# OPERATING INSTRUCTIONS

## INTRODUCTION

### INSTRUMENT DESCRIPTION

The FG 503 Function Generator is designed to operate in a TM 500 series power module. Low distortion sine, square and triangle waveforms from 1 Hz to 3 MHz, are available at the front panel. A +2.5 V square wave trigger also is available at the front panel. Variable dc offset of  $\pm 5$  V is provided.

A custom timing switch position is provided. This allows the user to install a timing capacitor for custom tailoring the frequency range of the FG 503.

A voltage-controlled frequency (VCF) input controls the output frequency from an external voltage source. The output frequency can be swept above or below the selected frequency, to a maximum of 1000:1, depending on the polarity and amplitude of the VCF input and the selected output frequency.

The variety of swept and modulated signals available from the FG 503 make it especially useful for such applications as testing servo-system or amplifier response, distortion and stability. It is also useful for FM generation or as a variable beat-frequency oscillator. The square wave trigger output can be used as a source for TTL logic, or to synchronize an external device such as an oscilloscope or counter.

### INITIAL OPERATION

The FG 503 is calibrated and ready for use when received. It is designed to operate in any compartment of the TM 500 series power module. Refer to the power module instruction manual for line voltage requirements and power module operation. See Fig. 1-1 for installation-removal procedure. Check that the FG 503 is fully inserted in the power module. Pull the PWR switch on the power module. Check that the green POWER light on the FG 503 is on. The Controls, Connectors and Adjustments foldout

Fig. 1-1. FG 503 installation and removal.

## Operating Instructions—FG 503

page in Section 3 gives a complete description of the front panel controls and connectors.

### FUNCTIONS AVAILABLE AT REAR CONNECTOR

Refer to the rear connector assignment illustration in the Service Section of this manual for pin assignments.

A slot between pins 23 and 24 on the rear connector identifies the FG 503 as a member of the signal source family. A barrier may be inserted in the corresponding position of the power module jack, to prevent other than signal source plug-ins from being used in that compartment. This protects the plug-in should specialized connections be made to that compartment. Consult the Building A System section of the power module manual for further information.

## OPERATING CONSIDERATIONS

### OUTPUT CONNECTIONS

The output of the FG 503 is designed to operate as a 50  $\Omega$  voltage source working into a 50  $\Omega$  load. At higher frequencies, an unterminated or improperly terminated output will cause excessive aberrations on the output waveform (see Impedance Matching discussion). Loads less than 50  $\Omega$  will reduce the waveform amplitude.

Excessive distortion or aberrations, due to improper termination, are less likely to occur at the lower frequencies (especially with sine and triangle waveforms). To ensure waveform purity, observe the following precautions:

1. Use good quality 50  $\Omega$  coaxial cables and connectors.
2. Make all connections tight and as short as possible.
3. Use good quality attenuators, if it is necessary to reduce waveform amplitude to sensitive circuits.
4. Use terminators or impedance-matching devices to avoid reflections when using long cables (six feet or more).
5. Ensure that attenuators, terminations, etc. have adequate power handling capabilities for the output waveform.

### RISETIME AND FALLTIME

If the output pulse from the FG 503 is used to measure the rise or falltime of a device, consider the risetime characteristics of the associated equipment used. If the risetime of the device under test is at least ten times greater than the combined risetimes of the FG 503 plus the monitoring oscilloscope and associated cables, the error

introduced will not exceed 1%. This error can generally be ignored. When the rise or falltime of the test device is less than ten times as long as the combined risetimes of the testing system, the actual risetime of the device must be determined. This is found from the risetime of each component making up the system. The total risetime equals the square root of the sum of the squares of the individual risetimes.  $R_t = \sqrt{(R_1)^2 + (R_2)^2 + \dots}$ . Conversely, the risetime of the device under test can be found, from the same relationship, if the actual risetimes in the system are known.

The physical and electrical characteristics of the pulse transmitting cable determine the characteristic impedance, velocity of propagation, and amount of signal loss. Signal loss, is related to the frequency; therefore, a few feet of cable can attenuate high frequency information in a fast-rise pulse. It is important therefore, to keep these cables as short as practical.

When signal comparison measurements or time difference determinations are made, the two signals from the test device should travel through coaxial cables with identical loss and time delay characteristics.

If there is a dc voltage across the output load, the output pulse amplitude will be compressed, or in some cases (if the voltage exceeds  $\pm 10$  V), it may short the output. To prevent this from occurring, the output must be coupled through a dc blocking capacitor to the load. The time constant of the coupling capacitor and load must be long enough to maintain pulse flatness.

### IMPEDANCE MATCHING

As a pulse travels down a transmission line, each time it encounters a mismatch, or different impedance than that of the transmission line, a reflection is generated and sent back along the line to the source. The amplitude and polarity of the reflections are determined by the amount of

the encountered impedance in relation to the characteristic impedance of the cable. If the mismatch impedance is higher than the line, the reflection will be of the same polarity as the applied signal. If it is lower, the reflection will be of opposite polarity.

If the reflected signal returns before the pulse is ended, it adds to or subtracts from the amplitude of the pulse. This distorts the pulse shape and amplitude. If the FG 503 is driving a high impedance such as the 1 MΩ input impedance (paralleled by a stated capacitance) of the vertical input to an oscilloscope, connect the transmission line to a 50 Ω attenuator, 50 Ω termination, and then the oscilloscope input. The attenuator isolates the input capacitance of the device, and the FG 503 is properly terminated.

A simple resistive impedance-matching network, that provides minimum attenuation, is illustrated in Fig. 1-2. To match impedance with the illustrated network, the following conditions must exist:

$$\frac{(R_1 + Z_2) R_2}{R_1 + Z_2 + R_2} \text{ must equal } Z_1$$

and

$$R_1 + \frac{Z_1 R_2}{Z_1 + R_2} \text{ must equal } Z_2.$$

Therefore:

$$R_1 R_2 = Z_1 Z_2; \text{ and } R_1 Z_1 = R_2 (Z_2 - Z_1)$$

or

$$R_1 = \sqrt{Z_2(Z_2 - Z_1)}$$

and

$$R_2 = Z_1 \sqrt{\frac{Z_2}{Z_2 - Z_1}}$$

For example, to match a 50 Ω system to a 125 Ω system, Z<sub>1</sub> equals 50 Ω and Z<sub>2</sub> equals 125 Ω.

Therefore:

$$R_1 = \sqrt{125(125 - 50)} = 96.8 \text{ ohms}$$

and

$$R_2 = 50 \sqrt{\frac{125}{125-50}} = 64.6 \text{ ohms.}$$

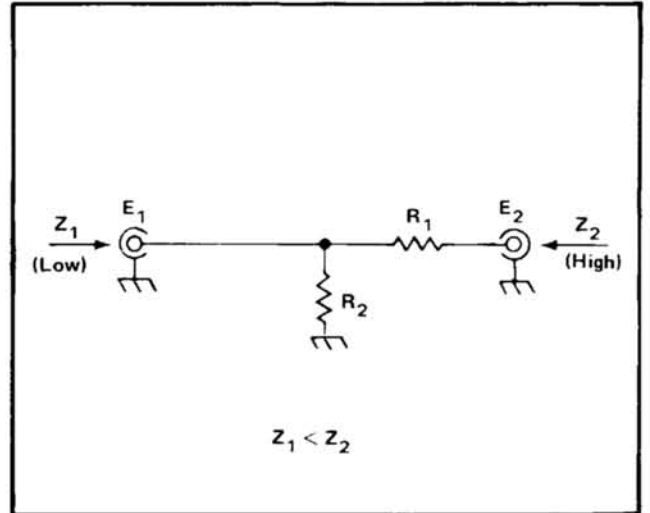

Fig. 1-2. Impedance matching network that provides minimum attenuation.

When constructing such a device, the environment surrounding the components should be designed to provide a transition between the impedances. The characteristic impedance of a coaxial device is determined by the ratio between the outside diameter of the inner conductor to the inside diameter of the outer conductor,

$$Z_0 = \frac{138}{\sqrt{\epsilon}} \log_{10} \frac{D}{d}$$

D is the inside diameter of the outer conductor, d is the diameter of the inner conductor, and ε is the dielectric constant (1 in air).

