**Tektronix®**  
COMMITTED TO EXCELLENCE

## **Instrument Serial Numbers**

Each instrument manufactured by Tektronix has a serial number on a panel insert or tag, or stamped on the chassis. The first letter in the serial number designates the country of manufacture. The last five digits of the serial number are assigned sequentially and are unique to each instrument. Those manufactured in the United States have six unique digits. The country of manufacture is identified as follows:

B010000	Tektronix, Inc., Beaverton, Oregon, USA
G100000	Tektronix Guernsey, Ltd., Channel Islands
E200000	Tektronix United Kingdom, Ltd., London
J300000	Sony/Tektronix, Japan
H700000	Tektronix Holland, NV, Heerenveen, The Netherlands

Instruments manufactured for Tektronix by external vendors outside the United States are assigned a two digit alpha code to identify the country of manufacture (e.g., JP for Japan, HK for Hong Kong, etc.).

# General Information

The QuickStart board produces signals specifically designed to demonstrate the timing- and voltage-measurement capabilities of modern instruments. The board is especially useful for demonstration and training purposes because some of its output signals incorporate imperfections found in the "real world".

This manual documents the QuickStart board. This manual includes safety and warranty information, instructions for configuring the board, an adjustment procedure, descriptions of the output signals, circuit diagrams, and a replaceable parts list.

## Board Removal and Replacement

The board has rubber feet on its underside. Therefore, when you want to use the board, you may remove it from the carrying case and place it on any flat surface.

To remove the QuickStart board from the carrying case, pull up on any of the three mounting tabs located at the corners of the board. Then lift the board out of the carrying case.

To replace the board, perform the reverse procedure.

## Warranty

Tektronix, Inc. warrants the QuickStart board and the step-down transformer to be free from defects in materials and workmanship for a period of 90 days from the shipment date. If the board or transformer fails during the warranty period, return it to your local Tektronix service center.

## Safety Summary

The general safety information in this part of the summary is for both operators and service personnel. Specific warnings and cautions will be found throughout the manual where they apply, but may not appear in this summary.

### Terms in Manuals

**CAUTION** statements in manuals identify conditions or practices that could result in damage to the equipment or other property.

**WARNING** statements in manuals identify conditions or practices that could result in personal injury or loss of life.

### Terms on Equipment

**CAUTION** on equipment means a personal injury hazard not immediately accessible as one reads the marking, or a hazard to property including the equipment itself.

**DANGER** on equipment means a personal injury hazard immediately accessible as one reads the marking.

### Symbols in Manuals

*Static Sensitive Devices*

### Symbols on Equipment

*DANGER  
High Voltage*

*Protective  
ground (earth)  
terminal*

*ATTENTION  
Refer to  
manual*

## Power Source

The QuickStart board operates from a 9 V DC power supply. You can power the board from your main AC power source using the step-down transformer included in this *QuickStart Package*.

**List of Options** – the QuickStart board has the following options:

- Option 2F – A transformer for use with a 110 V to 120 V, 60 Hz AC power source.
- Option 3F – A transformer for use with a 220 V to 250 V, 50 Hz AC power source.

To power the board:

- Connect the power cord to power connector J10 on the board.
- Plug the transformer into a wall socket.

or

You can also power the QuickStart board from the CRS 10 Power Unit board. To power the board from the CRS 10 Power Unit board:

- Connect the ribbon cable from the CRS 10 Power Unit board to connector J9 on the QuickStart board.

## Do Not Operate in Explosive Atmospheres

To avoid explosion, do not operate this product in an explosive atmosphere unless it has been specifically certified for such operation.

*The LED DS109 (in the upper-right corner of the board) will light when the board is properly powered.*

## **Shipping the QuickStart Board**

To commercially transport the QuickStart board or transformer, package the board or transformer as follows:

- Step 1: Obtain a corrugated cardboard shipping carton with inside dimensions at least six inches greater than the board's or transformer's dimensions and with a carton test strength of at least 200 pounds.
- Step 2: If you are shipping the package to a Tektronix service center for Warranty service, attach a tag to the board or transformer showing the following:
  - Owner (with address)
  - Name of a person who can be contacted
  - Board or transformer type and serial number
  - Description of the problem
- Step 3: Place the board in an anti-static bag to protect static-sensitive components.
- Step 4: Tightly pack dunnage or urethane foam between the carton and the board or transformer (allowing three inches on each side) to cushion the board or transformer on all sides.
- Step 5: Seal the carton with shipping tape or with an industrial stapler.
- Step 6: Mark the address of the Tektronix service center and your return address on the carton in one or more prominent places.

## **Non-Warranty Repairs**

Tektronix service centers are not authorized to repair QuickStart boards that fail after the 90-day warranty period has expired. In the event of such a failure, you can order Tektronix part number 671-0799-00 from your local Tektronix representative to purchase a replacement board.

Alternatively, you can repair the board. All electrical components on the board are parts that are available at any local commercial source.

# Using the QuickStart Board

## User Controls

The QuickStart board has three user controls:

- SW1 A momentary switch
- C4 A variable capacitor to adjust the frequency of the TTL reference clock
- R31 A variable resistor to adjust the frequency of the 1 kHz sine wave

## Configuring the Board

You can configure the board using the board's eight jumpers. The jumper configuration you choose will determine the output signals appearing at the test pins TP1 through TP15.

### Jumpers

The eight jumpers, J1 through J8, are located along one edge of the board.

Each jumper consists of a socket and a jumper cap (shorting block). The socket contains either two, three, or four pairs of square pins labeled A through D. The jumper cap selects the mode for the function of its jumper.

The table that follows lists the function for each jumper, and the mode selected for each configuration of its jumper cap.

### *Jumper Functions and Modes*

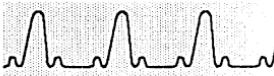

Jumper	Function	Jumper Cap Configuration	Mode
J1	TTL Clock on TP7	A	70 MHz Clock
		B	40 MHz Clock
		C	20 MHz Clock

### *Jumper Functions and Modes (Cont.)*

<b>Jumper</b>	<b>Function</b>	<b>Jumper Cap Configuration</b>	<b>Mode</b>
J2	Power <sup>1</sup>	A	ECL circuits enabled
		B	Eye Diagram circuits enabled
J3	Spikes on Sine Wave TP10	A	Pressing SW1 fires a single-shot spike.
		B	Depressing SW1 causes continuous spikes
		C	Continuous spikes
		D	No spikes
J4	40 MHz Noise on the TP10 Sine Wave	A	40 MHz noise
		B	No 40 MHz noise
J5	Transient Pulse on TP8	A	Transient pulse frequency = 15.5 Hz
		B	Transient pulse frequency = 1 kHz
		C	Single-shot transient pulse
J6	Metastability on ECL Pulses TP1-TP6	A	Metastability (requires J7-A or C)
		B	No metastability
J7	ECL Pulses on TP1-TP6	A	Continuous train of ECL pulses
		B	Single-shot burst of ECL pulses
		C	Repetitive burst of ECL pulses
J8	Noise on the Ringing Square Wave TP15	A	Square wave noise
		B	No square wave noise

<sup>1</sup>Press SW1 to reset power after changing J2 from A to B or from B to A.

## Test Pins

Fifteen test pins are arranged along two edges of the board. Each test pin has from one to four related jumpers, as shown in the following table. The jumper-cap settings on unrelated jumpers have no effect on the output signal of a test pin. An \* denotes that the jumper has an effect on the output signal for every jumper cap configuration.

*Test Pins and their Related Jumpers*

Test Pin	Related Jumpers							
	J1	J2	J3	J4	J5	J6	J7	J8
TP1 ECL Pulses	*	A				*	*	
TP2 ECL Pulses	*	A				*	*

## QuickStart Board Performance

The following procedure requires an instrument with a vertical bandwidth of 100 MHz or greater and a 10X probe (for example, an oscilloscope or digitizing signal analyzer (DSA)) to adjust and verify the performance of the QuickStart board.

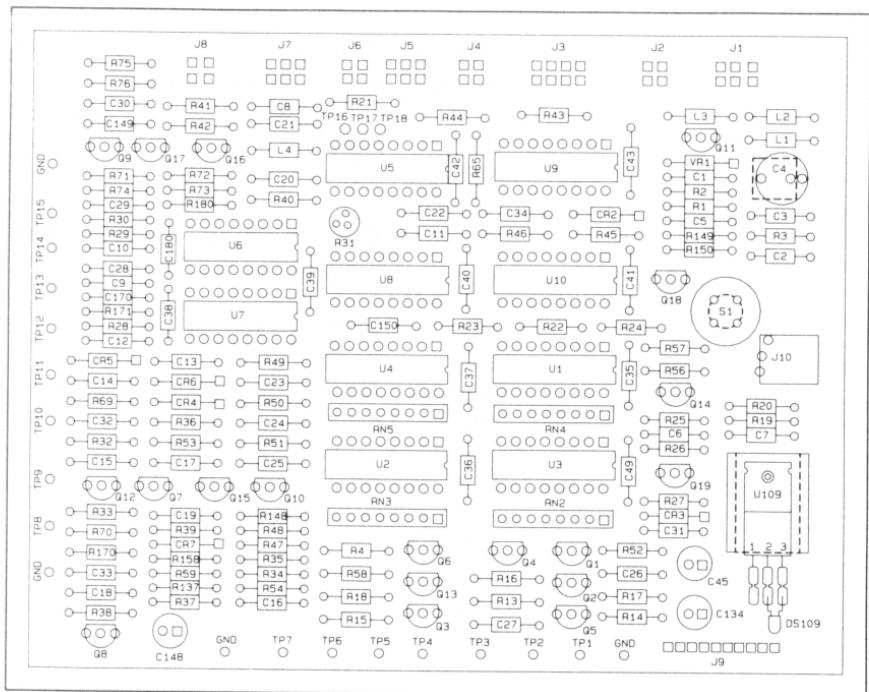

See the figure on page 2-6 for the connector and adjustment locations.

