To Avoid Fire or Personal Injury

Use Proper Power Cord. Use only the power cord specified for this product and certified for the country of use.

Ground the Product. This product is grounded through the grounding conductor of the power cord. To avoid electric shock, the grounding conductor must be connected to earth ground. Before making connections to the input or output terminals of the product, ensure that the product is properly grounded.

Observe All Terminal Ratings. To avoid fire or shock hazard, observe all ratings and markings on the product. Consult the product manual for further ratings information before making connections to the product.

The inputs are not rated for connection to mains or Category II, III, or IV circuits.

Do not apply a potential to any terminal, including the common terminal, that exceeds the maximum rating of that terminal.

Power Disconnect. The power cord disconnects the product from the power source. Do not block the power cord; it must remain accessible to the user at all times.

Do Not Operate Without Covers. Do not operate this product with covers or panels removed.

Do Not Operate With Suspected Failures. If you suspect that there is damage to this product, have it inspected by qualified service personnel.

Avoid Exposed Circuitry. Do not touch exposed connections and components when power is present.

Wear Eye Protection. Wear eye protection if exposure to high-intensity rays or laser radiation exists.

Do Not Operate in Wet/Damp Conditions.

Do Not Operate in an Explosive Atmosphere.

Keep Product Surfaces Clean and Dry.

Provide Proper Ventilation. Refer to the manual's installation instructions for details on installing the product so it has proper ventilation.

Pulse response, peak detect, or envelope mode, typical	Sample rate setting			Minimum pulse width
< 4 GHz models	≤ 10 GS/s			1 ÷ (sample rate) or 100 ps
	≥ 40 MS/s			1 ÷ (sample rate) or 25 ps
	This instrument uses analog peak detection for pulse capture in Peak Detect or Envelope mode at sample rates of 125 MS per second and slower. At faster sample rates the instrument uses conventional sampling.			
	The minimum single pulse widths for 50% or greater amplitude capture for pulses greater than 2 divisions in magnitude.

✓ Timebase and delay time accuracy (Long term sample rate accuracy)	
< 4 GHz models	± 2.5 ppm initial accuracy. Aging < 1ppm per year.
≥ 4 GHz models	± 1.5 ppm initial accuracy. Aging < 1ppm per year from date of factory calibration. Applies only when using the internal reference.
Aperture uncertainty, typical, ≥ 4 GHz models	Measured at the maximum BWE enabled bandwidth. Total: <250 fs rms for record durations less than 10 µs <350 fs rms for record durations less than 100 µs <650 fs rms for record durations less than 1 ms <15 parts/trillion for record durations less than 60 s <2 ps peak-to-peak for record durations less than 10 µs <3 ps peak-to-peak for record durations less than 100 µs <4 ps peak-to-peak for record durations less than 1 ms This assumes either internal reference, or external reference in low (stable) mode. For external reference in high (tracking) mode, the input reference must be low noise, and the edge slew rate must exceed 1.5 V/ns to achieve the above approximate jitter results. For the general case, external reference in high (tracking) mode, the specification is: <250 fs rms for record durations less than 2 µs You can approach the performance of internal reference using a clean reference signal with input slew rate exceeding 1.5 V/ns. This is most easily achieved either with a square wave meeting that slew rate or using a 100 MHz sine wave (≈2 $V_{pk\text{-}pk}$). This is required for the best possible performance in synchronous sampling applications.
Jitter noise floor, typical, ≥ 4 GHz models	Applies to time periods as long as 10.0 µs DPO72004 400 fs DPO71604 300 fs DPO71254 300 fs DPO70804 450 fs DPO70604 450 fs DPO70404 450 fs Calculate the jitter noise floor (JNF) for a given instrument setting using the following formula: FS = full-scale setting (volts) A = signal amplitude as a fraction of full-scale t_{rm} = 10 - 90% displayed (or measured) rise time (sec) N = input-referred noise (volts rms) t_j = short term aperture uncertainty (sec rms) $JNF = \sqrt{\left[\frac{N}{FS \times A} \times t_{rm}\right]^2 + t_j^2}$ (seconds rms)

Delta time measurement accuracy, typical, ≥ 4 GHz models	An approximate formula to calculate delta-time measurement accuracy (DTA) for a given setting and input signal is given below (assumes insignificant signal content above Nyquist and insignificant error due to aliasing): A = input signal amplitude (volts) t_{rm} = 10 to 90% measured rise time (sec) N = input-referred noise (volts rms) t_j = short/medium term aperture uncertainty (sec rms) TBA = timebase accuracy (2 ppm) duration = delta-time measurement (sec) assume edge shape that results from Gaussian filter response $$DTA_{pk-pk} = 5 \times \sqrt{2 \times \left\{ \left[\frac{N}{A} \times t_{rm} \right]^2 + t_j^2 \right\}} + TBA \times duration$$ (seconds peak-to-peak) For timer durations less than 100 ns, the rms jitter in DTA measurements can be estimated as:

Characteristic	Description
	$$DTA_{rms} = \sqrt{2 \times \left\{ \left[\frac{N}{A} \times t_{rm} \right]^2 + t_j^2 \right\}}$$
	(seconds rms)
	The term under the square-root sign is the stability and is due to TIE. The errors due to this term occur throughout a single-shot measurement. The second term is due to both the absolute center-frequency accuracy and the center-frequency stability of the timebase and varies between multiple single-shot measurements over the observation interval (the amount of time from the first single-shot measurement to the final single-shot measurement). The observation interval may not exceed 1 year.