The network shown in Fig. 1-2 provides minimum attenuation for a purely resistive impedance-matching device. The attenuation as seen from one end does not equal that seen from the other end. A signal (E<sub>1</sub>) applied from the lower impedance source encounters a voltage attenuation (A<sub>1</sub>) that is greater than 1 and less than 2, as follows:

$$A_1 = \frac{E_1}{E_2} = \frac{R_1}{Z_2} + 1.$$

## Operating Instructions—FG 503

A signal ( $E_2$ ) applied from the higher impedance source ( $Z_2$ ) encounters a greater voltage attenuation ( $A_2$ ) that is greater than 1 and less than  $2(Z_2/Z_1)$ :

$$A_2 = \frac{E_2}{E_1} = \frac{R_1}{R_2} + \frac{R_1}{Z_1} + 1.$$

In the example of matching  $50 \Omega$  to  $125 \Omega$ ,

$$A_2 = \frac{96.8}{125} + 1 = 1.77$$

and

$$A_2 = \frac{96.8}{64.6} + \frac{96.8}{50} + 1 = 4.43.$$

The illustrated network can be modified, to provide different attenuation ratios, by adding another resistor (less than  $R_1$ ) between  $Z_1$  and the junction of  $R_1$  and  $R_2$ .

# BASIC OPERATION

## FREE-RUNNING OUTPUT

Set the AMPLITUDE control fully clockwise. Notice the two identical sets of waveforms near the FUNCTION selector on the front panel. The three waveforms in the lightly shaded area allow use of the OFFSET control; the other three do not. Select the desired waveform with or without offset. See Fig. 1-3. Select the desired frequency with the MULTIPLIER and FREQUENCY Hz dials. The output frequency is calibrated when the FREQUENCY VERNIER control is in the full clockwise position. Connect the load to the OUTPUT connector and adjust the AMPLITUDE control for the desired output amplitude.

Fig. 1-3. Output waveforms available from the FG 503.

When using the offset feature select the waveform desired in the light shaded area. Now adjust the OFFSET control to position the dc level (baseline) of the output waveform above or below 0 V as desired.

## VOLTAGE-CONTROLLED FREQUENCY (VCF) OUTPUT

The output frequency of the FG 503 can be swept over a frequency range of 1000:1 depending on the

MULTIPLIER setting, by applying a 0 V to 10 V signal to the VCF IN connector. See Fig. 1-4 for maximum VCF range for each MULTIPLIER setting.

Fig. 1-4. Graph showing range of frequencies for each MULTIPLIER setting that can be swept with a 0 to 10 V signal applied to the VCF input.

The polarity of the VCF input signal determines the direction the output frequency is swept from the frequency set by the MULTIPLIER, FREQUENCY Hz, and VER-

NIER controls. A positive-going voltage raises the frequency, while a negative-going voltage lowers the frequency. A voltage that varies symmetrically about 0 V sweeps the output frequency symmetrically about the center frequency determined by the frequency controls. See Fig. 1-5.

Since the VCF input amplitude versus frequency is a linear relationship, the frequency output range may be determined from the VCF input amplitude. Use a fixed dc voltage and frequency counter or other comparison method, to accurately determine the output frequency and VCF voltage relationship. Refer to the test under the heading Response Analysis for a typical application using the VCF feature.

range of 20 Hz to 20 kHz is desired. Fig. 1-4 shows that no fixed multiplier setting includes the desired limits. The value of the capacitor that must be installed is determined by the following formula:

$$C_{cus} = \frac{300}{F_{max}}$$

where  $C_{cus}$  is in  $\mu F$ , and  $F_{max}$ , in Hz, is the maximum frequency required. Apply the formula to the example;

$$C_{cus} = \frac{300}{20 \times 10^3} = 0.015 \mu F.$$

The capacitor selected must be a low leakage non-polarized type within the range of 100 pF to 100  $\mu F$  and must have at least a 10 V rating. Ceramic and mylar capacitors work well in this application.

### CUSTOM TIMING CAPACITOR SELECTION

This feature allows the user to custom select a swept frequency range. For example, assume a swept frequency

Fig. 1-5. Swept frequency range with 10 V signals applied to VCF IN Connector.

## Operating Instructions—FG 503

Remove the left side cover of the FG 503. Refer to Fig. 1-6 for capacitor location. Solder the capacitor to the test points located on the left rear side of the circuit board as shown in Fig. 1-6. Finally, set the MULTIPLIER control to the C position, and apply the correct voltage to the VCF IN connector. Set the FREQUENCY Hz and FREQ VERNIER dials for the desired swept frequency range.

Fig. 1-6. Custom timing capacitor location.

The calibration marks on the FREQUENCY Hz dial are not appropriate for use directly in determining frequency in the custom range position. It is possible however, to custom calibrate the dial, since the linearity of the FREQUENCY Hz dial calibration is not changed in the custom position.

### TYPICAL VCF APPLICATION

The FG 503 is particularly suited for determining response characteristics of circuits or systems. This application utilizes the VCF input of the FG 503 to sweep the generator over a range of frequencies. By applying the desired waveform from the FG 503 to a device under test, and sweeping the waveform frequency over a selected range, various response characteristics can be observed on a monitoring oscilloscope.

The following procedure describes a technique for determining response characteristics of any frequency sensitive device that operates within the frequency range of the FG 503. Refer to the Voltage-Controlled Frequency (VCF) Output discussion for additional information.

1. Connect the equipment as shown in Fig. 1-7.
2. Set the MULTIPLIER selector and FREQUENCY Hz dial for the desired upper or lower frequency limit

Fig. 1-7. Analyzing circuit or system response.

(depending on the direction you may wish to sweep). See Fig. 1-4 for VCF ranges and MULTIPLIER settings.

3. Apply the desired waveform to the VCF IN connector.

4. Adjust the amplitude of the VCF input waveform for the desired output frequency range.

5. Observe the response characteristics on the monitoring oscilloscope.

The frequency at which a displayed response characteristic occurs can be determined by first removing the VCF input waveform, then manually adjusting the FREQUENCY Hz dial to again obtain the particular characteristic observed in the swept display. Then read the frequency on the FREQUENCY Hz dial.

## ELECTRICAL CHARACTERISTICS

### PERFORMANCE CONDITIONS

The electrical characteristics are valid only if the FG 503 is calibrated at an ambient temperature between +20°C and +30°C, and operated between 0°C and +50°C, unless otherwise noted.

### WAVEFORMS:

Sine, square, and triangle.

### FREQUENCY RANGE:

Calibrated Range: 1 Hz to 3 MHz.

Usable Range:  $\leq 0.01$  Hz to  $\geq 5$  MHz.

Custom Range: Switch selectable on front panel. Frequency range determined by user-installed timing capacitor.

### FREQUENCY RESOLUTION:

1 part in  $10^5$  of full scale setting using FREQUENCY VERNIER control.

### FREQUENCY STABILITY:

$\leq 0.1\%$  of full scale for 1 hour after a 30 minute warmup,  
 $\leq 0.5\%$  of full scale for 24 hours. Dial must be on calibrated portion and ambient temperature must be 25°C  $\pm 5^\circ$ C.

### DIAL ACCURACY:

Within  $\pm 5\%$  of full scale from 1 Hz to 3 MHz.

### DIAL RANGE:

1 to 30 calibrated, 0.1 to 1 uncalibrated.

### OUTPUT AMPLITUDE:

$\geq 20$  V p-p open circuit,  $\geq 10$  V p-p into a 50  $\Omega$  load referenced at 10 kHz and excluding offset.

Variable Amplitude Range:  $\geq 20:1$ .

### AMPLITUDE FLATNESS:

Within 2 db referenced at 10 kHz.

### OFFSET RANGE:

At least  $\pm 5$  V open circuit,  $\geq \pm 2.5$  V into a 50  $\Omega$  load.  
 Peak signal plus offset at least  $\pm 10$  V open circuit,  $\pm 5$  V into 50  $\Omega$  load.

### SINE WAVE DISTORTION:

$\leq 0.5\%$  from 1 Hz to 30 kHz,  
 $\leq 1.0\%$  from  $>30$  kHz to 300 kHz,  
 $\leq 2.5\%$  from  $>300$  kHz to 3 MHz. Valid for calibrated frequencies only.

### TRIANGLE SYMMETRY:

Within 1% from 1 Hz to 100 kHz; within 5% from 100 kHz to 3.0 MHz using  $10^5$  MULTIPLIER setting. Dial must be on calibrated portion, and ambient temperature must be 25°C  $\pm 5^\circ$ C.

### TRIANGLE LINEARITY:

Within 1% from 1 Hz to 100 kHz.

Within 5% from 100 kHz to 3 MHz.

### SQUAREWAVE:

Risetime:  $\leq 60$  ns.

Aberrations:  $\leq 3\%$  p-p at full amplitude into a 50  $\Omega$  load.

