Tektronix

SPG 422
Component Digital Sync Generator
S/N B034000 and above

071-0596-00

Warning
The servicing instructions are for use by qualified personnel only. To avoid personal injury, do not perform any servicing unless you are qualified to do so. Refer to all safety summaries prior to performing service.

Tektronix, Inc., P.O. Box 1000, Wilsonville, OR 97070–1000

WARRANTY

Tektronix warrants that the products that it manufactures and sells will be free from defects in materials and workmanship for a period of one (1) year from the date of shipment. If a product proves defective during this warranty period, Tektronix, at its option, either will repair the defective product without charge for parts and labor, or will provide a replacement in exchange for the defective product.

In order to obtain service under this warranty, Customer must notify Tektronix of the defect before the expiration of the warranty period and make suitable arrangements for the performance of service. Customer shall be responsible for packaging and shipping the defective product to the service center designated by Tektronix, with shipping charges prepaid. Tektronix shall pay for the return of the product to Customer if the shipment is to a location within the country in which the Tektronix service center is located. Customer shall be responsible for paying all shipping charges, duties, taxes, and any other charges for products returned to any other locations.

This warranty shall not apply to any defect, failure or damage caused by improper use or improper or inadequate maintenance and care. Tektronix shall not be obligated to furnish service under this warranty a) to repair damage resulting from attempts by personnel other than Tektronix representatives to install, repair or service the product; b) to repair damage resulting from improper use or connection to incompatible equipment; c) to repair any damage or malfunction caused by the use of non-Tektronix supplies; or d) to service a product that has been modified or integrated with other products when the effect of such modification or integration increases the time or difficulty of servicing the product.

THIS WARRANTY IS GIVEN BY TEKTRONIX IN LIEU OF ANY OTHER WARRANTIES, EXPRESS OR IMPLIED. TEKTRONIX AND ITS VENDORS DISCLAIM ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. TEKTRONIX' RESPONSIBILITY TO REPAIR OR REPLACE DEFECTIVE PRODUCTS IS THE SOLE AND EXCLUSIVE REMEDY PROVIDED TO THE CUSTOMER FOR BREACH OF THIS WARRANTY. TEKTRONIX AND ITS VENDORS WILL NOT BE LIABLE FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES IRRESPECTIVE OF WHETHER TEKTRONIX OR THE VENDOR HAS ADVANCE NOTICE OF THE POSSIBILITY OF SUCH DAMAGES.

General Safety Summary

Review the following safety precautions to avoid injury and prevent damage to this product or any products connected to it. To avoid potential hazards, use this product only as specified.

Only qualified personnel should perform service procedures.

To Avoid Fire or Personal Injury

Use Proper Power Cord. Use only the power cord specified for this product and certified for the country of use.

Use Proper Voltage Setting. Before applying power, ensure that the line selector is in the proper position for the power source being used.

Connect and Disconnect Properly. Do not connect or disconnect probes or test leads while they are connected to a voltage source.

Ground the Product. This product is grounded through the grounding conductor of the power cord. To avoid electric shock, the grounding conductor must be connected to earth ground. Before making connections to the input or output terminals of the product, ensure that the product is properly grounded.

Observe All Terminal Ratings. To avoid fire or shock hazard, observe all ratings and markings on the product. Consult the product manual for further ratings information before making connections to the product.

The common terminal is at ground potential. Do not connect the common terminal to elevated voltages.

Replace Batteries Properly. Replace batteries only with the proper type and rating specified.

Recharge Batteries Properly. Recharge batteries for the recommended charge cycle only.

Use Proper AC Adapter. Use only the AC adapter specified for this product.

Do Not Operate Without Covers. Do not operate this product with covers or panels removed.

Use Proper Fuse. Use only the fuse type and rating specified for this product.

Avoid Exposed Circuitry. Do not touch exposed connections and components when power is present.

Wear Eye Protection. Wear eye protection if exposure to high-intensity rays or laser radiation exists.

Do Not Operate With Suspected Failures. If you suspect there is damage to this product, have it inspected by qualified service personnel.

Do Not Operate in Wet/Damp Conditions.

Do Not Operate in an Explosive Atmosphere.

Keep Product Surfaces Clean and Dry.

Provide Proper Ventilation. Refer to the manual's installation instructions for details on installing the product so it has proper ventilation.

Symbols and Terms

Terms in this Manual. These terms may appear in this manual:

WARNING. *Warning statements identify conditions or practices that could result in injury or loss of life.*

CAUTION. *Caution statements identify conditions or practices that could result in damage to this product or other property.*

Terms on the Product. These terms may appear on the product:

DANGER indicates an injury hazard immediately accessible as you read the marking.

