Instruction Manual

Tektronix

ECO170A
Synchronous Changeover Unit

070-6113-03

Warning
The servicing instructions are for use by qualified personnel only. To avoid personal injury, do not perform any servicing unless you are qualified to do so. Refer to all safety summaries prior to performing service.

Tektronix, Inc., P.O. Box 500, Beaverton, OR 97077

WARRANTY

Tektronix warrants that this product will be free from defects in materials and workmanship for a period of one (1) year from the date of shipment. If any such product proves defective during this warranty period, Tektronix, at its option, either will repair the defective product without charge for parts and labor, or will provide a replacement in exchange for the defective product.

In order to obtain service under this warranty, Customer must notify Tektronix of the defect before the expiration of the warranty period and make suitable arrangements for the performance of service. Customer shall be responsible for packaging and shipping the defective product to the service center designated by Tektronix, with shipping charges prepaid. Tektronix shall pay for the return of the product to Customer if the shipment is to a location within the country in which the Tektronix service center is located. Customer shall be responsible for paying all shipping charges, duties, taxes, and any other charges for products returned to any other locations.

This warranty shall not apply to any defect, failure or damage caused by improper use or improper or inadequate maintenance and care. Tektronix shall not be obligated to furnish service under this warranty a) to repair damage resulting from attempts by personnel other than Tektronix representatives to install, repair or service the product; b) to repair damage resulting from improper use or connection to incompatible equipment; or c) to service a product that has been modified or integrated with other products when the effect of such modification or integration increases the time or difficulty of servicing the product.

THIS WARRANTY IS GIVEN BY TEKTRONIX WITH RESPECT TO THIS PRODUCT IN LIEU OF ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED. TEKTRONIX AND ITS VENDORS DISCLAIM ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. TEKTRONIX' RESPONSIBILITY TO REPAIR OR REPLACE DEFECTIVE PRODUCTS IS THE SOLE AND EXCLUSIVE REMEDY PROVIDED TO THE CUSTOMER FOR BREACH OF THIS WARRANTY. TEKTRONIX AND ITS VENDORS WILL NOT BE LIABLE FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES IRRESPECTIVE OF WHETHER TEKTRONIX OR THE VENDOR HAS ADVANCE NOTICE OF THE POSSIBILITY OF SUCH DAMAGES.

GENERAL SAFETY SUMMARY

Review the following safety precautions to avoid injury and prevent damage to this product or any products connected to it. To avoid potential hazards, use this product only as specified.

Only qualified personnel should perform service procedures.

TO AVOID FIRE OR PERSONAL INJURY

Use Proper Power Cord. Use only the power cord specified for this product and certified for the country of use.

Connect and Disconnect Properly. Do not connect or disconnect probes or test leads while they are connected to a voltage source.

Ground the Product. This product is grounded through the grounding conductor of the power cord. To avoid electric shock, the grounding conductor must be connected to earth ground. Before making connections to the input or output terminals of the product, ensure that the product is properly grounded.

Observe All Terminal Ratings. To avoid fire or shock hazard, observe all ratings and markings on the product. Consult the product manual for further ratings information before making connections to the product.

Do not apply a potential to any terminal, including the common terminal, that exceeds the maximum rating of that terminal.

Do Not Operate Without Covers. Do not operate this product with covers or panels removed.

Use Proper Fuse. Use only the fuse type and rating specified for this product.

Avoid Exposed Circuitry. Do not touch exposed connections and components when power is present.

Wear Eye Protection. Wear eye protection if exposure to high-intensity rays or laser radiation exists.

Do Not Operate With Suspected Failures. If you suspect there is damage to this product, have it inspected by qualified service personnel.

Do Not Operate in Wet/Damp Conditions.

Do Not Operate in an Explosive Atmosphere.

Keep Product Surfaces Clean and Dry.

Provide Proper Ventilation. Refer to the manual's installation instructions for details on installing the product so it has proper ventilation.

SYMBOLS AND TERMS

Terms in this Manual. These terms may appear in this manual:

WARNING. *Warning statements identify conditions or practices that could result in injury or loss of life.*

CAUTION. *Caution statements identify conditions or practices that could result in damage to this product or other property.*

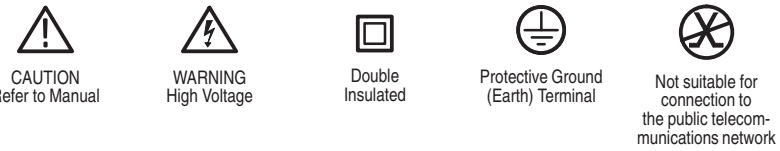
Terms on the Product. These terms may appear on the product:

DANGER indicates an injury hazard immediately accessible as you read the marking.

WARNING indicates an injury hazard not immediately accessible as you read the marking.

CAUTION indicates a hazard to property including the product.

Symbols on the Product. The following symbols may appear on the product:



SERVICE SAFETY SUMMARY

Only qualified personnel should perform service procedures. Read this *Service Safety Summary* and the *General Safety Summary* before performing any service procedures.

Do Not Service Alone. Do not perform internal service or adjustments of this product unless another person capable of rendering first aid and resuscitation is present.

Disconnect Power. To avoid electric shock, switch off the instrument power, then disconnect the power cord from the mains power.

Use Care When Servicing With Power On. Dangerous voltages or currents may exist in this product. Disconnect power, remove battery (if applicable), and disconnect test leads before removing protective panels, soldering, or replacing components.

To avoid electric shock, do not touch exposed connections.

SECTION 1

OPERATING INSTRUCTIONS

This section explains how to operate the ECO–170A, and describes the front panel controls and the rear panel connectors.

Introduction

The ECO–170A is a Synchronous Changeover unit which provides transparent, automatic selection of sync sources. Changeover occurs upon fault detection of the source in use. Electronic sync transfer ensures uninterrupted sync for critical applications; the ECO–170A uses relay switching only to switch to bypass in case of power failure, or if one of the input amplifiers fail.

The ECO–170A tests both pulse amplitude and pulse timing, providing two methods of error checking for your sync system. When the ECO–170A detects a fault it automatically switches to the backup generator, unless that, too, has a fault. Separate indicators on the front panel display faults for each generator. These indicators remain on until cleared by an operator.

Description

Fig. 1-1 shows how the ECO–170A is typically connected, at the outputs of two sync generators. Note that of each input pair, the channel A input is connected to a bypass relay, while the channel B input is connected directly to the electronic switch. Further, note that the ECO–170A is powered by the same source as the backup generator, while the primary generator is powered by a separate source.

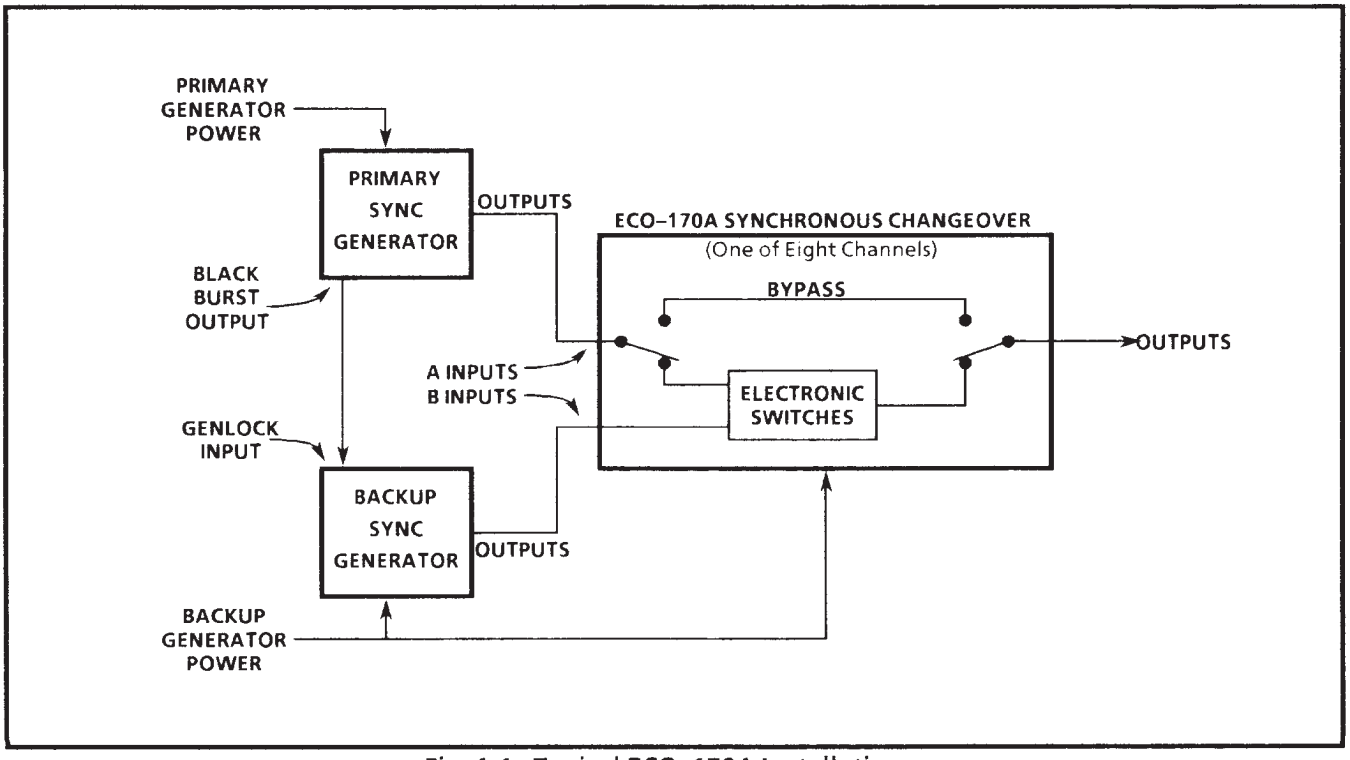


Fig. 1-1. Typical ECO–170A Installation.

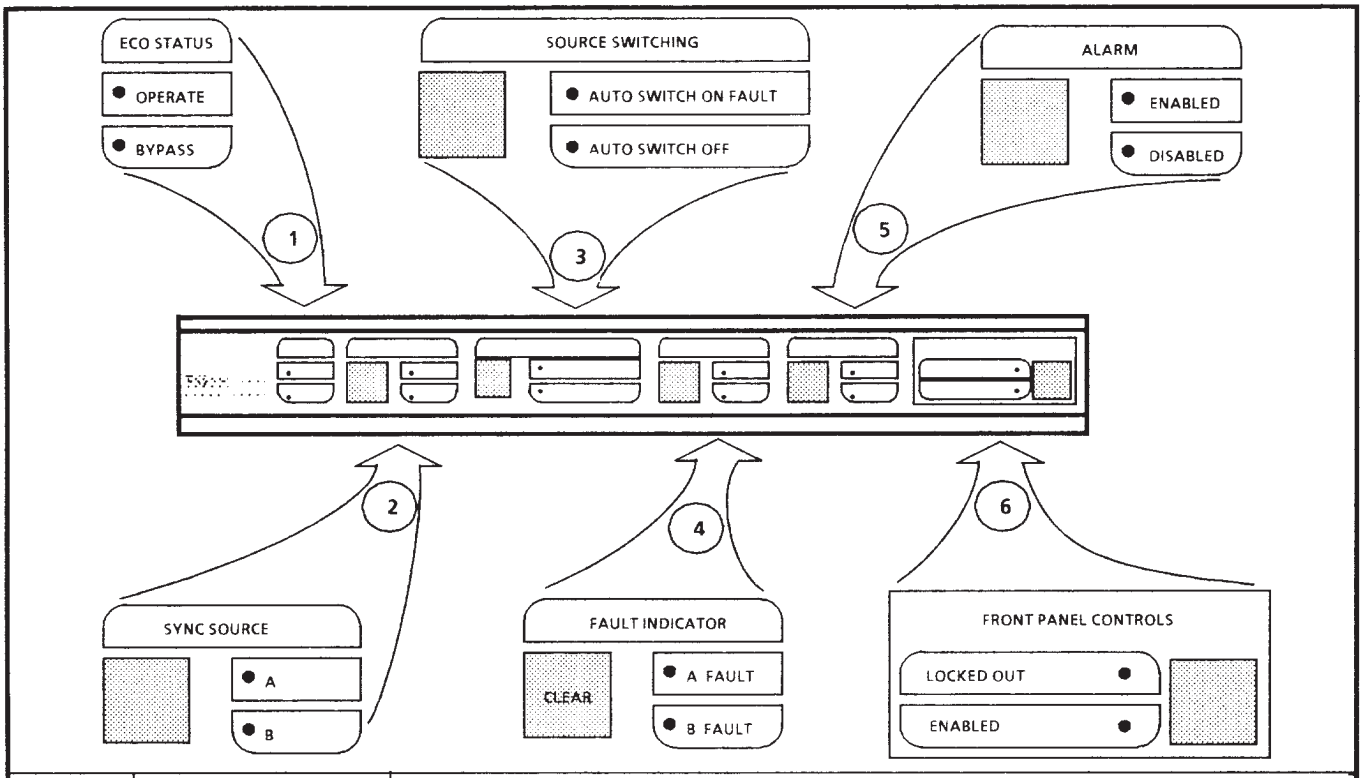
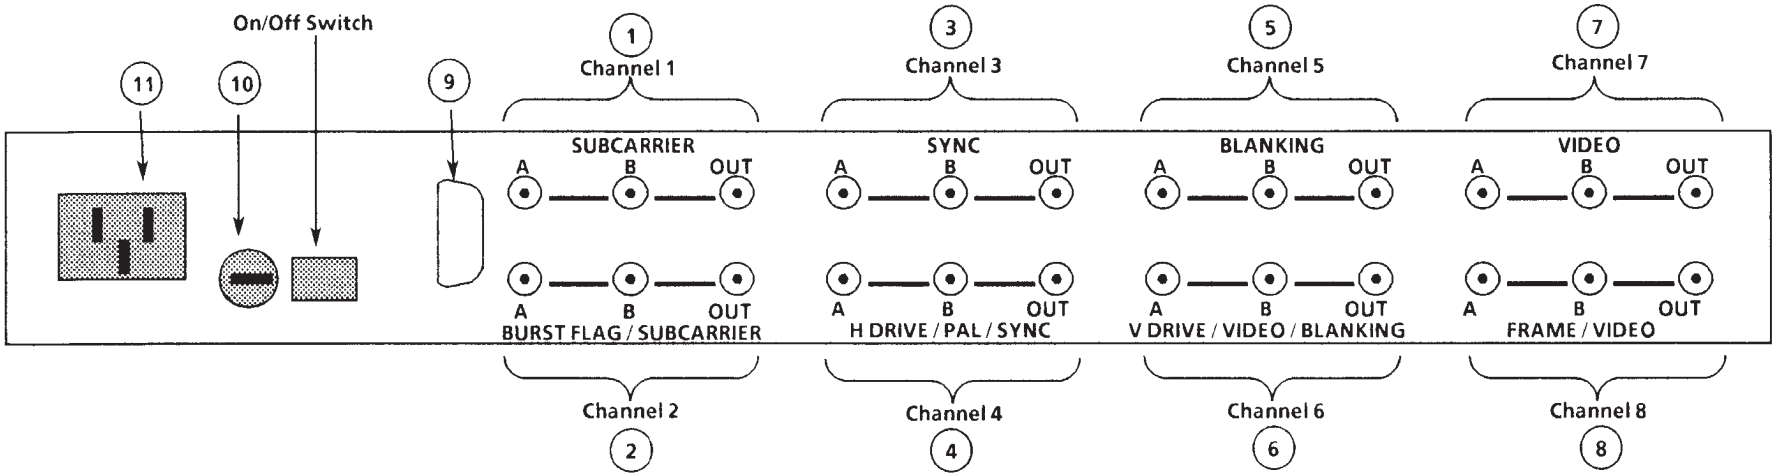


Key #	Control/Indicator Name	Description
1	ECO STATUS	The LEDs light to indicate whether the ECO-170A is in the OPERATE or the BYPASS mode of operation. In BYPASS, the A inputs are connected directly to the outputs.
2	SYNC SOURCE	When the FRONT PANEL CONTROLS are ENABLED this push button allows manual selection of the SYNC SOURCE to be used. The LEDs light to indicate the current selection, source A or source B.
3	SOURCE SWITCHING	When the FRONT PANEL CONTROLS are ENABLED the SOURCE SWITCHING push button toggles between the AUTO SWITCH ON FAULT and the AUTO SWITCH OFF selections.
4	FAULT INDICATOR	When a fault is detected, the appropriate LED lights to indicate which source has the fault. The CLEAR push button will clear this indication only when the FRONT PANEL CONTROLS are ENABLED.
5	ALARM	When the FRONT PANEL CONTROLS are ENABLED this push button alternately ENABLES and DISABLES the audio alarm. The LEDs indicate the current selection. Once tripped, the alarm will continue to sound until cleared by the FAULT INDICATOR CLEAR or ALARM DISABLED push buttons.
6	FRONT PANEL CONTROLS	This push button controls the rest of the front panel controls, toggling them between the LOCKED OUT and the ENABLED states. The LEDs indicate the current state.

Fig. 1-2. ECO–170A Front Panel Controls

In this way, both power sources would have to fail before sync would be lost. If the power to the primary generator fails, the ECO–170A and the backup generator continue to operate; if the power to the ECO–170A and backup generator fails, the ECO–170A switches to bypass mode and the primary generator signals are passed directly through to the output.



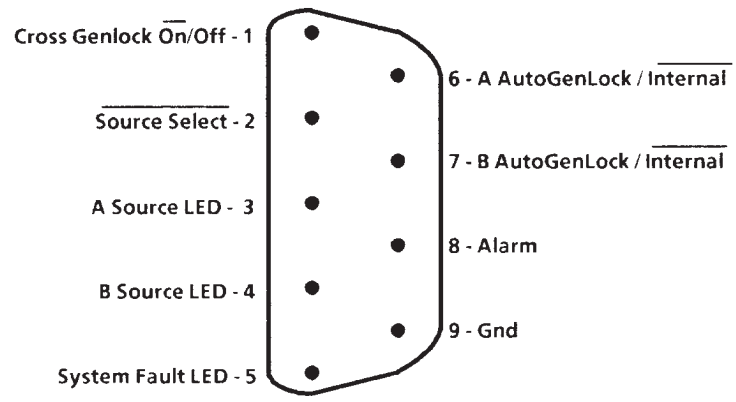
Key #	Name	Function	Factory Signal Settings	
			NTSC	PAL
1	Subcarrier ***REQUIRED***[3]	Dedicated connectors for Subcarrier, no selection except frequency.	3.58 MHz	4.43 MHz
2	Burst Flag / Subcarrier	May be configured for either Burst Flag or Subcarrier.[1]	Burst Flag	Burst Flag
3	Sync ***REQUIRED***[3]	Dedicated connectors for Sync pulse, no selection of signal.	Sync	Sync
4	H Drive / PAL Pulse / Sync	May be configured for H Drive, Sync, or PAL Pulse (or Square) signals.[1]	H Drive	PAL Pulse
5	Blanking	Dedicated connectors for Blanking, no signal selection.	Blanking	Blanking
6	V Drive / Video / Blanking	May be configured for either V Drive, Video, or Blanking.[1]	V Drive	Video
7	Video	Dedicated connectors for Video, no selection of signal.	Video	Video
8	Frame/Video	May be configured for either Frame Pulse (or Square) or Video.[1,2]	Frame Pulse	Frame Pulse
9	Remote Control Connector	See Fig. 1-4 for details on Remote Connector.	NA	NA
10	Fuse	Line Fuse.	2A Med Blo	1A Med Blo
11	Power	115/230 VAC Input.	115 VAC	230 VAC

Fig. 1-3. ECO-170A Rear Panel Connectors

[1] See Table 1-1 for signal selection jumper and switch settings.

[2] Frame Pulse must be negative-going, not TTL, such as that supplied by a TEKTRONIX TSG–170A or SPG–170A.

[3] SUBCARRIER and SYNC are required from both Generators, for both Pulse Width Detection and to have manual switching of sync sources occur during the vertical interval.



Pin #	Name	Function
1	Cross Genlock On / Off	Ground closure to enable (low) or disable (high) the Cross Genlock function.
2	Source Select	Ground closure to manually select the sync source. Toggles between A and B each time pin 2 is pulled low.
3	A Source LED	Output to light an LED at the remote when sync source A is selected. Capable of supplying 15 mA at TTL levels.
4	B Source LED	Output to light an LED at the remote when sync source B is selected. Capable of supplying 15 mA at TTL levels.
5	System Fault LED	Output to light an LED when the ECO–170A front panel displays an A Fault, B Fault, or Bypass indication. Capable of supplying 15 mA.
6	A AutoGenLock/Internal	
7	B AutoGenLock/Internal	
8	Alarm	Output to sound an alarm at the remote. Capable of supplying 50 mA at TTL levels.
9	Ground	Common return for Remote connector.

Fig. 1-4. ECO–170A Remote Connector

Fig. 1-2 describes the Front Panel Controls of the ECO–170A, and Fig. 1-3 describes the Rear Panel. Fig. 1-4 describes the Remote Connector details.

Configuration

As shipped from Tektronix, the ECO–170A will be configured to accept either NTSC or PAL signals, depending on the power cord option ordered. An instrument with a standard power cord will be configured for NTSC; if ordered with any of the option power cords (A1, A2, or A3), the ECO–170A will be set up for PAL.

The following table provides information on switch and jumper settings for changing the factory selections.

Table 1-1. ECO–170A Factory Configuration [a]

Channel	Selections Available	Factory Settings	
		NTSC	PAL
General			
Line Voltage	110V/220V	110V	220V
NTSC/PAL	NTSC/PAL	NTSC	PAL
PulseWidth Detection [b]	Enabled/Disabled	Enabled	Enabled
Pulse Amplitude	4 Volt/ 2 Volt	4 Volt	2 Volt
Subcarrier (Channel 1)	Fault Detection - Enable/Disable [b] 3.58 MHz/4.43 MHz	Enabled 3.58 MHz	Enabled 4.43 MHz
Burst Flag/Subcarrier (Channel 2)	Fault Detection - Enable/Disable Burst Flag/Subcarrier (Subcarrier) 3.58 MHz/4.43 MHz	Enabled Burst Flag 3.58 MHz	Enabled Burst Flag 4.43 MHz
Sync (Channel 3)	Fault Detection - Enable/Disable [b]	Enabled	Enabled
H Drive/PAL/Sync (Channel 4)	Fault Detection - Enable/Disable H Drive/PAL Pulse/PAL Square/Sync	Enabled H Drive	Enabled PAL Pulse
Blanking (Channel 5)	Fault Detection - Enable/Disable	Enabled	Enabled
V Drive/Video/Blanking (Channel 6)	Fault Detection - Enable/Disable V Drive/Video/Blanking	Enabled V Drive	Enabled Video
Video (Channel 7)	Fault Detection - Enable/Disable	Enabled	Enabled
Frame/Video (Channel 8)	Fault Detection - Enable/Disable Frame Pulse/Frame Square/ Video	Enabled Frame Pulse	Enabled Frame Pulse

[a] Qualified service personnel may refer to Section 3, INSTALLATION, for information on changing the ECO–170A Configuration.

[b] If fault detection for either channel 1 or 3 is disabled, all Pulse Width Detection will be disabled as well.

SECTION 2

SPECIFICATION and PERFORMANCE CHECK

PERFORMANCE CONDITIONS

Electrical Characteristics: The Performance Requirements listed in the Electrical Specification apply over an ambient temperature range of 0°C to +50°C. The rated accuracies are valid when the instrument is calibrated at an ambient temperature range of +20°C to +30°C, after a warm-up time of 20 minutes. Test equipment used to verify Performance Requirements must be calibrated and working within the limits specified under the Equipment Required list.

Table 2-1. General Information

Characteristic	Specification	Supplemental Information
Input Impedence		
Bypass		Direct connection in Bypass,
A Inputs	Unterminated	A Inputs to Outputs.
B Inputs	75Ω	B Inputs not specified unless power is turned on.
Operate	75Ω	Inputs and Outputs
Return Loss		
Input	≥ 36 dB to 5 MHz	
Output	≥ 36 dB to 5 MHz	
DC Offset	0 V ± 50 mV	

Table 2-2. Video Channel Characteristics

Characteristic	Specification	Supplemental Information
Gain	Unity ± 2%	
Chrom/Lum Gain	≤ 2% to F_{SC}	
Maximum Input Amplitude	1.4 V p-p	
Diff Phase	≤ 2°	
Diff Gain	≤ 2%	
Ringing and Tilt	≤ 2%	
Channel to Channel Delay	≤ 10 ns	
Crosstalk		
Channel to Channel		
Input to Input	-55 dB @ F_{SC}	
Residual Noise	≤ 2 mV	To 5 MHz

Table 2-3. Subcarrier Channel Characteristics

Characteristic	Specification	Supplemental Information
Gain	Unity ± 4%	
Maximum Input Amplitude	2.5 V p-p + 100 mV, centered around 0 V	
Channel to Channel Delay	≤ 10 ns	
Crosstalk Channel to Channel Input to Input	≤ –55 dB @ F_{SC}	
Residual Noise	≤ 2 mV	To 5 MHz

Table 2-4. Pulse Channel Characteristics

Characteristic	Specification	Supplemental Information
Gain	Unity ± 2%	
Maximum Input Amplitude	+ 1 V to –5 V, terminated into 75Ω	
Crosstalk Channel to Channel Input to Input	–40 dB @ F_{SC}	
Residual Noise	≤ 4 mV	To 5 MHz

Dimensions	
Height	4.4 cm (1.734 inches).
Width	48.3 cm (19.0 inches).
Length	56.1 cm (22.1 inches).
Weight	
Net	5.7 kg (12.5 lbs).
Shipping	10.4 kg (22.9 lbs).