## Operating Instructions—FG 503

### VOLTAGE CONTROLLED FREQUENCY INPUT:

Range: A 10 V signal shifts frequency  $\geq 1000:1$  where freq (max) is  $\leq 30X$  MULTIPLIER setting and freq (min) is  $\geq 0.03X$  MULTIPLIER setting.

Slew Rate:  $\geq 0.5$  V/ $\mu$ s.

### TRIGGER OUTPUT:

$\geq 2.5$  V into 600  $\Omega$ . Leading edge coincides with positive peak of sine and triangle waveforms, and precedes leading edge of square wave nominally by 50 ns.

### POWER CONSUMPTION:

$\approx 15$  watts.

# THEORY OF OPERATION

## INTRODUCTION

The triangle waveform is the basic waveform in the FG 503. The sine wave is derived from the triangle waveform using a five-step approximation. The square waveform is generated by the triangle generator control circuitry.

Refer to the simplified block diagram, and the circuit diagrams in the pullout pages of this manual along with the following discussion, for a complete understanding of the FG 503 operation.

## TRIANGLE GENERATOR

Operational amplifier U121, with Q121, form a positive constant-current source. Q145 and Q141 form a negative constant-current source. These constant current sources supply the current (either positive or negative) to charge the timing capacitor, generating the triangle waveform.

Assume that the junction of CR127 and CR135 is positive (about  $+9$  V) with respect to ground. CR127 is off and CR135 is conducting. CR140 is off, and the timing capacitor is charging from the positive current source through CR130. Q261 is off. Current to hold the junction of CR127 and CR135 positive is supplied via VR131, connected to the  $+20$  V supply.

The ramp, moving in the positive direction, appears in the same polarity at the  $+$  inputs of U235. This is accomplished through the action of source follower Q201A, with its constant current source, Q201B. Q211 and Q221, complementary emitter followers, drive the ac compensated attenuator R226, R227, and C226.

The voltage at pin 2 of U235A rests at about 1.6 V above ground. The voltage at pin 6 of U235B is about the same below ground. Under these conditions, the output of U235A and U235B (pin 10) rests so that the inputs of U241C are at the low TTL level. When the ramp voltage at pins 3 and 5 of U235A and U235B respectively reaches about 1.6 V, the output of these comparators start to go positive. When they reach the high TTL level, pin 10 of U241C goes low, causing the output of U241D to go high. This high level couples through VR261 to the base of Q261, turning Q261 on.

The lowered voltage (about  $-9$  V) at the junction of CR127 and CR135 turns CR140 on, and CR135 and CR130 off. This action disconnects the positive current source from the timing capacitor and connects the negative current source through CR140, causing the ramp to go in the negative direction. The ramp goes negative until the voltage at pins 3 and 5 of U235A and B, respectively, drops to about  $-1.6$  V. At this time the outputs of U235A and U235B go low causing the output of U241C to go high. This action causes the output of U241D to go negative, turning Q261 off, and the cycle repeats.

R123 balances the current between the positive and negative constant current sources so that the charge and discharge times for the capacitor are equal.

The frequency of the triangle waveform is controlled by two factors: (1) the value of the timing capacitor, and (2) the amount of current available to charge it.

When the FREQUENCY Hz dial is turned in the ccw direction, the voltage at pin 5 of U101A goes positive. This causes pin 7 of U101A and pin 2 of U101B to go positive. The voltage at pin 2 of U101B is also controlled by an external voltage applied to the front panel VCF IN connector. Under the above conditions, pin 1 of U101B goes negative, causing pin 6 of U121 to go negative. This increases the current available to charge the ramp generating capacitor. The negative current is also increased through the action of emitter follower Q141.

The waveform at pin 13 of U241D (about 15 V above the base of Q261) drives gates U241A and B, which in turn provide in-phase trigger signals to the front panel and the rear interface connector.

The square wave is taken from the collector of Q255.

## SINE SHAPER

This circuit, by means of a five-step approximation method, develops a sine wave from the applied triangle wave. The circuit is composed of Q320, Q340, and associated components. Although they operate in opposite polarity, each half of the sine shaper functions the

Fig. 2-1. Simplified sine shaper circuits. Part A shows equivalent circuit. Part B shows a three step approximation (actual circuit is a five step approximation). See text.

same, so only the upper half (Q320) is described. See Fig. 2-1 for a simplified version of the sine shaper.

Transistor Q320, controlled by the setting of — sine adjustment R311, establishes a fixed current through the resistive divider chain attached to its emitter. This fixes a different voltage at the cathode of each diode connected to the divider chain. When sine-wave operation is selected, a triangle wave is applied through R224, which forms part of a voltage divider, the other half of which is the diodes and the Q320 resistor chain. The output waveform is taken from the junction of R224 and the Q320 resistor chain.

As the applied triangle waveform rises to the voltage at the cathode of CR327, the diode conducts, changing the divider ratio and thus the slope of the output waveform. The slope is changed each time another diode turns on (as a result of the triangle waveform reaching the turn-on point of the diode), resulting in a waveform of approximate sinusoidal shape. As the input falls, the diodes turn off in succession, until the input waveform reaches zero volts. The changes in slope during this operation would seem to be pronounced; however, the nonlinear characteristics of the diodes tends to round off the changes. The result is a close approximation of a pure sine wave at the output.

## OUTPUT AMPLIFIER

This circuit operates as an inverting operational amplifier.  $R_f$  is R371 and  $R_i$  is R369. The base of Q371 is the negative input and the base of Q380 is the positive input. The overall gain is about four. The selected waveform is applied to the base of Q355. This transistor and Q360 operate as cascaded emitter followers. The waveform is taken from the emitter of Q360, through the AMPLITUDE control to the base of Q371. Q380 and Q371 operate as an emitter-coupled amplifier with Q376 serving as a constant current source. R375, in the emitter circuitry, adjusts for dc unbalance in the output amplifier. The base of Q380 is connected to the OFFSET control when waveform offset capability is required (S380-5 closed). This control also effectively adjusts dc levels in the output amplifier. The in-phase signal is fed from the collector of Q380 to the base of Q405. The out-of-phase signal is fed from the collector of Q371 to the base of inverter Q400. The waveform at the collectors of Q420 and Q405 are in phase. Their collectors drive complementary emitter-follower amplifiers Q425 and Q410. Output and feedback are taken from their common emitters. C369 compensates  $R_f$  for higher frequency components.

## POWER SUPPLIES

VR517 sets the voltage at pin 3 (+ input of an operational amplifier) of U512. U512 has a gain of

approximately three. The output at pin 6, therefore, is about 20 V. Emitter follower Q526 drives the base of the series pass transistor. Should the +20 V load increase, pin 2 of U512 (through R522 and R520) goes negative. This causes pin 6 to go positive, increasing current flow and restoring the +20 V to its previous level. Should the current drawn increase, so the voltage across R523 is sufficient to turn Q523 on, current limiting occurs. Q526 reduces conduction, reducing the current through the series pass transistor to a safe level. CR536 protects the +20 V supply, if it shorts to the minus supply.

U566 is an operational amplifier with a gain of about one. The reference voltage is the +20 V applied at pin 2. The output, at pin 6 (-20 V), drives emitter follower Q569. Q569 drives the series pass transistor located in the power module. Current limiting takes place in conjunction with Q566 and R567. Feedback occurs through R564. The

action of this circuit is similar to the +20 V regulator. CR539 protects this supply, should a short to +20 V occur.

The +17 V is referenced to the +20 V. U628, with a gain of about one, controls Q628, the series pass transistor for this supply. Feedback occurs at pin 2 of U628. Current limiting in the +20 V supply protects this circuit.

The -17 V supply is referenced to +17 V at pin 2 of U640. The gain of U640 is about one. Q640 serves as the series pass transistor for this supply. Feedback occurs through R633. Current limit for this supply is the +20 V supply.

The regulatory action of the +17 V and -17 V supplies is similar to that in the 20 V supplies.

# CALIBRATION PROCEDURE

## SERVICES AVAILABLE

Tektronix, Inc. provides complete instrument repair and adjustment at local Field Service Centers and the Factory Service Center. Contact your local Tektronix Field Office or Representative for further information.

## MAINTENANCE

Refer to the TM 500 series power module manual for complete maintenance information.

## TEST EQUIPMENT

For complete calibration, the following equipment is recommended:

Digital voltmeter with ranges greater than  $\pm 20$  V DC, Tektronix DM 501 or equivalent.

At least a 10 MHz oscilloscope system. Tektronix 5403 main frame, 5A45 vertical plug-in, 5B40 time base, or equivalent.