### Adjustment and Verification Procedure

- Step 1: Connect the jack on the power cord to J10 on the board.
- Step 2: Plug the transformer into an AC power-source outlet. (Observe that the LED DS109 is lit.)
- Step 3: Connect the 10X probe to the vertical input of the instrument.
- Step 4: Select DC input coupling.
- Step 5: Set the instruments **Vert Size** to 1 V/div and the **Main Size** to 1 ms/div.
- Step 6: Connect the probe tip to TP7. Ensure that the J1 jumper cap is set in the A position.
- Step 7: Change the **Vert Size** to 500 mV/div and the **Main Size** to 10 ns/div.
- Step 8: Adjust variable capacitor C4 for a 70 MHz sine wave (that is, exactly seven cycles in the 10 divisions of the screen).
- Step 9: Move the J1 jumper cap to the B position.

- Step 10: *Check* that the frequency of the TP7 sine wave is approximately 40 MHz.
- Step 11: Move the J1 jumper cap to the C position.
- Step 12: *Check* that the frequency of the TP7 sine wave is approximately 20 MHz.
- Step 13: Move the probe tip to TP10.
- Step 14: Connect the probe ground to the nearest GND test pin.
- Step 15: *Adjust* variable resistor R31 for a 1 kHz sine wave (that is, one cycle per division at 1 ms/div).
- Step 16: Disconnect the instrument from the QuickStart board.

*QuickStart Board Component Locator Diagram*

## Output Signal Descriptions

The output signals are categorized as follows:

- ECL pulses (TP1-TP6)
- Triggers (TP7, TP8, TP11, TP12)
- Sine wave (TP10)
- Ringing square wave (TP15)
- TTL square waves (Q1, Q2, Q3)
- Eye diagram (TP13, TP14)
- Transient pulse (TP9)

### ECL Pulses

The output signals on TP1-TP5 are groups of level-shifted, fast-rise ECL pulses. The signal on TP6 is a single ECL pulse. The TP6 pulse is the index for the TP1-TP5 groups of pulses.

**TP1 Description** – The output signal on TP1 consists of five negative-going, level-shifted ECL pulses.

**TP2 Description** – The output signal on TP2 consists of six positive-going, level-shifted ECL pulses.

**TP3 Description** – The output signal on TP3 consists of four equally spaced, negative-going, level-shifted ECL pulses.

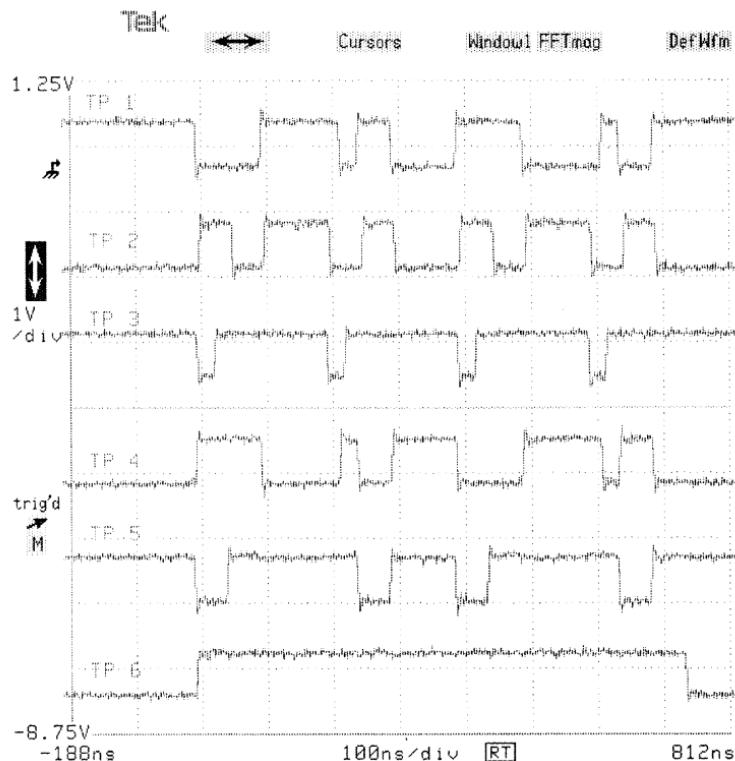

**TP4 Description** – The output signal on TP4 is the inverse of the signal on TP1.

**TP5 Description** – The output signal on TP5 consists of four unequally spaced, negative-going, level-shifted ECL pulses.

**TP6 Description** – The output signal on TP6 consists of a single positive-going, level-shifted ECL pulse.

The figure below is a display of ECL pulses, TP1-TP6 where the clock is set to 20 MHz (J1-C).

*ECL Pulses TP1-TP6*

### *ECL Pulses Jumper Configurations and Applications*

<b>Test Point</b>	<b>Jumper Configurations</b>	<b>Applications</b>
TP1	J7-A – Continuous train of pulses J7-B – Single-shot burst of pulses J7-C – Equally-spaced bursts of pulses	<ul style="list-style-type: none"> <li>■ Measuring ECL rise and fall times</li> <li>■ Delay by Events (use the recurring bursts in conjunction with one of the framing pulses on TP11 and TP12)</li> <li>■ Word Recognizer Probe (use the recurring bursts in conjunction with Q1, Q2, and Q3)</li> <li>■ Single-shot applications</li> <li>■ Glitch triggering</li> </ul>
TP2	J7-A – Continuous train of pulses J7-B – Single-shot burst of pulses J7-C – Equally spaced bursts of pulses	<ul style="list-style-type: none"> <li>■ Measuring ECL rise and fall times</li> <li>■ Single-shot applications</li> <li>■ Viewing metastability</li> </ul>
TP3	J7-A – Continuous train of pulses J7-B – Single shot burst of pulses J7-C – Equally spaced bursts of pulses	<ul style="list-style-type: none"> <li>■ Measuring ECL rise and fall times</li> <li>■ Single-shot applications</li> <li>■ Viewing metastability</li> </ul>

### ECL Pulses Jumper Configurations and Applications (Cont.)

Test Point	Jumper Configurations	Applications
TP4	J7-A – Continuous train of pulses J7-B – Single-shot burst of pulses J7-C – Equally-spaced bursts of pulses	<ul style="list-style-type: none"><li>■ Measuring ECL rise and fall times</li><li>■ Delay by Events (use the recurring bursts in conjunction with one of the framing pulses on TP11 and TP12)</li><li>■ Word Recognizer Probe (use the recurring bursts in conjunction with Q1, Q2, and Q3)</li><li>■ Single-shot applications</li><li>■ Glitch triggering</li></ul>
TP5	J7-A – Continuous train of pulses J7-B – Single-shot burst of pulses J7-C – Equally spaced bursts of pulses	<ul style="list-style-type: none"><li>■ Measuring ECL rise and fall times</li><li>■ Single-shot applications</li><li>■ Viewing metastability</li></ul>
TP6	J7-A – Continuous train of pulses J7-B – Single-shot burst of pulses J7-C – Equally spaced bursts of pulses	<ul style="list-style-type: none"><li>■ Measuring ECL rise and fall times</li><li>■ Single-shot applications</li><li>■ Viewing metastability</li></ul>

The interval between the recurring bursts is a function of a variable resistor R31. When R31 is adjusted for a 1 kHz sine wave on TP10, the bursts occur at intervals of approximately 15.5  $\mu$ s. The clock frequency, that J1 selects, affects the pulse widths but does not affect the interval between bursts.

When J6 is set to select metastability (J6-A), J7 must be set for continuous pulses (J7-A) or repetitive bursts (J7-C). The resulting display jitters occasionally, even when triggered.

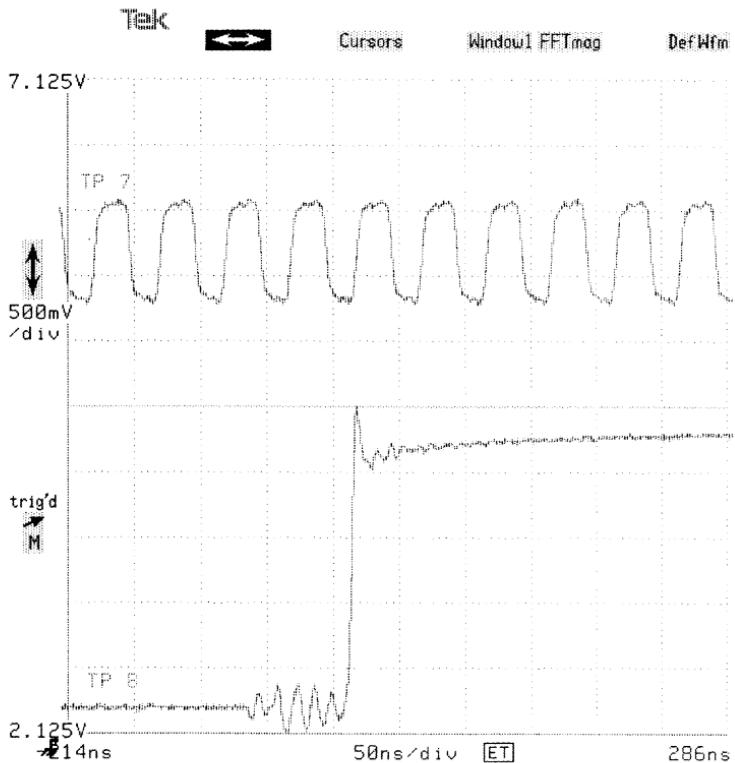

## Triggers

The output signals on TP7, TP8, TP11, and TP12 are primarily used for triggering.