Table 2-8. ENVIRONMENTAL CHARACTERISTICS

Characteristics	Information
Instrument Class	The ECO–170A is a Class 3 instrument as defined in Tektronix Standard 062-2853-00, Product Classification Environmental Test Summary.
Temperature	
Operating	0°C to + 50°C.
Storage	–40°C to + 65°C.
Altitude	
Operating	To 15,000 feet.
Storage	To 50,000 feet.
Vibration (Operating)	15 minutes each axis at 0.025 inch, frequency varied from 10–55–10 Hz in 1-minute cycles with instrument secured to vibration platform. Ten minutes each axis at any resonant point or at 55 Hz.
Shock (Non-Operating)	50 g's, 1/2 sine, 11 ms duration, 3 guillotine-type shocks per axis.
Transportation	Qualified under NTSC Test Procedure IA, Category II (24-inch drop).

Table 2–8A: CERTIFICATIONS AND COMPLIANCES

Category	Standards or description
EC Declaration of Conformity – EMC [1]	Meets intent of Directive 89/336/EEC for Electromagnetic Compatibility. Compliance was demonstrated to the following specifications as listed in the Official Journal of the European Union: EN 50081-1 Emissions: EN 55022 Class B Radiated and Conducted Emissions EN 50082-1 Immunity: IEC 801-2 Electrostatic Discharge Immunity IEC 801-3 RF Electromagnetic Field Immunity IEC 801-4 Electrical Fast Transient/Burst Immunity [1] High-quality shielded cables must be used to ensure compliance to the above listed standards.
FCC Compliance	Emissions comply with FCC Code of Federal Regulations 47, Part 15, Subpart B, Class A Limits.
Australia/New Zealand Declaration of Conformity – EMC	Complies with EMC provision of Radiocommunications Act per the following standard(s): AN/NZS 2064.1/2 Industrial, Scientific, and Medical Equipment: 1992
Installation (Overvoltage) Category	Terminals on this product may have different installation (overvoltage) category designations. The installation categories are: CAT III Distribution-level mains (usually permanently connected). Equipment at this level is typically in a fixed industrial location. CAT II Local-level mains (wall sockets). Equipment at this level includes appliances, portable tools, and similar products. Equipment is usually cord-connected. CAT I Secondary (signal level) or battery operated circuits of electronic equipment.
Pollution Degree	A measure of the contaminates that could occur in the environment around and within a product. Typically the internal environment inside a product is considered to be the same as the external. Products should be used only in the environment for which they are rated. Pollution Degree 1 No pollution or only dry, nonconductive pollution occurs. Products in this category are generally encapsulated, hermetically sealed, or located in clean rooms. Pollution Degree 2 Normally only dry, nonconductive pollution occurs. Occasionally a temporary conductivity that is caused by condensation must be expected. This location is a typical office/home environment. Temporary condensation occurs only when the product is out of service. Pollution Degree 3 Conductive pollution, or dry, nonconductive pollution that becomes conductive due to condensation. These are sheltered locations where neither temperature nor humidity is controlled. The area is protected from direct sunshine, rain, or direct wind. Pollution Degree 4 Pollution that generates persistent conductivity through conductive dust, rain, or snow. Typical outdoor locations.
Safety Standards	
U.S. Nationally Recognized Testing Laboratory Listing	UL1244 Standard for electrical and electronic measuring and test equipment.

Table 2–8A: CERTIFICATIONS AND COMPLIANCES (cont.)

Category	Standards or description	
Canadian Certification	CAN/CSA C22.2 No. 231 and	CSA safety requirements for electrical and electronic measuring test equipment.
European Union Compliance	Low Voltage Directive 73/23/EEC, amended by 93/69/EEC	
	EN 61010-1	Safety requirements for electrical equipment for measurement, control, and laboratory use.
Additional Compliance	IEC61010-1	Safety requirements for electrical equipment for measurement, control, and laboratory use.
Safety Certification Compliance		
Temperature, operating	+5 to +40° C	
Altitude (maximum operating)	2000 meters	
Equipment Type	Test and measuring	
Safety Class	Class 1 (as defined in IEC 1010-1, Annex H) – grounded product	
Overvoltage Category	Overvoltage Category II (as defined in IEC 1010-1, Annex J)	
Pollution Degree	Pollution Degree 2 (as defined in IEC 1010-1). Note: Rated for indoor use only.	

PERFORMANCE CHECK

This section gives the procedures for checking your ECO–170A. There are both short and long form procedures here. The short form procedure provides a quick reference for experienced technicians. The long form procedure gives more detailed steps.

Table 2-9 lists the equipment you will need. If you use alternate equipment, make sure it meets the specifications given in this table.

Table 2–9. Recommended Test Equipment (Including Accessories)

Test Equipment	Minimum Specifications	Equipment Examples
Test Oscilloscope Mainframe	At least 50 MHz bandwidth with dual-trace plug-in and 10X probe.	TEKTRONIX 7603.
Test Oscilloscope Differential Comparator Plug-In	Minimum deflection factor 10 mV/div with 10X probe.	TEKTRONIX 7A13; plugs into 7603 mainframe.
Test Oscilloscope Dual-Trace Amplifier Plug-In	Minimum deflection factor 50 mV/div with 10X probe.	TEKTRONIX 7A26; plugs into 7603 mainframe.
Test Oscilloscope Dual Time Base Plug-In	Sweep rate 5 ns/div to 5 μs/div.	TEKTRONIX 7B53A; plugs into 7603 mainframe.
Spectrum Analyzer	Capable of measuring to at least 5 MHz.	TEKTRONIX 7L12; plugs into TEKTRONIX 7603 mainframe.
Low Pass Filter	5 MHz.	Tektronix Part No. 015-0213-00.
Test Signal Generator (Qty 2)	Provides the following test signals: black burst, flat field, staircase, pulse & bar, H Drive, V drive, and subcarrier output.	TEKTRONIX TSG–170A (NTSC) or TEKTRONIX TSG–271 (PAL)
Waveform Monitor	For displaying and measuring field-rate and line-rate waveforms.	TEKTRONIX 1485 MOD W5F.
Vectorscope	For measuring differential phase and gain.	TEKTRONIX 520A (NTSC) or TEKTRONIX 521A (PAL).
Video Amplitude Calibration Fixture (VAC)	Provides a chopped voltage reference accurate to $\pm$0.05% from 0 to 1 V in 0.1 mV increments. (Used with the TEKTRONIX 1480 MOD W5F Waveform Monitor.)	Tektronix Part No. 067-0916-00. Plugs into a TEKTRONIX TM 503 Power Mainframe.
Leveled Sine Wave Generator	250 kHz to 5 MHz.	TEKTRONIX SG 503A; plugs into TM 503 Power Mainframe.
Return Loss Bridge	At least 54 dB, dc to 10 MHz; 75Ω inputs.	Tektronix Part No. 015-0149-00.
Low Loss Coaxial Cable (Qty 4)	Belden 8281 video cable. Impedance, 75Ω; length, 6 feet. Equipped with bnc connectors.	Tektronix Part No. 012-0159-01.

Table 2-9 (cont.) Recommended Test Equipment (Including Accessories)

Test Equipment	Minimum Specifications	Equipment Examples
RG59/U Coaxial Cables (Qty 3)	Impedance, 75Ω; length, 42 inches. Equipped with BNC connectors.	Tektronix Part No. 012-0074-00.
RG58C/U Coaxial Cables (Qty 16)	Impedance, 75Ω; length, 10 inches. Equipped with BNC connectors.	Tektronix Part No. 012-0208-00
End-Line Termination (Qty 3)	Impedance, 75Ω. Equipped with BNC connectors.	Tektronix Part No. 011-0102-00.
Feed-Through Termination (Qty 2)	Impedance, 75Ω. Equipped with BNC connectors.	Tektronix Part No. 011-0103-02.
50Ω to 75Ω Minimum Loss Attenuator	Equipped with BNC connectors.	Tektronix Part No. 011-0057-00.
10X 75Ω Attenuator	Equipped with BNC connectors.	Tektronix Part No. 011-0061-00.
DC Block	None.	Tektronix Part No. 015-0221-00.
BNC Female-to-BNC Female Adapter	None.	Tektronix Part No. 103-0028-00.
50Ω Coaxial Cable	Length, 42 inches. Equipped with BNC connectors. For use with the spectrum analyzer and SG 503.	Tektronix Part No. 012-0057-01.
Variable Resistor Test Fixture	0–200 Ω, equipped with BNC connectors. Locally constructed.	See Fig. 2-1
Variable Autotransformer		General Radio Model W10MT3W.

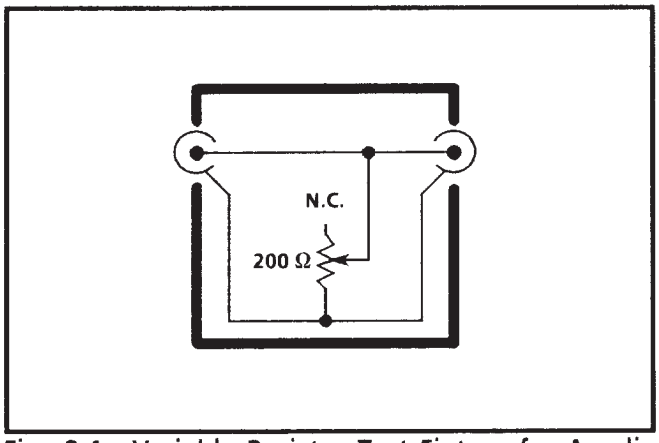

Fig. 2-1. Variable Resistor Test Fixture for Amplitude Error Detection tests.

SHORT FORM
PERFORMANCE CHECK

1. **Return Loss**
   250 kHz – 5 MHz
   Inputs ≥30 dB
   Outputs ≥36 dB

2. **Crosstalk (Operate Mode)**
   Drive each input in turn
   Check all outputs for each driven input
   Subcarrier and Video channels ≥55 dB
   Pulse channels ≥40 dB

3. **Crosstalk (Bypass Mode)**
   Power Off
   Drive each A Input in turn
   Check all outputs for each driven input
   Subcarrier and Video channels ≥55 dB
   Pulse channels ≥40 dB

4. **DC Offfset and Residual Noise**
   Check each channel (terminate input)
   DC Level 0V ±50 mV
   Residual Noise
   ≤2 mV (Subcarrier and Video channels)
   ≤4 mV (Pulse channels)

5. **Amplitude Error Detection**
   For each channel in turn, reduce the signal amplitude until the FAULT LED comes on. Check that the signal amplitude at fault is:

Signal Type	Fault Between
Video (Sync)	189 mV - 226 mV
Subcarrier	1.26 V - 1.58 V
Pulse	
4 Volt	2.52 V - 3.17 V
2 Volt	1.26 V - 1.58 V

6. **Op Amp Bad Detection**
   Ground each of the following Test Points in turn:

TP282	TP382	TP563	TP368
TP564	TP755	TP954	TP768

   CHECK — as each TP is grounded: the relays click, the STATUS LED switches to BYPASS, and the FAULT LEDs remain off.

   CHECK — as the ground is removed: the relays click, the STATUS LED switches to OPERATE, and the FAULT LEDs remain off.

7. **Gain - Subcarrier channels**
   Check gain with VAC
   200 mV ±8 mV

8. **Gain - Pulse channels**
   Check gain with VAC
   4 Volt - 400 mV ±8 mV
   2 Volt - 200 mV ±4 mV

9. **Gain, Chrominance to Luminence Gain, Ringing and Tilt - Video**
   Check with VAC:
   Gain
   714.3 mV ±14.2 mV
   Chrominance to Luminance Gain
   Mod Pulse = Bar ± 7.14 mV
   Ringing
   ≤14.2 mV

   Check with Waveform Monitor:
   Line Tilt
   ±14.2 mV
   Check Field Tilt
   ±14.2 mV

10. **Differential Gain and Phase - Video Channels**
    Check Differential Gain
    ≤2%
    Check Differential Phase
    ≤2°

11. **Pulse Width Fault Detection**
    Pulse Width On - No Fault indication
    Pulse Width Off - No Fault indication
    Swap BLANKING and BURST FLAG inputs
    Clear Fault
    Pulse Width On - Fault indication

LONG FORM
PERFORMANCE CHECK

1. Return Loss

a. Connect test equipment as in Fig. 2-2.

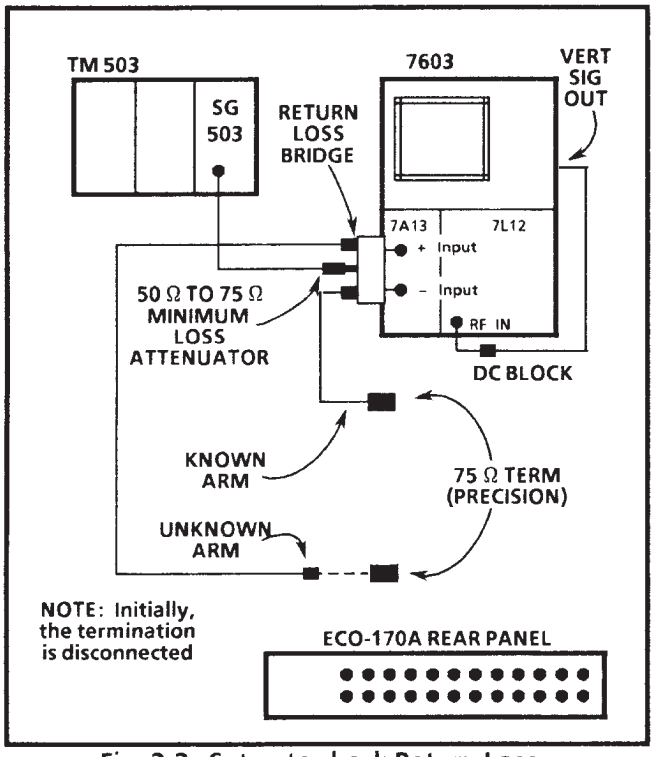

Fig. 2-2. Setup to check Return Loss.

b. Set the following controls:

ECO–170A:
SYNC SOURCE A
AUTO SWITCH OFF

7A13:

+Input	DC
–Input	DC
BW	Full
Volts/Div	50 mV

7603:

Vert Mode	Right
Trig Source	Left

SG503:

Amplitude	250 mV

7L12:

Freq	0 MHz
Time/Div	5 ms
Ref Level	–20 dB
Display Mode	10 dB/Div.
Gain Selector	CCW
Freq Span/Div	1 MHz
Resolution	300 kHz

c. Set the SG503 to 5 MHz.

d. With both precision terminators connected, adjust the Return Loss Bridge to null the 5 MHz response displayed on the spectrum analyzer.

e. Remove the precision 75Ω terminator from the UNKNOWN cable.

f. Place the peak of the displayed 5 MHz to be at the top line of the graticule by adjusting the spectrum analyzer Vertical Position controls.

Parts g through l are repeated for each channel in turn:

- ☐ *SUBCARRIER*
- ☐ *BURST FLAG / SUBCARRIER*
- ☐ *SYNC*
- ☐ *H DRIVE / PAL PULSE / SYNC*
- ☐ *BLANKING*
- ☐ *V DRIVE / VIDEO / BLANKING*
- ☐ *VIDEO*
- ☐ *FRAME/VIDEO*

g. Connect the UNKNOWN cable to the A IN connector for the current channel, and select SYNC SOURCE A.

h. **CHECK** — that the return loss is ≥30 dB (3 major divisions) as you vary the SG503 frequency between 5 MHz and 250 kHz.

i. Connect the UNKNOWN terminator to the OUT connector for that channel, and turn the ECO–170A off, to put it into the Bypass mode of operation.

j. **CHECK** — that the return loss is ≥36 dB (3.6 major divisions) as you vary the SG503 frequency between 5 MHz and 250 kHz.

k. Remove the UNKNOWN terminator and turn the instrument back on. Move the UNKNOWN cable to the B IN connector for that channel, and select SYNC SOURCE B. Repeat part h of this step.

l. Move the UNKNOWN cable to the OUT connector for that channel, and repeat part j of this step.

m. Return to part g and repeat these steps for the next channel.

n. After checking all channels, remove the coax from the 7L12 RF IN connector, and remove the Return Loss Bridge from the 7A13.

2. Crosstalk (Operate Mode)

NOTE

The Spectrum Analyzer must be calibrated to the 7603 mainframe. See the Spectrum Analyzer manual for details.

a. Connect a 75 Ω coax and 10X 75Ω Attenuator to the Subcarrier output of the primary generator (Subcarrier coax). Connect a 50Ω coax with a 50/75Ω MIN LOSS Network on the end of it to the Spectrum Analyzer RF Input (Spectrum Analyzer coax).

Connect both of these to the ECO–170A SUBCARRIER channel and terminate the SUBCARRIER B IN connector with a 75Ω terminator, as shown in Fig. 2-3.

b. Set the following controls:

7L12:

Freq	0 MHz
Time/Div	5 ms
Ref Level	–20 dBm
Display Mode	10 dB/Div.
Gain Selector	CCW
Freq Span/Div	1 MHz
Resolution	300 kHz
Video Filter	30 kHz

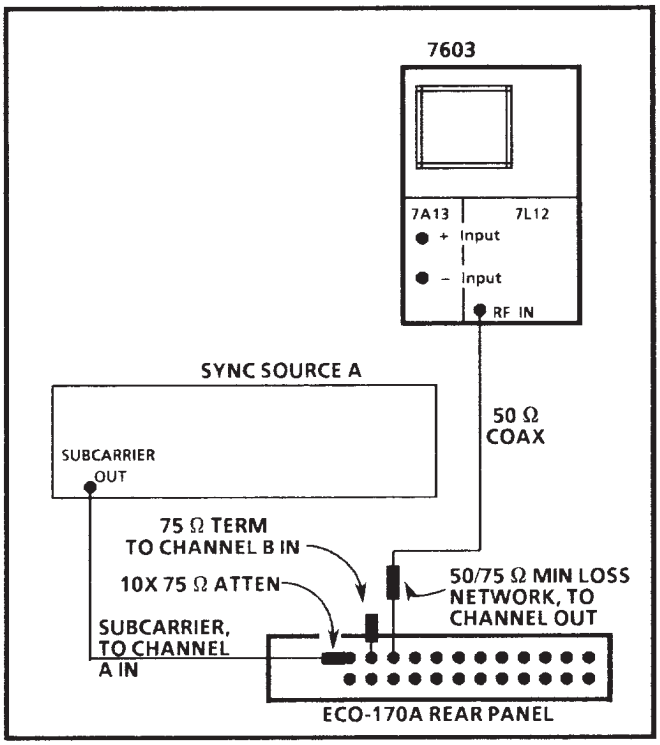

Fig. 2-3. Initial setup to check Crosstalk.

ECO–170A:
SYNC SOURCE A
AUTO SWITCH OFF

c. Place the peak of the displayed response at the top line of the graticule, by adjusting the Vertical Position controls on the Spectrum Analyzer.

d. Change the Spectrum Analyzer Freq Span/Div to 500 kHz, and depress the Freq Start push button.

e. Set the ECO–170A so the FRONT PANEL CONTROLS are ENABLED, and select SYNC SOURCE B.

f. **CHECK** — that the Spectrum Analyzer response is ≥55 dB down (5.5 major divisions).

Move the Spectrum Analyzer coax from the SUBCARRIER OUT connector to the BURST FLAG/SUBCARRIER OUT connector.

g. **GO TO** part j of this step.

After the initial time through this step, parts h through y are repeated for each of the following channels:

- ☐ *BURST FLAG/SUBCARRIER*
- ☐ *SYNC*
- ☐ *H DRIVE/PAL PULSE/SYNC*
- ☐ *BLANKING*
- ☐ *V DRIVE/VIDEO/BLANKING*
- ☐ *VIDEO*
- ☐ *FRAME/VIDEO*

NOTE

If any channels output (except the driven channel) does not meet the specification, it may be necessary to terminate both of the inputs for that channel and the output of the driven channel in 75Ω.

h. Connect Subcarrier from the primary generator to the A IN connector for the channel to be tested. Terminate the B IN connector for that channel with a 75Ω terminator.

Move the Spectrum Analyzer coax from the FRAME/VIDEO OUT connector to the SUBCARRIER OUT connector.

i. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥55 dB down.

Move the Spectrum Analyzer coax from the SUBCARRIER OUT connector to the BURST FLAG/SUBCARRIER OUT connector.

j. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥55 dB down (when BURST FLAG/SUBCARRIER is the driven channel, check SYNC SOURCE B only).

Move the Spectrum Analyzer coax from the BURST FLAG/SUBCARRIER OUT connector to the SYNC OUT connector.

k. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥40 dB down (when SYNC is the driven channel, check SYNC SOURCE B only).

Move the Spectrum Analyzer coax from the SYNC OUT connector to the H DRIVE/PAL PULSE/SYNC OUT connector.

l. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥40 dB down (when H DRIVE/PAL PULSE/SYNC is the driven channel, check SYNC SOURCE B only).

Move the Spectrum Analyzer coax from the H DRIVE/PAL PULSE/SYNC OUT connector to the BLANKING OUT connector.

m. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥40 dB down (when BLANKING is the driven channel, check SYNC SOURCE B only).

Move the Spectrum Analyzer coax from the BLANKING OUT connector to the V DRIVE/VIDEO/BLANKING OUT connector.

n. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥55 dB down (when V DRIVE/VIDEO/BLANKING is the driven channel, check SYNC SOURCE B only).

Move the Spectrum Analyzer coax from the V DRIVE/VIDEO/BLANKING OUT connector to the VIDEO OUT connector.

o. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥55 dB down (when VIDEO is the driven channel, check SYNC SOURCE B only).

Move the Spectrum Analyzer coax from the VIDEO OUT connector to the FRAME/VIDEO OUT connector.

p. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥55 dB down (when FRAME/VIDEO is the driven channel, check SYNC SOURCE B only).

q. Exchange the Subcarrier coax and the terminator, so that the Subcarrier coax is now connected to the B IN connector and the terminator is connected to the A IN connector for the channel being tested.

Move the Spectrum Analyzer coax from the FRAME/VIDEO OUT connector to the SUBCARRIER OUT connector.

r. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥55 dB down (when SUBCARRIER is the driven channel, check SYNC SOURCE A only).

Move the Spectrum Analyzer coax from the SUBCARRIER OUT connector to the BURST FLAG/SUBCARRIER OUT connector.

s. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥55 dB down (when BURST FLAG/SUBCARRIER is the driven channel, check SYNC SOURCE A only).

Move the Spectrum Analyzer coax from the BURST FLAG/SUBCARRIER OUT connector to the SYNC OUT connector.

t. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥40 dB down (when SYNC is the driven channel, check SYNC SOURCE A only).

Move the Spectrum Analyzer coax from the SYNC OUT connector to the H DRIVE/PAL PULSE/SYNC OUT connector.

u. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥40 dB down (when H DRIVE/PAL PULSE/SYNC is the driven channel, check SYNC SOURCE A only).

Move the Spectrum Analyzer coax from the H DRIVE/PAL PULSE/SYNC OUT connector to the BLANKING OUT connector.

v. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥40 dB down (when BLANKING is the driven channel, check SYNC SOURCE A only).

Move the Spectrum Analyzer coax from the BLANKING OUT connector to the V DRIVE/VIDEO/BLANKING OUT connector.

w. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥55 dB down (when V DRIVE/VIDEO/BLANKING is the driven channel, check SYNC SOURCE A only).

Move the Spectrum Analyzer coax from the V DRIVE/VIDEO/BLANKING OUT connector to the VIDEO OUT connector.

x. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥55 dB down (when VIDEO is the driven channel, check SYNC SOURCE A only).

Move the Spectrum Analyzer coax from the VIDEO OUT connector to the FRAME/VIDEO OUT connector.

y. **CHECK** — for both SYNC SOURCE A and SYNC SOURCE B that the Spectrum Analyzer response is ≥55 dB down (when FRAME/VIDEO is the driven channel, check SYNC SOURCE A only).

z. **RETURN** — to part i of this step, and repeat for the next channel.

