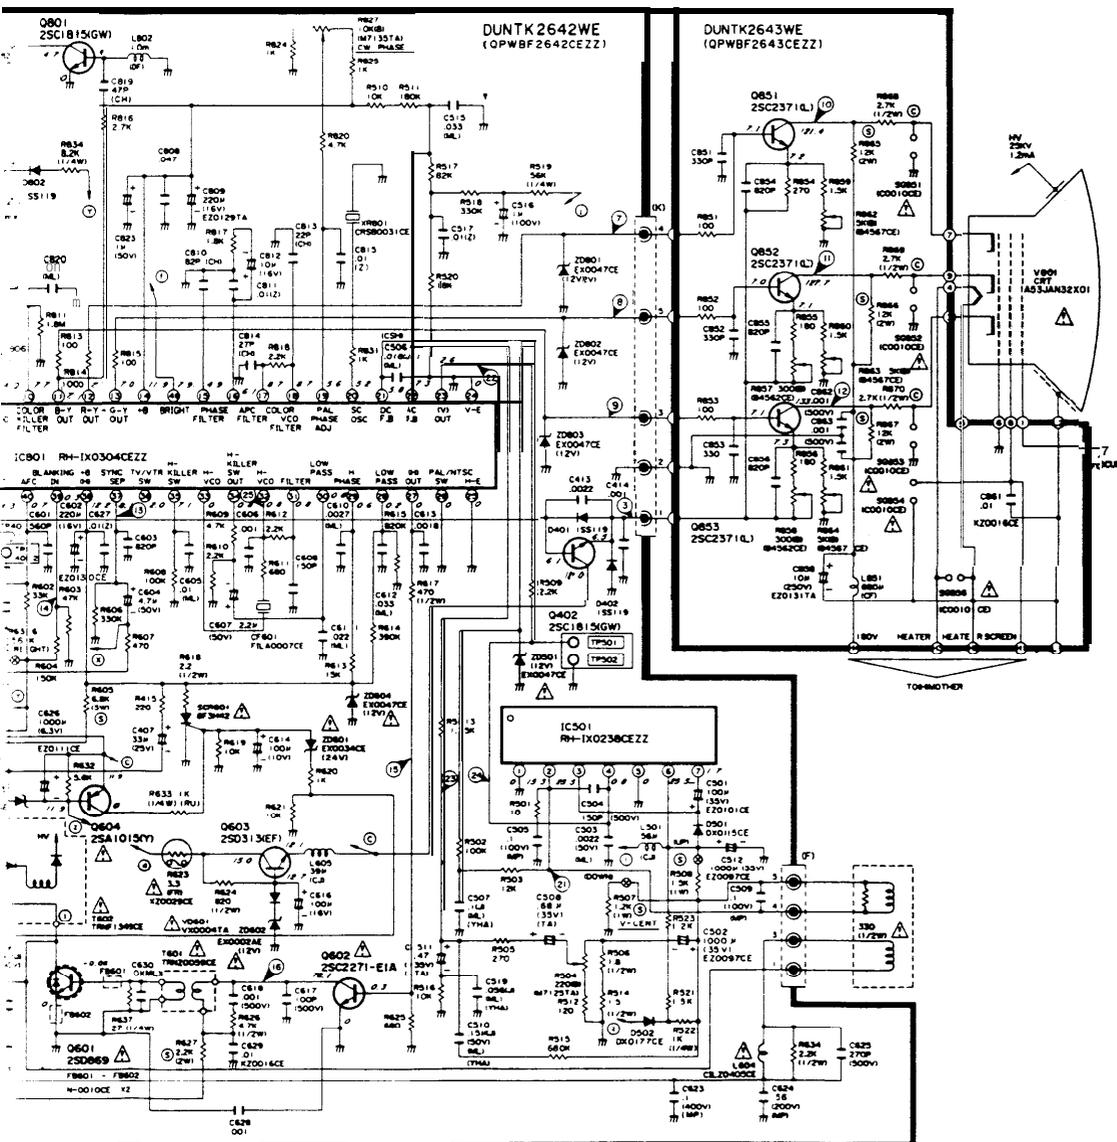

1. All these figures represent the voltage levels measured upon reception of PAL Colour signals.
2. All the voltages in each point are measured with Vacuum Tube Volt Meter.

Waveform Measurement Conditions

1. Upon receiving colour bar signal of 70 dB in field intensity.

ON MODEL CX-2273 SCHEMATIC DIAGRAM

PARTS LIST

PARTS REPLACEMENT

Replacement parts which have these special safety characteristics identified in this manual: electrical components having such features are identified by Δ in the Replacement Parts Lists.

The use of a substitute replacement part which does not have the same safety characteristics as the factory recommended replacement parts shown in this service manual may create shock, fire or other hazards.

"HOW TO ORDER REPLACEMENT PARTS"

To have your order filled promptly and correctly, please furnish the following informations.

1. MODEL NUMBER
2. REF. NO.
3. PART NO.
4. DESCRIPTION