Performance Verification

Performance Verification

Two types of Performance Verification procedures can be performed on this product: *Brief Procedures* and *Performance Tests*. You may not need to perform all of these procedures, depending on what you want to accomplish.

- To rapidly confirm that the instrument functions and was adjusted properly, just do the brief procedures under *Self Tests*.

Advantages. These procedures are quick to do, require no external equipment or signal sources, and perform extensive functional and accuracy testing to provide high confidence that the instrument will perform properly. They can be used as a quick check before making a series of important measurements.

- To further check functionality, first do the *Self Tests* just mentioned; then do the brief procedures under *Functional Tests*.

Advantages. These procedures require minimal additional time to perform, require no additional equipment other than cables and adapters, and these procedures more completely test the internal hardware of the instrument. They can be used to quickly determine if the instrument is suitable for putting into service, such as when it is first received.

- If more extensive confirmation of performance is desired, do the *Performance Tests*, (See page 2-13, *Performance Tests*.), after doing the *Functional* and *Self Tests* mentioned above.

Advantages.These procedures add direct checking of the warranted specifications that are marked with the ✓ symbol. These procedures require specific test equipment. (See Table 2-2.)

If you are not familiar with operating this instrument, read the instrument user manual or explore the online help.

Conventions

Throughout these procedures the following conventions apply:

- Each test procedure uses the following general format:
  - Title of Test
  - Equipment Required
  - Prerequisites
  - Procedure
- Each procedure consists of as many steps, substeps, and subparts as required to do the test. Steps, substeps, and subparts are sequenced as follows:

1. First Step
   a. First Substep
      - First Subpart
      - Second Subpart
   b. Second Substep
2. Second Step

- In steps and substeps, the lead-in statement in italics instructs you what to do, while the instructions that follow tell you how to do it, as in the example step below:

  Initialize the instrument: Push the front-panel **Default Setup** button.

STOP. The **STOP** notation at the left is accompanied by information you must read to do the procedure properly.

- The term "toolbar" refers to a row of buttons at the top of the display. The term "menu bar" refers to a row of menus at the top of the display. You can switch between toolbar and menu bar operating modes by using the menu at the top right of the toolbar or menu bar. (See Figure 2-1.)
- Item numbers in the equipment required lists refer to the equipment. (See Table 2-2 on page 2-14.)

Figure 2-1: Toolbar and menu bar (< 4 GHz models shown)

- The procedures assume you have connected a mouse to the instrument so you can click on the screen controls. If you have not connected a mouse, you can use the touch screen to operate the screen controls.

Brief Procedures

The *Self Tests* use internal routines to confirm basic functionality and proper adjustment. No test equipment is required to do these test procedures.

The *Functional Tests* utilize the probe-compensation output at the front panel as a test-signal source for further verifying that the instrument functions properly. A BNC cable and an adaptor or a probe, depending on your instrument model are required to do these test procedures.

Self Tests

This procedure uses internal routines to verify that the instrument functions and was adjusted properly. No test equipment or hookups are required.

Equipment required	Prerequisites
None	Power on the instrument and allow a 20 minute warm-up before doing this procedure.

1. *Verify that internal diagnostics pass:* Do the following substeps to verify passing of internal diagnostics.

   a. *Display the System diagnostics menu:*

      If the instrument is in toolbar mode, put the instrument into menu bar mode.

      Pull down the **Utilities** menu and select **Instrument Diagnostics. . .** . This displays the diagnostics control window.

   b. *Run the System Diagnostics:*

      - First disconnect any input signals from all four channels.
      - Click the **Run** button in the diagnostics control window.

   c. *Wait:* The internal diagnostics do an exhaustive verification of proper instrument function. This verification may take several minutes. When the verification is finished, the resulting status will appear in the diagnostics control window.

   d. *Verify that no failures are found and reported on-screen.* All tests should pass.

   e. *Run the signal-path compensation routine:*

      Pull down the **Utilities** menu and select **Instrument Calibration. . .** . This displays the instrument calibration control window.

      If required because the instrument is in service mode, select the **Signal Path** button under Calibration Area.

      Click the **Run SPC** (**Calibrate** on some instruments) button to start the routine.

   f. *Wait:* Signal-path compensation may take five to fifteen minutes to run.

   g. *Confirm signal-path compensation returns passed status:* Verify that the word **Pass** appears in the instrument calibration control window.

2. *Return to regular service:* Click the **X** (close) button to exit the instrument calibration control window.

Functional Tests

The purpose of these procedures is to confirm that the instrument functions properly. The only equipment required is a BNC or SMA cable and an adapter or the instrument probe. If you need to store settings during these procedures, access the local C: drive and store them in the TekScope > Setups directory.

STOP. These procedures verify functions; that is, they verify that the instrument features operate. They do not verify that they operate within limits.

Therefore, when the instructions in the functional tests that follow call for you to verify that a signal appears on-screen "that is about five divisions in amplitude" or "has a period of about six horizontal divisions," etc., do NOT interpret the quantities given as limits. Operation within limits is checked in Performance Tests. (See page 2-13, *Performance Tests*.)