3. Crosstalk (Bypass Mode)

a. Continuing from the previous step, turn off the power to the ECO–170A. Move the Subcarrier coax to the SUBCARRIER A IN connector, and move the 75Ω terminator to the SUBCARRIER B IN connector. Move the Spectrum Analyzer coax to the BURST FLAG/SUBCARRIER OUT connector.

b. **CHECK** — that the Spectrum Analyzer response is ≥55 dB down.

Move the Subcarrier coax to the BURST FLAG/SUBCARRIER A IN connector, move the 75Ω terminator to the BURST FLAG/SUBCARRIER B IN connector, and move the Spectrum Analyzer coax to the SUBCARRIER OUT connector.

c. **CHECK** — that the Spectrum Analyzer response is ≥55 dB down.

Move the Subcarrier coax to the SYNC A IN connector, move the 75Ω terminator to the SYNC B IN connector, and move the Spectrum Analyzer coax to the H DRIVE/PAL PULSE/SYNC OUT connector.

d. **CHECK** — that the Spectrum Analyzer response is ≥40 dB down.

Move the Subcarrier coax to the H DRIVE/PAL PULSE/SYNC A IN connector, move the 75Ω terminator to the H DRIVE/PAL PULSE/SYNC B IN connector, and move the Spectrum Analyzer coax to the SYNC OUT connector.

e. **CHECK** — that the Spectrum Analyzer response is ≥40 dB down.

Move the Subcarrier coax to the BLANKING A IN connector, move the 75Ω terminator to the BLANKING B IN connector, and move the Spectrum Analyzer coax to the V DRIVE/VIDEO/BLANKING OUT connector.

f. **CHECK** — that the Spectrum Analyzer response is ≥55 dB down.

Move the Subcarrier coax to the V DRIVE/VIDEO/BLANKING A IN connector, move the 75Ω terminator to the V DRIVE/VIDEO/BLANKING B IN connector, and move the Spectrum Analyzer coax to the BLANKING OUT connector.

g. **CHECK** — that the Spectrum Analyzer response is ≥55 dB down.

Move the Subcarrier coax to the VIDEO A IN connector, move the 75Ω terminator to the VIDEO IN B connector, and move the Spectrum Analyzer coax to the V DRIVE/VIDEO/BLANKING OUT connector.

h. **CHECK** — that the Spectrum Analyzer response is ≥55 dB down.

Move the Subcarrier coax to the FRAME/VIDEO A IN connector, move the 75Ω terminator to the FRAME/VIDEO B IN connector, and move the Spectrum Analyzer coax to the VIDEO OUT connector.

i. **CHECK** — that the Spectrum Analyzer response is ≥55 dB down.

j. Disconnect all connections, and turn on the ECO–170A power.

4. DC Offset and Residual Noise

NOTE

Perform this step for each channel:

- ☐ *VIDEO*
- ☐ *FRAME/VIDEO*
- ☐ *BLANKING*
- ☐ *V DRIVE / VIDEO / BLANKING*
- ☐ *SYNC*
- ☐ *H DRIVE / PAL PULSE / SYNC*
- ☐ *SUBCARRIER*
- ☐ *BURST FLAG / SUBCARRIER*

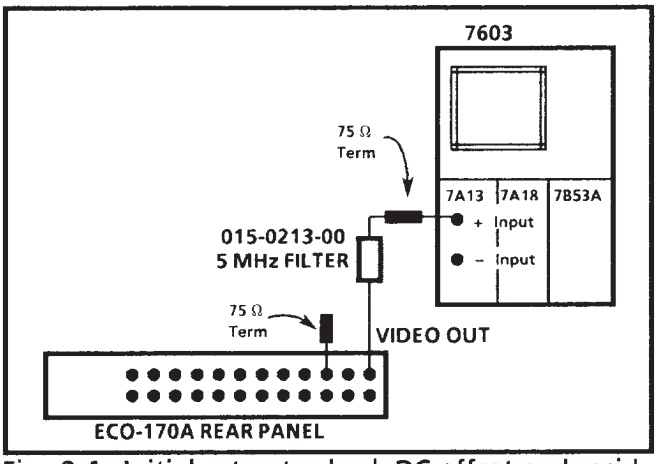

Fig. 2-4. Initial setup to check DC offset and residual noise.

a. Set the following controls:

Test Oscilloscope

Vertical Mode	7A13
Trigger Source	7B53A

7A13	**Setting**
Volts/Div	20 mV
+ Input Coupling	DC
– Input Coupling	GND
BW	Full

7B53A

Mode	AUTO
Coupling	AC
Source	INT
Time/Div	10 μS

b. Connect a 75Ω terminator to the ECO–170A A IN connector for the channel under test. Connect the ECO–170A OUT connector for the channel under test to the Test Oscilloscope Differential Comparator + Input, using an external 5 MHz filter and a 75Ω feed through terminator (see Fig. 2-4). Select SYNC SOURCE A on the ECO–170A Front Panel.

c. **CHECK** — that the blanking level is at 0 V ±50 mV.

d. Change the Test Oscilloscope Vertical Deflection to 2 mV/Div.

e. **CHECK** — that there is ≤2 mV (Subcarrier or Video channels) or ≤4 mV (Pulse channels) of noise present on the output for that channel.

Move the 75Ω terminator to the ECO–170A B IN connector for the channel under test, and select SYNC SOURCE B on the ECO–170A.

f. **CHECK** — that there is ≤2 mV (Subcarrier or Video channels) or ≤4 mV (Pulse channels) of noise present on the output for that channel.

Change the Test Oscilloscope Vertical Deflection to 20 mV/Div.

g. **CHECK** — that the blanking level is at 0 V ±50 mV.

h. **RETURN** — to part b and repeat this entire step for the next channel configured for VIDEO.

5. Amplitude Error Detection

NOTE

Perform this step for each channel:

- ☐ *VIDEO*
- ☐ *FRAME/VIDEO*
- ☐ *BLANKING*
- ☐ *V DRIVE/VIDEO/BLANKING*
- ☐ *SYNC*
- ☐ *H DRIVE/PAL PULSE/SYNC*
- ☐ *SUBCARRIER*
- ☐ *BURST FLAG/SUBCARRIER*

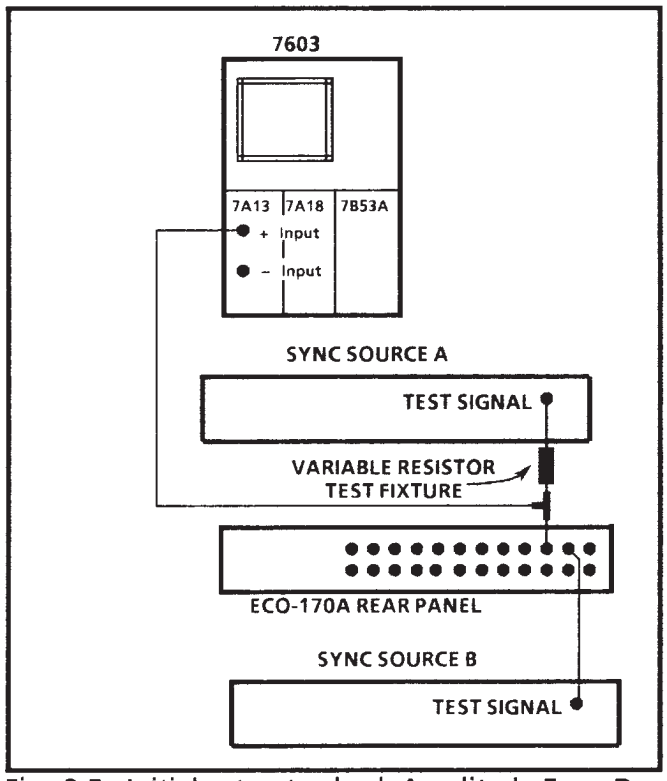

Fig. 2-5. Initial setup to check Amplitude Error Detection.

a. Connect all of the signals from the two Sync Sources to the ECO–170A inputs, according to the configuration of the instrument. Select SYNC SOURCE A with the front panel controls.

b. Insert the Variable Resistor test fixture (shown in Fig. 2-1) at the ECO–170A A IN connector for the channel under test, using a BNC T-connector to run a coax to the test oscilloscope vertical input as shown in Fig. 2-5. Set the oscilloscope to view the video sync, subcarrier, or pulses, depending on what that channel is configured for.

c. Use the variable resistor test fixture to reduce the amplitude of the signal, while watching the front panel FAULT INDICATOR LEDs. As soon as the FAULT LED for the channel comes on, stop turning the variable resistor.

d. **CHECK** — on the oscilloscope that the video sync, subcarrier, or pulse amplitude is within the limits of that signal type, shown in Table 2-10, when the FAULT LED comes on.

e. Return the signal to full amplitude, and move the variable resistor test fixture and BNC T-connector to the B INPUT connector for the channel. Use the front panel controls to clear the fault indication, and to select SYNC SOURCE B.

Table 2-10 Amplitude Fault Detection Limits

SIGNAL TYPE	Fault when signal is	
	less than	but at least
VIDEO (sync only)	226 mV	189 mV
SUBCARRIER	1.58 V	1.26 V
PULSE		
4 Volt	3.17 V	2.52 V
2 Volt	1.58 V	1.26 V

f. **REPEAT** — parts c and d of this step for the B INPUT of the channel under test.

g. **REPEAT** — this entire step for the next channel configured for VIDEO.

6. Op Amp Bad Detection

a. Continuing from the previous step, remove the variable resistor test fixture and BNC T-connector, and re-connect the coax from the Sync Source to the ECO–170A input.

b. Select SYNC SOURCE B at the ECO–170A front panel.

c. Use a test lead to ground the appropriate test point:

TP282	(Video)
TP382	(Frame/Video)
TP563	(Blanking)
TP368	(V Drive/Video/Blanking)
TP564	(Sync)
TP755	(H Drive/PAL Pulse/Sync)
TP954	(Subcarrier)
TP768	(Burst Flag/Subcarrier)

d. **CHECK** — as each test point is grounded, that the relays click and the ECO STATUS LEDs switch from OPERATE to BYPASS. The FAULT INDICATOR LEDs should remain off.

e. Remove the ground from the test point.

f. **CHECK** — that the relays click and the ECO STATUS LEDs switch from BYPASS to OPERATE. The FAULT INDICATOR LEDs should still remain off.

g. Apply the ground to the next test point listed in part c.

7. Gain – Subcarrier Channels

NOTE

Perform this step for the following channel:

☐ Subcarrier

This step must be repeated for the BURST FLAG/SUBCARRIER channel, if it is configured for SUBCARRIER.

a. Connect the test equipment as shown in Fig. 2-6.

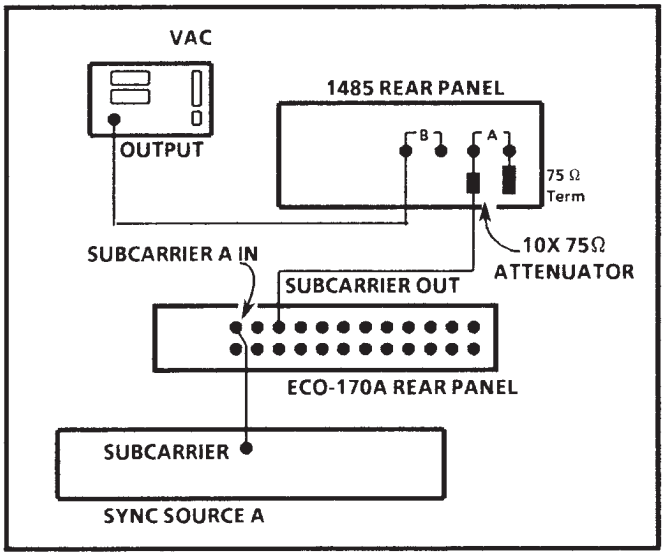

Fig. 2-6. Initial setup to check SUBCARRIER Channels gain.

b. Set the following controls:

1485:

Input	A–B, DC Coupled
Response	FLAT
Volts Full Scale	0.2
DC Restorer	OFF
Oper/Cal	OPER
Sync	INT, DIRECT
All Fields	OFF
Display	10 μs/Div
Magnifier	X1

ECO–170A:
Select SYNC SOURCE A.

c. With all of the VAC push buttons out, set the VAC lever switches for 200.0 mV.

d. Calibrate the test setup by connecting the coax from Sync Source A directly to the coax to the Waveform Monitor with a barrel connector. Then pull out the VAC tolerance control and adjust it so that the waveforms displayed on the 1485 just touch.

NOTE
DO NOT change the setting of the VAC Tolerance control for the remainder of this step.

e. Remove the barrel connector and re-connect the two cables to the ECO–170A.

f. Adjust the VAC Variable control so that the two waveforms on the 1485 just touch.

g. **CHECK** — using the VAC, that the displayed subcarrier amplitude is 200 mV ± 8 mV.

h. Turn off the ECO–170A power, to force it into BYPASS mode, and repeat parts f and g of this step.

i. Turn the ECO–170A power back on, move the Subcarrier coax from the A IN connector to the B IN connector, and select SYNC SOURCE B with the ECO–170A.

j. **REPEAT** — parts f and g of this step.

k. **REPEAT** — parts f through j of this step for the BURST FLAG/SUBCARRIER channel, if it is configured for subcarrier.

8. Gain – Pulse Channels

NOTE
Perform this step for the following channels:

- ☐ SYNC
- ☐ BLANKING
- ☐ H DRIVE/ PAL PULSE/ SYNC

This step must be repeated for each of the following channels, if they are configured for PULSE signals:

- ☐ V DRIVE/ BLANKING/ VIDEO
- ☐ FRAME/ VIDEO
- ☐ BURST FLAG/ SUBCARRIER

a. Connect the test equipment as shown in Fig. 2-7.

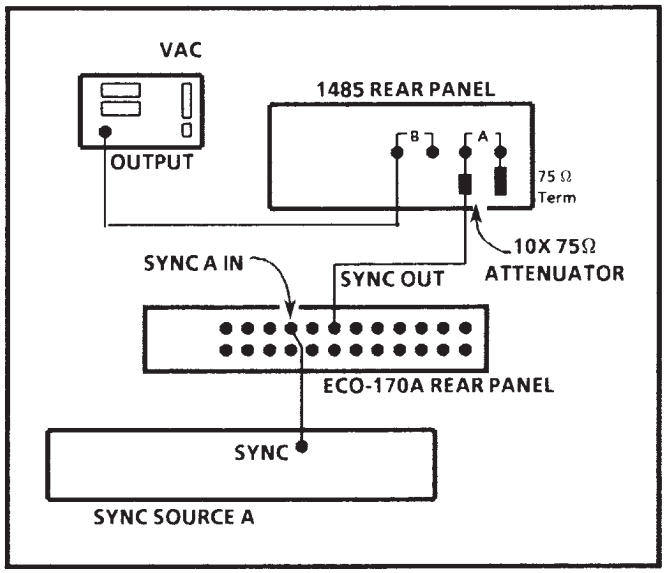

Fig. 2-7. Initial setup to check SUBCARRIER Channels gains, ringing, and tilt.

b. Set the following controls:

ECO–170A:
Select SYNC SOURCE A.

1485:

Input	A–B, DC Coupled
Response	FLAT
Volts Full Scale	0.2
DC Restorer	OFF
Oper/Cal	OPER
Sync	INT, DIRECT
All Fields	OFF
Display	10 μs/Div
Magnifier	X1

c. With all of the VAC push buttons out, set the VAC lever switches for 400.0 mV (NTSC) or 200.0 mV (PAL).

d. Calibrate the test setup by connecting the coax from Sync Source A directly to the coax to the Waveform Monitor with a barrel connector. Then pull out the VAC tolerance control and adjust it so that the waveforms displayed on the 1485 just touch.

NOTE

DO NOT change the setting of the VAC Tolerance control for the remainder of this step.

e. Remove the barrel connector and re-connect the two cables to the ECO–170A.

f. Adjust the VAC Variable control so that the two waveforms on the 1485 just touch.

g. **CHECK** -- using the VAC, that the displayed pulse amplitude is:

NTSC	400 mV ± 8 mV
PAL	200 mV ± 4 mV

h. Turn off the ECO–170A power, to force it into BYPASS mode, and repeat parts f and g of this step.

i. Turn the ECO–170A power back on, move the SYNC coax from the A IN connector to the B IN connector, and select SYNC SOURCE B with the ECO–170A.

j. **REPEAT** — parts f and g of this step.

k. **REPEAT** — parts f through j of this step for the next channel configured for pulse signals.

9. Gain, Chrominance to Luminance Gain, Ringing, and Tilt – Video Channels

NOTE

Perform this step for the following channel:

☐ VIDEO

This step must be repeated for each of the following channels, if they are configured for VIDEO:

☐ V DRIVE/ BLANKING/ VIDEO
☐ FRAME/ VIDEO

a. Connect the test equipment as shown in Fig. 2-8. If continuing from the previous step, be sure to remove the 10X 75Ω attenuator from the cable from the ECO–170A to the Waveform Monitor.

b. Set the following controls:

ECO–170A:
Select SYNC SOURCE A.

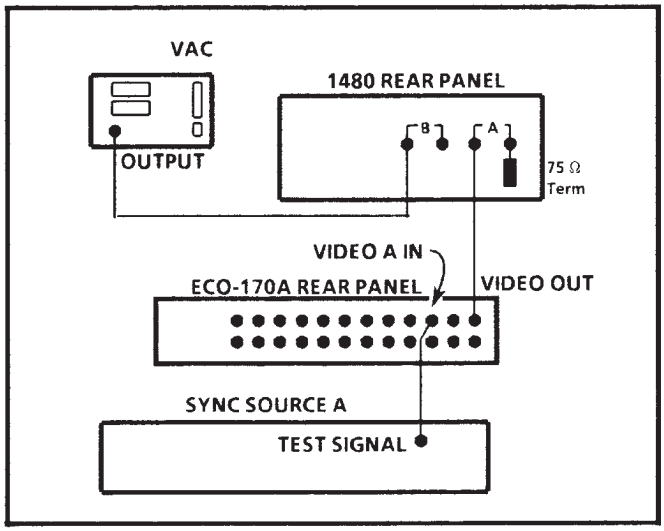

Fig. 2-8. Initial setup to check VIDEO Channels gains, ringing, and tilt.

SYNC SOURCE A:
Select Pulse and Bar as test signal.

1485:

Input	A–B, DC Coupled
Response	FLAT
Volts Full Scale	0.2
DC Restorer	OFF
Oper/Cal	OPER
Sync	INT, DIRECT
All Fields	OFF
Magnifier	X1
Display	10 μS/Div

c. Set the VAC lever switches for 714.3 mV, with all push buttons out.

d. Calibrate the test setup by connecting the coax from Sync Source A directly to the coax to the Waveform Monitor with a barrel connector. Then pull out the VAC tolerance control and adjust it so that the waveforms displayed on the 1485 just touch.

NOTE

DO NOT change the setting of the VAC Tolerance control for the remainder of this step.

e. Remove the barrel connector and re-connect the two cables to the ECO–170A.

f. **CHECK** — using the VAC, that the bar amplitude is 714.3 mV ±14.2 mV.

g. **CHECK** — using the VAC, that amplitude of the tallest displayed Mod Pulse matches the Bar amplitude ±7.14 mV.

h. **CHECK** — using the VAC, for less than 14.2 mV ringing on the inverted pulse.

i. **CHECK** — using the VAC, for less than 14.2 mV ringing at blanking level on the 2T Pulse.

Set the VAC lever switches to 000.0 mV, and change the 1485 Display setting to 5 μS/Div. Select the 100 IRE signal as the test signal from SYNC SOURCE A.

j. **CHECK** — that the line tilt of the display is ≤14.2 mV.

Change the 1485 Display setting to 2 Field.

k. **CHECK** — that the field tilt of the display is ≤14.2 mV.

l. Turn the ECO–170A power off.

m. **REPEAT** — parts f through k of this step.

Turn the ECO–170A power back on, and move the test signal coax from the A IN connector to the B IN connector of the channel being tested. Select SYNC SOURCE B on the ECO–170A.

n. **REPEAT** — parts f through k of this step.

o. **REPEAT** — parts f through n of this step for the next channel configured for VIDEO.

10. Differential Gain and Phase - Video Channels

NOTE

Perform this step for the following channel:

☐ VIDEO

This step must be repeated for each of the following channels, <u>if they are configured for VIDEO</u>:

☐ V DRIVE/ BLANKING/ VIDEO
☐ FRAME/ VIDEO

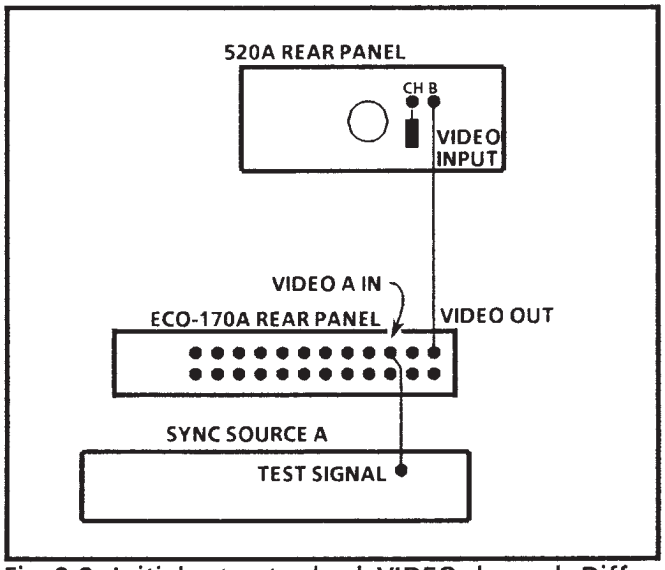

Fig. 2-9. Initial setup to check VIDEO channels Diff Gain and Diff Phase.

a. Set the following controls:

VECTORSCOPE

Channel B	IN
B Phase	IN
Full Field	IN
Phase Ref	BURST
Vector	IN
Sync	INT
Diff Phase	DOUBLE

b. Connect the SYNC SOURCE A test signal to the ECO–170A A IN connector for the channel under test, and select Mod Ramp as the test signal out of SYNC SOURCE A. Connect the ECO–170A OUT connector for the channel under test to the Vectorscope Channel B Input, and terminate the Channel B loop-through in 75Ω (see Fig. 2-9). Select SYNC SOURCE A on the ECO–170A.

c. Normalize the burst vector on the Vectorscope, and set it to 180°. Set the Vectorscope for Diff Gain.

d. **CHECK** — for Diff Gain of ≤ 2%.

Set the Vectorscope to measure Diff Phase.

e. **CHECK** — for Diff Phase of ≤ 2°.

Turn the ECO–170A power off. Set the Vectorscope to display a vector pattern.

f. **CHECK** — Diff Gain and Diff Phase with the ECO–170A in BYPASS Mode by repeating parts c through e of this step.

Turn the ECO–170A power back on, and move the SYNC SOURCE A Test Signal coax from the A IN connector to the B IN connector of the channel under test. Select SYNC SOURCE B on the ECO–170A.

g. **CHECK** — Diff Gain and Diff Phase for the B INPUT of the channel under test by repeating parts c through e of this step.

h. **RETURN** — to part b and repeat this entire step for the next channel configured for VIDEO.

11. Pulse Width Fault Detection

a. Connect all of the signals from the two Sync Sources to the ECO–170A inputs, according to the configuration of the instrument. Select SYNC SOURCE A with the front panel controls.

b. **CHECK** — that neither of the FAULT INDICATOR LEDs are lighted.

c. Turn off Pulse Width Detection by opening S715 segment 2.

d. **CHECK** — that neither of the FAULT INDICATOR LEDs are lighted.

e. Exchange the Burst Flag A coax and the Blanking A coax, connecting Burst Flag to the BLANKING A IN connector, and Blanking to the BURST FLAG A IN connector. Clear the fault caused by moving the cables

f. **CHECK** — that neither of the FAULT INDICATOR LEDs are lighted.

g. Turn on Pulse Width Detection by closing S715 segment 2.

h. **CHECK** — that the A FAULT INDICATOR LED is lighted.

This completes the Performance Check procedure. The Pulse Width Counter accuracy may be verified, and several other tests performed, with the built-in Diagnostic routines. See Section 5, Maintenance, for details of the Diagnostic tests.

CALIBRATION

Power Supply Adjustment

a. Apply power to the ECO–170A through the Variable Autotransformer, and set it to apply 90 V as the input voltage. Set R415 (current limit) 1/4 turn from its counterclockwise limit.

b. CHECK/ADJUST — for +5 V ±100 mV at the +5 V test point on the power board. Use R510 to adjust, if necessary. Set R415 (current limit) to its clockwise limit.

c. CHECK — to see if the LED (DS670) is flashing or not. If the LED is flashing, then the supply is current limiting. If the LED is not flashing, go to part e.

d. ADJUST — R415 slowly counterclockwise until the supply stops current limiting (the LED stops flashing).

e. ADJUST — R415 counterclockwise 1/4 turn from the point where the LED stops flashing.

f. CHECK — that the +5 V test point is still at +5 V ±100 mV.

