SECTION ONE

1. GENERAL INFORMATION

1.1. SCOPE OF MANUAL

This manual contains the information necessary to operate and maintain a TrueTime Model 560-5195 Sine Wave Output SILIOM. SILIOM stands for Single In-Line Input / Output Module.

1.2. PURPOSE OF EQUIPMENT

The Model 560-5195 card provides a method of adding a sine wave output of either 1544 kHz (T1) or 2048 kHz (E1) to a 560-5153 E1T1 motherboard. An optional output transformer is available to provide ohmic isolation in either a balanced or unbalanced configuration. It is stocked in 4 dash versions as follows:

- 1 = T1
- 2 = T1 with transformer
- 3 = E1
- 4 = E1 with transformer

1.2.1. PHYSICAL SPECIFICATIONS

Dimensions: 4.25" long X .687" wide
Weight: Approximately 2 ounces

1.2.2. ENVIRONMENTAL SPECIFICATIONS

Operating temp: 0° to +50°C
Storage temp: -40° to +85°C
Humidity: Up to 95% relative, non-condensing
Cooling Mode: Convection
Altitude: Sea level to 10,000 ft.

1.2.3. POWER REQUIREMENTS

Voltage: ±5 VDC ±10%
Current: +50 mA
Power: 250 mW

1.2.4. OUTPUT RATING

Voltage: 1 Vrms ±10%. Output may be adjusted.
Load: 50Ω

SECTION TWO

2. INSTALLATION AND OPERATION

2.1. INTRODUCTION

This section contains installation instructions and operating instructions.

2.2. REMOVAL AND INSTALLATION

CAUTION: All SILIOMS contain static sensitive semiconductor devices. Use a personal grounding strap and a static safe workstation while performing any handling of the SILIOM and/or the Motherboard.

This SILIOM is a customer installed option. To install the SILIOM in the motherboard, grasp it gently by the ends and insert it into the SIMM style connector on the motherboard while orienting it perpendicularly to the face of the motherboard. Then press the top of the SILIOM down and toward the bottom edge of the motherboard until the retainer clips snap down over the SILIOM. Removal is accomplished by spreading the retainer clips apart with your fingers while pushing the SILIOM top up with your thumbs. The SILIOM is keyed to prevent improper insertion, and only gentle pressure is required.

If replacing the SILIOM, check the switch setting on the old SILIOM and set the switches on the new SILIOM the same. The proper location for the SILIOM is determined by deciding which of the six possible channels you want the SILIOM to reside in. If you are replacing a SILIOM simply use the same slot it came out of. If this is a new addition then you must wire the appropriate connector on the rear panel adapter associated with the Channel you decide to use. Any SILIOM can be used in any slot without restriction.

Each SILIOM edge connector is associated with an "Output Jumper" located on the 560-5153 Card, which must be set according to the type of SILIOM installed. JP1 is associated with Channel A (at the top of the 560-5153), JP2 is associated with Channel B, and so on through JP6 and Channel F. The card JP(X) must have a shunt installed across pins 1 and 2 (out of 4). Pin 1 is near the top of the card when viewed from an "as installed" perspective. The JP blocks are located near the end of the SILIOM edge connectors that are farthest from the Front Panel of the 560-5153 Card. Revision 2 and later cards have additional jumper blocks (JP7-12) that are used for special JTAG operations on the card. If shunts are installed on these jumper blocks they should be "stored" on only one pin of the jumper block.

2.3.

OPERATION

There are no operator actions required by this SILIOM other than setting the configuration switches. Other possible operator actions can only be carried out by use of software associated with the Fault Monitor card in a 56000 system. SW1-1 selects whether 1544 kHz (SW1-1 ON) or 2048 kHz (SW1-1 OFF) is used to drive the output. SW1-2 reports whether the transformer is installed (SW1-2 ON) or not installed (SW1-2 OFF). These switch sections will normally be sealed with inspection varnish since the filter components, which work with only one frequency, and the transformer are factory installed. SW1-3 is used to clear local faults on the card in factory test procedures. It should always be left in the **ON** position *unless* you wish to disable fault detection on this module. SW1-4 determines whether the AIS_ENABLE signal will cause the output sine wave to be disabled when it is asserted (SW1-4 ON) or not (SW1-4 OFF).