**TP7 and TP8 Description**—The signal on TP7 is the TTL Reference Clock, and the signal on TP8 is a TTL square wave.

See the figure below for a display of triggers TP7 and TP8.

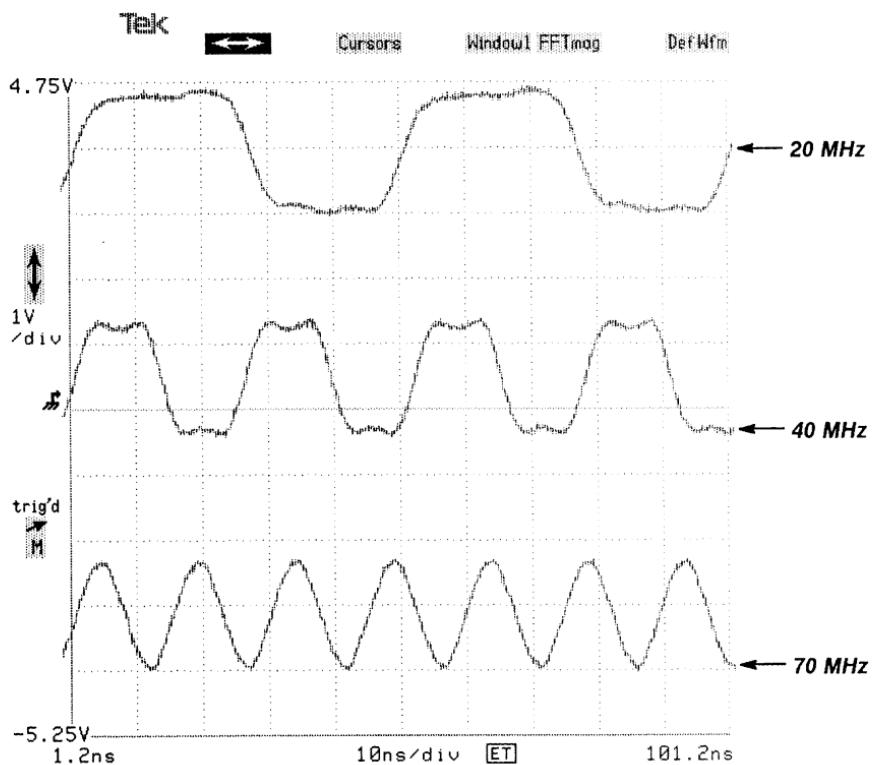

Triggers TP7 and TP8

### *TP7 and TP8 Jumper Configurations and Applications*

<b>Test Point</b>	<b>Jumper Configurations</b>	<b>Applications</b>
TP7	J1-A — 70 MHz Clock J1-B — 40 MHz Clock J1-C — 20 MHz Clock	■ Adjusting the clock frequency ■ Triggering the eye diagrams on TP13 and TP14
TP8	J5-A — Transient pulse frequency of 15.5 Hz J5-B — Transient pulse frequency of 1 kHz J5-C — Single-shot transient pulse when SW1 is pressed	■ Triggering the fast transient on TP9

The following figure shows trigger TP7 at the various jumper configurations listed in the preceding table.

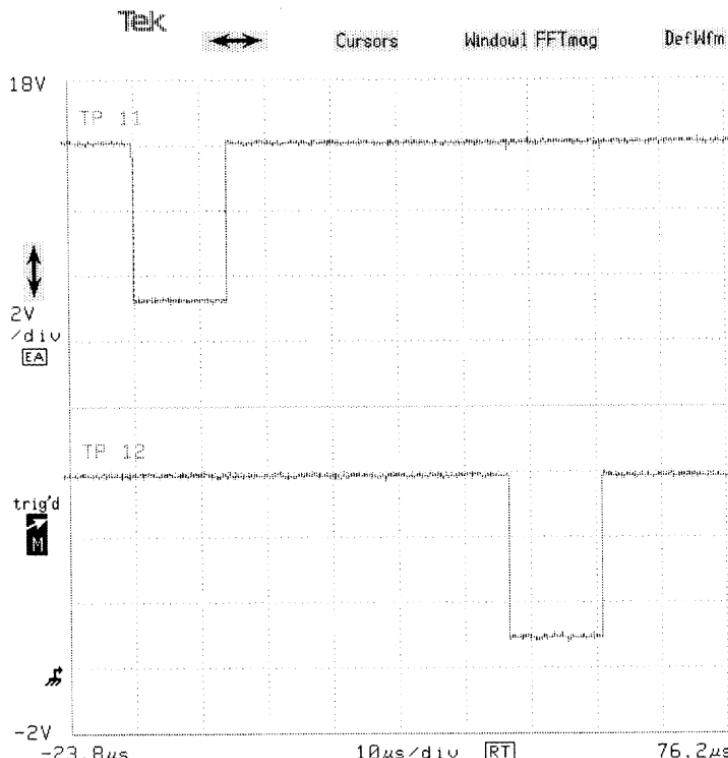

*Trigger TP7 at Various Jumper Configurations*

**TP11 and TP12 Description**—The signals on TP11 and TP12 are normally high TTL framing pulses for the ECL bursts on TP1-TP5. The framing-pulse frequency depends on the adjustment of variable resistor R1. When R1 is adjusted for a 1 kHz sine wave on TP10, the framing-pulse frequency is approximately 8 kHz.

When the TP11 signal is low, the pulses on TP1 and TP4 are degraded. When the TP12 signal is low, the pulses on TP1 and TP4 are normal.

See the figure below for a display of triggers TP11 and TP12.

*Triggers TP11 and TP12*

### TP11 and TP12 Jumper Configurations and Applications

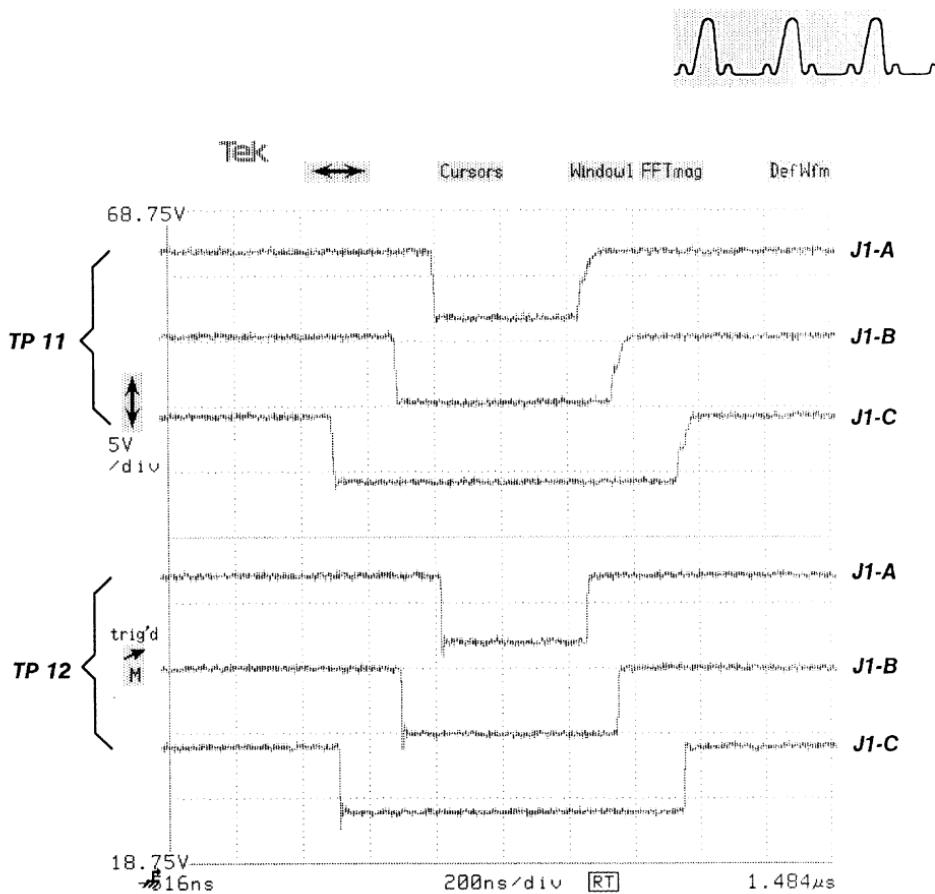

Test Point	Jumper Configurations	Applications
TP11	<p>J7-A – The framing pulse width is <math>\simeq 15.5 \mu s</math> (if R31 is adjusted for a 1 kHz sine wave on TP10)</p> <p>J7-B – The signal remains high</p> <p>J7-C, J1-A – The framing pulse width is <math>\simeq 410 \text{ ns}</math> (if the TTL Reference Clock is calibrated)</p> <p>J7-C, J1-B – The framing pulse width is <math>\simeq 610 \text{ ns}</math> (if the TTL Reference Clock is calibrated)</p> <p>J7-C, J1-C – The framing pulse width is <math>\simeq 970 \text{ ns}</math> (if the TTL Reference Clock is calibrated)</p>	<ul style="list-style-type: none"><li>■ Delay by Events in conjunction with TP1 or TP4 as a changing ECL waveform (see the figure on page 2-18)</li><li>■ Timing Measurements that measure the delay between TP11 and TP12</li></ul>