WARNING

The following servicing instructions are for use only by qualified personnel. To avoid injury, do not perform any servicing other than that stated in the operating instructions unless you are qualified to do so. Refer to all safety summaries before performing any service.

SECTION 3
INSTALLATION

PACKAGING

At installation time, save the shipping carton and packaging materials for repackaging in case reshipment becomes necessary. See Fig. 3-1.

ELECTRICAL INSTALLATION

Power Supply Frequency and Voltage Ranges

The power supply in this instrument operates over a line frequency range of 48 to 62 Hz and is set (by jumper P810) to receive a nominal line voltage of 115 V. Its installed line fuse is rated for 250 V and 2 Amps. To set the power supply to receive a nominal line voltage of 230 V, move P810 as shown in Table 3-3 and replace the line fuse with one rated for 250 V and 1 Amp.

Securing Power Cord

Plug in power cable, then mount to extreme left of the line filter using one of the screws (on the instrument), loop clamp, and washer. See Fig. 3-2.

Required Signals

SYNC and SUBCARRIER signals **MUST** be applied from both Generators in order for the Pulse Width Detection to work, and to ensure that manual switching of sync sources occurs during the vertical interval.

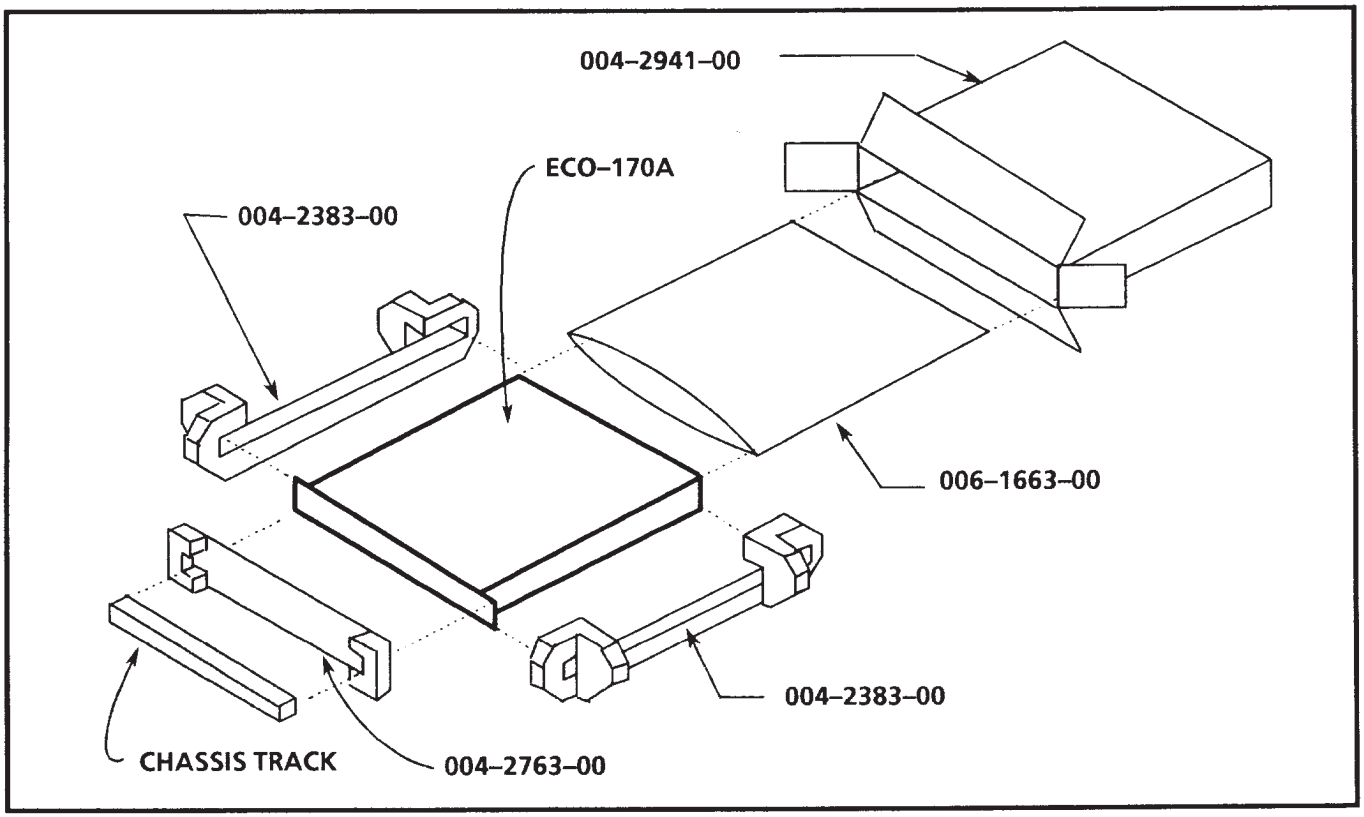

Fig. 3-1. Repacking instructions.

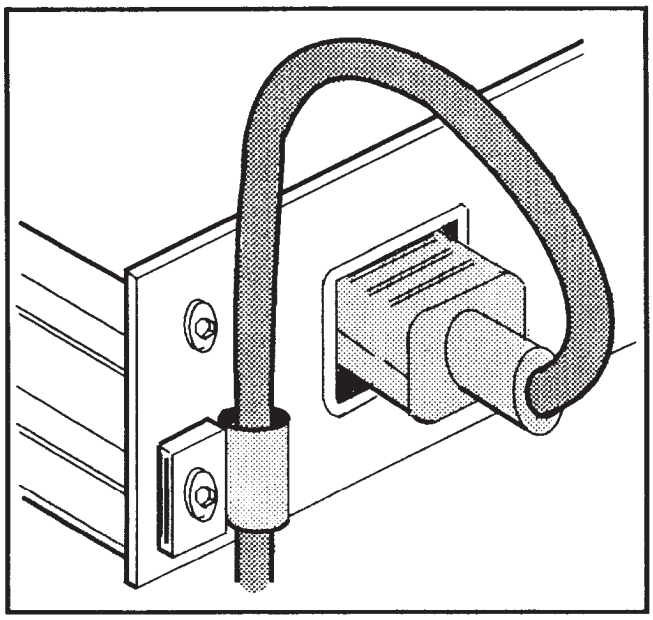

Fig. 3-2. Mounting the power cord.

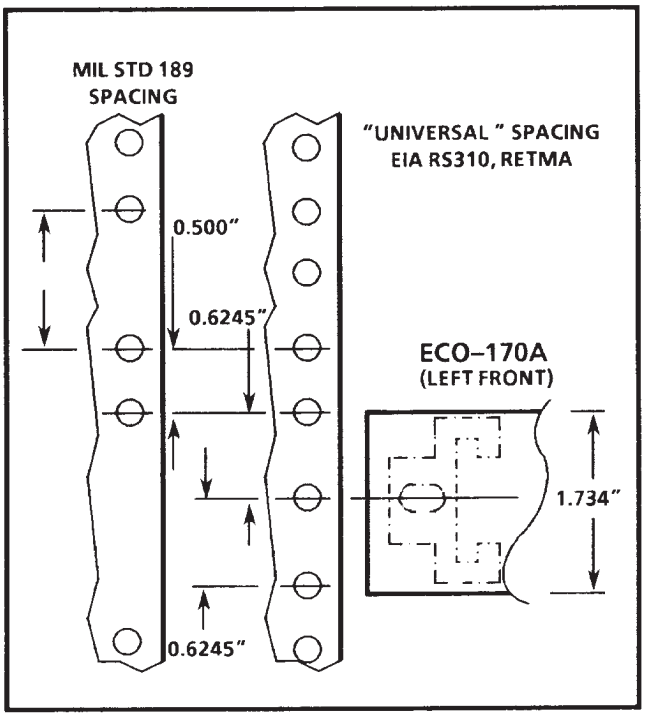

Fig. 3-3. Rail detail for mounting slide tracks.

MECHANICAL INSTALLATION

Rack Mounting

The ECO–170A is shipped with hardware for rackmounting. The instrument fits in a standard 19-inch rack. Spacing between the front rails of the rack must be at least 17–3/4 inches to allow clearance for the slide-out tracks.

Rack slides conveniently mount in any rack that has a front-to-rear rail spacing between 15–1/2 and 28 inches.

Mounting the Slide Tracks

Locate the proper rack holes as shown in Fig. 3-3. Notice that the hole spacing varies with the type of rack. When installing the slides in EIA-type racks, make certain that the slides are attached to the 1/2–inch-spaced holes.

Mount the rails using enclosed hardware as shown in Fig. 3-4. Fig. 3-5 shows the rail mounting details for both deep and shallow racks. Make sure the stationary sections are horizontally aligned and are level and parallel.

Installing the Instrument

Install the instrument in the rack, as shown in Fig. 3-6. Table 3-1 lists the signals available at the rear-panel connectors.

Rack Adjustments

After installation, the slide tracks may bind if they are not properly adjusted. To adjust the tracks, slide the instrument out about 10 inches, slightly loosen the screws holding the tracks to the front rails, and allow the tracks to seek an unbound position. Retighten the screws and check the tracks for smooth operation by sliding the instrument in and out of the rack several times.

Once the instrument is in place within the rack, tighten the knurled retaining screw to fasten it securely into the rack.

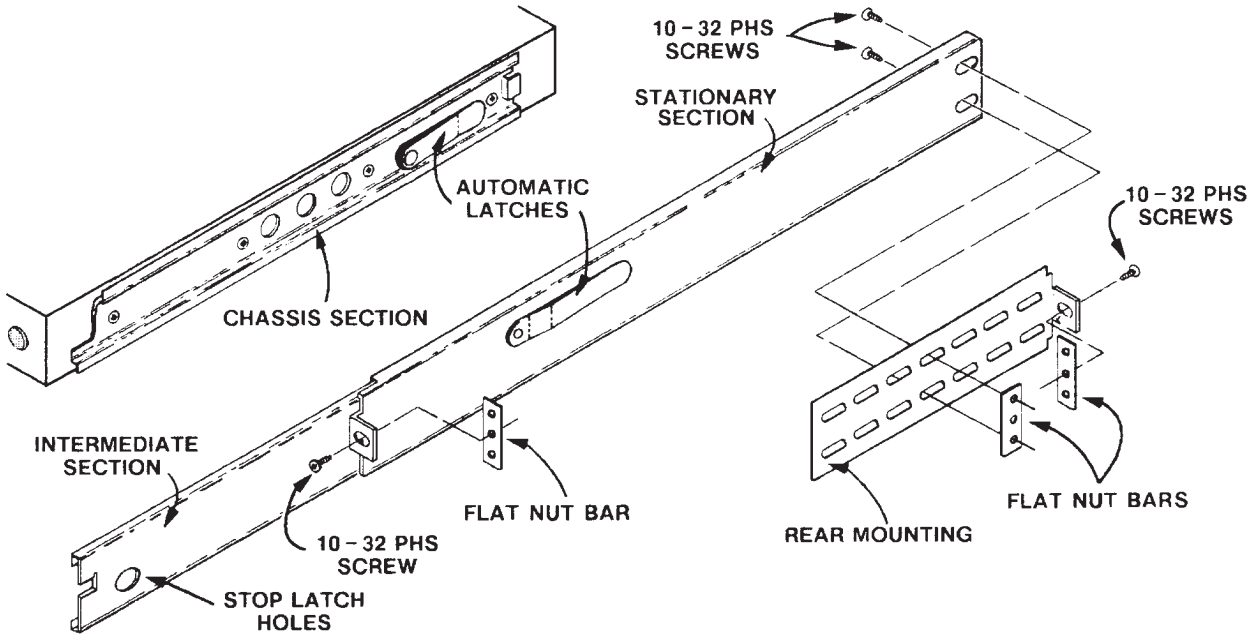
Rack Slide Maintenance

The slide-out tracks do not require lubrication. The dark gray finish on the tracks is a permanent, lubricated coating.

Removing the Instrument

First, loosen the front-panel knurled retaining screw. See Fig. 3-6. Grasp the front handles and pull the instrument out until all three slide sections latch. The instrument is firmly held in this position.

To completely remove the instrument, press both release-latch buttons (visible in the stop-latch holes) and carefully slide the instrument free from the tracks. Be sure that all cabling is disconnected before removing the instrument.



NOTE:

Right hand and left hand stationary section is designated by the RH and the LH marked on the rails. Stop latch holes should be towards the bottom when slides are in place. (The right hand rail is shown above.)

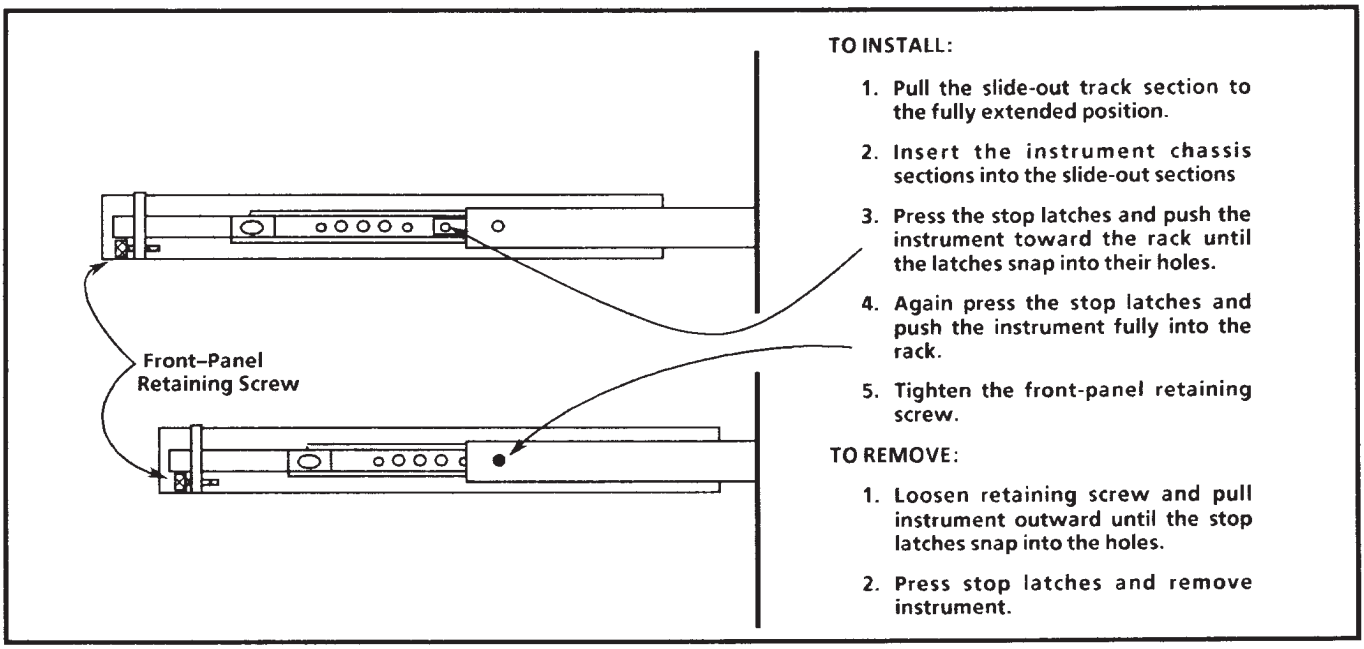

Fig. 3-6. Racking and unracking the ECO–170A.

Operating and Test Mode Selection

This section explains the jumper and switch settings to select the various operating and test modes for the entire instrument. In all cases, the ▶ symbol on the circuit boards denotes pin 1. Green jumpers are for selecting operating modes. Red jumpers are for testing the instrument. The red jumpers should be used only by qualified service personnel.

SECTION 4
THEORY OF OPERATION

INTRODUCTION

This section of the manual begins with a functional block diagram description of the ECO–170A, followed by a more detailed description of each circuit block. The detailed discussion is arranged to follow the same order that the circuit blocks appear in the schematic diagrams. While using this Theory of Operation, refer to the Block Diagram and the Schematic Diagrams located in the foldout pages at the rear of the manual.

BLOCK DIAGRAM DESCRIPTION

The A and B inputs for each channel are applied to the Input Amps and Switches block, which affects the selection of which input (A or B) to apply to the input amplifier.

Input Amps and Switches

Each input channel accepts an A input from the primary generator and a B input from the backup generator. The A input is applied to the bypass relay which, in turn, applies it to an electronic switch. The B inputs in each channel are applied directly to the electronic switch. This electronic switch selects either the A or B input to apply to that channel's amplifier. The outputs of these eight amplifiers (one for each channel) are applied to the rear panel outputs, and to the Peak Detectors.

Peak Detectors

Each channel's input amplifier drives a peak detector whose output is applied to a comparator. If the Peak Detector output falls below the comparator's reference voltage, indicating that there is a problem with the signal, an $\overline{\text{OPBAD}}$ flag is placed on the EDBUS. This will cause the ECO–170A to evaluate whether there is a problem with the signal path, and, if there is, switch into the BYPASS mode of operation.

Pulse Detectors

All the Primary generator inputs are applied to the A Pulse Detectors, and all the Backup generator inputs are applied to the B Pulse Detectors. The Pulse Detectors check the amplitude and period of all the signal inputs. If there is a fault with any signal from the primary generator, the A Pulse Detectors force the APRES line low; for a fault with a backup generator signal, the B Pulse Detectors force the BPRES line low.

These flags are applied to the source switching circuitry, to effect a switch if needed, and are also placed on the EDBUS.

Pulse Width Detector

The pulse inputs are applied to a multiplexer, which passes them one at a time to a counter control circuit. This control circuit starts and stops a counter at the beginning and end of the pulse, and places the result on the EDBUS for the μP to compare against the stored value for that pulse type.

Voltage References

The Voltage References, located on Schematic 2, develop all of the reference voltages for the comparators in the Peak Detectors, Pulse Detectors, and the Pulse Width Detector.

Source Switching Logic

The Source Switching Logic contains the circuitry which determines whether to switch automatically on detection of a fault, or manually on the push of a front-panel button, and when to do the switch.

Configure Switch

The Configure Switch, an eight-segment DIP switch, is used to turn off the detectors on a channel-by-channel basis. The switch segments correspond to the channel numbers; segment 1 turns off detection for channel 1 when closed. The Configure Switch setting is also placed on the EDBUS when the μP asserts $\overline{\text{CONFIG}}$.

Miscellaneous Switch

The Miscellaneous Switch is a four-segment DIP switch, with only three of its segments used. It is used to select NTSC or PAL, to enable or disable Pulse Width Detection, and in diagnostics. The switch settings are transferred to the EDBUS when $\overline{\text{MISC}}$ is asserted.

Signal Set Switch

The Signal Set Switch is used to inform the μP of which of the selectable signals to be testing for at the Pulse Width Detector.

Timing Counters

The Timing Counters are driven by the 4 MHz μP clock, which they divide down to provide all the timing reference signals for the Pulse Detectors and the Pulse Width Detectors, as well as the WatchDog Reset pulse to the μP.

Remote Logic

The Remote Logic circuitry inputs the information from Remote Connector pins 1 and 2 to $\overline{\text{ED1}}$ and ED0, respectively, when the μP asserts $\overline{\text{REMI}}$. It also places the information from ED0 – ED5 onto pins 3 through 8 of the Remote Connector, when the μP asserts $\overline{\text{REMO}}$.

Data I/O

The Data I/O port consists of U317, an octal bus transceiver which controls communication between the Kernel Data Bus and the External Data Bus.

μP Kernel

The μP Kernel controls the whole instrument, containing the μP and the instructions to run it. The μP asserts its control through the EDBUS and the various Control Bus outputs from the Decoder.

Front Panel & Front Panel Logic

The Front Panel consists of a Lexan™ face permanently bonded to a printed circuit board. There are five push buttons molded into the assembly to provide manual control of the instrument functions, and 12 LEDs used to indicate the operating status of the instrument and current operator selections.

The Front Panel Logic encodes the push button selections, placing the data on the EDBUS when $\overline{\text{KEYBRD}}$ is asserted; and it loads the EDBUS data into the buffers which drive the LEDs when $\overline{\text{FPLEDA}}$ and $\overline{\text{FPLEDB}}$ are asserted.

One of the LED buffers also provides the drive for the Aural Alarm circuitry and the Bypass Relay Drive.

VERTPR

The Vertical Preset circuitry provides identification of the Vertical Interval, pulling $\overline{\text{VERTPR}}$ low to indicate the Vertical Interval has been detected. $\overline{\text{VERTPR}}$ is applied to the EDBUS when the μP asserts $\overline{\text{MISC}}$.

DETAILED CIRCUIT DESCRIPTION

INPUT AMPLIFIERS
Schematics 1 & 2

The ECO–170A uses eight amplifiers of almost identical design, one for each channel. This discussion will center on the general form of these amplifiers, which is shown in Fig. 4-1. The differences between the individual amplifiers are primarily selections for reference voltages, and a different CONfigure input, applied to U5 in Fig. 4-1, to tailor the amplifier to the signal it will be processing. Also, those channels which handle signals containing subcarrier components have an additional electronic switch, shown as U2 in Fig. 4-1b. The purpose of this switch is to provide extra isolation.

The signal from Generator A is input to a relay (K1a). When de-energized, the relay is in the bypass position, connecting the Generator A inputs directly to the outputs. The relay goes into bypass mode if the ECO–170A loses power, or if one of the Input Amps goes bad. The energized position of the relay applies the Generator A input to U1, and also applies the Generator A input to the A Pulse Detectors and the Pulse Width Detectors. The Generator B signal is connected to the other input of U1.

U1 is configured as a DPDT switch, controlled by the μP. Each switch segment is closed when its associated control line goes low. Normally, the $\overline{A}$ line is low, and $\overline{B}$ is high, so the Generator A signal is passed through U1. If the μP detects a failure in any of the signals from Generator A, the control lines change states. U1 then switches, passing the Generator B signal instead of the Generator A signal.

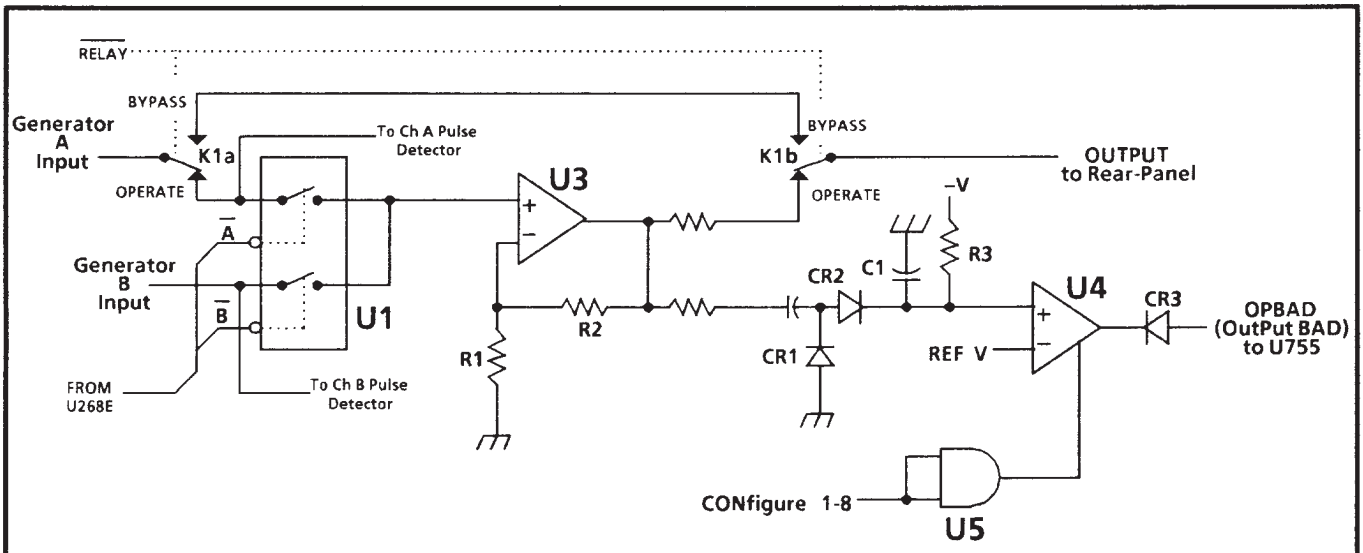

Fig. 4–1a. General form of the Input Amplifiers and Peak Detectors.