Distortion analyzer or 10 kHz notch filter constructed as shown in Fig. 3-1.

One 50  $\Omega$  termination, bnc connectors, Tektronix Part Number 011-0049-01.

One 50  $\Omega$ , 42-inch coaxial cable, bnc connectors, Tektronix Part Number 012-0057-01 or equivalent.

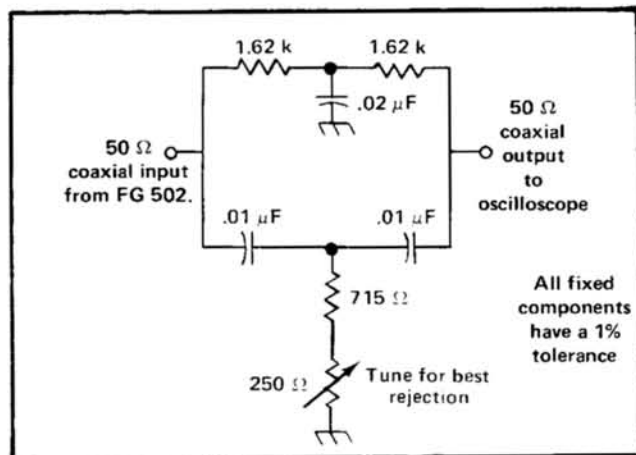

Fig. 3-1. 10 kHz notch filter.

## GENERAL

The FG 503 can be calibrated either fully installed in a TM 500 series power module, or connected to the power module via a flexible plug-in extender (Tektronix Part No. 067-0645-01). Remove the power module cabinet to make adjustments to the FG 503 inside the power module. All adjustments are located on the right side of the circuit board. Make all adjustments at an ambient temperature between 20°C and 30°C (+68°F to +86°F).

### 1. ADJUST +20 V SUPPLY

Connect the positive lead of the voltmeter set to read +20 V to the +20 V TP and the negative lead to the Gnd TP. Adjust R520, +20 V, for a reading of 20 V  $\pm 1\%$ .

### 2. CHECK POWER SUPPLY VOLTAGES

Connect the negative lead of the voltmeter set to read -20 V to the -20 V TP and the positive lead to the Gnd TP. Check that the reading is -20 V  $\pm 1\%$ . Move the negative lead to the -17 V TP and check that the reading is 17 V  $\pm 1\%$ . Now measure the +17 V by switching the negative lead to the Gnd TP and the positive lead to the +17 V TP and check that the reading is within  $\pm 1\%$  of 17 V.

### 3. ADJUST SYMMETRY

Connect the OUTPUT of the FG 503 through a 50  $\Omega$  coaxial cable and a 50  $\Omega$  termination, in that order, to the vertical input of the oscilloscope. Set the FG 503 AMPLITUDE control fully cw, the MULTIPLIER control to 10<sup>3</sup>, the FREQ VERNIER control fully cw, the FUNCTION switch to  $\square$  in the darkly shaded area (no offset) and the FREQUENCY Hz dial to 10. Set the oscilloscope vertical sensitivity to 2 V/div and the horizontal sweep rate to 10  $\mu$ s/div. Obtain a triggered square wave display on the crt. Adjust the FREQUENCY Hz dial so that only one complete square wave is visible on the crt. Adjust R123, Sym, for a symmetrical square wave. Finally, while switching the sweep triggering on the oscilloscope from positive slope to negative slope, check that the vertical transition of the square wave does not shift in time. Readjust R123, Sym, if necessary to achieve this result.

### 4. ADJUST LOW FREQUENCY TIMING

Set the oscilloscope sweep speed to 1 ms/div. Set the FREQUENCY Hz dial fully cw and make certain the FREQ VERNIER control is fully cw. Now adjust R116, X0.1 Cal, for one complete square wave in ten horizontal divisions on the crt.

### 5. ADJUST HIGH FREQUENCY TIMING

Set the FREQUENCY Hz dial to 30 and the oscilloscope sweep speed to 10  $\mu$ s/div. Adjust R101, X30 Cal, for three complete square wave cycles in ten horizontal divisions. Repeat step four and this step until proper calibration is achieved.

# CALIBRATION PROCEDURE

## 6. CHECK DIAL POSITIONING

Set the oscilloscope sweep rate at 0.1 ms/div. Adjust the FREQUENCY Hz dial so that exactly one complete square wave is displayed over ten horizontal divisions on the crt. The FREQUENCY Hz dial should now read 1. If not, loosen the two set screws on the knob and adjust so the dial reads 1. Go back and repeat steps four and five if adjustment of the FREQUENCY Hz dial was necessary.

## 7. ADJUST 300 kHz TIMING

Set the MULTIPLIER to  $10^4$ , FREQUENCY Hz dial to 30 and the oscilloscope sweep speed to 1  $\mu$ s/div. Adjust C226, 300 kHz Tmg, for a display of three complete cycles in ten horizontal divisions.

## 8. ADJUST 3 MHz TIMING

Set the MULTIPLIER to  $10^5$ , and the oscilloscope sweep speed to 0.1  $\mu$ s/div. Adjust C280, 3 MHz Tmg, for a display of three complete cycles in ten horizontal divisions.

## 9. ADJUST SQUARE WAVE COMPENSATION

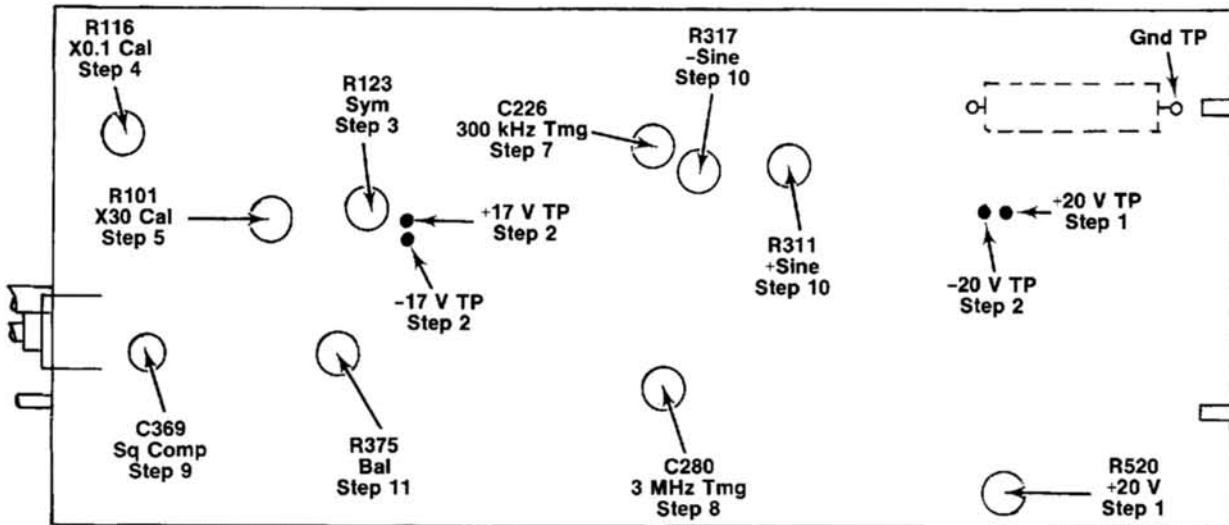

Set the FREQUENCY Hz dial to 10 (1.0 MHz). Adjust C369, Sq Comp, for the squarest front corner on the waveform. Check that the risetime of the square wave is within specification.

## 10. ADJUST SINE WAVE UPPER AND LOWER LEVEL CONTROLS (DISTORTION)

Set the FUNCTION switch to  $\nu$  in the shaded portion (no offset), MULTIPLIER to  $10^3$ , and FREQUENCY Hz to 10. Set the oscilloscope sweep speed to 50  $\mu$ s/div. Connect the distortion analyzer to the FG 503 output, or the notch filter (constructed as shown in Fig. 3-1) to the 50  $\Omega$  terminated end of a coaxial cable from the FG 503. Connect the output of the notch filter to the oscilloscope vertical input. Set the oscilloscope vertical sensitivity for a four-division display and adjust the FREQUENCY Hz dial for minimum display amplitude. Using a four-division display on the oscilloscope, alternately adjust R311, + Sine, R317, - Sine, and the FREQ VERNIER control for minimum display amplitude. If the distortion analyzer is used, adjust for minimum distortion. To arrive at the percent distortion, divide the amplitude of the display, using the notch filter, by the amplitude of the sine wave without the notch filter, and multiply by 100.