STOP. DO NOT make changes to the front-panel settings that are not called out in the procedures. Each verification procedure will require you to set the instrument to certain default settings before verifying functions. If you make changes to these settings, other than those called out in the procedure, you may obtain invalid results. In this case, just redo the procedure from step 1.

When you are instructed to press a front-panel or screen button, the button may already be selected (its label will be highlighted). If this is the case, it is not necessary to press the button.

Verify All Input Channels

Equipment required	Prerequisites
< 4 GHz models: One precision 50 Ω coaxial cable (Item 4)	None
< 4 GHz models: One BNC to Minigrabber adapter (item 18)	
≥ 4 GHz models: One SMA cable (item 21)	
≥ 4 GHz models: One adapter (item 19)	

1. *Initialize the instrument:* Push the front-panel **Default Setup** button.
2. *Hook up the signal source:* Connect the equipment as shown in the following figure to the channel input you want to test (beginning with Ch 1).

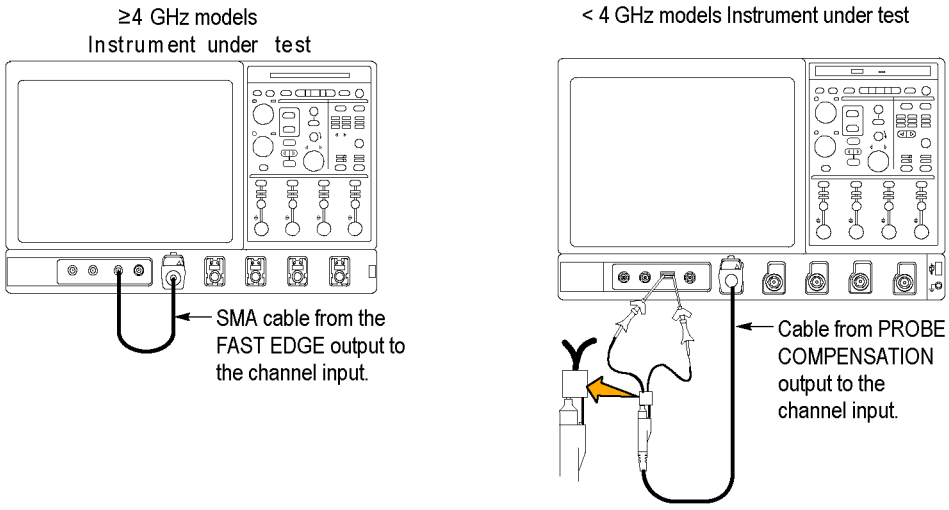

Figure 2-2: Universal test hookup for functional tests - Ch 1 shown

3. *Turn off all channels:* If any of the front-panel channel buttons are lighted, push those buttons to turn off the displayed channels as shown in the following figure.

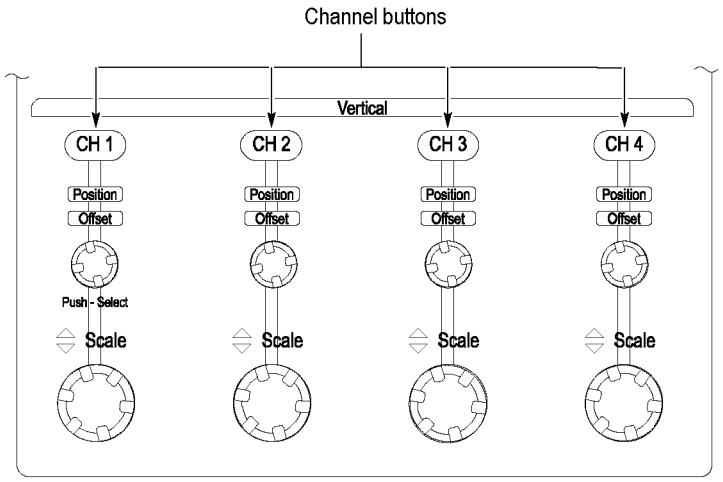

Figure 2-3: Channel button location

4. *Select the channel to test:* Push the channel button for the channel you are currently testing. The button lights and the channel display comes on.

5. *Set up the instrument:*

NOTE. *If the AutoSet Undo window appears, click the X.*

- Push the front panel **Autoset** button. This sets the horizontal and vertical scale and vertical offset for a usable display and sets the trigger source to the channel you are testing.
- Pull down the **Vertical** menu, select Vertical Setup. Confirm that the Ch1 Offset is about **0.0 mV**.

6. *Verify that the channel is operational:* Confirm that the following statements are true.

   - Verify that the vertical scale readout and the waveform amplitude for the channel under test. (See Table 2-1.)

Table 2-1: Vertical settings

	< 4 GHz models	≥ 4 GHz models
Setting	**Without probe**	**Without probe**
Scale	500 mV	100 mV
Waveform amplitude	2 divisions	4 divisions

- The front-panel vertical **Position** knob (for the channel you are testing) moves the signal up and down the screen when rotated.
- Turning the vertical **Scale** knob counterclockwise (for the channel you are testing) decreases the amplitude of the waveform on-screen, turning the knob clockwise increases the amplitude, and returning the knob to the original scale setting returns the original amplitude for that scale setting. (See Table 2-1.)