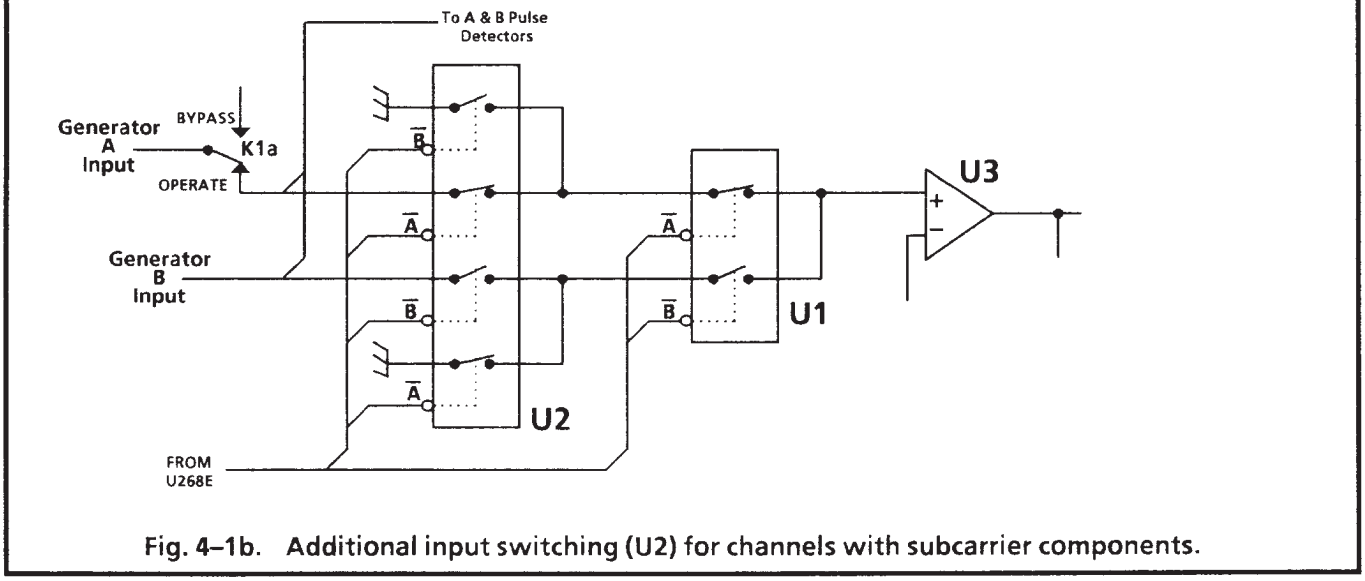

Fig. 4–1b. Additional input switching (U2) for channels with subcarrier components.

Fig. 4–1. ECO–170A Input Amplifier circuitry.

The output of U1 is applied to an amplifier (U3), which drives the operate position of the output side of the bypass relay (K1b), and a peak detector.

The peak detector, comprised of CR1, CR2, C1, and R3, provides a dc level to comparator U4, representing the peak amplitude of the input signal. The reference voltage applied to the comparator is selected according to the signal that particular channel is processing. As long as the peak detector output exceeds the reference voltage, the comparator output will be high, indicating that the amplifier is working correctly. If the peak detector output falls below the reference voltage level, the comparator output goes low, turning on CR3. The anodes of these diodes (one for each amplifier) are summed at the input of another comparator, U755 on Schematic 1. If the summation node is pulled low by any of the amplifiers, U755's output goes low. This puts an OutPut BAD flag on the EDBUS (External Data Bus), alerting the μP of an amplifier failure.

AND gate U5 is essentially a buffer between the CONFIGURE switch (Schematic 5) and the strobe input on comparator U4. The purpose of this is so the comparator can be disabled if the signal assigned to that channel is not available, preventing a false OPBAD flag from being generated.

REFERENCE VOLTAGE SUPPLIES
Schematic 2

The reference voltages provide an assortment of six voltage levels; a pulse detector and a peak detector reference for each of the pulse, video, and subcarrier channels.

U547A and B provide the pulse detector reference (PMREF) and the peak detector reference (PPDREF) for the pulse channels. The voltage provided by these two depends on the setting of P543. If set to pins 1 & 2, PMREF will be 2.5 V and PPDREF will be about 1.5 V. If set to 2 & 3, PMREF will be about 1.25 V and PPDREF will be around 0.3 V. This accommodates the variations between NTSC and PAL pulse amplitude levels.

U450A and B provide the pulse detector reference (VMREF) and peak detector reference (VPDREF) for the video channels. VMREF is about −200 mV, and VPDREF is around −50 mV.

U647A and B provide the pulse detector reference (SMREF) and peak detector reference (SPDREF) for the subcarrier channels SMREF is about 0.8 V, and SPDREF is set for 1.5 V.

A and B PULSE DETECTORS
Schematics 3 & 4

Schematic 3, A PULSE DETECTOR, contains circuitry to check the amplitude and timing for the A Inputs for each channel. There are two basic types of detectors: Pulse Detectors, for the pulse signals (Burst Flag, Blanking, Sync, etc.), and Periodic Detectors for Subcarrier. The Channel 2 A Input, BURST FLAG/SUBCARRIER, is applied to both a pulse and a periodic detector, with a jumper (J935 for A, J937 for B) that selects which of their outputs to use. The circuitry on Schematic 4, B PULSE DETECTOR, is the same as that on Schematic 3, but handles the B Inputs.

The primary differences between the individual detectors are the Reference Voltages, the Configure switch segment, and (for the Pulse Detectors) the clock timing for the counter; these will all be selected according to the signal being processed. As the detectors are so similar, this discussion will focus on the general form of each of the two types.

Pulse Detectors (see Fig. 4-2)

U5 is a divide-by-16 counter, which is set to ripple count as long as its Ripple Carry Output (Rco) is low, pulling the ENP pin high. The clock rate for this counter is selected to be less than 15 times the input pulse frequency. If the input pulse arrives on time, and with sufficient amplitude to pass comparator U1, it will then clear U5 before the Rco goes high. If the input pulse amplitude is too low, or the pulse is missing or late, U5 is allowed to complete its count and drive the Rco high. This is inverted by U6, driving the $\overline{\text{ERROR}}$ line low.

This low stops U5 from counting by pulling the ENP pin low, so the Rco remains high until U5 is cleared; it also holds U2 in preset, through U3, so that the input pulse cannot clock through to clear the counter. This locks the low on the $\overline{\text{ERROR}}$ line, so that only the $\overline{\text{CLEAR}}$ signal applied through U4 is able to clear U5.

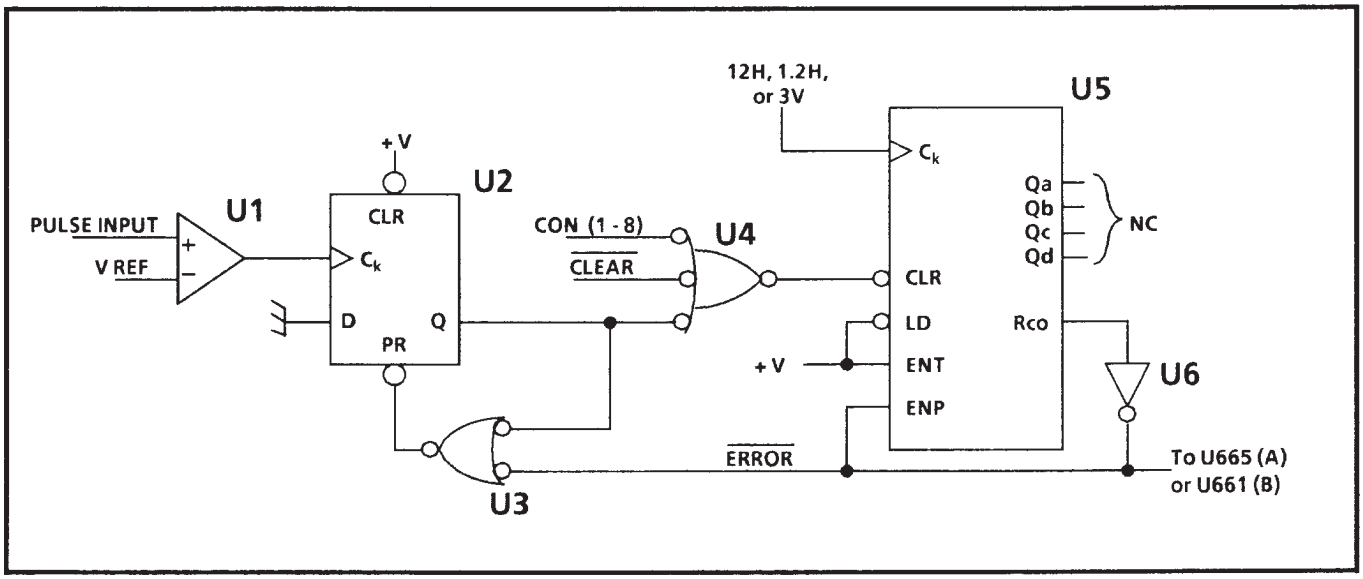

Fig. 4-2. Pulse Signal Detector configuration.

The Configure switch, on Schematic 5, can disable these detectors by holding a clear on U5, through U4, when the appropriate switch segment is closed. This keeps the Rco at a low state, so U6's output stays high.

Periodic Detectors (See Fig. 4-3)

The Periodic Detectors operate in a slightly different manner. The subcarrier signal is input to buffer amp Q1, which passes it along to L1 and C1 (or C1/C2), forming a bandpass filter tuned to subcarrier frequency. J1 selects between NTSC and PAL subcarrier settings. Q2 provides isolation to a peak detector, comprised of CR1, CR2, C4, and R6.

As long as the peak voltage stored in C4 exceeds the voltage reference (SMREF) applied to the other input of comparator U1, then U1's output will be high. As U3 is initially preset by a $\overline{\text{CLEAR}}$ signal from the μP, its Q output is high. If the subcarrier signal fails, through reduced input signal amplitude or drifting out of the filter's bandpass range, the peak detector output will fall below the reference voltage for U1. U1's output then goes low, and is

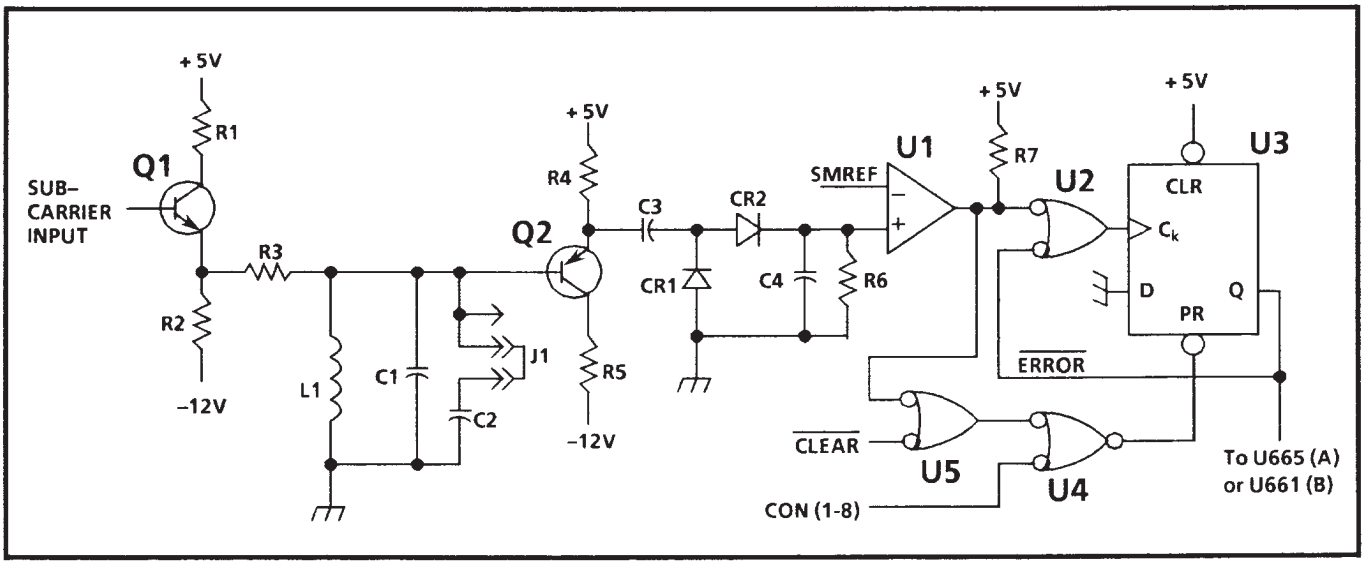

Fig. 4-3. Periodic Signal Detector configuration.

gated through U2 to clock U3. U3 then passes the low applied to its D input through to the Q output, which is fed back to U2 to lock out any further changes from U1. U3's Q output will then remain low, to indicate a failure, until U3 is again preset, by a $\overline{\text{CLEAR}}$ signal through U5 and U4.

The Configure switch, on Schematic 5, disables these detectors by applying a preset to U3, through U4, when the appropriate switch segment is closed. This forces the Q output to remain at a high state.

Detector Output

The outputs of all the detectors on each page are applied to an eight input NAND gate, U655 for the A detectors or U661 for the B detectors. The outputs of these gates are inverted, producing the APRES and BPRES flags, respectively. If any of the detector outputs goes low, indicating a failure of that signal, the appropriate flag (APRES or BPRES) will go low as well. These flags are routed to Schematic 6, where they are used by the switching logic, and are also applied to the EDBUS.

PULSE WIDTH DETECTORS Schematic 5

Schematic 5, Pulse Width Detectors, consists of five main blocks: the Multiplexer, Pulse Width Counter Control, Pulse Width Counters, Vertical Preset, and the Configuration Switch.

Multiplexer

When the μP asserts $\overline{\text{MUX}}$, U529 passes the EDBUS information to two 8-to-1 multiplexers, U637 and U629, to select which of the input signals is to be measured.

U637 is addressed by ED0 - ED2, with ED3 being applied to the inhibit line. The inputs that it has to select from are the Generator A signals (except Channel 1, SUBCARRIER), and the 6H timing reference from Schematic 7.

U629 is addressed by ED4 - ED6, with ED7 to the inhibit. Its inputs are the Generator B signals, except Channel 1, and the 0.6H timing reference from Schematic 7.

The outputs of U637 and U629 are summed together and applied to two comparators, U249 and U348. U249 has the multiplexer output applied to its negative input, and +2.5 V at its positive input. U348 is the opposite, with the multiplexer output applied to its positive input and PMREF (–2.5 or –1.25 V) applied to its negative input. The comparator outputs drive a NOR gate, U349A.

In this way when the multiplexer outputs are at 0 V, U349A's output will be high. Then, no matter whether the multiplexer output goes positive or negative the output of U349A will go low, so long as the pulse amplitude exceeds the appropriate reference voltage.

Pulse Width Counter Control

U349A and U344A are configured so that the input to U344B-5 consists of negative-going pulses. U344A will invert the signal to achieve this, if needed; if PWPOL (Pulse Width Polarity) is high, the signal will be inverted. See Fig. 4-4.

U344B and U343B are configured so that after $\overline{\text{PWCLR}}$ goes low, the next pulse will clock U343B with both its falling and its rising edges. $\overline{\text{PWCLR}}$ then clears both U343A and B, which causes pins 6 (PULSDN) & 8 to go high. The high from U343B is applied to its D input and to U344B-4.

As U344B-5 is also high until the arrival of the input pulse, its output will be low. When the input pulse goes low at U344-5 its output goes high, clocking U343B. This makes pin 9 go high (starting the Pulse Width Counters) and pin 8 go low. The low at pin 8 is applied to the D input and to U344B.

When U344B-5 goes positive again at the end of the pulse, its output will go positive too, clocking U343B again. Pin 9 goes low (stopping the counters), and pin 8 goes high, which clocks U343A. This makes U343A-6 (PULSDN) go low, which applies a low to the clear input of U343B, locking pin 9 low and pin 8 high until the next $\overline{\text{PWCLR}}$ pulse comes along to restart the process.

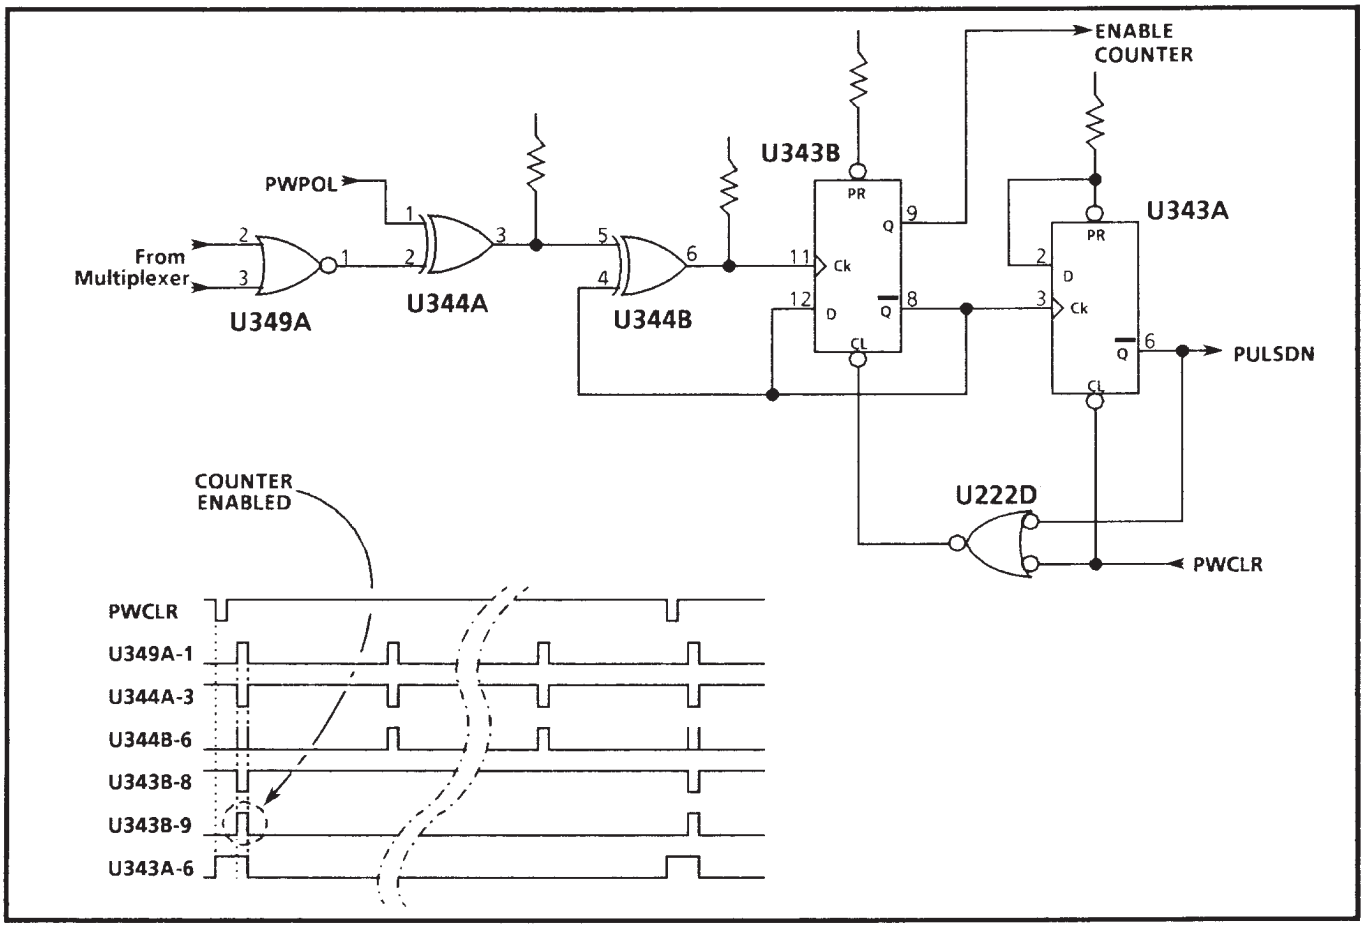

Fig. 4-4. Pulse Width Counter Control circuitry.

Pulse Width Counters

When U343B-9 goes high, in the Pulse Width Counter Control circuitry, it enables both enable inputs on U525, and one of the two enable inputs each on U514, U614, and U615. The second enable input on each of these three counters is connected to the carry output of the preceding counter. In this manner they will count sequentially, but only during the one pulse width that U343B-9 is high.

All four counters are clocked simultaneously by subcarrier from the sync source in use. U742 selects between the Generator A or the Generator B subcarrier, and U741 converts it to a positive-going pulse.

The counter output, is the number of cycles of subcarrier occurring during the one pulse that the counters are enabled, expressed in binary. The outputs of U525 and U514 are applied to U521, the LSB buffer, and U614 and U615 are applied to U621, the MSB buffer. These are transferred to the EDBUS when $\overline{\text{PWLSB}}$ and $\overline{\text{PWMSB}}$ are asserted.

Vertical Preset

U729 is a counter which counts subcarrier ÷ 4, provided by U736, only while enabled (when sync is low), and after U732A times out. U732A is a one-shot which is triggered by sync and then holds U729 in a clear state for approximately 3.5 μs following the start of sync. This prevents U729 from attaining a count of four during H sync and equalizing pulses. During Vertical sync, however, there is sufficient time for U729 to count to four, causing pin 12 to go high. This is inverted by U837C and used to disable U729, which then holds its current state.

At the start of the second V Sync pulse, U729 is again cleared for $\approx$3.5 μs by U732A, which makes pin 12 return low. This transition triggers U732B, which removes the clear state from U827 for $\approx$300 μs (long enough to enable the counter for the remaining V Sync period). U729-12 going low is also

inverted by U837C, to re-enable U729. It would also clock U827, but it occurs just prior to the clear state being removed from U827, so it has no effect.

U827, is not clocked until the start of the third V Sync pulse, and is clocked at the beginning of each V Sync pulse after that, when U729-12 goes low, until it reaches a count of four. This would be at the start of the sixth Vertical Sync pulse. U827-12 then goes high, which is inverted by U837D to pull $\overline{\text{VERTPR}}$ low. This, applied to pin 7, prevents U827 from counting, so $\overline{\text{VERTPR}}$ remains low until U827 is cleared by U832B timing out. $\overline{\text{VERTPR}}$ is applied to U421 on Diagram 6, for placement on the EDBUS when the μP requests $\overline{\text{MISC}}$ through decoder U334.

Configure Switch

The Configure Switch, S537, is an eight segment DIP switch. Each segment of the switch corresponds to one of the eight input channels, segment 1 controls channel 1, segment 2 controls channel 2, and so on.

When a switch segment is closed, that line will be grounded, which disables error detection for that channel. When the segment is open, the line is at +5 V, enabling the channel. These eight lines (CON 1 through CON 8) are applied to the Peak Detectors on Schematics 1 and 2, and the Pulse Detectors on Schematics 3 and 4. They also address buffer U521, to be transferred to the EDBUS when $\overline{\text{CONFIG}}$ is asserted.

MICROPROCESSOR KERNEL

Schematic 6

Schematic 6, Microprocessor Kernel, consists of 6 blocks. These blocks are the Microprocessor, Microprocessor Memory, Decoder, Source Switching Logic, Diagnostics Switch and Readout, and the Signal Set Switch. For a description of the diagnostics performed, refer to Section 5 Maintenance.

Microprocessor

The μP, U110, controls the kernel. Its control lines, $\overline{\text{RD}}$, $\overline{\text{WR}}$, $\overline{\text{MREQ}}$, $\overline{\text{I/OREQ}}$, and $\overline{\text{M1}}$ enable the various devices in the kernel such as the Diagnostics Switch buffer and the Decoder. Its address lines (A0 – A15) are used to address the Memory and the Decoder, and its Data lines (D0 – D7) receive information from throughout the instrument.

There are three ways to reset the μP. When the instrument is first turned on the Power Supply provides the $\overline{\text{PWRRST}}$ pulse, which is gated through U222C and A to the μP. While the instrument is operating, if the μP does not assert $\overline{\text{AWAKE}}$ on time the Timing Counters on Schematic 7 will send a $\overline{\text{WTCHDG}}$ pulse, which is also gated through U222C & A. The third method of resetting the μP is by manually moving jumper J227 to pins 2 & 3 momentarily, grounding U222A-1. **Make sure to return J227 to its 1 & 2 position, or the μP will not be allowed to operate.**

The μP clock, U134, is a crystal controlled oscillator which runs at 4 MHz. This is picked off to drive the Timing Counters, and is wave shaped by U139B, C, and Q136 for use by the μP.

Microprocessor Memory

The μP memory consists of a memory decoder, U133, the EPROM, U210, and the RAM, U125.

Address lines A13 – A15 are used only to address U133, the memory decoder. When the μP asserts $\overline{\text{MREQ}}$, U133 decodes these three address lines to determine whether to enable the PROM or the RAM, and to disable the DATA I/O port, U317, during that time.

The EPROM, U210, contains the micro-instructions which control the μP. It is enabled when $\overline{\text{ROMEN}}$ and RD are asserted at the same time. The RAM, U125, is used to store temporary data, such as the output for the Diagnostic LEDs. It is enabled when $\overline{\text{RAMEN}}$ is asserted at the same time as $\overline{\text{RD}}$ or $\overline{\text{WR}}$.

Decoder

When enabled by $\overline{\text{I/OREQ}}$ being asserted only when $\overline{\text{M1}}$ is not asserted, U334 decodes address lines A0 – A3 to provide 15 different enable signals for use throughout the instrument.