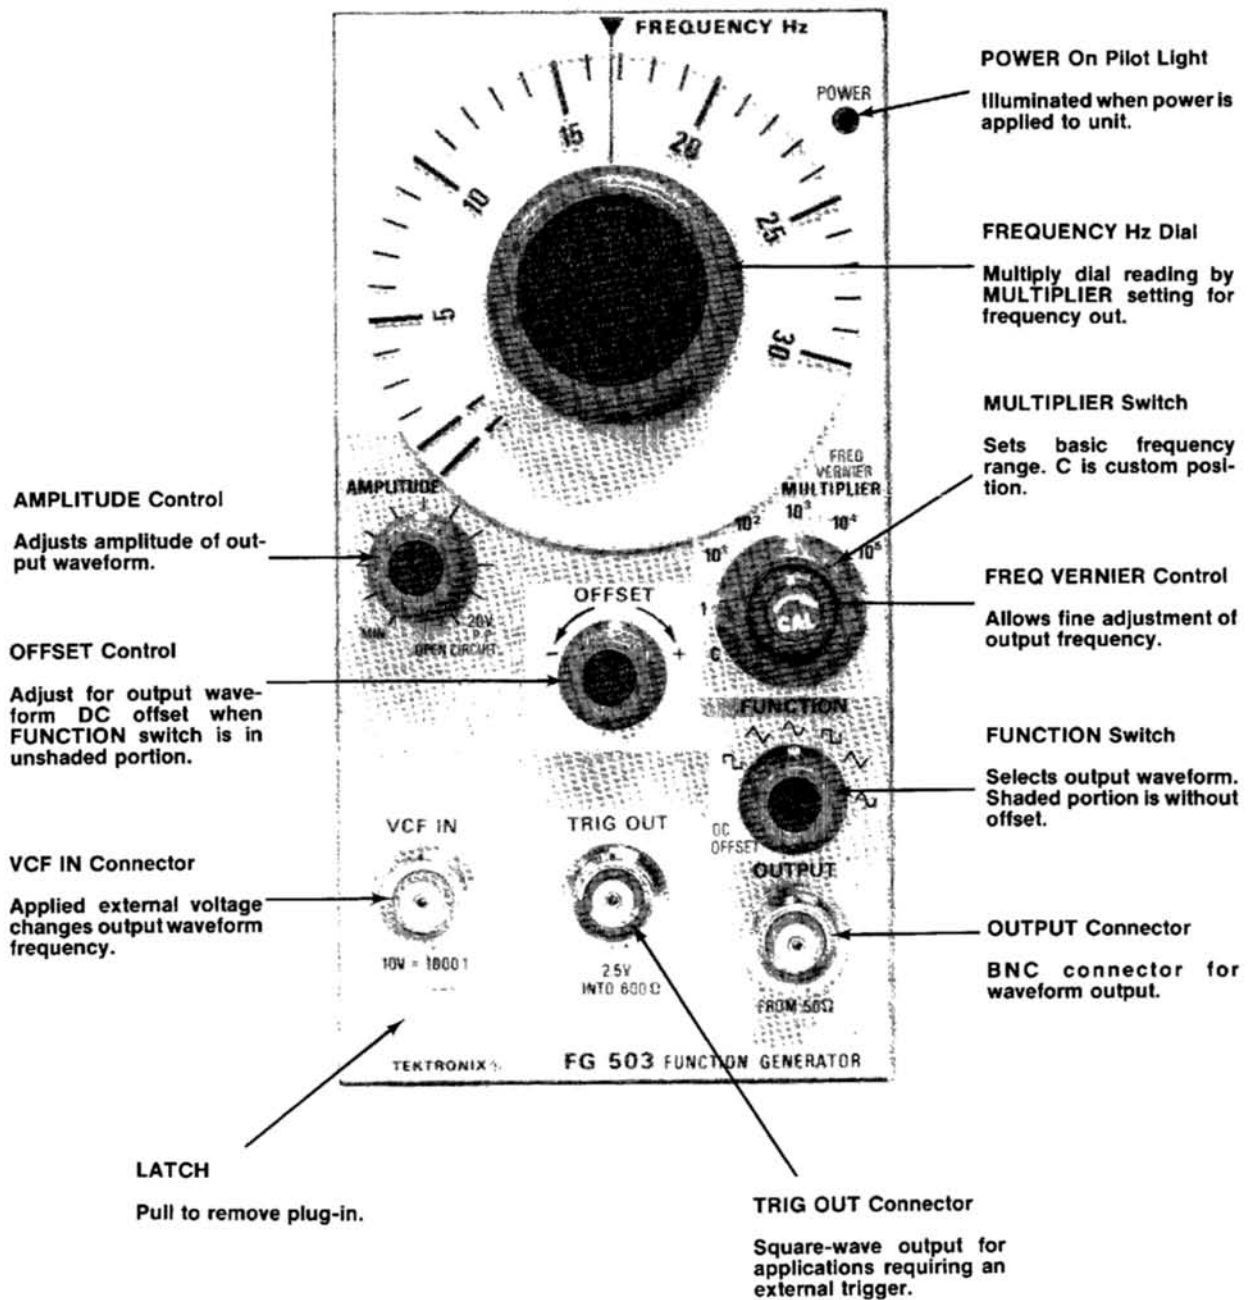

## 11. ADJUST OUTPUT DC BALANCE

Establish the oscilloscope ground reference by grounding the vertical input and position the trace to the graticule center. Connect the output of the FG 503 to the oscilloscope vertical input. Set the vertical deflection at 0.1 V/div. Turn the AMPLITUDE control fully ccw. Now adjust R375, Bal, so that the waveform is centered around the ground reference on the oscilloscope.