7. *Verify that the channel acquires in all acquisition modes:* Pull down the **Horiz/Acq** menu to select **Horizontal/Acquisition Setup. . .** . Click the **Acquisition** tab in the control window that displays. Click each of the acquisition modes and confirm that the following statements are true.
   - Sample mode displays an actively acquiring waveform on-screen. (Note that there is a small amount of noise present on the square wave).
   - Peak Detect mode displays an actively acquiring waveform on-screen with the noise present in Sample mode "peak detected".
   - Hi Res mode displays an actively acquiring waveform on-screen with the noise that was present in Sample mode reduced.
   - Average mode displays an actively acquiring waveform on-screen with the noise reduced.
   - Envelope mode displays an actively acquiring waveform on-screen with the noise displayed.

NOTE. *Default setup enables enhanced triggering. Enhanced triggering can cause a slower acquisition rate that can be noticed in waveform database mode. As waveform database mode acquires 100,000 samples, the display intensity will increase, be cleared, and then the process will start over. When enhanced triggering is turned off, and with the specified settings and input signal, the display reaches full intensity right away.*

   - Waveform Database mode displays an actively acquiring waveform on-screen with the noise displayed.

8. *Test all channels:* Repeat steps 2 through 7 until all four input channels are verified.
9. *Remove the test hookup:* Disconnect the equipment from the instrument.

Verify the Time Base

Equipment required	Prerequisites

< 4 GHz models: One BNC to Minigrabber adapter (item 18)	
≥ 4 GHz models: One SMA cable (item 21)	
≥ 4 GHz models: One adapter (item 19)	

1. *Initialize the instrument:* Push the front-panel **Default Setup** button.
2. *Hook up the signal source:* Connect the probe compensation or fast edge output to the Ch 1 input as shown in the following figure.

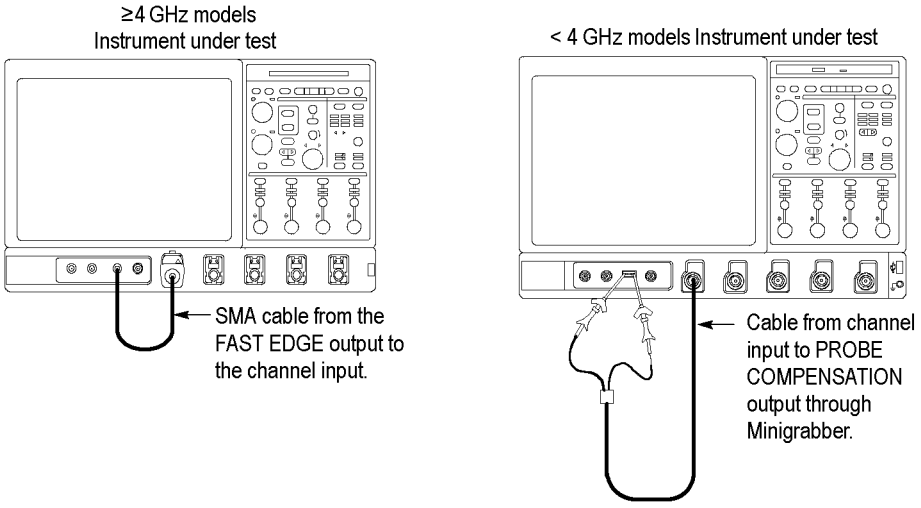

Figure 2-4: Setup for time base test

5. *Set the time base:* Set the horizontal **Scale** to **200 µs/div**. The time-base readout is displayed at the bottom of the graticule.
6. *Verify that the time base operates:* Confirm the following statements.
   - One period of the square-wave signal is about five horizontal divisions on-screen for the 200 µs/div horizontal scale setting.
   - Rotating the horizontal **Scale** knob clockwise expands the waveform on-screen (more horizontal divisions per waveform period), counterclockwise rotation contracts it, and returning the horizontal scale to 200 µs/div returns the period to about five divisions.
   - The horizontal **Position** knob positions the signal left and right on-screen when rotated.

7. *Verify horizontal delay:*

   a. *Center a rising edge on screen:*

      - Set the horizontal **Position** knob so that the rising edge where the waveform is triggered is lined up with the center horizontal graticule.
      - Change the horizontal **Scale** to **20 µs/div**. The rising edge of the waveform should remain near the center graticule and the falling edge should be off screen.

   b. *Turn on and set horizontal delay:*

      - Pull down the **Horiz/Acq** menu to select **Horizontal/Acquisition Setup. . .** .
      - Click the **Horizontal** tab in the control window that displays.
      - Click the **Delay Mode** button to turn delay on.
      - Double click the **Horiz Delay** control in the control window to display the pop-up keypad. Click the keypad buttons to set the horizontal delay to **1 ms** and then click the **ENTER** key.

   c. *Verify the waveform:* Verify that a rising edge of the waveform is within a few divisions of center screen.

   d. *Adjust the horizontal delay:* Rotate the upper multipurpose knob to change the horizontal delay setting. Verify that the rising edge shifts horizontally. Rotate the front-panel horizontal **Position** knob. Verify that this knob has the same effect (it also adjusts delay, but only when delay mode is on).

   e. *Verify the delay toggle function:*

      - Rotate the front-panel horizontal **Position** knob to center the rising edge horizontally on the screen.
      - Change the horizontal **Scale** to **50 ns/div** (< 4 GHz models) or **40 ns/div** (≥ 4 GHz models). The rising edge of the waveform should remain near the center graticule.
      - Readjust the delay setting to position the rising edge 2 divisions to the right of the center graticule line.
      - Push the front-panel **Delay** button several times to toggle delay off and on and back off again. Verify that the display switches quickly between two different points in time (the rising edge shifts horizontally on the display).