Source Switching Logic

U434 produces the $\overline{A}$/B signal, which is applied to the switches in the Input Amplifiers to switch the sync source between Generator A or Generator B. When clocked by sync through U440C, U434 passes the dc level applied at pin 15 to pin 13. If the dc level is low, Generator A is selected; if high, Generator B.

U428B, which applies the dc level to U434-15, is driven by U427C, for manual switching, or U427D, for automatic switching. Which of these two is to drive U428B is determined by the level of the $\overline{\text{AUTOMAN}}$ signal from U420. When low, this signal prevents U427C from passing the MAN $\overline{A}$/B signal from U420-9, but is inverted by U439D to enable U427D to pass the output of U433B. When the FRONT PANEL CONTROLS are ENABLED, the $\overline{\text{AUTOMAN}}$ signal toggles every time the SOURCE SWITCHING push button is depressed.

U433B is controlled by U427A and B, which are used as negative-input NOR gates. These two gates are applied to the preset and clear inputs of U433B. U427A, applied to the preset input, is driven by the $\overline{\text{APRES}}$ signal from the A Pulse Detector and by the $\overline{\text{AUTOB}}$ signal from U420. The APRES signal is normally high, going low if the A Pulse Detector detects a loss of any of the eight channels' A inputs. The $\overline{\text{AUTOB}}$ signal is also normally high, going low if the μP detects any other Generator A problem. Either signal going low presets U433B, forcing its Q output high.

U427B operates in an identical manner, using BPRES or $\overline{\text{AUTOA}}$ going low to apply a low to the clear input of U433B, forcing the Q output low.

When the $\overline{\text{AUTOMAN}}$ output from U420 goes high, U427C is enabled, so it can pass the MAN $\overline{A}$/B signal output by U420; at the same time U427D is disabled, so it cannot pass the auto switch. The AUTO SWITCH toggles each time the SYNC SOURCE push button is depressed (again, only when the FRONT PANEL CONTROLS are ENABLED). The MAN $\overline{A}$/B signal is then gated through U427C and U428B to U434.

U428A and C are used to disable U440C so that it cannot pass the ASNK and BSNK pulses which clock U434. This occurs when the $\overline{\text{AUTOMAN}}$ signal is low (allowing auto switching), and both the APRES and the BPRES signals go low, indicating a pulse detector fault for both generators.

The APRES, BPRES, and $\overline{A}$/B signals are placed on the EDBUS by U421B when the μP asserts $\overline{\text{MISC}}$.

Data I/O

U317 is a transceiver to allow communication between the EDBUS and the Kernel DATA BUS, unless $\overline{\text{RAMEN}}$, $\overline{\text{ROMEN}}$, $\overline{\text{DIAGSW}}$, or $\overline{\text{DIAGLED}}$ are asserted. The direction of communication is controlled by the $\overline{\text{WR}}$ signal from the μP; when $\overline{\text{WR}}$ is high data flows from the EDBUS to the Kernel DATA BUS, and when $\overline{\text{WR}}$ is low the data flow is reversed.

Signal Set Switch

The Signal Set Switch (S320) is used to inform the μP of particular signal characteristics for the selected signal set See Table 1-1, ECO–170A Configuration, for details of the signal selection settings. The switch settings are transferred to the EDBUS when $\overline{\text{SIGSET}}$ is asserted.

Diagnostics Switch and Readout

The Diagnostics Switch and Readout are used to initiate and evaluate a variety of diagnostic routines for an operational check of the ECO–170A. See Section 5 Maintenance for details on the individual tests. Buffer U316 places the switch settings on the kernel DATA BUS when the μP asserts $\overline{\text{DIAGSW}}$.

The Diagnostics Readout is a set of eight LEDs, arranged on the circuit board in two groups of four. These LEDs are used to evaluate the diagnostic tests initiated by the Diagnostics Switch. The LEDs are addressed by the Kernel DATA BUS through U306, when $\overline{\text{DIAGLED}}$ is asserted.

TIMING and REMOTE LOGIC Schematic 7

Schematic 7, Timing and Remote Logic, has three main blocks; the Timing Counters, Remote Control Logic, and the Miscellaneous Switch.

Timing Counters

The 4 MHz μP clock (U134 on Schematic 6) drives U145A which, along with U148 and U145B, divide it down to 100 kHz (6H). This 100 kHz is applied to two counter chains, which provide the H and V timing signals used in the Pulse Detectors and the Pulse Width Multiplexer.

U154 provides the 3H (50 kHz), and 0.6H (10 kHz) pulses, and U254A the 0.3H (5 kHz), while U159, U248 and U241 provide the 6 V (390 Hz) and 1.5 V (97 Hz) pulses.

The 1.5 V pulses drive U235, the Watchdog counter. If the $\overline{\text{AWAKE}}$ pulse does not clear this counter in time it is assumed that the μP is caught in a loop, so U235 is allowed to count out and its Rco output goes high. This is inverted by U223A and applied back to U222C on Schematic 6 to reset the μP. J231 allows you to disable this if you would rather not have the μP reset in this manner.

Miscellaneous Switch

S715, the Miscellaneous Switch, is used to select NTSC or PAL, to enable or disable Pulse Width Detection, and in diagnostics (see Section 5 Maintenance). See Table 1-1 ECO–170A Configuration for details on switch settings.

The switch settings are applied to the EDBUS by U622 when the μP asserts $\overline{\text{MISC}}$.

Remote Control Logic

The rear panel REMOTE CONTROL connector is a 9-pin connector used to provide limited control and operational indications at a remote location. See Fig. 1-4 for details of the remote connector.

Pins 1 & 2 of the connector are used for input to the ECO–170A, and are applied to the EDBUS by U622 when $\overline{\text{REMI}}$ is asserted. Pins 3 through 8 are used for output to the remote. $\overline{\text{ED0}}$ – ED5 is clocked through latch U721 when $\overline{\text{REMO}}$ is asserted, and gated through U722. Q824 is used to increase the current capability for pin 8, used for driving an alarm at the remote location.

FRONT PANEL LOGIC and POWER DISTRIBUTION Schematic 8

Schematic 8 shows the front panel and its logic, the ALARM and RELAY DRIVE circuitry, and the power distribution for the instrument.

Front Panel

The front panel consist of 5 momentary-closed push buttons, which are molded into the front panel assembly, and 12 LEDs which are soldered to the rear of the front panel board.

Front Panel Logic

The separate and common inputs from the front panel switches are applied to U508, a keyboard decoder, which converts any keypush into a 3-bit word and applies it to buffer U421A. This 3-bit word is passed through the buffer to the EDBUS when the $\overline{\text{KEYBRD}}$ signal is asserted, along with the output of U516A, which is used to inform the μP if a selection has been made at the front panel since it was last polled. U516A-5 will go high if a selection is made at the front panel, just long enough to be placed on ED3 when $\overline{\text{KEYBRD}}$ is next asserted.

U412 and U413 are the latches used to drive the front panel LEDs. U412 clocks the $\overline{\text{EDBUS}}$ information through to its Q outputs when $\overline{\text{FPLEDA}}$ is asserted, to drive the SYNC SOURCE A, SYNC SOURCE B, AUTO SWITCH ON FAULT, AUTO SWITCH OFF, A FAULT, B FAULT, FRONT PANEL CONTROLS LOCKED OUT, and FRONT PANEL CONTROLS ENABLED LEDs.

When $\overline{\text{FPLEDB}}$ is asserted, U413 clocks the EDBUS information through to drive the ALARM ENABLED, ALARM DISABLED, OPERATE, and BYPASS LEDs. It also drives the ALARM and the RELAY DRIVE circuitry.

Alarm

If ED4 is high when $\overline{\text{FPLEDB}}$ is asserted, indicating a signal fault has been detected, then U223F starts U505, an NE555 timer. U505 is used to provide a pulsed output for the alarm. This drives LS603, a speaker, which sounds to alert the operator that an error has been detected. DS605, an internal LED in parallel with LS603, lights at the same time. LS603 may be disabled, for troubleshooting, by moving J602 to its pins 2 & 3 position. DS605 will still light to inform the technician of a fault.

Relay Drive

If ED5 is high when $\overline{\text{FPLEDB}}$ is asserted, indicating that the $\overline{\text{OPBAD}}$ flag has been asserted, then there has been a failure with one of the amplifiers shown on Schematics 1 and 2. This high is used to turn Q798 off, which allows the $\overline{\text{REL}}$ line to go high; this is routed to all the input relays, which then switch to BYPASS.

Power Distribution

Power Distribution shows all the power supply connections between the Power Supply board (A4) & the Main board (A2), and between the Main board (A2) & the Front Panel board (A1).

POWER SUPPLY
Schematic 9

Overview

The ECO–170A Power Supply consists of a Buck-type switching power supply that generates two regulated voltages (±5 V) and a linear supply that uses outputs from the switching supply (±15 V) to generate ±12 V. The Power Supply circuitry is contained on one board (A4). Fig. 4-5 shows a functional block diagram of the Power Supply.

The AC line voltage enters the Power Supply through the Line Filter, where an EMI filter removes noise. The 300 V supply rectifies and filters the line voltage to provide +300 V to the Switching circuit.

Using the 300 V supply, the Switching circuits provide the current from which the regulated ±5 V and ±12 V supplies are generated. The Pulse Width Modulator regulates the ±5 V output, and the Linear Supply regulates the ±12 V supply.

Line Filter

The Line Filter (LF950) isolates the instrument from the power line. This prevents noise on the power lines from affecting the instrument's performance and, conversely, prevents any noise generated by the instrument from reaching the power lines.

300 V Supply

CAUTION

When modulator operation is in doubt, protect the FETs from high voltage by removing the jumper (J950) that connects them to the 300 V supply.

The purpose of the 300 V supply is to convert the AC line voltage to 300 V for use in the Switching circuit.

Jumper J810 allows the Power Supply to accept either 115 or 230 Vac line voltage. When the arrow of the jumper plug is lined up with the **115** arrow on the circuit board, the two primary windings of T610 are in parallel and bridge rectifier CR810 acts as a full wave voltage doubler. When the jumper housing is rotated 180° so that its arrow is lined up with the **230** arrow, the windings of T610 are in series and CR810 acts as a full wave bridge rectifier.

Housekeeping Supplies

The Housekeeping Supply provides the Power Supply with a precision +2.5 V reference, a regulated ±8 V, and also a +14.4 V supply. The +2.5 V reference is used as a yardstick against which all other voltages that the Power Supply generates can be measured. The ±8 V supplies the regulation and protection circuits throughout the Power Supply.

From the +8 V supply, the +5 V Housekeeping Supply (+5 V_{ref}) is derived. This +5 V_{ref} supply is generated across a 5 V Zener diode connected to pin 18 inside U435. Current to the Zener diode is from the +8 V supply. The +14.4 V supply provides power to the Pulse Width Modulator output buffer, U525.

When the instrument is first powered up, the secondary of T610 provides power for the Housekeeping Supply. Bridge rectifier CR510 converts the filtered line voltage to ±14.4 Vdc. C412 averages the positive output of CR510. U310 regulates this averaged output to generate the +8 V housekeeping voltage. U210 then accurately regulates the +8 V to produce the +2.5 V reference.

C410 averages the negative output of CR510, and U212 regulates it to provide the -8 V reference.

Once the instrument is powered up, T610 no longer provides power for the housekeeping and reference voltages. Instead, the ±15 V at the input of the Linear Supply provides the power. This ±15 V supply is stepped down to ±14.4 V by diodes CR420 and 410. The presence of ±14.4 V at the outputs of CR510 shuts CR510 off by reverse biasing its diodes.

Having two power sources for the Housekeeping Supply — one during power-up and one after power-up — makes the Housekeeping Supply independent of the regulated supplies that power the rest of the instrument. The Housekeeping Supply will always be powered up even if the rest of the regulated power supplies are shut down.

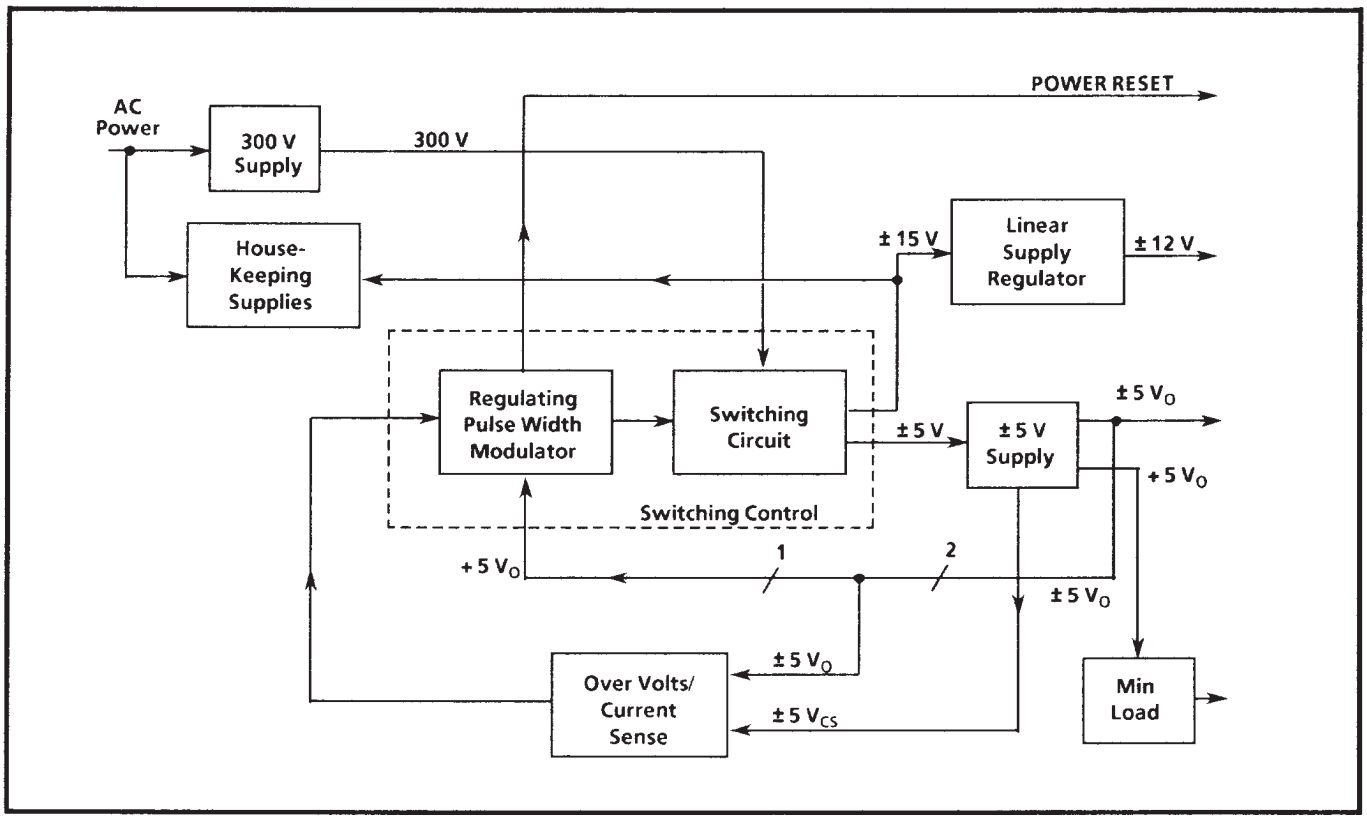

Fig. 4-5. Block diagram of Power Supply.

Switching Control (Pulse Width Modulator and Switching Circuit)

WARNING

When replacing the FETs (Q660 and Q661), be sure to replace the FET shield before powering up the supply. This shield is a protection from flying fragments should an FET explode.

The heart of the Switching Control circuit is the Pulse Width Modulator and the Switching circuit. Their combined purpose is to convert the 300 Vdc supply to a high frequency supply and then to a lower voltage supply that can be efficiently stepped down to generate the regulated supplies (±12 V and ±5 V).

The main purpose of the Pulse Width Modulator (U435) is to provide and control the switching pulses for the FET gates (Q660 and Q661) in the Switching circuit. An oscillator inside the Modulator generates the switching pulses. This oscillator is set at 47 kHz by the RC network connected to pins 9-11. The duty cycle of the switching pulses will vary in proportion to the load at the output and line voltage into the Power Supply. The output pulses from U435 are buffered by U525 and combined in the primary of T735 to form a signal that drives the FET gates on and off, one at a time.

The primary current for the main power transformer (T650) is gated by the FETs (Q660 and Q661) switching the 300 V supply on and off at a 47 kHz rate across the primary windings. C766 and C768 isolate DC voltage from the primary of the transformer.

When the Power Supply is first starting, U435 is not operational until the Housekeeping Supply reaches +8 V. Once U435 is operational, C433 charges, and the output duty cycle of U435 increases from minimum until the power requirements of the instrument are met. This process of increasing the duty cycle from minimum to meet the power demand is called "Soft Start." It prevents the FETs from being damaged as the supply charges the filter capacitors and attempts to regulate.

As the Power Supply is starting up, comparator U325B holds the POWER RESET line ($\overline{\text{PWRRST}}$) low. This disables the μP on the Main board until the Power Supply is powered up and operating at proper voltage levels. Even after the voltage is up to the proper level, U325B will continue to hold the POWER RESET line low for a few more moments to wait until the voltage has stabilized.

Troubleshooting Notes — When the FETs (Q660 and 661) fail, the gate resistors (R750 and R751) also fail, so both the FETs and resistors should be replaced.

To ensure sufficient heat transfer, be sure that heat-sink-mounted components are screwed down with 4 inch-lbs torque.

± 12 V Linear Supply

The ±12 V supply is derived from the line-regulated ±15 V generated by one of the secondaries of T650. The secondary voltage is rectified by CR533-CR536 and applied to L435. This inductor acts as a current storage device. During the first part of each switching cycle, the inductor current increases from zero, storing energy taken from the input. During the second part, the stored energy discharges into the load, pumping energy from input to output. C156 and C176 filter the inductor output and then pass it to U360 and U260 (monolithic voltage regulators), which regulate it down to ±12 V. The nominal tolerance on the ±12 V supplies is 1%. If the current drawn from the ±12 V supply exceeds approximately 2 A, the monolithic regulators shut down to protect the regulators and the circuits they supply.

The ±15 V also powers the Housekeeping Supply once the Power Supply is powered up, providing a more regulated voltage than CR510 provides.

± 5 V Supply

The ±5 V supply is regulated by the Pulse Width Modulator (U435). The output from the secondary of T650 (pins 15 and 18) is rectified by CR460 and CR360, then applied to L451, which "pumps" the current to the load as described above. C235-C351 filter the inductor output to provide the ±5 V supply.

The Pulse Width Modulator samples the +5 V (+5 V_0) and compares it at the Voltage Sense circuit (U331B) to a precise 2.5 V reference generated by the Housekeeping Supply. The difference is applied to the positive error input of U435. In response, U435 varies the duty cycle of the Switching Regulator, which, in turn, corrects the voltage of the ±5 V supply. This also causes a corresponding change to the other secondaries.

Overvolt Sensing

Comparators U335B and U220B monitor the regulated ±5 V power supply. If one of the supplies increases in magnitude by more than approximately 1 V, the output of one of the comparators will pull the input to timer U133 low and shut down U435. The normal operating voltages at pin 10 of U335B is +2.1 V, and at pin 9 of U220B is +0.3 V. Jumpers J242 and J120 provide easy testing of the sensors. When pins 1 & 2 of either jumper are shorted together, the Power Supply should shut down.

Overcurrent Sensing

Comparators U335A and U220A monitor the current output from the ±5 V supplies. If current flow from the +5 V supply exceeds approximately 8 A, or if the current flow from the -5 V supply exceeds approximately -4 A, the comparators shut down U435 in the same manner as do the Overvolt Sensors.

+5 Undervolt Reset

Comparator U331A monitors the +5 V (V_0) which holds U331A-2 at about 2.8 V. If the +5 V supply decreases in magnitude by more than approximately 0.6 V, U331A-1 will go high. This causes U325B-7 to pull $\overline{\text{PWRRST}}$ low; resetting the μP on the Main board.

Minimum Load

This circuit ensures the Power Supply always has the minimum load required to keep it operational. When the Main board is connected to the supply, the base of Q160 is grounded and the transistor draws no current. But if the Main board is disconnected, the 5 V supply at the base of Q160 switches on the transistor, which draws current.

Indicator Lights

The Power Supply has two indicator lights. The first is the neon safety light (DS810) located in the 300 V supply. This light flashes when it has at least 70 V across it. When the mains power is switched off, the light will still remain flashing for about 30 seconds to indicate that the neighboring capacitors still have a residual charge.

The second light is a two-color LED (DS112) that indicates with a red LED when the instrument is in power-reset mode, and with a green LED when the instrument has powered up.

When the instrument is powering up, the POWER RESET line is low and the +5 V_{ref} supply lights the red LED. Shortly after, power reaches the +12 V supply and it lights the green LED. For a brief moment, both LEDs are on. Finally, as full power is reached, the POWER RESET line is pulled high and the red LED switches off.

POWER SUPPLY CIRCUIT DESCRIPTION (Schematic 9) B020000 & Above

This type of power supply is called a current-mode-controlled, discontinuous, flyback, switching power supply. The current output is distributed between the four supplies as follows:

+12 V	0.5 Amps max
+5 V	7 Amps max
-5 V	2 Amps max
-12 V	0.5 Amps max

The maximum power is limited by the maximum current in the primary of T440. This is also the only current limit for the ±5 V supplies, as they have no secondary current limit. The ±12 V supplies are current limited on the secondaries by the ±12 V linear regulators, U176 and U276.

The power inductor, T440, is driven by switching the current to its primary on and off. T440 is not used as a transformer, but as an energy storage device, storing the energy in the primary while the current is being applied. On the second half of the switching cycle the current to the primary is switched off, and

the energy stored in the primary is transferred to the secondaries (flyback). Regulation is accomplished by applying feedback from the +5 V supply to the pulse width modulator controlling the current to the primary. This varies the length of time that the current is applied to the primary, causing it to store either more or less energy.

There is also circuitry to provide for operation from both 110 and 220 Vac supplies, under-voltage shutdown if the ac input is too low, overvoltage protection (crowbar) on the +5 V supply, and shutdown circuitry which forces a restart of the supply if it remains in current limit for more than a short period of time (<1 second).

WARNING

All primary voltages are referenced to a floating ground, not chassis ground. An isolation transformer or a differential amplifier is therefore needed in order to troubleshoot the circuitry in the primary and the pulse width modulator, and in their supporting circuitry.

As current never flows simultaneously in both the primary and the secondary, there is never any actual transformer action. As the magnetic flux in the inductor goes to zero at the end of each switching cycle, it is discontinuous.

Input, AC to DC Converter, and Voltage Doubler

This circuitry filters and rectifies the input ac voltage, placing a charge of approximately 320 Vdc across capacitors C845 and C865.

The line current passes through line filter LF950, fuse F940, and power switch S930, and is applied to rectifier CR820. At the input of CR820, J810 is used to select between 110 V and 220 V operation. If set to 220 V, CR820 works as a full-wave rectifier and C845 and C865 act in series, charging to the peak voltage (approximately 320 Vdc) during the first part of each one-half cycle. They then maintain that voltage through the rest of the cycle, as the input voltage and current fall to zero.

If, on the other hand, J810 is set for 110 V operation, CR820, C845, and C865 act as a half-wave rectifier and voltage doubler. During the positive half-cycle of the ac input only one of the diodes within CR820 conducts, charging C865 to the peak positive voltage. A different diode within CR820 conducts during the negative half-cycle, and charges C845 to the negative peak. The total voltage across C845 and C865 is then approximately 320 Vdc.

RV920 and RV820 limit voltage surges on the input which might pass the line filter, while R831 and R830 discharge C865 and C845 when the power is off. C830 and C730 bypass switching noise to ground, keeping it out of the input power line. DS720 and associated parts form a relaxation oscillator, so DS720 blinks when the instrument is powered up.

Kick Starter, Housekeeping Supply, and Undervoltage Lockout Circuits

These circuits supply the power to start and maintain oscillation of the Pulse Width Modulator, so long as the input ac voltage is sufficient to maintain regulation. The primary purpose of the undervoltage lockout circuit is to prevent the supply from starting up when set for 220 V operation and 110 Vac is applied instead, but it will stop the oscillation in the Pulse Width Modulator whenever the voltage across C845 and C865 (normally at 320 V) falls below approximately 200 V.

VR765 holds the emitter of Q755 at about 20 V, while the base is controlled by a divider comprised of R766, R767, and R768. So long as the charge across C845 and C865 remains around 320 V, Q755's base is held at approximately +30 V, and the transistor is off. As the voltage across C845 and C865 decreases, the base voltage does as well; when the voltage across the caps is down to approximately 200 V, Q755's base is at about +19 V, and Q755 is turned on. This, in turn, turns on Q727, applying the +5 V reference from U722-8 to U722-2. This disables the Pulse Width Modulator.