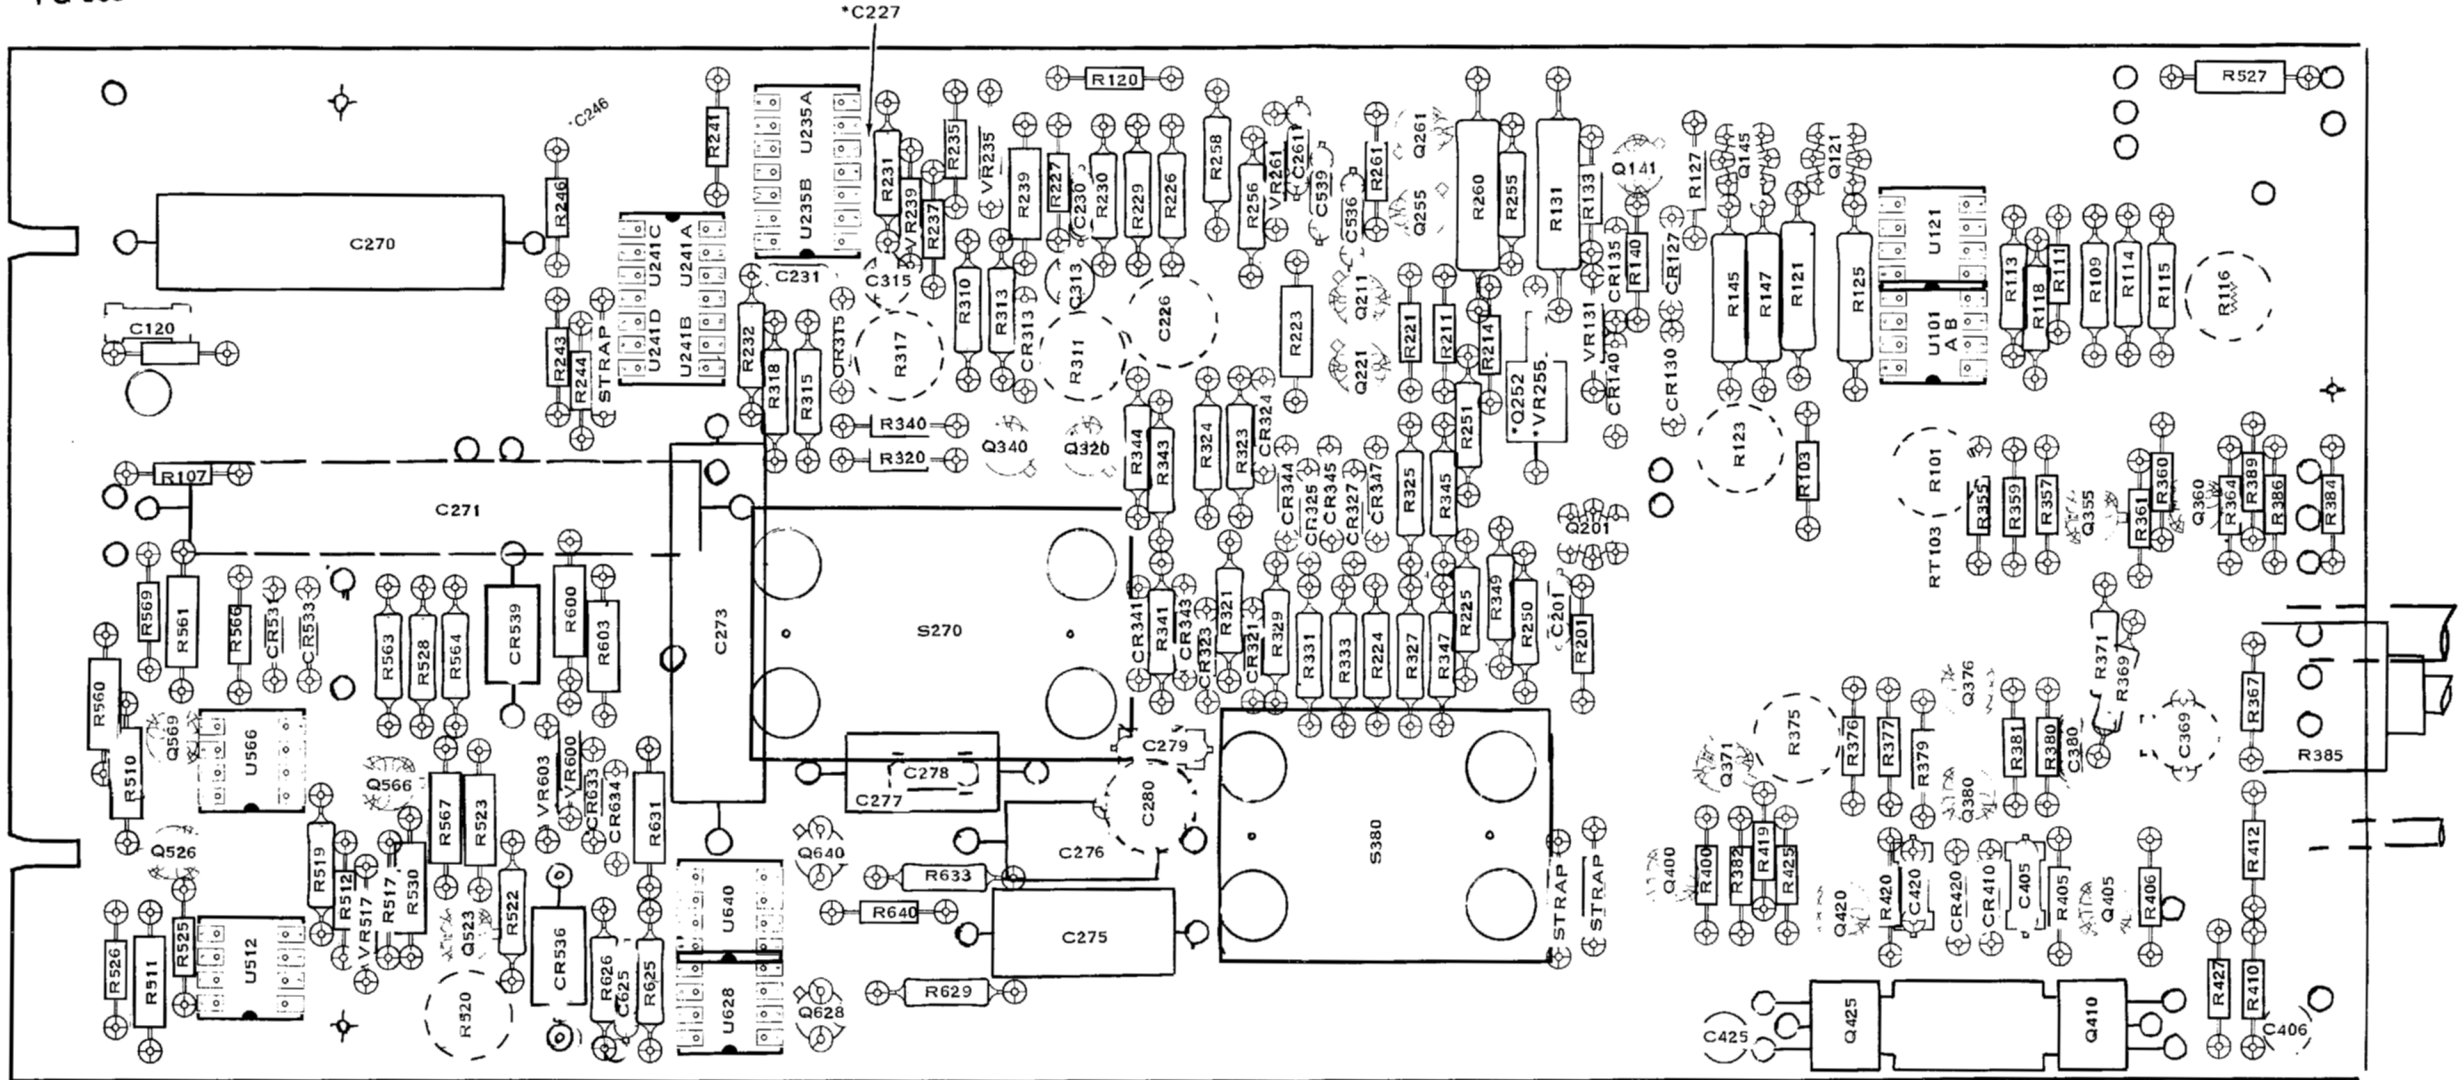

BACK SIDE OF BOARD SHOWN,  
TEST POINTS WILL BE FOUND ON COMPONENT SIDE OF BOARD.

Assignments listed for pins 1A—13A and 1B—13B are available in all power modules; however only those pins marked with an asterisk (\*) are used by the FG 503.