### TP11 and TP12 Jumper Configurations and Applications (Cont.)

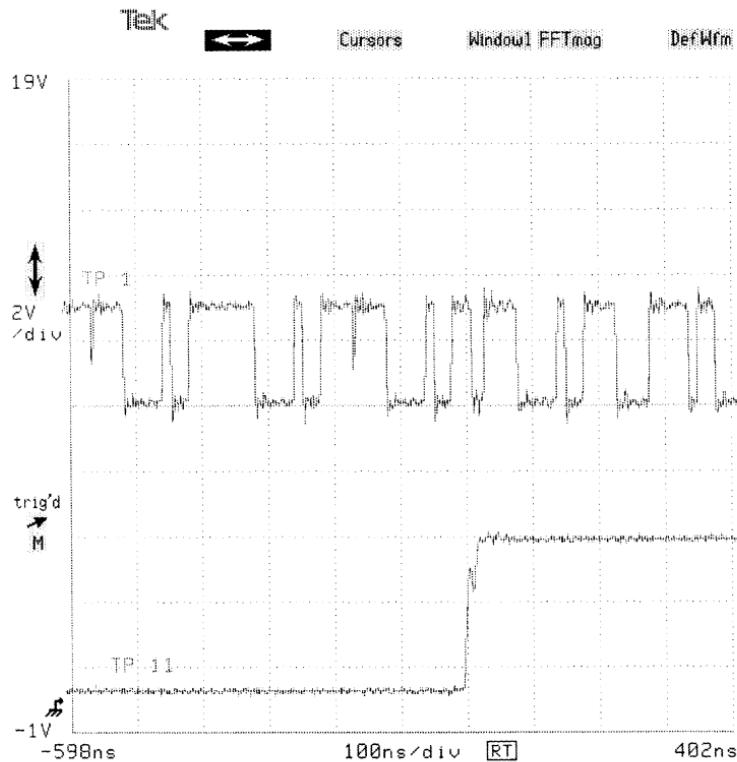

Test Point	Jumper Configurations	Applications
TP12	J7-A — The framing pulse width is $\approx 15.5 \mu s$ (if R31 is adjusted for a 1 kHz sine wave on TP10) J7-B — The signal remains high J7-C, J1-A — the framing pulse width is $\approx 410$ ns (if the TTL Reference Clock is calibrated) J7-C, J1-B — The framing pulse width is $\approx 610$ ns (if the TTL Reference Clock is calibrated) J7-C, J1-C — The framing pulse width is $\approx 970$ ns (if the TTL Reference Clock is calibrated)	■ Delay by Events in conjunction with TP1 or TP4 as a changing ECL waveform on page 2-18 ■ Timing Measurements that measure the delay between TP11 and TP12

The following figure shows triggers TP11 and TP12 at the various jumper configurations listed in the preceding table.

### *TP11 and TP12 at Various Jumper Configurations*

The following figure shows the ECL pulse TP1 changing when triggered by TP11.

*TP1 Shown as a Changing ECL Waveform Triggered by TP11*

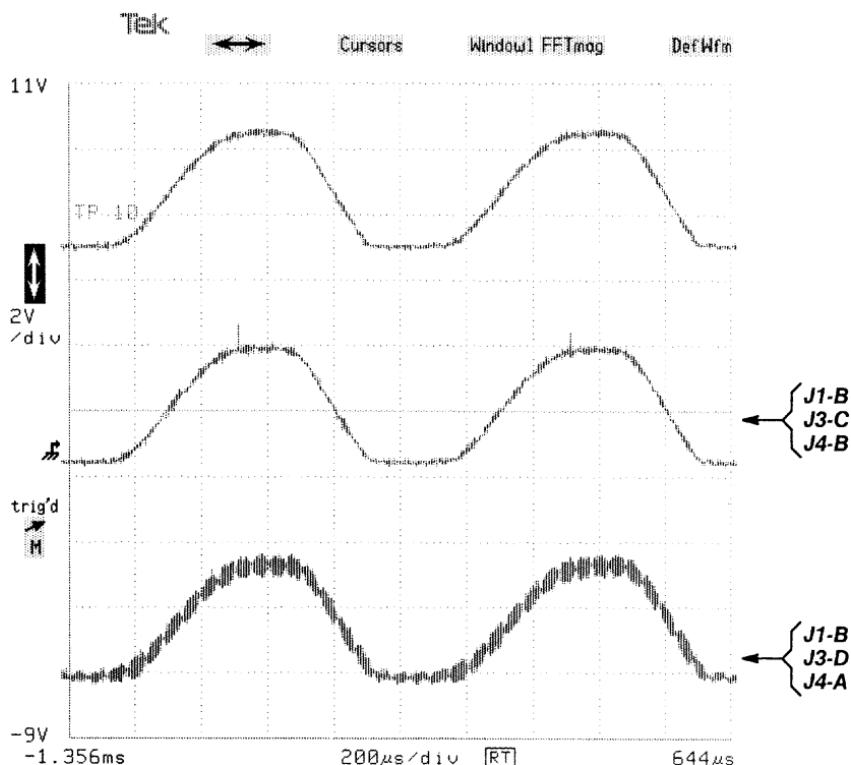

## Sine Wave

The output signal on TP10 is a sine wave.

**TP10 Description**—The sine wave on TP10 is approximately 3.7 V peak-to-peak. The sinewave frequency is 1 kHz  $\pm \sim 30\%$ , which you can adjust using variable resistor R31.

See the figure below for a display of sine wave TP10.

Sine Wave TP10

## TP10 Jumper Configurations and Applications

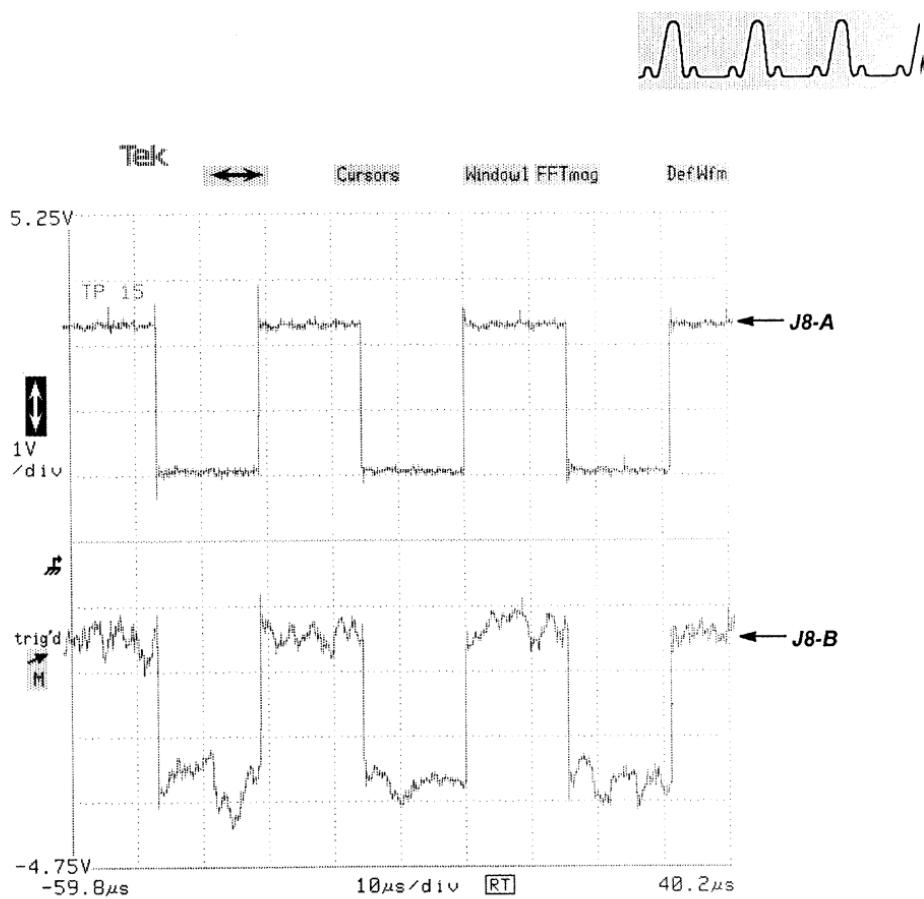

Test Point	Jumper Configurations	Applications
TP10	J3-A — A single-shot spike when SW1 is pressed J3-B — Continuous spikes while SW1 is pressed J3-C — Continuous spikes J3-D — No spikes J1B, J4A — 40 MHz noise J1B, J4B — No 40 MHz noise	<ul style="list-style-type: none"><li>■ Act-on-Delta Glitch capture</li><li>■ Envelope Glitch capture</li><li>■ Averaging (with 40 MHz noise)</li><li>■ Measuring bandwidth limit (with 40 MHz noise)</li><li>■ Noise Reject Trigger Coupling (with 40 MHz noise)</li></ul>

### Ringing Square Wave

The output signal on TP15 is a ringing square wave.