When the input voltage is sufficient to maintain the charge across C845 and C865 above 200 V, Q755 is off. This allows the Kick Start circuit to operate, providing the initial power to start up the Pulse Width Modulator. It does this by charging up C656 through Q667 and R560. During start-up, the +5 V reference output of U722 is at 0 V, and Q660 is off. The base current for Q667 during this time is supplied by R667.

When the charge across C656 reaches approximately 16 V, U722 starts to operate. It switches Q638 on and off through the base drive circuitry (Q741, Q750, Q648, and associated circuitry). The +5 V reference voltage at U722-8 is developed, which turns Q660 on. This diverts the base current from Q667, so it turns off and DS670 turns on to indicate normal operation.

The power to maintain the +16 V charge on C656 is now provided by the housekeeping winding of T440, pins 5 and 6, through CR556. If there is insufficient power to maintain the charge on C656 for any reason, such as the removal of J660, then the charge on C656 is quickly depleted. This stops the operation of U772, and the kick start sequence is repeated.

Power Inductor Operation

The heart of this power supply is T440, the multiwinding power inductor. The operation of T440 is as follows (see Fig. 4-6). Inductor T440 is initially uncharged (has zero magnetic flux). Q638, acting as a switch, is turned on by the base drive from U722. This places the charge developed on C845 and C865 (approximately 320 V) across the primary winding. The polarity of this charge is such that the voltages induced in the secondaries all reverse bias their respective diodes (note the polarity dots). In this way, there is no current flowing in the secondaries while it is flowing in the primary.

The primary current builds a linear ramp, storing the energy in T440 according to the relation $E = \frac{1}{2}Li^2$, where L is the primary inductance and i is the current flowing through it.

The current path is broken when Q638 is switched off, so current stops flowing in the primary. The flyback action of T440 then causes the voltages in the secondaries to reverse polarities, and all their diodes to turn on. The current in the secondaries linearly ramps down to zero as the energy which was stored in T440's primary is delivered to the load, charging the output capacitors.

When all of the energy which was stored in T440 during the first half of this cycle is delivered to the load, the current in the secondaries is at zero, and the diodes turn off. There is no current flowing in either the primary or the secondaries until Q638 is turned back on to start the next cycle. As there is not a continuous flow of energy in T440, this is called discontinuous flyback operation.

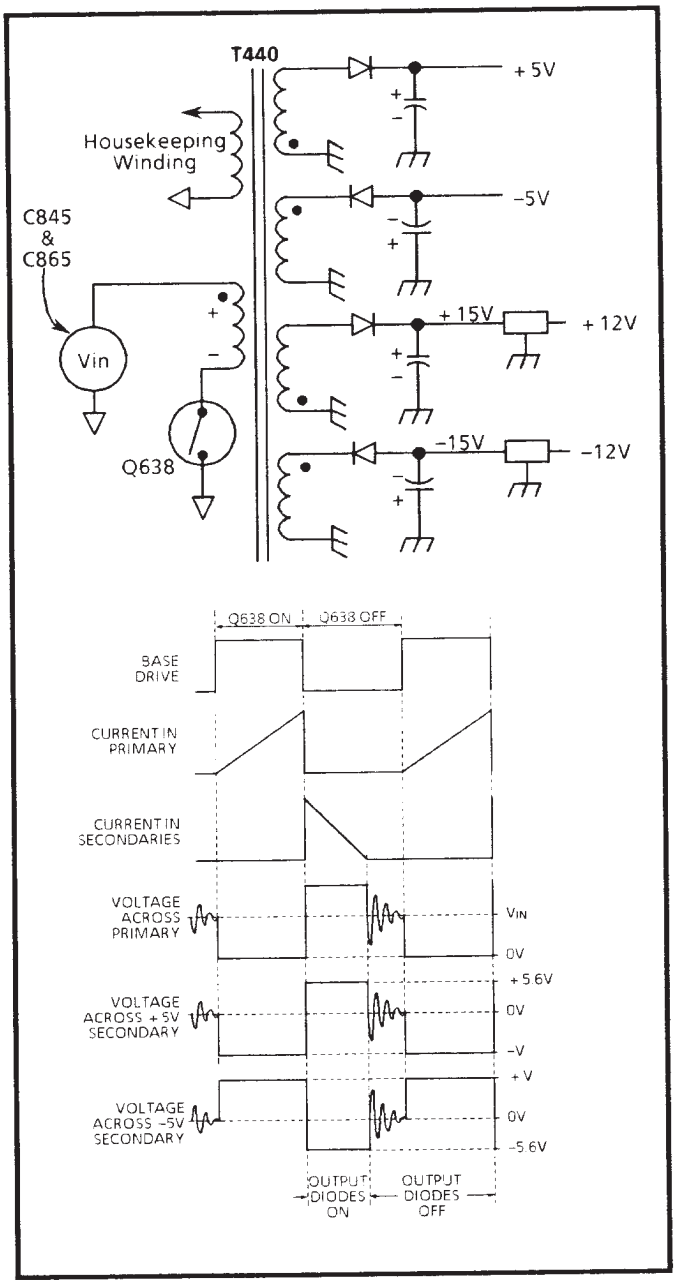

Fig. 4-6. Basic operation of T440

Load regulation is provided by sensing the +5 V supply with a divider comprised by R314, R315, and R415, and using U410 to convert this to an error signal. This error signal is optically coupled through U520 back to the Pulse Width Modulator, U722. U722 uses the error signal to vary the width of the pulse which drives Q638.

When the +5 V goes too high, U722 narrows the pulse width. This reduces the amount of energy stored in T440, and therefore the amount transferred to the load, so the +5 V goes down. Contrariwise, when the +5 V is too low, the pulse width is increased, increasing the amount of energy stored in T440 and then transferred to the load, so the voltage goes up.

Pulse Width Modulator and Error Amp

The Pulse Width Modulator, U722, is a current–mode controller. It uses inputs from the primary circuit and from the +5 V output to vary the width of the pulse which controls Q638, as mentioned above. This regulates the secondary voltages throughout variations of input voltage, output load, temperature, etc.

Current mode control works by allowing the current flowing in the primary to reach a peak level that is set by the output of the error amp, which is controlled by the +5 V output (see Fig. 4-7). The current in the primary winding is sensed by R630, and applied to U722-3 as a voltage. At the start of the cycle the oscillator sets the flip-flop within U722, which turns Q638 on. The primary current, and therefore the voltage to U722-3, ramp up until the I SENSE level is sufficient to trip the comparator. This resets the flip-flop, ending the drive pulse to Q638, and the energy stored in the transformer is transferred to the secondaries.

Line regulation, then, is a function of line voltage. As the line voltage varies, so will the primary current. An increase in line voltage causes an increase in primary current, so the slope of the ramp increases and the trip point is reached sooner. This results in a shorter pulse width. A decrease in line voltage causes a decrease in primary current, the slope of the ramp decreases, and it takes longer to reach the trip point. The same peak current is reached in both cases, however, so the same amount of energy is transferred to the load. Line regulation,

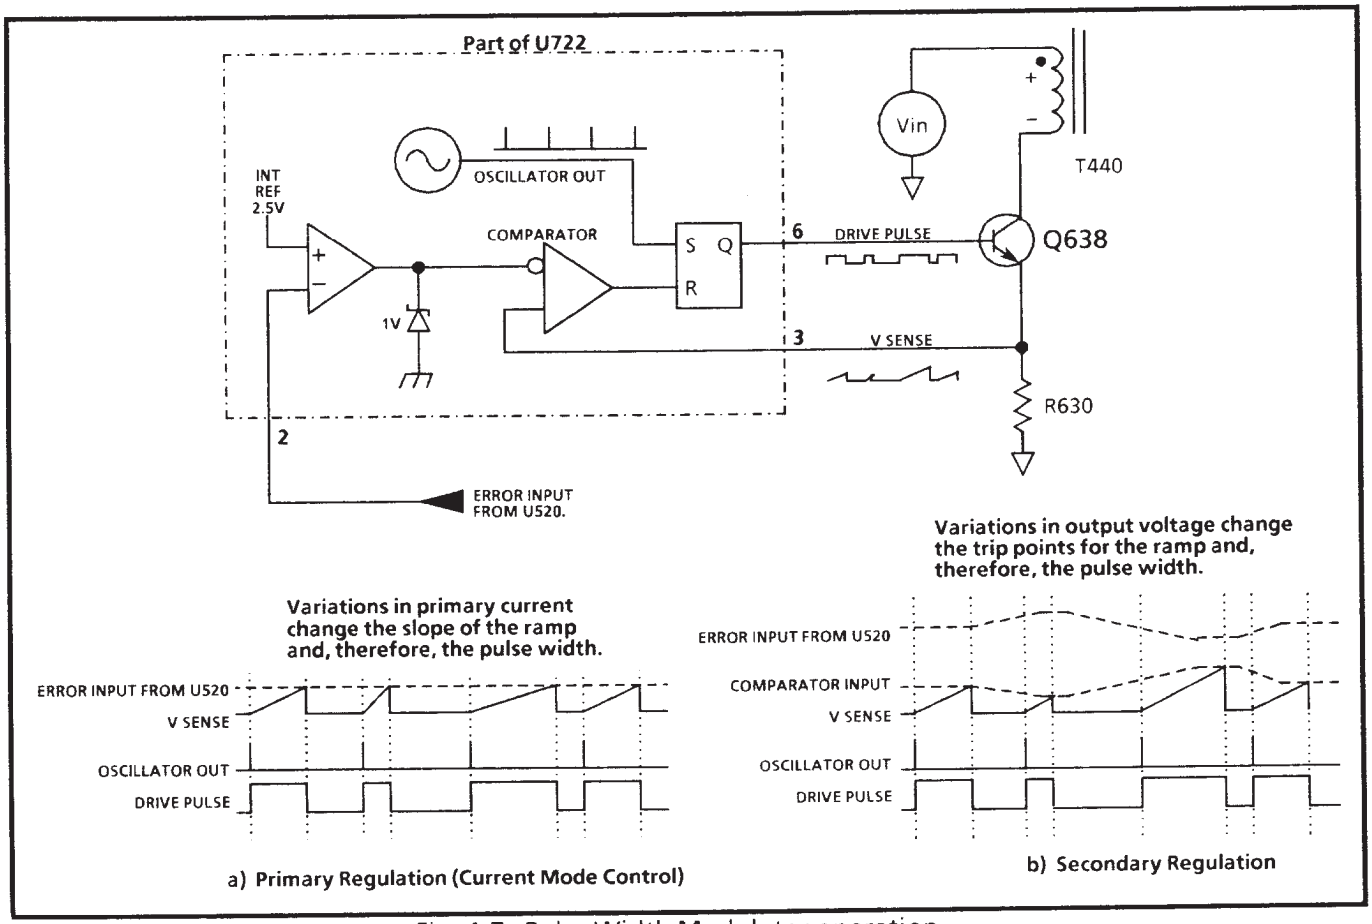

Fig. 4-7. Pulse Width Modulator operation.

then, is achieved without having to wait for output voltage variations.

Load regulation is accomplished by sensing the output voltage of the +5 V supply, and applying an error signal through opto-isolator U520 to U722–2. If the load increases, the supply voltage decreases, and so does the error signal at U722–2. This has the following results:

1. The comparator input increases, due to inversion of the IC.
2. The output pulse width increases, keeping Q638 on for a longer time.
3. I_p increases.
4. Power flow increases.

On the other hand, if the load decreases, the +5 V increases, so the output pulse width decreases along with I_p, and less power is transferred to the secondaries. In this way, the +5 V is kept constant through changes in the load, and, as it varies the amount of energy transferred to the other secondaries too, it regulates them as well.

The error amplifier is U410, a band-gap reference. It keeps the voltage at its cathode at a constant 2.5 V, set by the voltage applied to its reference, pin 2. This reference is set by R314, R315, and R415. R415 is also used to adjust the +5 V supply.

As U410s cathode is held at 2.5 V, the current through R416 will vary with changes in the output voltage, as will the current through the LED within opto–isolator U520. This changes the conductance of the transistor element of the opto-isolator, which then varies the voltage applied to the feedback input, U722-2.

Current Limit

Current limit is provided for the primary circuit by the internal circuitry of U722. As the ramp voltage at U722-2 reaches 1 V, the output drive pulse ends. This shuts Q638 off, so no further current is supplied. The maximum primary current is approximately 1.5 Amps, which corresponds to a maximum power level of approximately 75 Watts.

As the supply goes into current limit, U615A and Q717 come into play. U615A starts to turn on as the ramp voltage passes ≈900 mV, and starts to charge C717. If the current limit condition persists long enough for the charge on C717 to reach 700 or 800 mV, Q717 is turned on. This applies the reference voltage from U722-8 directly to U722-3, shutting down the supply and forcing a kick start. The supply will then cycle through kick start, current limit, and shut down until the problem is corrected.

Base Drive and Snubber

The pulse width modulated drive pulse from U722-6 is amplified by emitter followers Q741 and Q750. When the drive pulse is positive, Q750 is on and Q741 is off. Current flows through R746 and R747, through Q648 and CR649, and turns Q638 on. CR640, CR648, and CR649 form a Baker clamp to keep Q638 out of hard saturation.

As Q638 approaches saturation its collector–emitter voltage differential falls, and it needs less base current to maintain the same collector current. As saturation is approached, CR640 starts to conduct, providing a path for the excess base current.

When U722-6 goes to zero volts, Q750 is shut off and Q741 is turned on, so current is shunted to ground through CR651. C648 and VR650 speed up the switching off of Q638. The driven side of C648 is charged to approximately 5 V during the positive input half–cycle; then, when Q741 is turned on, C648's driven side is pulled down to +0.7 V by CR651, which pulls the base of Q638 down to approximately –3.3 V, through CR684. This abrupt transition draws a large current spike from the base momentarily (approximately 1 A for <0.3 μs), turning off Q638 very rapidly, along with CR640 and CR649.

When Q638 is turned off, there is a voltage spike applied to its collector. A combination of reflected secondary voltages, input voltage, and transformer leakage inductance can combine to produce a spike of over a thousand volts. As this can exceed the ratings of Q638, a snubber circuit, consisting of C540, CR545, and R647, limits the spike to approximately 800 V.

Secondary Circuits

The secondary circuits all work in the same manner. As mentioned earlier, under basic operation, during the first half of the cycle, all their diodes are reverse-biased, so there is no current flow.

On the second half of the cycle, when Q638 is shut off, the flyback action reverses the polarities of the secondaries, and the diodes are forward biased. This allows the energy stored within T440 to charge up the capacitors in the secondaries.

The +5 V and the -5 V supplies use LC filters from this point, to further smooth the voltage and eliminate most of the ripple.

The +12 V and -12 V supplies actually start as +15 V and -15 V, at the transformer. These voltages are used for the fan, B100 (-15 V), and for the opto-isolator U520 (+15 V) only. Then they are filtered and applied to linear regulators, U176 and U276. These provide clean +12 V and -12 V outputs, respectively. CR169 prevents the +12 V from going negative, while CR170 keeps it from exceeding +15.7 V. CR269 and CR369 perform identical functions for the -12 V output.

Overvoltage Protection

Overvoltage protection is provided on the +5 V output by a crowbar circuit comprised by Q127, VR120, and R120. If the +5 V output exceeds approximately +5.5 V, VR120 will start to conduct. When VR120 is drawing enough current through R120 to raise SCR Q127's gate voltage above its cathode, Q127 will turn on. This shorts the +5 V output to ground, forcing the primary circuit into current limit.

SECTION 5
MAINTENANCE

INTRODUCTION

This section has four main parts: preventive maintenance, troubleshooting aids, diagnostics, and corrective maintenance.

PREVENTIVE MAINTENANCE

Under average environmental conditions, preventive maintenance should be done about every 2000 hours. This includes cleaning, visual inspection, and a performance check. See Section 3 for performance check procedures.

Cleaning

Clean the instrument often enough to prevent dust or dirt from accumulating in or on it. Dirt prevents efficient heat dissipation. It also provides high-resistance electrical leakage paths between conductors or components in a humid environment.

CAUTION

The front panel is molded plastic. Do not allow water to get inside any enclosed assembly or component. Do not clean any plastic materials with organic cleaning solvents, such as benzene, toluene, xylene, acetone, or similar compounds, because they may damage the plastic.

Static-Sensitive Components

CAUTION

Static discharge can damage any semiconductor component in this instrument.

This instrument contains electrical components that are susceptible to damage from static discharge. Static voltages of 1 kV to 30 kV are common in unprotected environments.

Observe the following precautions to avoid damage:

1. Minimize handling of static-sensitive components.
2. Transport and store static-sensitive components or assemblies in their original containers, on a metal rail, or on conductive foam. Label any package that contains static-sensitive assemblies or components.
3. Discharge the static voltage from your body by wearing a wrist strap while handling these components. Servicing static-sensitive assemblies or components should be performed only at a static-free work station by qualified personnel.
4. Nothing capable of generating or holding a static charge should be allowed on the work station surface.
5. Keep the component leads shorted together whenever possible.
6. Pick up components by the body, never by the leads.
7. Do not slide the components over any surface.
8. Avoid handling components in areas that have a floor or work surface covering capable of generating a static charge.
9. Use a soldering iron that is connected to earth ground.
10. Use only special antistatic, suction-type or wick-type desoldering tools.

TROUBLESHOOTING AIDS

The following is miscellaneous information about schematics, circuit board illustrations, component numbering, and assembly numbering.

NOTE

No repair should be attempted during the warranty period.

Foldout Pages

The foldout pages at the back of the manual give block and schematic diagrams and circuit board illustrations. See Fig. 5-1.

Diagrams

The circuit number and electrical value of each component is shown on the diagrams. The first page in the Diagrams section explains the schematic symbols. The Replaceable Electrical Parts list gives a complete description of each component. Those portions of the circuit that are mounted on circuit boards or assemblies are enclosed in a gray border, with the name and assembly number shown on the border.

NOTE

Check the Change Information section at the rear of the manual for inserts describing corrections and modifications to the instrument and manual.

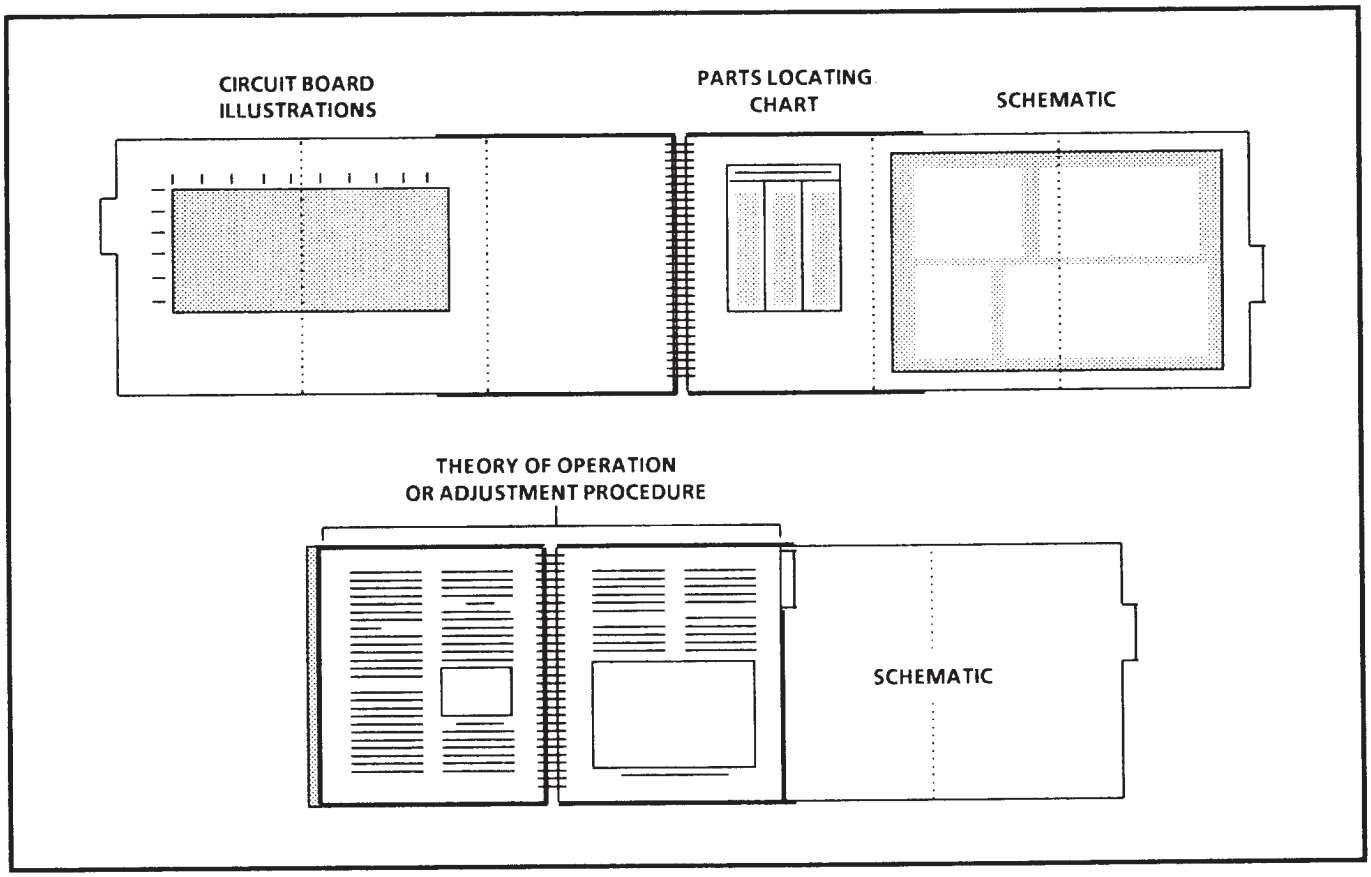

Fig. 5-1. Using the foldout pages.

Circuit Board Illustrations

Electrical components, connectors, and test points are identified on circuit board illustrations located on the inside fold of the corresponding circuit diagram or the back of the preceding diagram.

Assembly and Circuit Numbering

The circuit board assemblies are assigned assembly numbers starting with A1. Fig. 5-2 shows the location of the circuit board assemblies in the instrument. This illustration also shows the location of chassis-mounted components.

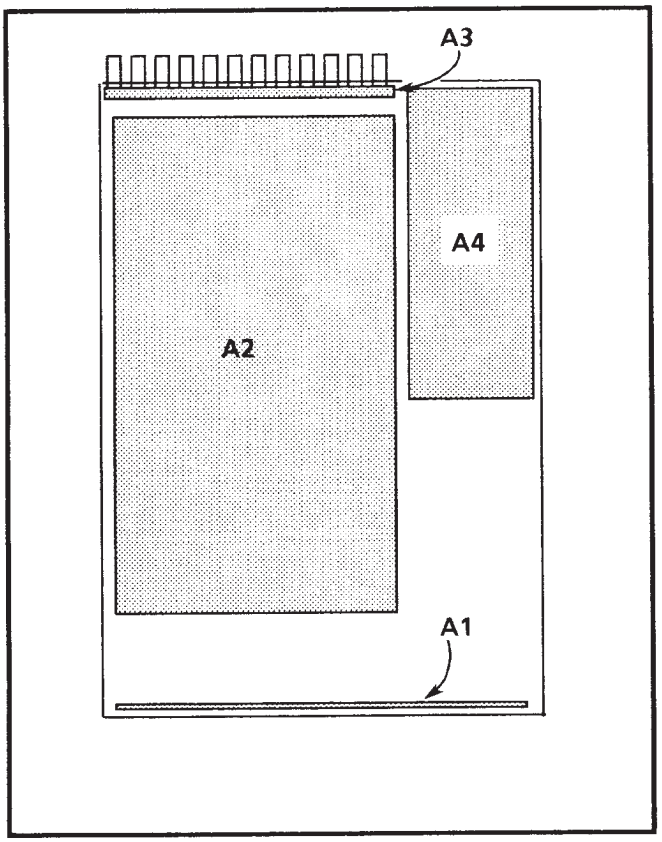

Fig. 5-2. Circuit board assembly locations.

Circuit boards have been assigned an assembly number so that they may be ordered from Tektronix, Inc. They are as follows:

A1	Front Panel Board Assembly
A2	Main Board Assembly
A3	BNC Board Assembly
A4	Power Supply Board

The part numbers for ordering these boards are given on the first page of the Replaceable Electrical Parts list in Section 9.

Each component is assigned a circuit number according to its location within an assembly. Component circuit numbers increase in units from left to right, and in hundreds from top to bottom on the circuit board.

The Replaceable Electrical Parts list is arranged in assembly-by-assembly order, as designated by ANSI Standard Y32.16-1975. The circuit number in the parts list is made up by combining the assembly number and the circuit number.

EXAMPLE: R123 on A2 would be listed in the Replaceable Parts list as A2R123.

In the Replaceable Electrical Parts list, assemblies are listed first, followed by circuit board-mounted parts in alpha numeric order.

