Model 6020 is a high-performance, 2-channel, 225MHz Universal Counter / Timer for applications from R&D benchtop to Automatic Test Equipment. The module offers nine automatic measurement functions and has an optional 1.3GHz third input available for RF requirements. Model 6020 offers outstanding frequency range and high resolution along with numerous special features and capabilities built-in to this optimal Counter/Timer. In short, there is simply no comparable instrument on the market for such a cost-effective price.

Extremely User-Friendly Operation

Design approach emphasizes simplicity of operation. Numerous functions, parameters and operating modes resolved to simple, logical blocks and one keystroke operation. In fact, operation is so easy that first time users rarely require an Instruction Manual.

A.T.E. Environment Unusually flexible software package. With simple commands one can adapt handshake, commands and termination to designated controller.

High Reliability

Each Tabor instrument is aged for at least two weeks and subsequently 100% computerized tested before shipping.

Versatility

Model 6020 is virtually a self-contained automatic test system. A non-volatile memory is capable of storing up to 10 various front panel set-ups; each dedicated to a different test procedure. Recalling a specific set-up or accessing a few set-ups is performed with pushbutton ease.

High Performance Trigger

In manual mode, the trigger level is programmable from -5.1V to +5.1V (-51V to +51V in X10 mode) with an exceptional resolution of 10 mV (100mV in X10 mode). An automatic trigger mode is also available covering the frequencies from 100Hz to 150MHz.

Automatic Attenuation Selection

Auto trigger mode automatically switches attenuator settings if the input signal exceeds 5.1Vpk-pk.

DVM Measurements

Automatic triggering is used to establish the peak voltages for setting trigger points. This feature is used to measure peak voltage levels.

Individual Channel Filtering

The 6020 has an independent 100kHz low pass filter on each channel to reduce input stage sensitivity when making low-frequency measurements.

High Stability Time Base

Counter measurement stability can be improved by using an external clock or one of the two optional internal high stability time bases. The internal time base options are:

- **TCXO:** Standard
- **OCXO:** Option 1a
- **Rubidium:** Option 4

Optional Analog Output

Option 3 (Analog Output) provides a high accuracy source to drive devices like chart recorders. This option is especially useful in measuring and recording the aging and temperature stability of devices like oscillators and Voltage to Frequency (V-F) converters.

Flexible Gate Time and Delay Time Control

The Model 6020 allows fine control of gate time and delay time settings with 46 pre-defined times ranging from 100ms to 10s. In addition, gate or delay may be set to any value between 100ms and 1000 seconds using an external input.

DEFINITION OF TERMS

- (1) LSD:**
Unit value of least significant digit. Calculation should be rounded as follows
1 to <5Hz becomes 1Hz, 5ns to <10ns becomes 10ns etc.
- (2) Trigger Error:**
$$\frac{\sqrt{(e_i^2 + e_n^2)}}{\text{input slew rate at trigger point}} \text{ seconds rms}$$

Where: e_i is the rms noise voltage of the counter's input channel (250 μ V typically)
 e_n is the rms noise of the input signal for 125MHz bandwidth
- (3) Time base error:**
Maximum fractional frequency change in time base frequency due to all errors: e.g. aging, temperature, line voltage etc.
- (4) Trigger Level Timing Error (x1):**
$$\frac{18 \text{ mV}}{\text{Input slew rate at start trigger point}} \pm \frac{18 \text{ mV}}{\text{Input slew rate at stop trigger point}}$$
- (5) External arming (trigger) delay:**
Delay from the positive going slope of the arming signal to the internal gate open signal.
- (6) External gate delay:**
Delay from the positive going slope of the gating signal to the internal gate open signal.
- (7) Dead Time:**
Minimum time between measurement which the counter is busy in performing the measurement. The counter will not at this time respond to any input transition.