**TP15 Description**—The signal on TP15 is a square wave of approximately 3 V peak-to-peak with ringing of approximately 1 V peak-to-peak. The square-wave frequency depends on the adjustment of variable resistor R1. When you adjust R1 for a 1 kHz sine wave on TP10, the square wave frequency on TP15 is 32 kHz.

See the figure on page 2-21 for a display of ringing square wave TP15 with and without noise.

*Ringing Square Wave TP15*

#### *TP15 Jumper Configurations and Applications*

Test Point	Jumper Configurations	Applications
TP15	J8-A — Square wave with noise J8-B — Square wave without noise	<ul style="list-style-type: none"> <li>■ Averaging</li> <li>■ Envelope Glitch capture</li> </ul>

### TTL Square Waves

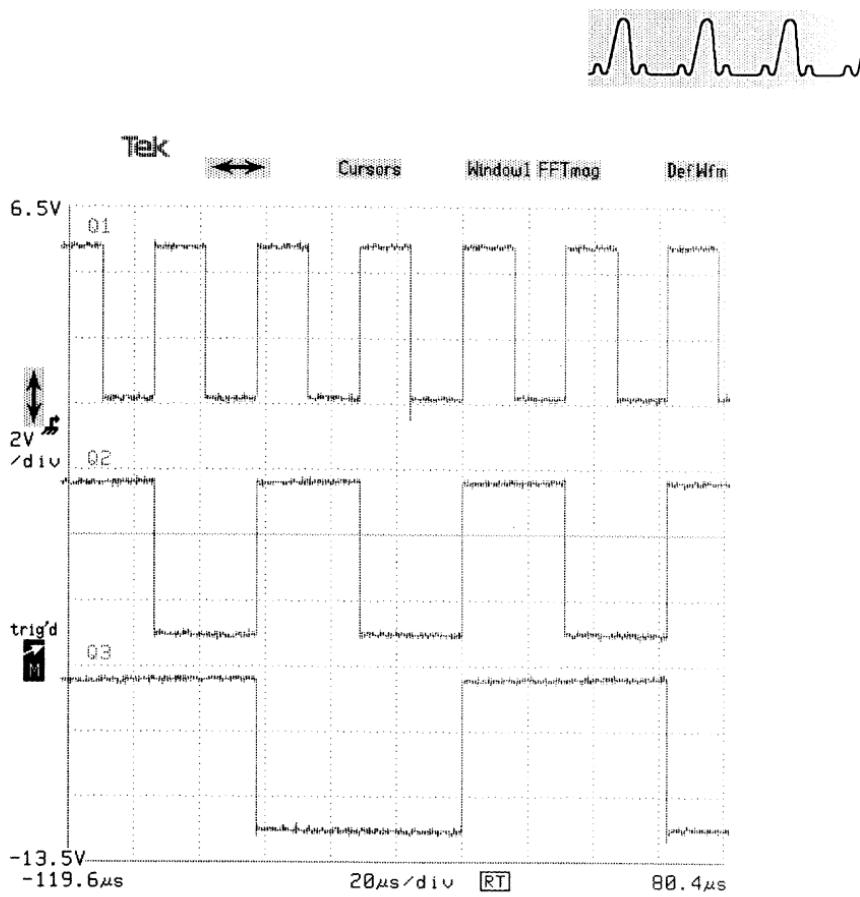

The output signals on Q1, Q2, and Q3 are TTL square waves.

**Q1 Description**—The output signal on Q1 is approximately a 32 kHz TTL square wave.

**Q2 Description**—The output signal on Q2 is approximately a 16 kHz TTL square wave.

**Q3 Description**—The output signal on Q3 is approximately a 8 kHz TTL square wave.

See the following figure for a display of TTL square waves Q1, Q2, and Q3.

TTL Square Waves Q1, Q2, and Q3

**Q1, Q2, Q3 Application**—Use the signals on Q1, Q2, and Q3 to demonstrate digital-word triggering with the Word Recognizer Probe.

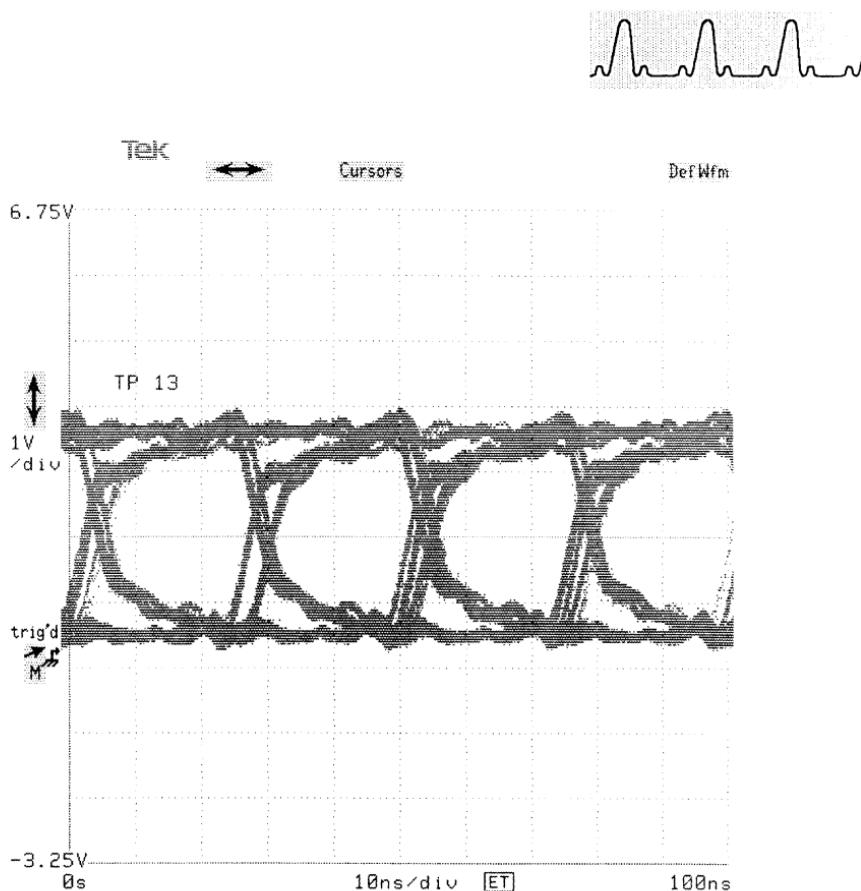

## Eye Diagrams

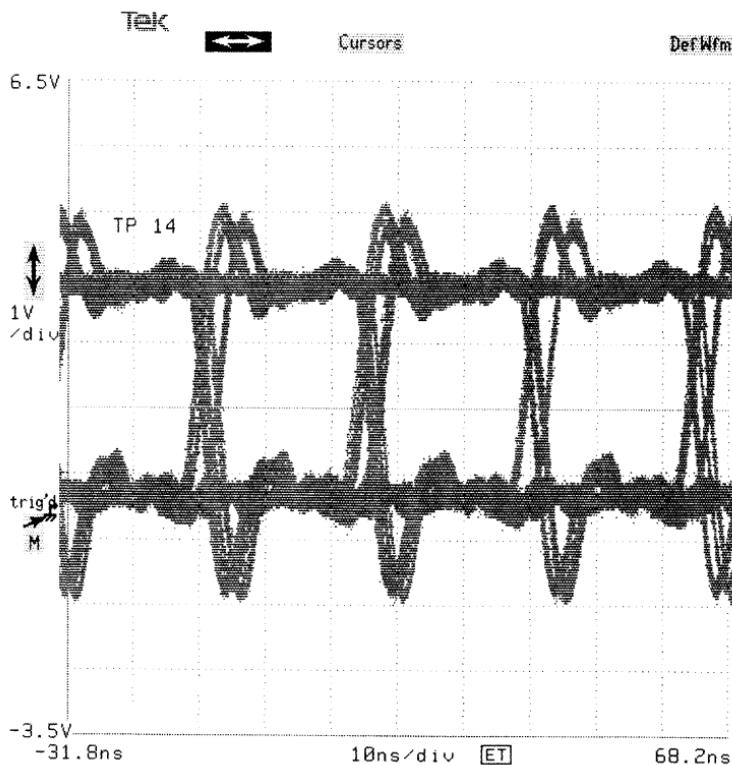

The signals on TP13 and TP14 are eye diagrams.

**TP13 and TP14 Description** – The output signals on TP13 and TP14 are one-bit, two-level eye diagrams. These output signals are representative of computer-bus eye patterns. You must trigger the TP13 and TP14 signals with the TTL clock on TP7. Also, you must set the oscillator frequency of the QuickStart board to 40 MHz (J1-B) or 20 MHz (J1-C). At 40 MHz, set the instruments **Main Size** to 5 ns/div; at 20 MHz, set the instruments **Main Size** to 10 ns/div.

See the following two figures for displays of eye diagrams TP13 and TP14 respectively.

*Eye Diagram TP13*

*Eye Diagram TP14*

**TP13 and TP14 Application** – Use the output signals on TP13 and TP14 to demonstrate the triggering on and displaying of an eye pattern.