8. *Remove the test hookup:* Disconnect the test hookup from the instrument.

Verify the A (Main) and B (Delayed) Trigger Systems

Equipment required	Prerequisites

   - The trigger level readout for the A (main) trigger system changes with the trigger-**Level** knob.
   - The trigger-**Level** knob can trigger and untrigger the square-wave signal as you rotate the knob. (Leave the signal untriggered).
   - Pushing the front-panel trigger **Level** knob sets the trigger level to the 50% amplitude point of the signal and triggers the signal that you just left untriggered. (Leave the signal triggered.)

6. *Verify that the delayed trigger system operates:*

   a. *Set up the delayed trigger:*

      Pull down the **Trig** menu and select **A – B Trigger Sequence. . .** . This displays the A →B Sequence tab of the trigger setup control window.

      Click the **Trig After Time** button under A Then B.

      Click the **B Trig Level** control in the control window.

      Set the front-panel trigger mode to **Norm**.

   b. *Confirm that the following statements are true*:

      - The trigger-level readout for the B trigger system changes as you turn the lower multipurpose knob.
      - As you rotate the lower multipurpose knob, the square-wave signal can become triggered and untriggered. (Leave the signal triggered.)

   c. *Verify the delayed trigger counter:*

9. *Remove the test hookup:* Disconnect the test hookup from the instrument.

Performance Tests

This section contains a collection of manual procedures for checking that the instrument performs as warranted.

The procedures are arranged in logical groupings: *Signal Acquisition System Checks, Time Base System Checks, Triggering System Checks*, *Output Ports Checks, and Serial Trigger Checks*. They check all the characteristics that are designated as checked in *Specifications.* (The characteristics that are checked appear with a ✓ in *Specifications*).

STOP. These procedures extend the confidence level provided by the basic procedures. The basic procedures should be done first, then these procedures performed if desired.

Prerequisites

The tests in this section comprise an extensive, valid confirmation of performance and functionality when the following requirements are met:

- The cabinet must be installed on the instrument.
- You must have performed and passed the procedures under *Self Tests,*, and those under *Functional Tests.* (See page 2-4, *Functional Tests*.)
- A signal-path compensation must have been done within the recommended calibration interval and at a temperature within ±5 ºC (±9 ºF) of the present operating temperature. (If at the time you did the prerequisite *Self Tests,* the temperature was within the limits just stated, consider this prerequisite met). A signal-path compensation must have been done at an ambient humidity within 25% of the current ambient humidity and after having been at that humidity for at least 4 hours.
- The instrument must have been last adjusted at an ambient temperature between +18 ºC (+64 ºF) and +28 ºC (+82 ºF), must have been operating for a warm-up period of at least 20 minutes, and must be operating at an ambient temperature as listed in the specifications. (See Table 1-9 on page 1-44.) (The warm-up requirement is usually met in the course of meeting the Self Tests and Functional Tests prerequisites listed above).
- Support sensor, probe, and adapter setups to avoid stress or torque when connected to the device under test (DUT).

Signal Acquisition System Checks

These procedures check those characteristics that relate to the signal-acquisition system and are listed as checked under *Warranted Characteristics* in *Specifications.* (See Table 2-2.) for test equipment specifications.

Check DC Voltage Measurement Accuracy

Equipment Required	Prerequisites
One DC calibration generator (Item 6) One SMA male-to-BNC female adapter (Item 19)	The instrument must meet the prerequisites. (See page 2-13, *Prerequisites*.)

WARNING. *The generator is capable of outputting dangerous voltages. Be sure to set the DC calibration generator to off or 0 volts before connecting, disconnecting, and/or moving the test hookup during the performance of this procedure.*

1. *Install the test hookup and preset the instrument controls:*
   - **a.** *Hook up the test-signal source:*
     - Set the output of a DC calibration generator to off or 0 volts. Set the DC impedance of the generator to 50 Ω.
     - Connect the output of a DC calibration generator. (See Figure 2-20.)
   - **b.** *Initialize the instrument:* Press **DEFAULT SETUP**.
   - **c.** *Modify the default settings:*
     - From the button bar, touch **Horiz/Acq** and select the **Acquisition** tab.
     - Touch **Average** and set the number of averages to **16**.
     - < 4 GHz models: Touch **Vertical**, select **Vertical Setup**, and then touch Termination **50 Ω**.

