

Model: CDX-C810DSP**No.** 419**Subject:** PICKUP IS HEARD THROUGH SUBWOOFER
OUTPUTS.**Date:** March 28, 1997**Symptom:**

(57)

Audible pickup can be heard through the subwoofer outputs. When the unit is tapped or shocked by vibration you can hear a thumping noise coming from the subwoofer outputs.

Solution:

There are two traces between C230 and C239. (see diagram below) If these traces have been cut, they need to be jumpered back for a connection. Jumper the two cut traces with thin wires on the solder side of the main board. After cut traces are reconnected, test unit by tapping chassis and monitoring subwoofer outputs.
