

Model 8230 Outdoor GPS/GNSS Antenna Installation Guide

Rev A, September 2013 / PN 1222-5000-0050

Spectracom provides the model 8230 for certain products with embedded GPS/GNSS receivers. Each antenna is shipped with an L-bracket and clamps for affixing the antenna to an appropriate structure. Various accessories are offered to facilitate installation of the antenna.

NOTE: A rugged antenna mount, post mounting kit, weather-proofing kit and free-standing base are sold separately. Contact Spectracom for details and to order these accessories for your antenna.

The Model 8230 is an active GPS/GNSS antenna tuned to receive L1 band satellite transmissions for the GPS and GLONASS systems. The active antenna circuitry provides 40dB of gain and requires 2.5 to 10 VDC at 21 milliamps (provided by a Spectracom receiver over the antenna cable) to operate.

Specifications Summary

	8230 Antenna
Type	Active
Frequency	1575 to 1606 MHz (GPS + GLONASS L1)
Temp Range	-40 to +85 C
Gain	40dB
Connector	N type, female
Diameter	66.5 mm dia. x 47.5 mm H (2.62" x 1.87")
Weight	140 g (4.9 oz)

Installing the Antenna

The GPS/GNSS antenna must be installed outdoors with an unobstructed view of the sky (to 20° elevation from the horizon). An unobstructed line of sight to the sky allows the antenna to locate and track the maximum number of satellites throughout the day. Installations with obstructed views may still prove functional, but the equipment may experience reduced reception quality or be unable to simultaneously track the maximum number of satellites. Make sure the antenna is installed somewhere that it will not be buried in loose or drifting snow, or obstructed by growing foliage. Whenever possible, avoid placing the GPS/GNSS antenna in close proximity to broadcast antennas. See Spectracom's technical note for detailed information on antenna installation.

When using the included L-bracket, remove the double panel nuts, insert the connector end into the 19 mm (0.75") through hole and replace and tighten the nuts. Connect the L-bracket to a post, pole, vent pipe, or other suitable location via hose clamps. Then connect the antenna to the antenna cable via type N connectors. In wet weather locations, it is recommended to wrap the connection in weather-proofing tape. Spectracom offers a weather-proofing kit for this purpose.

An antenna mounting L-bracket is included for post mounting via hose clamps or a ruggedized mount (model ANT-KT shown far right) can be purchased separately.

A rugged antenna mount is available separately as model ANT-KT. It is designed to mount to a vertical or horizontal pipe, or to a flat surface.

Antenna Cable and Accessories

When using the Model 8230 GNSS outdoor antenna, Spectracom recommends using low loss type cable for the antenna cable such as LMR-400 (or equivalent). To simplify the installation process, Spectracom offers cable assemblies terminated with Type N Male connectors. Standard lengths are 25, 50, 100, 150 and 200 feet.

If the antenna cable is purchased locally, select coax suitable for outdoor use. A surge protection device in the antenna line is recommended to protect the GPS/GNSS receiver and connected devices from lightning damage. Spectracom offers Surge Suppressors to shunt potentially damaging voltages on the antenna coax to ground.

Cable Length

With low loss LMR 400 equivalent antenna cable, the maximum recommended antenna cable length is 125 meters or 400 feet. Installations requiring longer distances can be achieved with an inline amplifier. See Spectracom's technical note for detailed information on cables and allowable cable lengths.