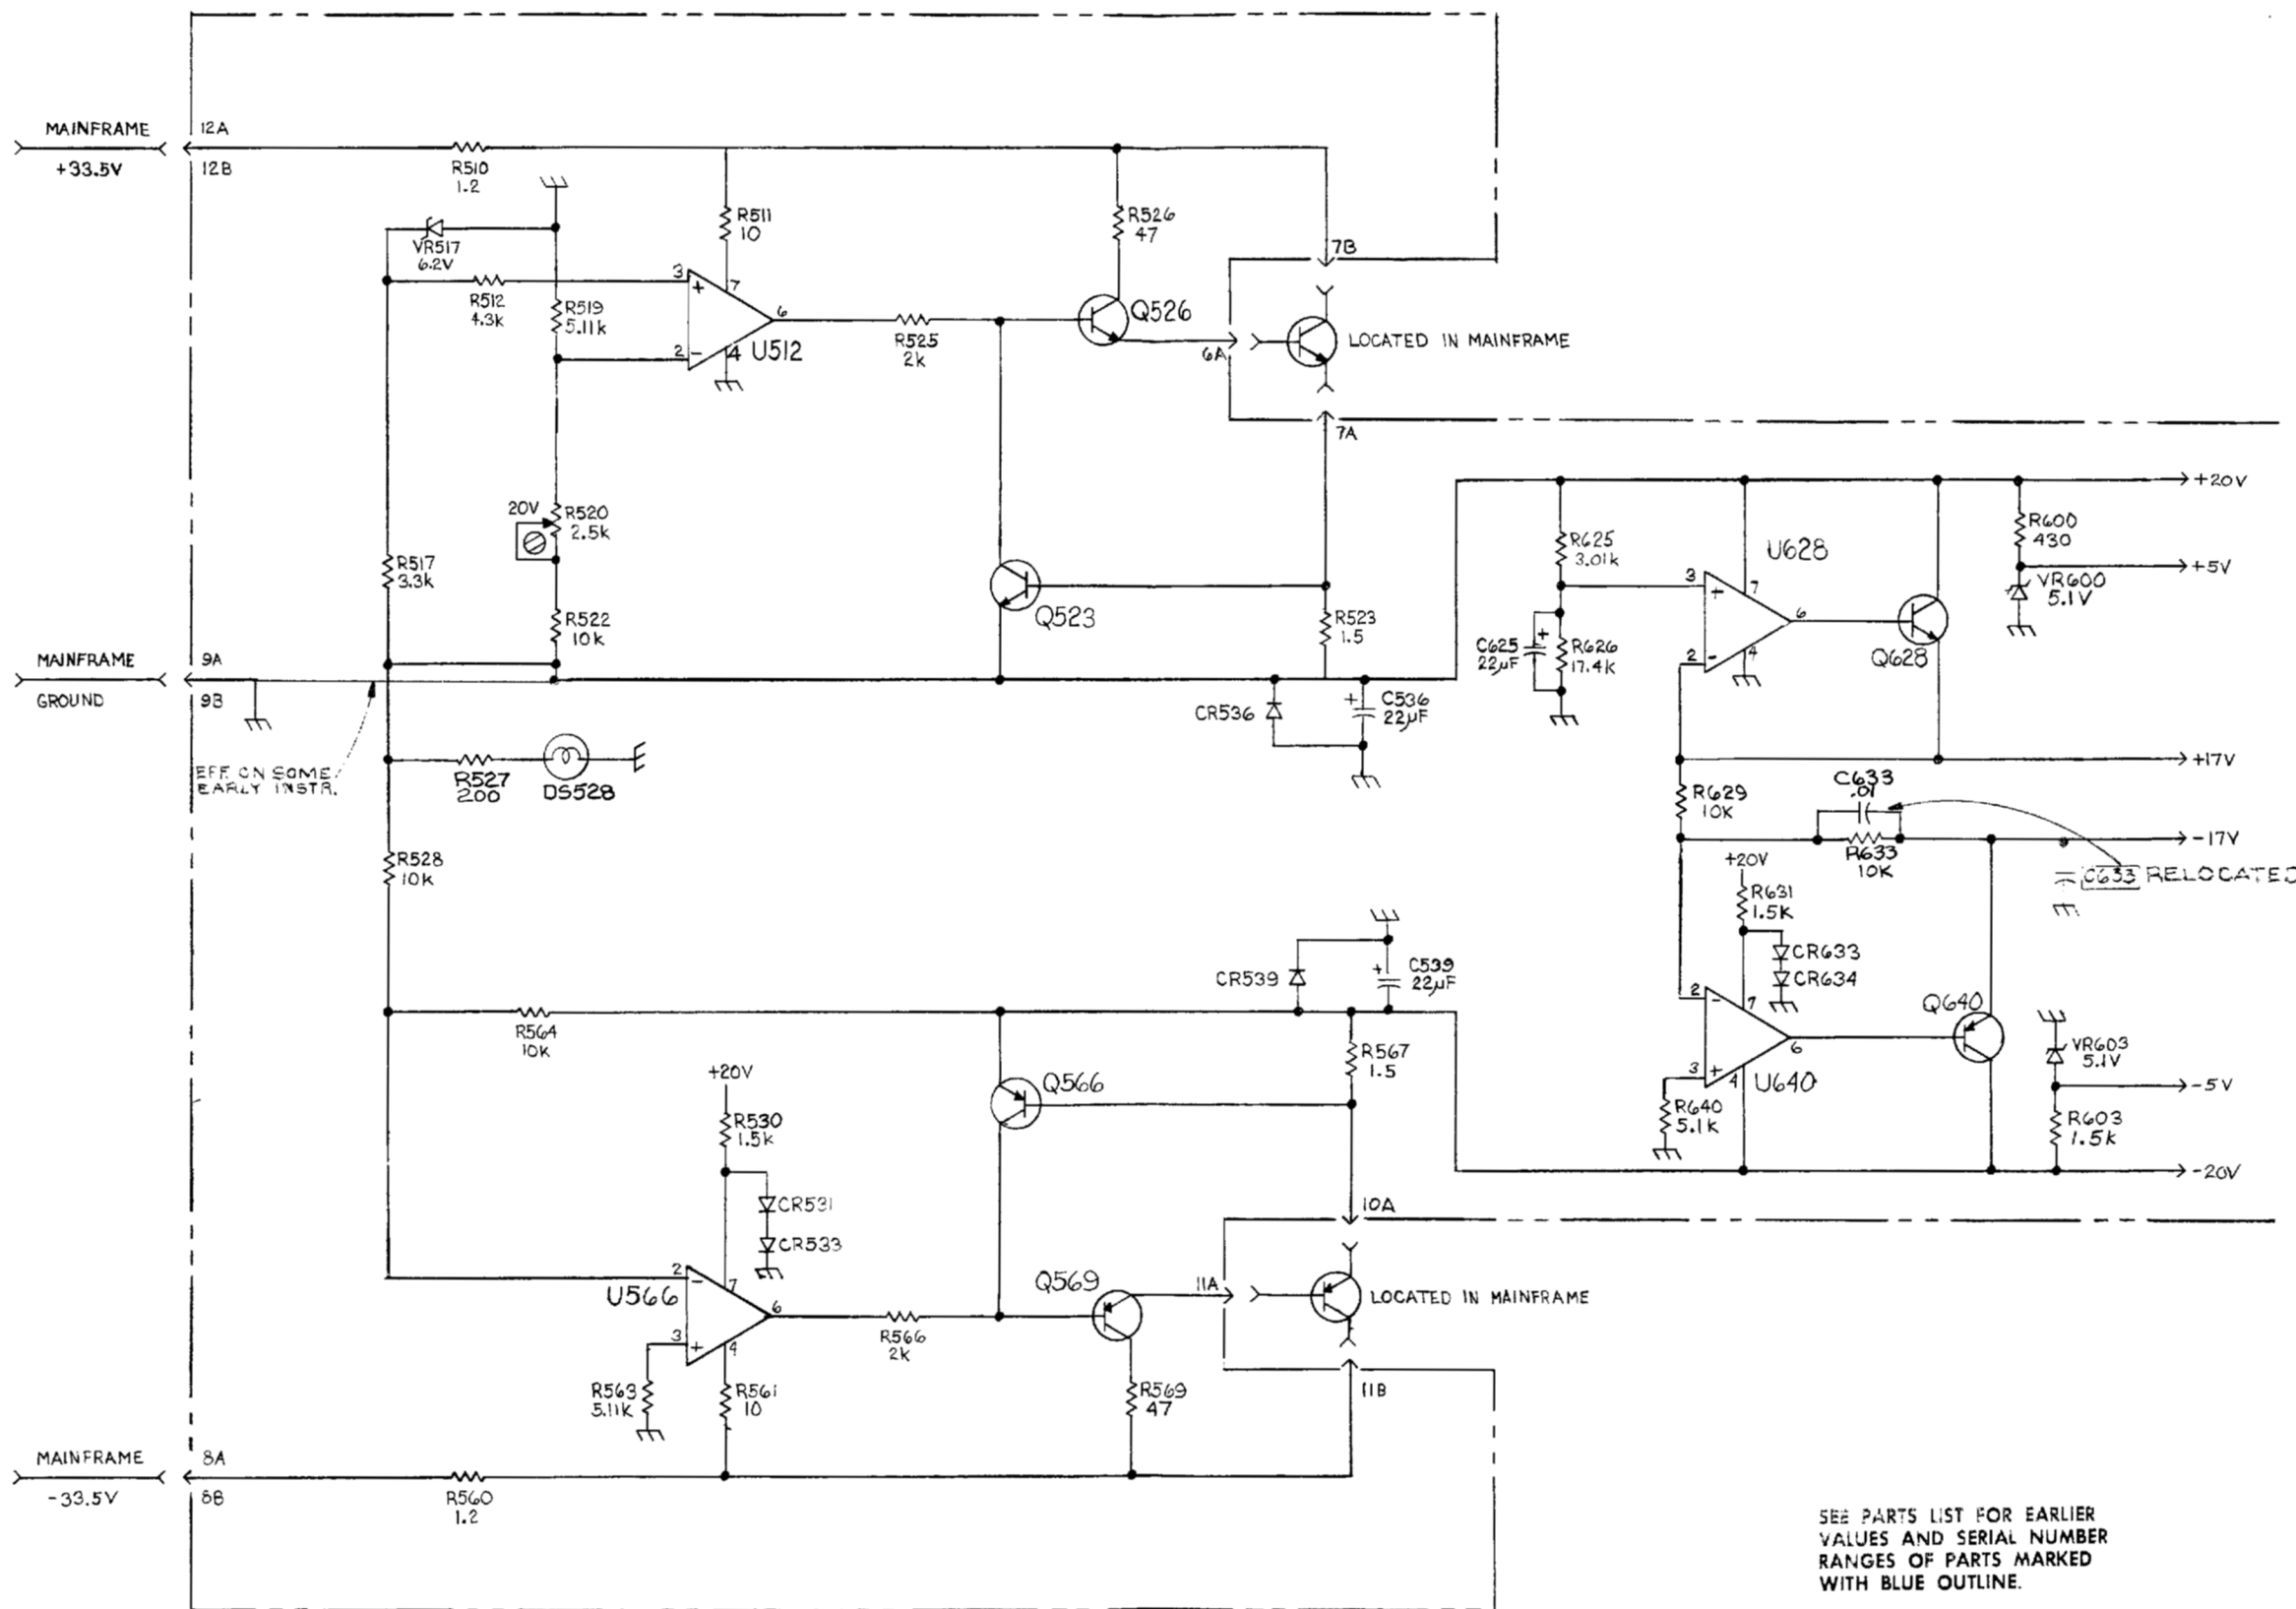

SEE PARTS LIST FOR PART NUMBER VALUES AND SERIAL NUMBER RANGES OF PARTS MARKED WITH BLUE OUTLINE.