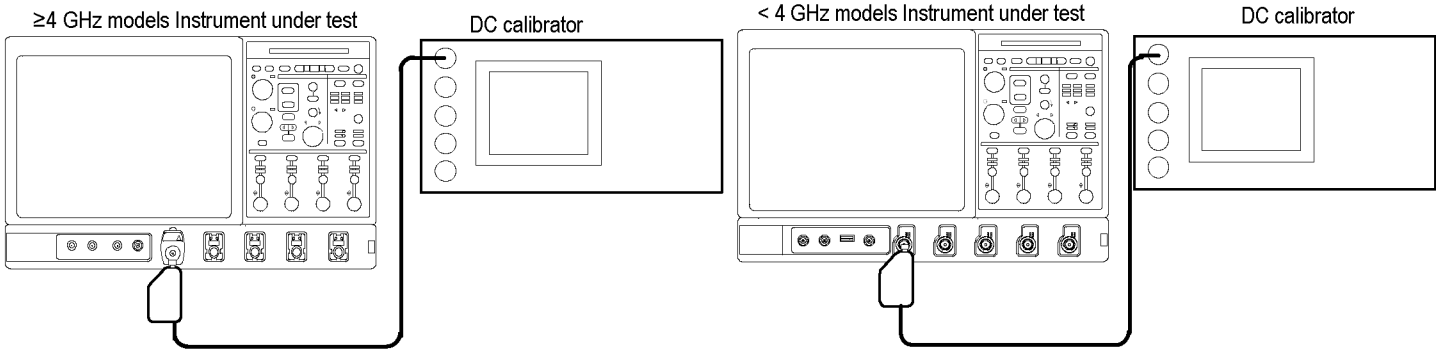

Figure 2-7: Initial test hookup

2. *Confirm input channels are within limits for DC accuracy at maximum offset and position:* Do the following substeps - test Ch 1 first, *skipping substep* a of this step *since Ch 1 is already selected from step* 1.

a. *Select an unchecked channel:*

- From the button bar, touch **Measure** and then **Clear All** to remove the previous measurement.
- Press the Vertical button of the channel just confirmed to remove the channel from the display.
- Press the front-panel Vertical button that corresponds to the channel you are to confirm.
- < 4 GHz models: Touch **Vertical**, select **Vertical Setup**, and then touch Termination **50 Ω**.
- Set the generator output to 0 V.
- Move the test hookup to the channel you selected.

b. *Turn on the measurement Mean for the channel:*

- From the button bar, touch **Measure** and select the **Ampl** tab, **More**, and then touch **Mean** to measure the mean of the current channel.
- Press the **X** (Close) button.

NOTE. *When setting the Fluke generator to output >5 V, use the following procedure:*
Press the Aux button
Press the fourth soft key down (Selects the pulse with an exclamation point)
Set the amplitude to 5.3 or 5.5 V
Press the ->| key to select the pulse energy

Check Analog Bandwidth, < 3.5 GHz models

Equipment required	Prerequisites
One sine wave generator (Item 9)	(See page 2-13, *Prerequisites*.)

NOTE. *The sine wave generator output amplitude must be leveled to within 0.35 dB of the reference frequency (50 MHz) through the bandwidth frequency. (See Table 2-7 on page 2-64.) The 0.35 dB requirement is necessary to ensure a bandwidth that meets Tektronix specifications.*

You can perform bandwidth PV using an unleveled sine wave generator (with amplitude error > 0.35 dB). Under these conditions, the bandwidth PV is subject to the flatness errors associated with the generator used.

Refer to the Sine Wave Generator Leveling Procedure if your sine wave generator does not have automatic output amplitude leveling. (See page 2-110.)

      - From the button bar, touch **Horiz/Acq** and select the **Acquisition** tab. Set the acquisition mode as follows:

        Touch **Average** and set the number of averages to **16**.
      - Set the sampling mode as follows:

        Touch the **Equivalent ET** button.
      - From the button bar, touch **Measure**. Touch Setups **Ref Levs**; then touch the **Histogram** button.

NOTE. *The sine wave generator output amplitude must be leveled to within 0.35 dB of the reference frequency (50 MHz) through the bandwidth frequency. (See Table 2-7 on page 2-64.) The 0.35 dB requirement is necessary to ensure a bandwidth that meets Tektronix specifications.*

You can perform bandwidth PV using an unleveled sine wave generator (with amplitude error > 0.35 dB). Under these conditions, the bandwidth PV is subject to the flatness errors associated with the generator used.

c. *Hook up the test-signal source:* Connect the sine wave output of a leveled sine wave generator to **Ch 1**. (See Figure 2-13.)Set the output of the generator to a reference frequency of 50 MHz or less.

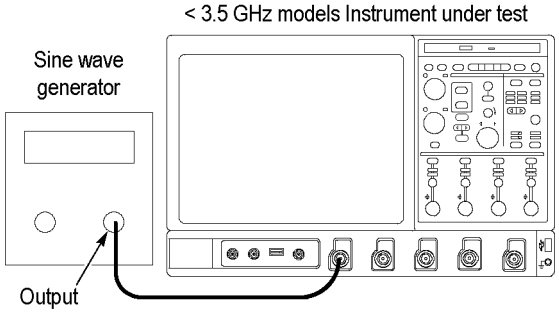

Figure 2-13: Initial test hookup

2. *Confirm the input channels are within limits for analog bandwidth:* Do the following substeps - test Ch 1 first, *skipping substeps* a *and* b *since Ch 1 is already set up for testing from step 1.*

a. *Select an unchecked channel:*

- From the button bar, touch **Measure** and then **Clear All** to remove the previous measurement.
- Press the Vertical button of the channel just confirmed to remove the channel from the display.
- Press the front-panel Vertical button that corresponds to the channel you are to confirm.