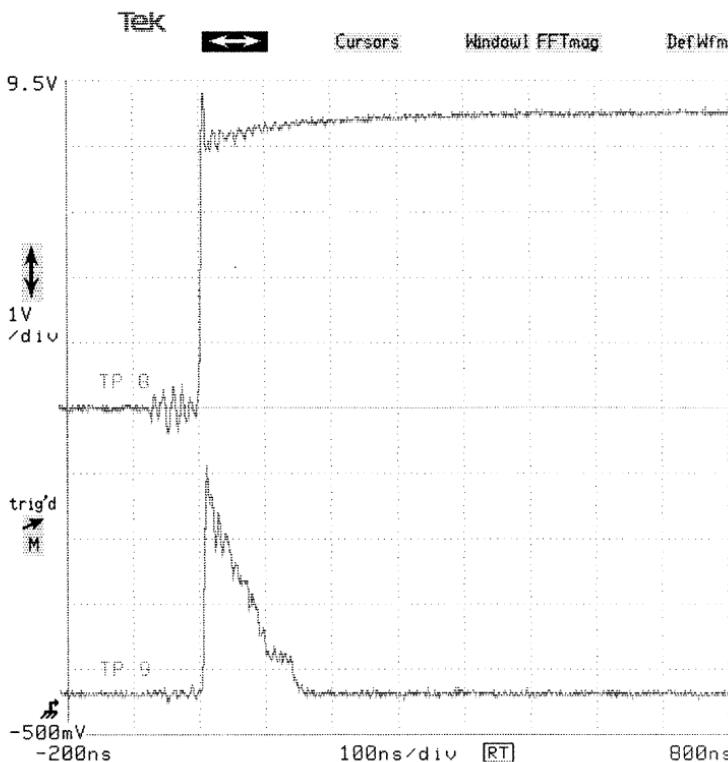

### Transient Pulse

The output signal on TP9 is a random fast transient.

**TP9 Description**—The output signal TP9 is a transient pulse, varying randomly from 0 to 5 V in amplitude and from 20 to 150 ns in duration.

See the figure below for a display of transient pulse TP9.

*Transient Pulse TP9*

The previous figure shows the TP8 signal and the TP9 transient. The transient occurs on the rising edge of the TP8 square wave.