SEE PARTS LIST FOR EARLIER VALUES AND SERIAL NUMBER RANGES OF PARTS MARKED WITH BLUE OUTLINE.

# SERVICE INFORMATION

## SYMBOLS AND REFERENCE DESIGNATORS

Electrical components shown on the diagrams are in the following units unless noted otherwise:

- Capacitors = Values one or greater are in picofarads (pF).  
 Values less than one are in microfarads ( $\mu$ F).  
 Resistors = Ohms ( $\Omega$ )

Symbols used on the diagrams are based on ANSI Y32.2 – 1970.

Logic symbology is based on MIL-STD-806B in terms of positive logic. Logic symbols depict the logic function performed and may differ from the manufacturer's data.

The following special symbols are used on the diagrams:

External Screwdriver adjustment.

External control or connector.

Clockwise control rotation in direction of arrow.

Refer to diagram number indicated in diamond.

Refer to waveform number indicated in hexagon.

# REPLACEABLE ELECTRICAL PARTS

## PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

## SPECIAL NOTES AND SYMBOLS

X000 Part first added at this serial number  
00X Part removed after this serial number

## ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

<sup>1</sup>Optional Timing Capacitor.

<sup>2</sup>Individual timing capacitors in this assembly must be ordered by the 9-digit part number, letter suffix and tolerance printed on the timing capacitor to be replaced. The letter suffix and tolerance should be the same for all the timing capacitors in the assembly.

EXAMPLE:

285-XXXX-XX F-

# REPLACEABLE MECHANICAL PARTS

## PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

## SPECIAL NOTES AND SYMBOLS

- X000 Part first added at this serial number
- 00X Part removed after this serial number

## FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

## INDENTATION SYSTEM

This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

```

1 2 3 4 5      Name & Description
Assembly and/or Component
Attaching parts for Assembly and/or Component
    ---*---
Detail Part of Assembly and/or Component
Attaching parts for Detail Part
    ---*---
Parts of Detail Part
Attaching parts for Parts of Detail Part
    ---*---
    
```

Attaching Parts always appear in the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation. The separation symbol --- \* --- indicates the end of attaching parts.

**Attaching parts must be purchased separately, unless otherwise specified.**

## ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

## **MANUAL CHANGE INFORMATION**

At Tektronix, we continually strive to keep up with latest electronic developments by adding circuit and component improvements to our instruments as soon as they are developed and tested.

Sometimes, due to printing and shipping requirements, we can't get these changes immediately into printed manuals. Hence, your manual may contain new change information on following pages.

A single change may affect several sections. Since the change information sheets are carried in the manual until all changes are permanently entered, some duplication may occur. If no such change pages appear following this page, your manual is correct as printed.

## **SERVICE NOTE**

Because of the universal parts procurement problem, some electrical parts in your instrument may be different from those described in the Replaceable Electrical Parts List. The parts used will in no way alter or compromise the performance or reliability of this instrument. They are installed when necessary to ensure prompt delivery to the customer. Order replacement parts from the Replaceable Electrical Parts List.

# CALIBRATION TEST EQUIPMENT REPLACEMENT

## Calibration Test Equipment Chart

This chart compares TM 500 product performance to that of older Tektronix equipment. Only those characteristics where significant specification differences occur, are listed. In some cases the new instrument may not be a total functional replacement. Additional support instrumentation may be needed or a change in calibration procedure may be necessary.

### Comparison of Main Characteristics

Comparison of Main Characteristics		
DM 501 replaces 7D13		
PG 501 replaces 107	PG 501 - Risetime less than 3.5 nsec into 50 $\Omega$ .	107 - Risetime less than 3.0 nsec into 50 $\Omega$ .
108	PG 501 - 5 V output pulse; 3.5 nsec Risetime.	108 - 10 V output pulse; 1 nsec Risetime.
111	PG 501 - Risetime less than 3.5 nsec; 8 nsec Pretrigger pulse delay.	111 - Risetime 0.5 nsec; 30 to 250 nsec Pretrigger Pulse delay.
114	PG 501 - $\pm 5$ V output.	114 - $\pm 10$ V output. Short proof output.
115	PG 501 - Does not have Paired, Burst, Gated, Delayed & Undelayed pulse mode; $\pm 5$ V dc Offset; short proof output. Has $\pm 5$ V output.	115 - Paired, Burst, Gated, Delayed & Undelayed pulse mode; $\pm 10$ V output. Short proof output.
PG 502 replaces 107		
108	PG 502 - 5 V output	108 - 10 V output.
111	PG 502 - Risetime less than 1 nsec; 10 nsec Pretrigger pulse delay.	111 - Risetime 0.5 nsec; 30 to 250 nsec Pretrigger pulse delay.
114	PG 502 - $\pm 5$ V output.	114 - $\pm 10$ V output. Short proof output.
115	PG 502 - Does not have Paired, Burst, Gated, Delayed & Undelayed pulse mode; $\pm 5$ V output. Short proof output.	115 - Paired, Burst, Gated, Delayed & Undelayed pulse mode; $\pm 10$ V output. Short proof output.
2101	PG 502 - Does not have Paired, Delayed, Undelayed and output locked mode; $\pm 5$ V output.	2101 - Paired, Delayed, Undelayed and output locked on mode; 10 V output.
PG 506 replaces 106	PG 506 - Positive-going trigger output signal at least 1 V; High Amplitude, 60 V output.	106 - Positive and Negative-going trigger output signal. 50 nsec and 1 V; High Amplitude output, 100 V.
067-0502-01	PG 506 - Does not have chopped feature.	0502-01 - Comparator output can be alternately chopped to a reference voltage.
SG 503 replaces 190, 190A, 190B, 191, 067-0532-01	SG 503 - Amplitude range 5 mV to 5.5 V p-p. SG 503 - Frequency range 250 kHz to 250 MHz. SG 503 - Frequency range 250 kHz to 250 MHz.	190B - Amplitude range 40 mV to 10 V p-p. 191 - Frequency range 350 kHz to 100 MHz. 0532-01 - Frequency range 65 MHz to 500 MHz.
TG 501 replaces 180, 180A	TG 501 - Marker outputs, 5 sec to 1 ns. Sinewave available only at 5, 2, and 1 ns. Trigger output - slaved to marker output from 5 sec through 100 ns. Only one time-mark can be generated.	180A - Marker outputs, 5 sec to 1 $\mu$ s. Sinewave available at 5, 10, and 50 MHz. Trigger pulses 1, 10, 100 Hz; 1, 10, and 100 kHz. Multiple time-marks can be stacked.
181	TG 501 - Marker outputs, 5 sec to 1 ns. Sinewave available only at 5, 2, and 1 ns.	181 - Marker outputs, 1, 10, 100, 1000, and 10,000, plus 10 MHz sinewave.
2901	TG 501 - Marker outputs, 5 sec to 1 ns. Sinewave available only at 5, 2, and 1 ns. Trigger output - slaved to marker output from 5 sec through 100 ns. Only one time-mark can be generated.	2901 - Marker outputs, 5 sec to 0.1 $\mu$ s. Sinewave available at 5, 10, and 50 ns. Separate trigger pulses, from 5 sec to 0.1 $\mu$ s. Multiple time-marks can be stacked.

technical excellence

# MANUAL CHANGE INFORMATION

PRODUCT FG 503

CHANGE REFERENCE C5/376

070-1727-00

DATE 3-19-76

CHANGE:

DESCRIPTION

## TEXT CORRECTION

Page 1-4, BASIC OPERATION, right column, just above Fig. 1-4

CHANGE: The text should read as follows:

MULTIPLIER setting, by applying a 0 V to 10 V signal to the VCF IN connector. It may be necessary to vary the CAL control to obtain the full 1000:1 swept range or the lowest swept frequency desired. See Fig. 1-4 for maximum VCF range for each MULTIPLIER setting."