You must also set or verify the Output Configuration Jumper (JP1-JP6) associated with the channel (A-F, J2-J7) that the card is installed in on the 560-5153 card. Set the shunt on this card to cover pins 1 and 2 of JP(X) for the dash 1 through 4 versions of this card. If you have a dash 2 or dash 4 version, it will have a transformer installed on it which allows the output to be delivered differentially. If the board has been modified for balanced output by cutting the trace across R18 (see sheet 3 of the schematic) then you can restore the unit to balanced operation by placing a shunt across pins 3 and 4 of JP(X). This action ties the “-” output to ground. Use a 2 mm pitch shunt.

Switch	Meaning
SW 1-1 ON OFF	1544 kHz = Driver Output 2048 kHz = Driver Output
SW 1-2 ON OFF	Transformer Installed Transformer Not Installed
SW 1-3 ON OFF	Fault Detection Enabled Fault Detection Disabled
SW 1-4 ON OFF	AIS_ENABLE signal output sine wave disabled when asserted AIS_ENABLE signal output since wave enabled when asserted

SECTION THREE

3. THEORY OF OPERATION

3.1. GENERAL INFORMATION

This section contains a detailed description of the circuits on this SILIOM. These descriptions should be used in conjunction with the drawings in SECTION FIVE.

3.2. SILIOM DESCRIPTION

The 560-5195 SILIOM contains all the circuitry needed to add a sine wave output to a 560-5153 E1T1 card. The SILIOMs' output can be adjusted downward from its nominal 1 Vrms (13 dBm) output level. Fault circuits monitor activity on the output and report the current status to the Fault Monitor card.

3.3. DETAILED DESCRIPTION

Reference drawing 560-5195, sheets 2 and 3 of 3. U2 is a CPLD which contains all the logic circuits needed on the SILIOM. U1 buffers the CPLD output to drive the sine shaping filter (R8-9, C13, C15, L1). C15 is adjusted for a peak on the output. U4:A buffers the filter and U6, inside the feedback path of U4:A, boosts the signal power out to drive a 50 Ω load. R11 adjusts the gain of the U4:A/U6 combination to set the output at 1 Vrms. Although the output *can* be adjusted above 1 Vrms, this is not recommended because the amplifier will go into limiting above that point causing distortion of the output waveform. If installed, T1 provides ohmic isolation of the output. T1s secondary can be floated above ground or referenced to ground. R18 is only installed if it is desired to ground refer an output after a transformer has been used in the floating (balanced) configuration. U4:B buffers a sample of the output and drives peak detector CR1. The output of Cr1 is filtered by C19 and applied to comparator U5. If the output fails altogether or drifts below the 1 Vrms value, the voltage across C19 will decrease below the value set by voltage divider R3/R19. U5 will then drive LineFault high to indicate a failure. If a failure is detected, that information is latched within U2 and reported to the 560-5153 card and thence to the Fault Monitor card if one is installed in the system. There are three ways to clear the fault, the preferred one is to use the Fault Monitor cards software, another is to turn SW1-3 Off and then ON again, and the third is to power down the system, necessary if there is no Fault Monitor card. U2 is programmed in system using a JTAG port and a dedicated fixture or the JTAG port on the 560-5153, and a special cable and software running on a PC.

SECTION FOUR

4. MAINTENANCE AND REPAIR

4.1. MAINTENANCE

This module requires no maintenance. Schematics are provided in SECTION FIVE for those who desire to troubleshoot a problem down to the component level. All parts are standard commercially-available parts except for the printed circuit board itself.

4.2. REPAIR

This module is constructed mostly of surface mount components. These components are extremely difficult to replace successfully without a great deal of specialized SMT rework equipment, and specialized training. Additionally, the majority of the circuitry on this board resides in a programmable part which requires special equipment, software and data files to program. For these reasons it is strongly recommended that you return any malfunctioning module to the factory where it can be repaired.