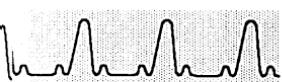

### *TP9 Jumper Configurations and Applications*

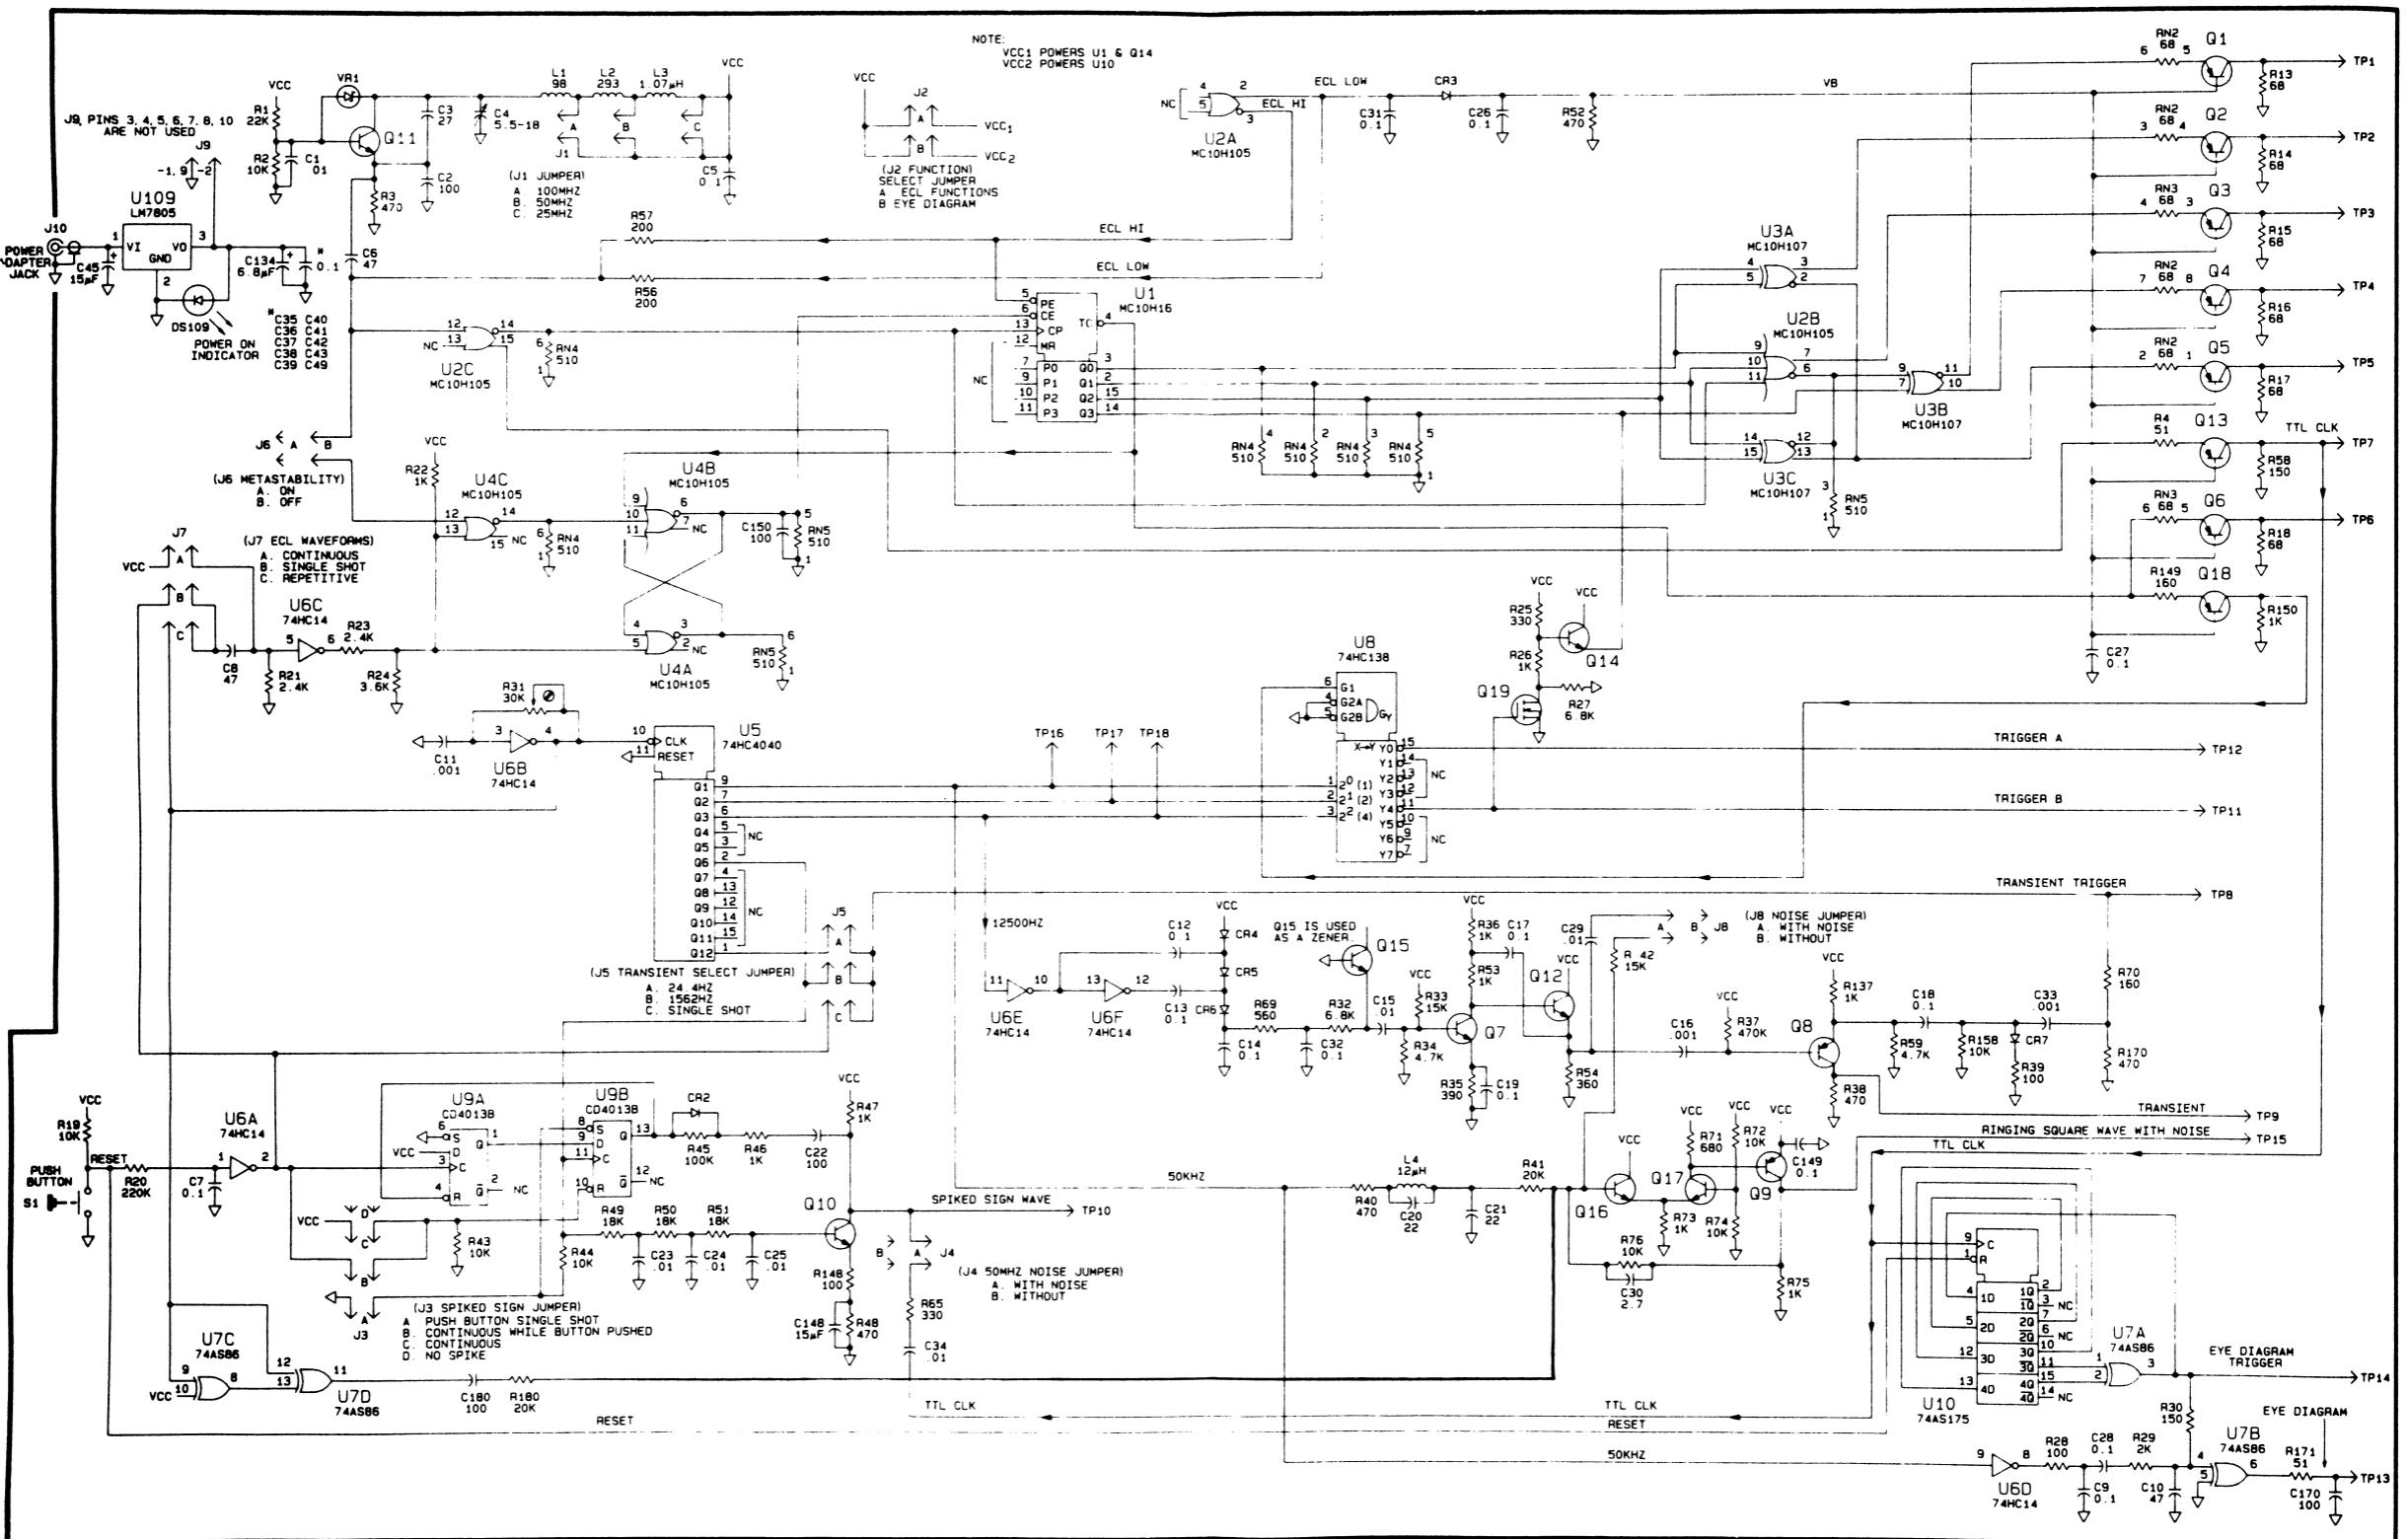

<b>Test Point</b>	<b>Jumper Configurations</b>	<b>Applications</b>
TP9	J5-A – The pulse frequency is $\approx 15.5$ Hz J5-B – The pulse frequency is $\approx 1$ kHz J5-C – Single shot transient pulse when SW1 is pressed	■ Demonstrating fast transients in either single-shot or repetitive applications