NOTE

The parts list number should be used when ordering replacement parts.

DIAGNOSTICS

Two Types of Diagnostics

EPROM U210 (Schematic 6) stores diagnostic programs that check both the μP kernel and external data paths that interface with the kernal. Table 5-1 describes the tests and how to interpret the results.

The μP automatically executes Power-up Diagnostics once each time the instrument is powered up or reset. The μP indicates detected failures in these tests by flashing all the front-panel LEDs on and off.

Selecting Diagnostics

All Diagnostics tests are selected through the Diagnostic switch (S224, Schematic 6). Table 5-1 is a switch guide for the tests. Segment 8 of S224 must be in the open position for Diagnostics to operate, and J231 (WTCHDG ENABLE) must be set to its pins 2 & 3 position.

To select a diagnostic test, set the Diagnostic switch for the desired test, then reset the μP by switching power off and on, or by momentarily moving jumper J227 (Schematic 6) to the 2 &3 position. Immediately after the reset, the μP polls the Diagnostic switch port (U316, Schematic 6) and performs the routine selected at switch S224.

Once the μP enters Diagnostics (except Power-up Diagnostics) you can move from test to test by changing the Diagnostic Switch setting, with two exceptions. These are the Port Test (10000000) and the Diagnostics Test (10000001). To exit these two tests, or to leave Diagnostics altogether, you must execute another reset.

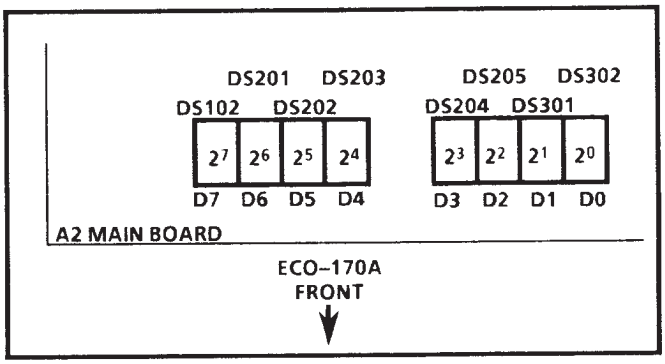

Fig. 5-3. ECO–170A Diagnostic LEDs.

Reading the Diagnostic LEDs

Many of the Diagnostic tests provide a readout on the Diagnostic LEDs DS102, DS201 – DS205, DS301, and DS302. These eight LEDs are arranged into two groups of four, as shown in Fig. 5-3.

Most of the tests which use these LEDs for output either light or extinguish a particular LED in response to a particular switch segment being opened or closed. In the Pulse Width Detector test, however, they present a binary number which is the measured width of the pulse, expressed in cycles of subcarrier.

Table 5-1. Diagnostic Tests

Switch Setting (S224) 87654321	Test	Test Function	Pass/Fail Indication
10000000	Port Test	Verifies that all I/O ports are operational by enabling each one in turn.	Trigger oscilloscope from U334 pin 18, check all U334 output pins (1–16) for an ≈ 600 ns pulse, offset ≈ 11μs from any adjacent output pin.
10000001	Diagnostic switch and LEDs.	Reads the setting of the Diagnostics switch (S224) and transfers it directly to the Diagnostic LEDs. Closed = LED off.	Pass - Diagnostic LEDs display pattern corresponding to Diagnostic switch settings.
10000010	Configure switch	Reads the setting of the Configure switch (S537) and transfers it directly to the Diagnostic LEDs. Closed = LED off.	Pass - Diagnostic LEDs display pattern corresponding to Configure switch settings.

Table 5-1. Diagnostic Tests (Cont.)

Switch Setting (S224) 87654321	Test	Test Function	Pass/Fail Indication
10000011	Front Panel Keyboard	Reads the Keyboard decoder (U508), and displays it on the four LSB Diagnostic LEDs. Other four LEDs are on.	When This Button is Pressed –You should see– Binary Number Displayed ALARM 0000 FAULT INDICATOR 0001 SOURCE SELECTION 0010 SYNC SOURCE 0011 FRONT-PANEL CONTROLS 0100
10000100	Front Panel LEDs	Checks the two front-panel output ports (U412 and U413) and the front-panel LEDs. Lights each LED in turn, beeps the alarm, and puts the ECO–170A momentarily into Bypass mode.	Fail - LED(s) do not light, alarm fails to sound, or Bypass relays fail to click.
10000101	Remote Input	Reads the Remote Input port and transfers it to the four LSB Diagnostics LEDs. Low = LED off. If one or more of these TPs fail to turn D2 off, check the peak detectors.	Ground This Pin –You should see– This LED Turn Off Remote pin 1 D0 Remote pin 2 D1 TP282, TP382, TP563, TP368, TP564, TP755, TP954, or TP768 D2 TP241 D3
10000110	Remote Output	Reads the Configure switch settings and transfers them to the Remote Connector output port (U721). Closed = high, except segment 6 (Remote pin 8) where Closed = low.	Configure Switch Segment Affects Remote Connector Pin 1 3 2 4 3 5 4 6 5 7 6 8
10000111	Automan Port	Reads the Configure switch settings and transfers them to the Automan Port.	See Table 5-2 for AUTOMAN Port Diagnostic Tests
10001000	Misc switch	Reads the Misc switch settings and transfers them to the Diagnostic LEDs. Closed = LED off.	Misc Switch Segment Affects This LED 1 D4 2 D5 3 D6 4 D7

Table 5-1. Diagnostic Tests (Cont.)

Switch Setting (S224) 87654321	Test	Test Function	Pass/Fail Indication
10001001	RAM Read / Write Test	Writes to and reads from all RAM locations. Checks for match between data written to and read from RAM.	Pass - Diagnostic LEDs flash, alternating LSB and MSB. Fail - all Diagnostic LEDs flash together.
10001010	Signal Set Switch	Reads the Signal Set switch (S320) and transfers it to the Diagnostic LEDs. Closed = LED off.	Pass - Diagnostic LEDs display pattern corresponding to Signal Set switch settings.
10001011	Front Panel LEDs	Turns on all of the Front Panel LEDs at the same time.	Fail - one or more LEDs do not light.
10001100	Pulse Width Detector	The Configure switch is used to address the multiplexers (U629 and U637) and select a signal. MISC switch (S715) segment 3 determines whether the signal is from Generator A or B, and segment 4 acts as PWPOL control. The Pulse Width Detector measures the pulse in cycles of subcarrier and outputs (in Binary) to Diagnostic LEDs; MSB then LSB.	See Table 5-3 for Pulse Width Detector Diagnostic tests

Automan Port Diagnostics

The Automan Port Diagnostics are used to check the operation of the Automan Port, U420, and the Source Switching Logic, all of which is located on Schematic 6. Table 5-2 gives a brief description of the circuit responses to the various segments of the Configure switch for this Diagnostic.

Pulse Width Detector Diagnostics

The Pulse Width Detector Diagnostics tests allow the operator to select the signal to be measured by the Pulse Width Detector. The measured pulse width is then displayed on the Diagnostic LEDs, in cycles-of-subcarrier.

This number is presented in several stages: first, the four MSB LEDs (D7 through D4) are sequentially turned on, to indicate that the following number is the MSB. The MSB is then displayed for approximately five seconds. The four LSB LEDs (D0 through D3) are sequentially turned on, to indicate that the following number is the LSB. The LSB is then displayed for approximately five seconds. This entire sequence takes approximately 13 seconds, repeating until another test is selected.

To determine the actual pulse width, you must multiply this count of subcarrier cycles by the subcarrier period which, if expressed in μs, converts cycles-of-subcarrier to μs. That's 0.2793 for NTSC, or 0.2256 for PAL.

The signal to be measured is selected with the Configure switch and the Misc switch. Each segment of the Configure switch, when closed, enables the Multiplexer to pass the corresponding channels' signal through to the Pulse Width Counters (i.e. closing segment 2 applies channel 2 to the MUX, segment 3 applies channel 3, etc.). The Channel 1 signal (Subcarrier) is replaced with one of the internal timing reference signals: 6H for the Generator A inputs, 0.6H for the Generator B inputs. Segment 3 of the Misc switch (S715) selects between the Generator A inputs (closed) or the Generator B inputs (open). Segment 4 of the Misc switch acts as the PWPOL signal when the pulse needs to be inverted; see Table 5-3.

An oscilloscope may be used to measure the actual signal being applied to the Pulse Width Counters, at TP245. This can then be compared to the readout on the Diagnostic LEDs to determine whether the Pulse Width Counters are working properly.

Table 5-2. AUTOMAN Port Diagnostics

S537 SEG	SIGNAL NAME	DESCRIPTION
1	$\overline{\text{AUTOMAN}}$	Sets circuitry to switch automatically when low (closed), or manually when high (open).
2	$\overline{\text{AUTOA}}$	When the AUTOMAN line is **low**, pulsing this line low (switching segment 2 closed & then open) sets U434-13 low.
3	$\overline{\text{AUTOB}}$	When the AUTOMAN line is **low**, pulsing this line low (switching segment 3 closed & then open) sets U434-13 high.
4	MAN $\overline{\text{A}}$/B	When the AUTOMAN line is **high**, closing this segment sets U434-13 low, opening this segment sets U434-13 high.
5	$\overline{\text{CLEAR}}$	When this segment is closed, U420-12 should be low.
6	$\overline{\text{PWCLR}}$	When this segment is closed, U420-15 should be low.
7	$\overline{\text{PWPOL}}$	As this segment is closed and opened, the level at TP245 should change states (alternates between + 5 and 0).
8	$\overline{\text{A}}$/BSS	When this segment is closed U420-19 should be low.

Table 5-3. Pulse Width Detector Diagnostic Tests

Switch Settings		Signal (CH.) Applied to P.W. Counter, Through Multiplexer (Schematic 5)
Config (S537) 87654321	Misc (S715) 3 4	
00000001	0 1	6H (REF)
00000010	0 0	ABF/SUB (2)
00000100	0 1	ASYNC (3)
00001000	0 0	AHD/SYNC/PAL (4)
00010000	0 0	ABLANK (5)
00100000	0 1	AVDBV (6)
01000000	0 1	AV (7)
10000000	0 1	AF V (8)
00000001	1 1	0.6H (REF)
00000010	1 0	BBF/SUB (2)
00000100	1 1	BSYNC (3)
00001000	1 0	BHD/SYNC/PAL (4)
00010000	1 0	BBLANK (5)
00100000	1 1	BVDBV (6)
01000000	1 1	BF V (7)
10000000	1 1	BV (8)

The following example shows the steps to run the Pulse Width Detector Diagnostics for the A SYNC input, with an NTSC system.

1. Set the Diagnostic switch to 10001100 (1 = open), and set J231 (WTCHDG ENABLE) to its pins 2 & 3 position. Reset the ECO–170A, by turning the power off and on, or by moving J227 (MANUAL RESET) momentarily to its pins 2 & 3 position.

2. Set the Configure switch to 00000100 (ch. 3), close (0) segment 3 & open (1) segment 4 of the Misc switch, as shown in Table 5-3. This step can be done either before or after resetting the ECO–170A.

3. The Diagnostic LEDs turn on each of the four MSB LEDs in turn, D7 to D4, and then all eight LEDs display the MSB for about five seconds. The four LSB LEDs then light in turn, D0 to D3, and then all eight LEDs display the LSB for about five seconds. In this case, the MSB is all zeros (blank) and the LSB is 0001 0001. The LEDs will sequence through these states until a different test is selected.

4. Convert this binary number to decimal ($2^4 + 2^0 = 16 + 1 = 17$), and multiply by the subcarrier period. For an NTSC system, $17 \times 0.2793 = 4.748\ \mu s$; well within the specified limits for NTSC sync width ($4.7\ \mu s \pm 0.56\ \mu s$). This same readout would be out of

the specified limits for PAL sync width though (4.7 μs $\pm$0.45 μs), as 17 $\times$ 0.2256 = 3.835 μs.

5. To check a different signal's pulse width, reset the Configure and Misc switches for the new signal, as shown in Table 5-3, and let the Diagnostic LEDs go through at least one complete sequence before reading them.

CORRECTIVE MAINTENANCE

Corrective maintenance deals with obtaining replacement parts, torque specifications, and component replacement.

Obtaining Replacement Parts

Replacement parts are available from or through the local Tektronix, Inc., field office or representative.

When ordering parts be sure to **include the following information** in your order:

1. Instrument type (and option numbers, if any)
2. Instrument serial number
3. Description of the part, as it appears in the Replaceable Electrical or Mechanical Parts list
4. The Tektronix part number

If a part that has been ordered is replaced with a new or improved part, the local Tektronix field office or representative will contact you concerning any change in the part number.

Torque Specifications

Only #4, #6, and #8 screws are used in the ECO–170A. Table 5-4 shows the torque ranges for these.

Correct torque is critical on the screws holding the devices to the Power Supply heat sink.

Table 5-4. Torque Specifications for ECO–170A

Screw #	Torque Range (in inch pounds)
4	3½–5
6	7–9
8	14–18

Replacing Circuit Assemblies

WARNING

Disconnect the instrument power cord before replacing components.

Use the following procedures to remove circuit board assemblies. Reverse the order of the removal procedures to reinstall or replace an assembly.

Power Supply Board Removal

1. Remove the main power connector and disconnect the Main board ribbon connector.
2. Remove the nuts and screws attaching the line filter to the rear panel.
3. Remove the four screws attaching the shield and circuit board to the bottom pan.
4. Remove the three screws attaching the heat sink to the bottom pan.
5. Remove the remaining two mounting screws.

Main Board Removal

1. Disconnect all seven ribbon connectors from the Main board.
2. Remove the eight mounting screws and the two mounting posts.

Front Panel Removal

1. Disconnect the Main board ribbon connector from the front-panel.

2. Remove the two nuts from the front panel.

3. Making sure to avoid pushing on the front-panel LEDs, push the front panel away from the front panel frame to break the glue which holds them together. Avoid bending the front panel any more than necessary.

BNC Board Removal

1. Remove the four Main board ribbon cable connectors.

2. Unsolder the BNC board from the twenty four center connector lugs and the four terminal lugs.

3. Pull BNC board away from the lugs.

BNC Removal

1. To remove any of the top twelve BNC connectors, unsolder the center connector lug and the terminal lug (if attached). For the lower row of BNCs, first remove the three BNC connectors above the one you're trying to remove; the one directly above, and one on either side of it.

2. Unbolt the BNC connector from the rear panel and pull out the connector.

EPROM Replacement Procedure

1. Making sure the power is switched off, remove the old EPROM (U210) from the Main board and replace it with the new EPROM.

2. Switch on power.

Section 6
Replaceable Electrical Parts

This section contains a list of the components that are replaceable for the ECO–170A. Use this list to identify and order replacement parts. There is a separate Replaceable Electrical Parts list for each instrument.

Parts Ordering Information

Replacement parts are available from or through your local Tektronix, Inc., Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available and to give you the benefit of the latest circuit improvements. Therefore, when ordering parts, it is important to include the following information in your order.

- Part number
- Instrument type or model number
- Instrument serial number
- Instrument modification number, if applicable

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc., Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

Using the Replaceable Electrical Parts List

The tabular information in the Replaceable Electrical Parts list is arranged for quick retrieval. Understanding the structure and features of the list will help you find all of the information you need for ordering replaceable parts.

Cross Index–Mfr. Code Number to Manufacturer

The Mfg. Code Number to Manufacturer Cross Index for the electrical parts list is located immediately after this page. The cross index provides codes, names, and addresses of manufacturers of components listed in the electrical parts list.

Abbreviations

Abbreviations conform to American National Standards Institute (ANSI) standard Y1.1.

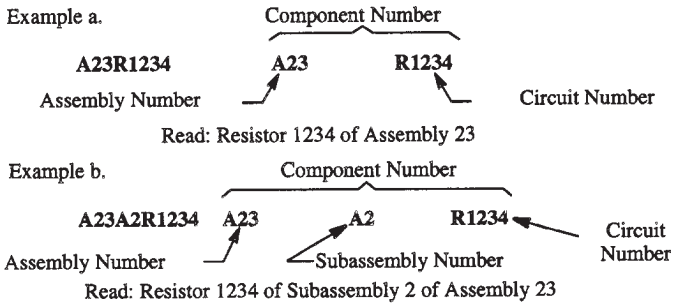
List of Assemblies

A list of assemblies can be found at the beginning of the electrical parts list. The assemblies are listed in numerical order. When the complete component number of a part is known, this list will identify the assembly in which the part is located.

Column Descriptions

Component No. (Column 1)

The component circuit number appears on the diagrams and circuit board illustrations, located in the diagrams section. Assembly numbers are also marked on each diagram and circuit board illustration, in the Diagram section and on the mechanical exploded views, in the mechanical parts list. The component number is obtained by adding the assembly number prefix to the circuit number.



The electrical parts list is arranged by assemblies in numerical sequence (A1, with its subassemblies and parts, precedes A2, with its subassemblies and parts).

Mechanical subparts to the circuit boards are listed in the electrical parts list. These mechanical subparts are listed with their associated electrical part (for example, fuse holder follows fuse).

Chassis-mounted parts and cable assemblies have no assembly number prefix and are located at the end of the electrical parts list.

Tektronix Part No. (Column 2)

Indicates part number to be used when ordering replacement part from Tektronix.

Serial/Assembly No. (Column 3 and 4)

Column three (3) indicates the serial or assembly number at which the part was first used. Column four (4) indicates the serial or assembly number at which the part was removed. No serial or assembly number entered indicates part is good for all serial numbers.

Name and Description (Column 5)

An item name is separated from the description by a colon (:). Because of space limitations, an item name may sometimes appear as incomplete. Use the U.S. Federal Catalog handbook H6-1 for further item name identification.

The mechanical subparts are shown as *ATTACHED PARTS* / *END ATTACHED PARTS* or *MOUNTING PARTS* / *END MOUNTING PARTS* in column five (5).

Mfr. Code (Column 6)

Indicates the code number of the actual manufacturer of the part. (Code to name and address cross reference can be found immediately after this page.)

Mfr. Part No. (Column 7)

Indicates actual manufacturer's part number.

Section 7— Diagrams and Circuit Board Illustrations

Symbols

Graphic symbols and class designation letters are based on ANSI Standard Y32.2-1975.

Logic symbology is based on ANSI Y32.14-1973 in terms of positive logic. Logic symbols depict the logic function performed and may differ from the manufacturer's data.

The overline on a signal name indicates that the signal performs its intended function when it is in the low state.

Abbreviations are based on ANSI Y1.1-1972.

Other ANSI standards that are used in the preparation of diagrams by Tektronix, Inc. are:

Y14.15, 1966 Drafting Practices.
Y14.2, 1973 Line Conventions and Lettering.
Y10.5, 1968 Letter Symbols for Quantities Used in Electrical Science and Electrical Engineering.

American National Standard Institute
1430 Broadway
New York, New York 10018

Component Values

Electrical components shown on the diagrams are in the following units unless noted otherwise:

Capacitors = Values one or greater are in picofarads (pF). Values less than one are in microfarads (μF).
Resistors = Ohms (Ω).

The information and special symbols below may appear in this manual.

Assembly Numbers and Grid Coordinates

Each assembly in the instrument is assigned an assembly number (e.g., A20). The assembly number appears on the circuit board outline on the diagram, in the title for the circuit board component location illustration, and in the lookup table for the schematic diagram and corresponding component locator illustration. The Replaceable Electrical Parts list is arranged by assemblies in numerical sequence; the components are listed by component number *(see following illustration for constructing a component number).

The schematic diagram and circuit board component location illustration have grids. A lookup table with the grid coordinates is provided for ease of locating the component. Only the components illustrated on the facing diagram are listed in the lookup table. When more than one schematic diagram is used to illustrate the circuitry on a circuit board, the circuit board illustration may only appear opposite the first diagram on which it was illustrated; the lookup table will list the diagram number of other diagrams that the circuitry of the circuit board appears on.

Section 8
Replaceable Mechanical Parts

This section contains a list of the components that are replaceable for the ECO–170A. Use this list to identify and order replacement parts. There is a separate Replaceable Mechanical Parts list for each instrument.

Parts Ordering Information

Replacement parts are available from or through your local Tektronix, Inc., Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available and to give you the benefit of the latest circuit improvements. Therefore, when ordering parts, it is important to include the following information in your order.

- Part number
- Instrument type or model number
- Instrument serial number
- Instrument modification number, if applicable

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc., Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

Using the Replaceable Mechanical Parts List

The tabular information in the Replaceable Mechanical Parts list is arranged for quick retrieval. Understanding the structure and features of the list will help you find all of the information you need for ordering replaceable parts.

Cross Index–Mfr. Code Number to Manufacturer

The Mfg. Code Number to Manufacturer Cross Index for the mechanical parts list is located immediately after this page. The cross index provides codes, names, and addresses of manufacturers of components listed in the mechanical parts list.

Abbreviations

Abbreviations conform to American National Standards Institute (ANSI) standard Y1.1.

Chassis Parts

Chassis-mounted parts and cable assemblies are located at the end of the Replaceable Electrical Parts list.

Column Descriptions

Figure & Index No. (Column 1)

Items in this section are referenced by figure and index numbers to the illustrations.

Tektronix Part No. (Column 2)

Indicates part number to be used when ordering replacement part from Tektronix.

Serial No. (Column 3 and 4)

Column three (3) indicates the serial number at which the part was first used. Column four (4) indicates the serial number at which the part was removed. No serial number entered indicates part is good for all serial numbers.

Qty (Column 5)

This indicates the quantity of mechanical parts used.

Name and Description (Column 6)

An item name is separated from the description by a colon (:). Because of space limitations, an item name may sometimes appear as incomplete. Use the U.S. Federal Catalog handbook H6-1 for further item name identification.

Following is an example of the indentation system used to indicate relationship.

```
1  2  3  4  5        Name & Description
Assembly and/or Component
Mounting parts for Assembly and/or Component
*MOUNTING PARTS*/*END MOUNTING PARTS*
    Detail Part of Assembly and/or Component
    Mounting parts for Detail Part
    *MOUNTING PARTS*/*END MOUNTING PARTS*
        Parts of Detail Part
        Mounting parts for Parts of Detail Part
        *MOUNTING PARTS*/*END MOUNTING PARTS*
```

Mounting Parts always appear in the same indentation as the Item it mounts, while the detail parts are indented to the right. Indented items are part of and included with, the next higher indentation. **Mounting parts must be purchased separately, unless otherwise specified.**

Mfr. Code (Column 7)

Indicates the code number of the actual manufacturer of the part. (Code to name and address cross reference can be found immediately after this page.)

Mfr. Part Number (Column 8)

Indicates actual manufacturer's part number.

Manual Change Information

Tektronix products are constantly under development for increased performance or lower cost to the customer. Often, changes are incorporated into a product as soon as they are shown to meet the highest quality standards.

This aggressive policy of product improvement can result in changes that are not reflected in the appropriate sections of the manual. Information regarding such changes will appear on the following pages. If no change notices are inserted after this page, the manual is correct as printed.

Please review any included change information and note the changes that will affect your use of the product. A single change may apply to several sections of the manual. Because change information sheets are inserted until all the changes are incorporated into every applicable section of the manual, some duplication may result.

TEXT, ELECTRICAL PARTS LIST and SCHEMATIC CHANGES

SECTION 1 OPERATING INSTRUCTIONS
Page 1-4, preceding Configuration

ADD THE FOLLOWING:

Fault Determination (B021141 and above)

The front panel FAULT INDICATOR shows when a fault has occurred and whether it was an A or B input, but does not show which input on what channel. Specific information, if needed, can be determined by looking at the diagnostic LEDs (see Fig. 1-5). These LEDs are located just behind the front panel at the left side of the instrument; you must remove the top cover to view them.

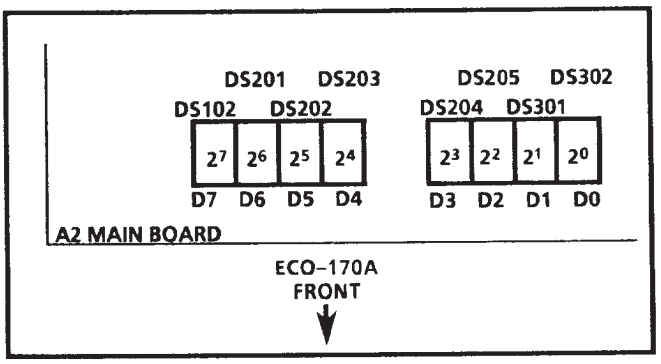

Fig. 1-5. ECO-170A Diagnostic LEDs.

These LEDs will give an indication of whether the A or B input to a specific channel failed, as shown in Table 1-2.

When a failure has occurred, the LEDs will blink at a slow rate, if the problem is still present, or at a fast rate, if the problem is no longer present. To clear the LED display, press the front panel FAULT INDICATOR CLEAR button.

Table 1-2. Channel Failure Determination

LEDs (1=on) D D D D D D D D 7 6 5 4 3 2 1 0	Failure Indication