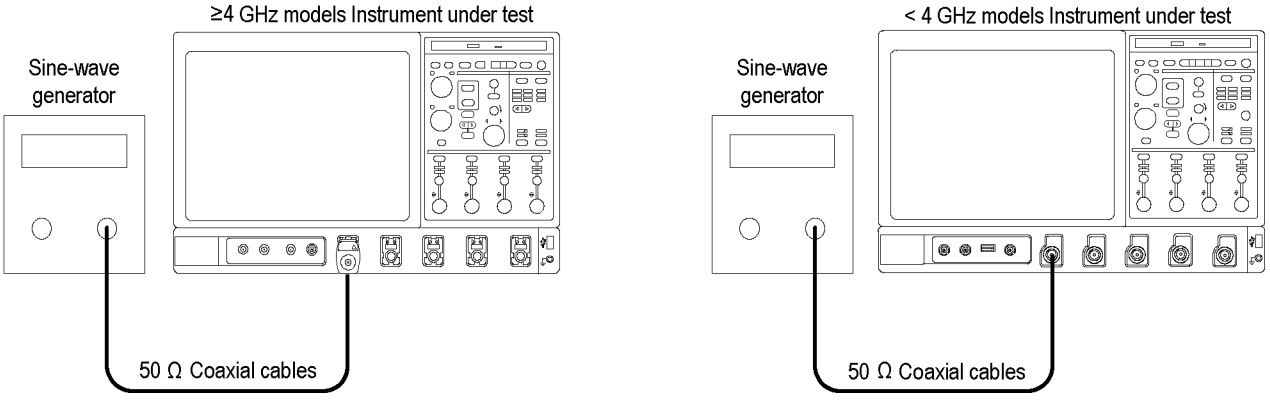

Figure 2-36: Initial test hookup

a. *Hook up test-signal source 1:* (See Figure 2-36.)

- Connect the sine wave output of the sine-wave generator through a 50 Ω precision coaxial cable to Ch 1 through an adapter.
- Set the sine-wave generator to output a 1.5625 GHz sine wave.

b. *Initialize the instrument:* Press the **Default Setup** button.

c. *Modify the initialized front-panel control settings:*

- Set the Vertical **Scale** to 50 mV per division.
- < 4 GHz models: Touch **Vertical**, select **Vertical Setup**, and then touch Termination **50 Ω**.
- Set the horizontal **Scale** to 200 ps per division.
- From the button bar, touch the **Display** button.
- Set the Display Style to **Dots**.
- Set the Display Persistence to **Variable**, and set the persist Time to **3.0 s**.
- Touch the **X** (close) button.
- Adjust the sine-wave generator output for 8 divisions of amplitude.
- From the button bar, touch **Trig** and select the **A Event** tab.

- Touch the **Select** button.
- Touch the **Comm** button. Set **Source** to Ch1, **Type** to R Clk, and **Coding** to NRZ.

2. *Verify the clock recovery at frequency:*

   a. From the button bar, touch **Trig** and select the **A Event** tab.

   b. Set the sine-wave generator to output one of the input frequencies in the table that is not yet checked, starting with the first setting. (See Table 2-16 on page 2-108.)

   c. Set the instrument Bit Rate to the Recovered clock Baud rate listed in the table for the current input frequency.

   NOTE. *The instrument will attempt to acquire lock once. If the input data is disrupted, removed, or heavily distorted, the instrument may not acquire lock or may loose lock. If the recovered clock is not locked to the incoming data, the waveform display will not be stable. Once the input data is available, press the PUSH SET TO 50% knob to force the instrument to acquire lock again.*

   d. Press **PUSH-SET 50%**.

   NOTE. *As the input frequency is lowered, adjust the Horizontal SCALE to maintain about 3 to 5 eyes across the display.*

   e. Verify that lock is acquired. (See Figure 2-37 on page 2-109.)

   f. Repeat substeps b through d for each input frequency and Baud rate listed in the table. (See Table 2-16 on page 2-108.).

   g. If all tests pass, enter passed in the test record.

3. *Disconnect the hookup:* Disconnect the equipment from the instrument.

Sine Wave Generator Leveling Procedure

Some procedures in this manual require a sine wave generator to produce the necessary test signals. If you do not have a leveled sine wave generator, use one of the following procedures to level the output amplitude of your sine wave generator.

Equipment required	Prerequisites
Sine wave generator (Item 9)	(See page 2-13, *Prerequisites*.)
Meter, power and sensor (Item 10)	
Power splitter (Item 11)	
50 Ω precision cable 2.92 mm male-to-female (Item 12)	
One K male-to-male adapter (Item 13)	