# Board Diagram

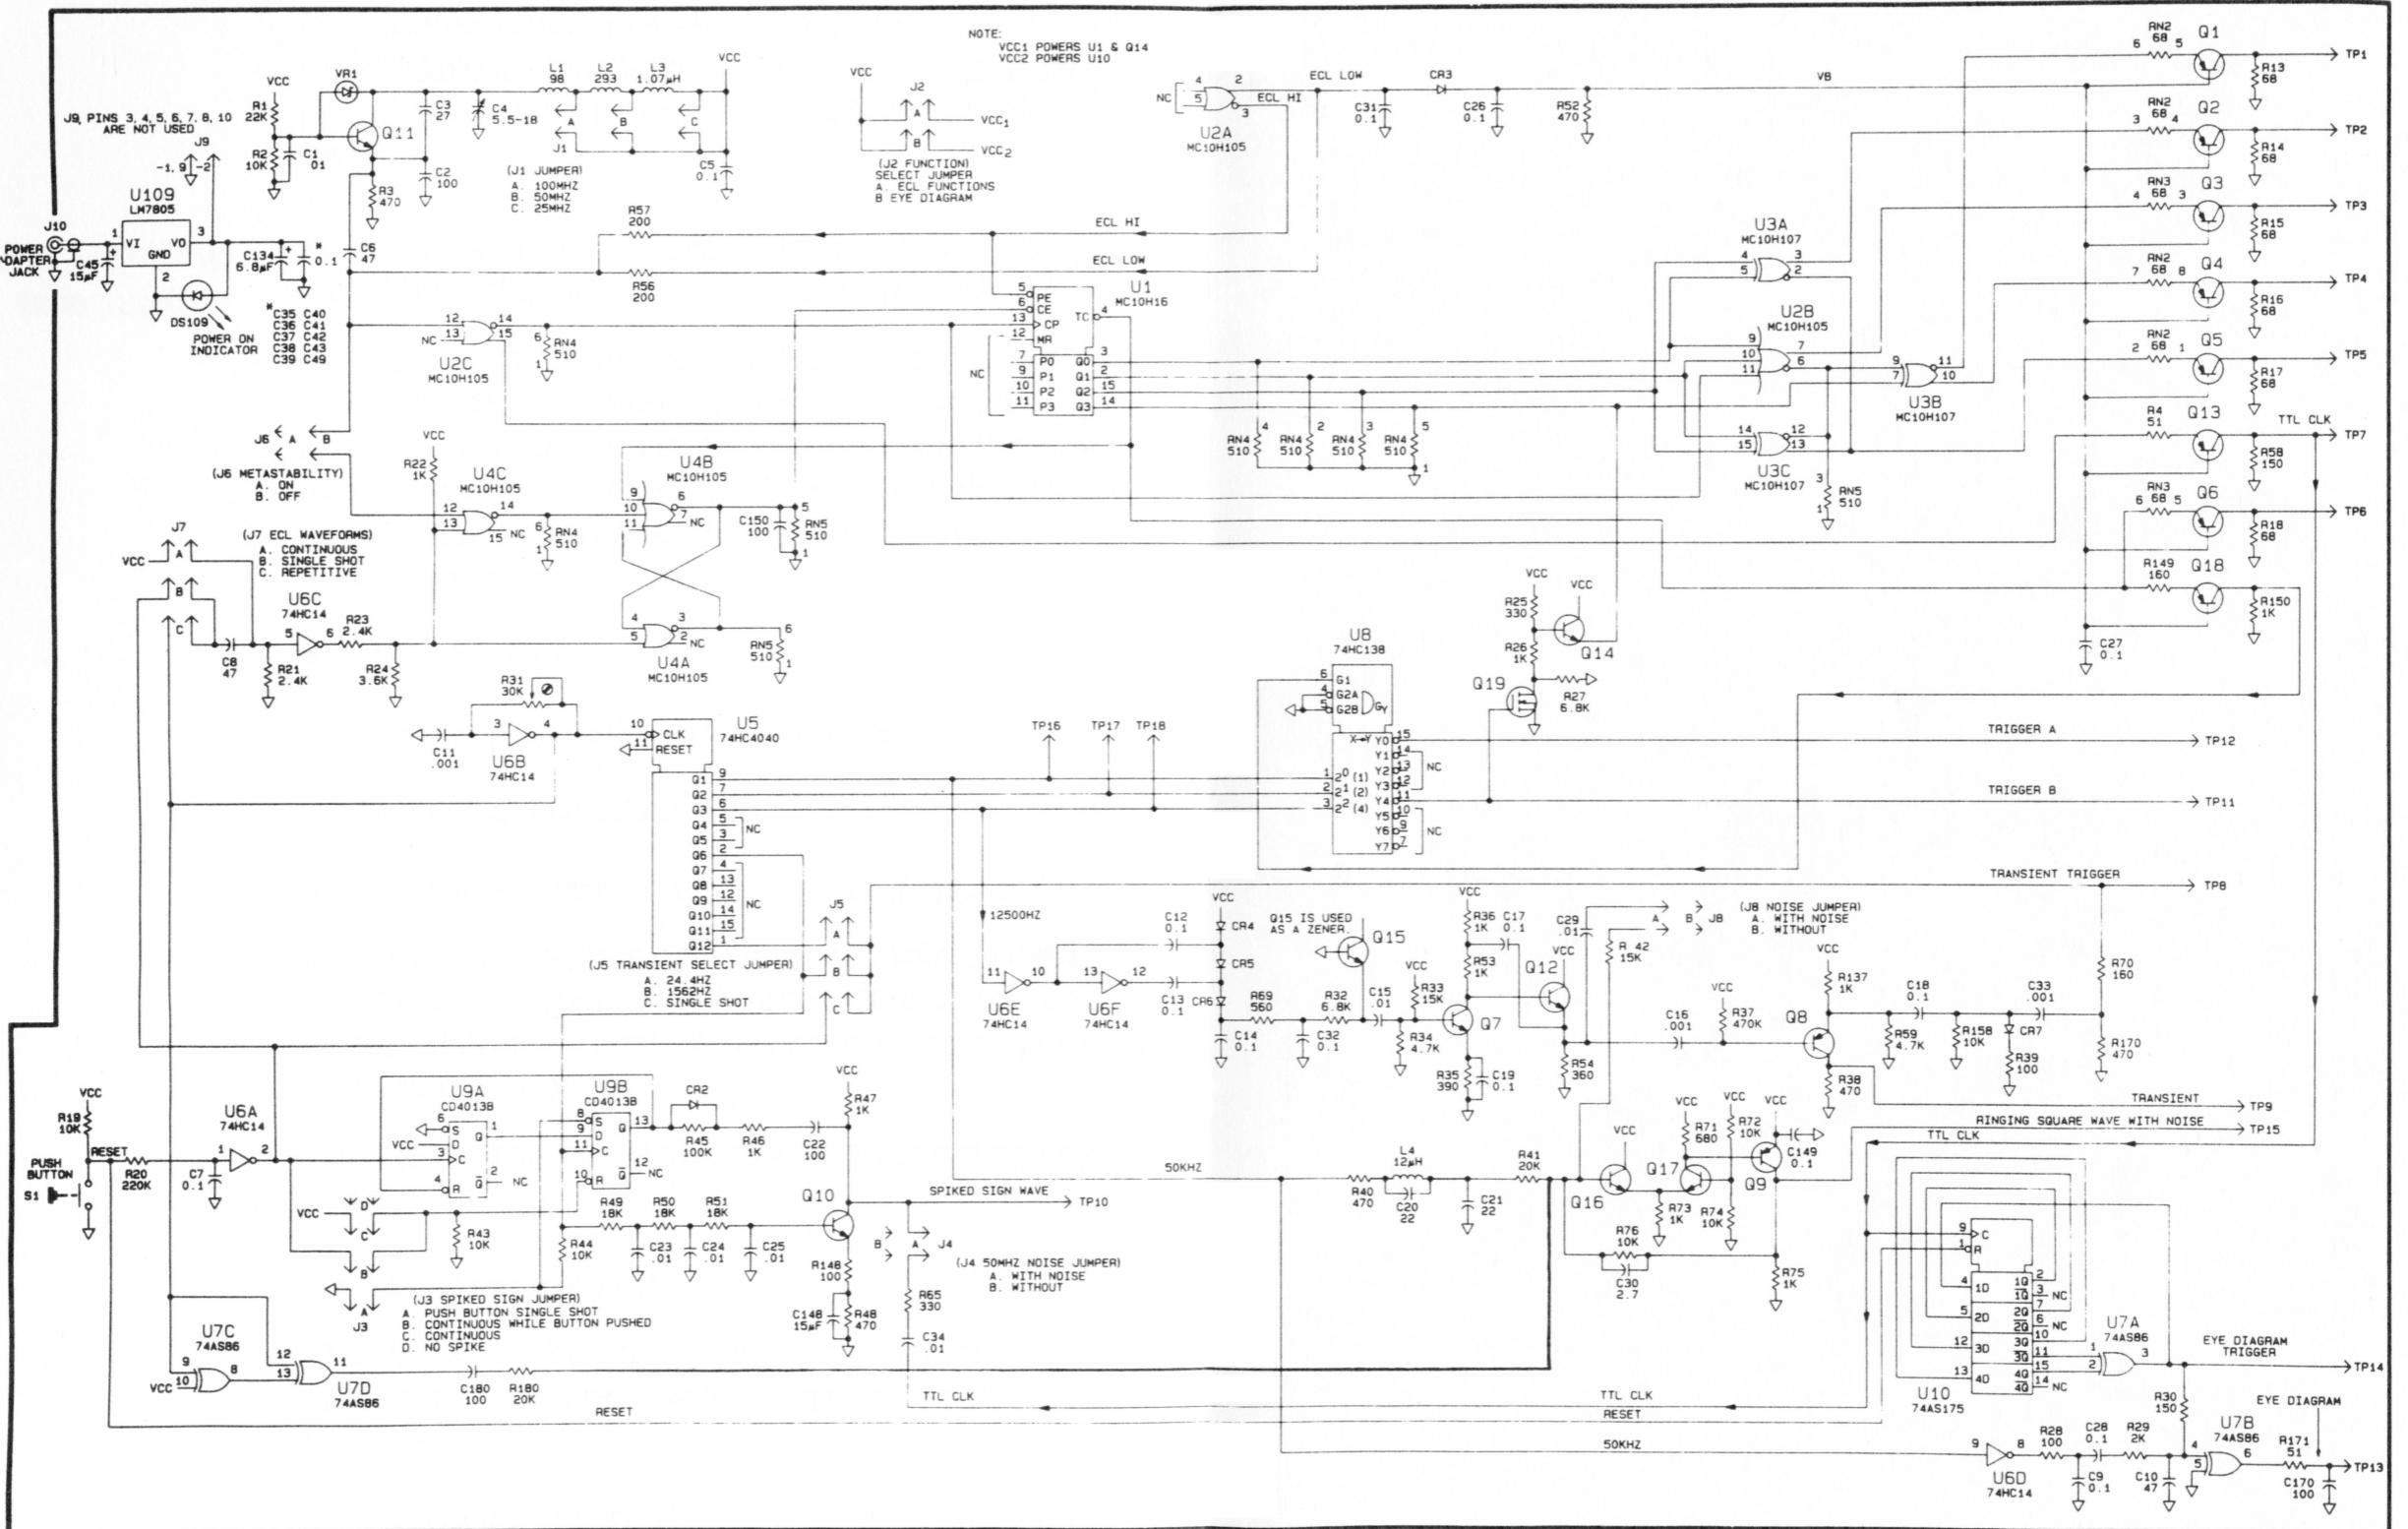

The following figure illustrates the operation of the QuickStart board. Use this figure to troubleshoot the QuickStart board, and for reference information.

QuickStart Board Schematic Diagram

## *QuickStart Board Schematic Diagram*

# Replaceable Parts

This section contains a list of the components that are replaceable for the QuickStart board. As described below, use this list to identify and order replacement parts.

## Parts Ordering Information

Replacement parts are available from or through your local Tektronix, Inc. service center or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available and to give you the benefit of the latest circuit improvements. Therefore, when ordering parts, it is important to include the following information in your order:

- Part number
- Instrument type or model number
- Instrument serial number
- Instrument modification number, if applicable

If a part you order has been replaced with a different or improved part, your local Tektronix service center or representative will contact you concerning any change in the part number.

Change information, if any, is located at the rear of this manual.

## Module Replacement

The QuickStart board is serviced by module replacement so there are three options you should consider:

- **Module Exchange.** In some cases you may exchange your module for a remanufactured module. These modules cost significantly less than new modules and meet the same factory specifications. For more information about the

module exchange program, call 1-800-TEKWIDE, ext. BJV5799.

- **Module Repair.** You may ship your module to us for repair, after which we will return it to you.
- **New Modules.** You may purchase new replacement modules in the same way as other replacement parts.

## Using the Replaceable Parts List

The tabular information in the Replaceable Parts List is arranged for quick retrieval. Understanding the structure and features of the list will help you find the all the information you need for ordering replacement parts.

### Item Names

In the Replaceable Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, U.S. Federal Cataloging Handbook H6-1 can be used where possible.

### Indentation System

This parts list is indented to show the relationship between items. The following example is of the indentation system used in the Description column:

1    2    3    4    5	Name & Description
Assembly and/or Component	
Attaching parts for Assembly and/or Component	
(END ATTACHING PARTS)	
Detail Part of Assembly and/or Component	
Attaching parts for Detail Part	
(END ATTACHING PARTS)	
Parts of Detail Part	
Attaching parts for Parts of Detail Part	
(END ATTACHING PARTS)	

Attaching parts always appear at the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation. Attaching parts must be purchased separately, unless otherwise specified.

### **Abbreviations**

Abbreviations conform to American National Standards Institute (ANSI) standard Y1.1

## CROSS INDEX - MFR. CODE NUMBER TO MANUFACTURER