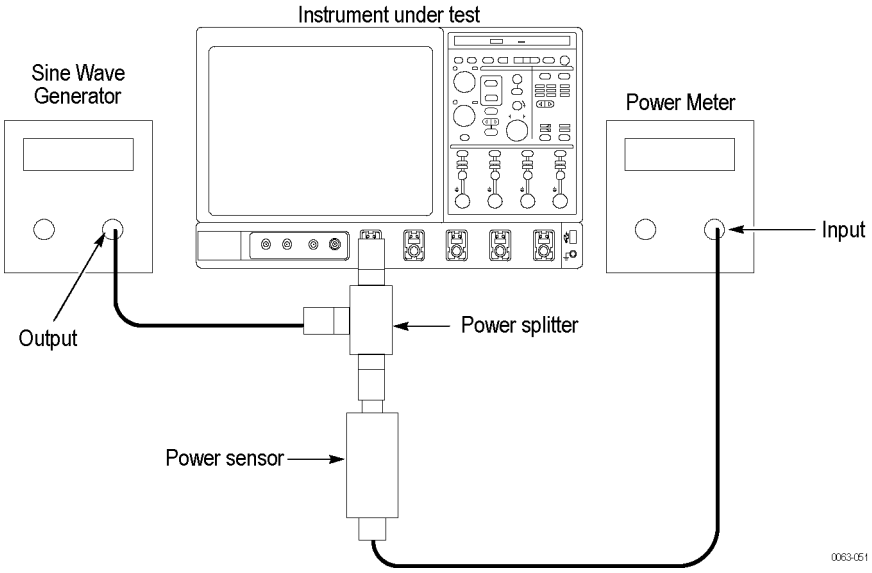

Figure 2-38: Sine wave generator leveling equipment setup

1. *Install the test hookup:* Connect the equipment as shown in the above figure.
2. *Set the Generator:*
   - Set the sine wave generator to a reference frequency of 10 MHz.
   - Adjust the sine wave generator amplitude to the required number of divisions as measured by the instrument.
3. *Record the reference level:* Note the reading on the level meter.
4. *Set the generator to the new frequency and reference level:*
   - Change the sine wave generator to the desired new frequency.
   - Input the correction factor and/or the new frequency into the level meter.
   - Adjust the sine wave generator amplitude until the level meter again reads the value noted in step 3. The signal amplitude is now correctly set for the new frequency.

Equipment required	Prerequisites
Sine wave generator (Item 9)	(See page 2-13, *Prerequisites*.)
Level meter and power sensor (Item 10)	
Two male N to female BNC adapters (Item 14)	
Two precision coaxial cables (Item 4)	
One or two SMA male-to-female BNC adapters (Item 19)	

1. *Install the test hookup:* Connect the equipment as shown in the figure below (start with the sine wave generator connected to the instrument). (See Figure 2-39.)
2. *Set the Generator:*
   - Set the sine wave generator to a reference frequency of 10 MHz.
   - Adjust the sine wave generator amplitude to the required number of divisions as measured by the instrument.

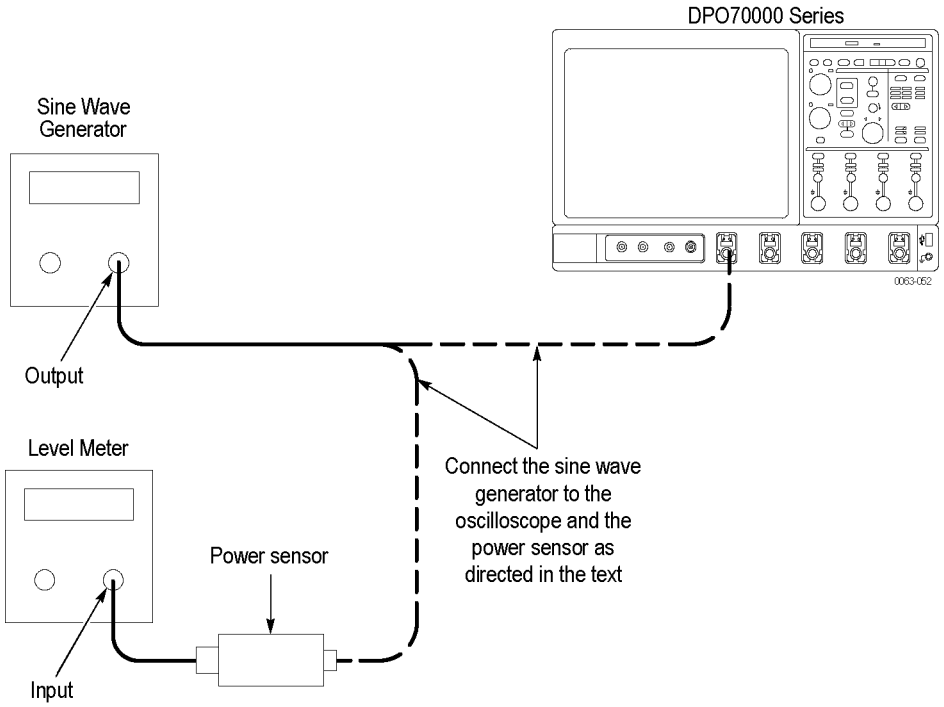

Figure 2-39: Equipment setup for maximum amplitude

3. *Record the reference level:*
   - Disconnect the sine wave generator from the instrument.
   - Connect the sine wave generator to the power sensor.
   - Note the level meter reading.
4. *Set the generator to the new frequency and reference level:*
   - Change the sine wave generator to the desired new frequency.
   - Input the correction factor and/or the new frequency into the level meter.
   - Adjust the sine wave generator amplitude until the level meter again reads the value noted in step 3. The signal amplitude is now correctly set for the new frequency.
   - Disconnect the sine wave generator from the power sensor.
   - Connect the sine wave generator to the instrument.