WARNING indicates an injury hazard not immediately accessible as you read the marking.

CAUTION indicates a hazard to property including the product.

Symbols on the Product. The following symbols may appear on the product:

WARNING
High Voltage

Protective Ground
(Earth) Terminal

CAUTION
Refer to Manual

Double
Insulated

Service Safety Summary

Only qualified personnel should perform service procedures. Read this *Service Safety Summary* and the *General Safety Summary* before performing any service procedures.

Do Not Service Alone. Do not perform internal service or adjustments of this product unless another person capable of rendering first aid and resuscitation is present.

Disconnect Power. To avoid electric shock, disconnect the mains power by means of the power cord or, if provided, the power switch.

Use Caution When Servicing the CRT. To avoid electric shock or injury, use extreme caution when handling the CRT. Only qualified personnel familiar with CRT servicing procedures and precautions should remove or install the CRT.

CRTs retain hazardous voltages for long periods of time after power is turned off. Before attempting any servicing, discharge the CRT by shorting the anode to chassis ground. When discharging the CRT, connect the discharge path to ground and then the anode. Rough handling may cause the CRT to implode. Do not nick or scratch the glass or subject it to undue pressure when removing or installing it. When handling the CRT, wear safety goggles and heavy gloves for protection.

Use Care When Servicing With Power On. Dangerous voltages or currents may exist in this product. Disconnect power, remove battery (if applicable), and disconnect test leads before removing protective panels, soldering, or replacing components.

To avoid electric shock, do not touch exposed connections.

X-Radiation. To avoid x-radiation exposure, do not modify or otherwise alter the high-voltage circuitry or the CRT enclosure. X-ray emissions generated within this product have been sufficiently shielded.

Preface

This manual provides servicing information for the SPG 422 Component Digital Sync Generator with serial numbers (S/N) B034000 and above. Procedures in this manual are designed for experienced service technicians.

About This Manual

This manual is composed of the following sections:

- *Specifications* provides a list of all instrument performance requirements, operating environment requirements, and certifications.
- *Operating Information* provides an overview of the main instrument features.
- *Theory of Operation* provides a block diagram description of the instrument circuits.
- *Performance Verification* provides a manual procedure for verifying the performance requirements in the *Specifications* section.
- *Adjustment Procedures* provides an automated procedure for adjusting the generator following repair.
- *Maintenance* provides instructions for troubleshooting and replacing instrument modules.
- *Options* provides a list of the available product options.
- *Replaceable Electrical Parts* provides a list of all electrical components used in the instrument.
- *Diagrams* provides block diagrams, component locators, and schematics.
- *Replaceable Mechanical Parts* provides a list of all mechanical parts and electrical modules not contained on a circuit board.

Contacting Tektronix

Product Support	For application-oriented questions about a Tektronix measurement product, call toll free in North America: 1-800-TEK-WIDE (1-800-835-9433 ext. 2400) 6:00 a.m. – 5:00 p.m. Pacific time Or contact us by e-mail: tm_app_supp@tektronix.com For product support outside of North America, contact your local Tektronix distributor or sales office.
Service Support	Contact your local Tektronix distributor or sales office. Or visit our web site for a listing of worldwide service locations. www.tektronix.com
For other information	In North America: 1-800-TEK-WIDE (1-800-835-9433) An operator will direct your call.

Specifications

This section contains specifications and signal illustrations for the SPG 422.

The items listed in the following tables describe the performance of the SPG 422 Component Digital Sync Generator. Performance Requirements are generally quantitative and can be tested by a Performance Verification procedure contained in the Service Section of this manual.

Supplemental Information is valuable data pertaining to the operation and output capabilities of this instrument. Only a few items listed in this category are testable in the Performance Verification procedure.

Performance Conditions – The requirements listed in the electrical specification portion of these specifications apply over an ambient temperature range of 0° C to +40° C. The rated accuracies are valid when the instrument is calibrated at an ambient temperature range of +20° C to +30° C, after a warm-up time of 20 minutes. Test equipment used to verify Performance Requirements must be calibrated and working within the limits specified under the Equipment Required list.

These instruments are intended to operate from an AC power source that will not apply more than 250 V_{RMS} between the supply conductors or either supply conductor and ground. A protective ground connection by way of the grounding conductor is essential for safe operation.

Environmental specifications are listed toward the back of the following tables. In addition a list of appropriate safety and electromagnetic interference (EMI) standards also can be found there.

Product Description

The SPG 422 is a component digital sync pulse generator (SPG). The SPG 422 provides basic setup and timing signals for component digital tape recorders and processing equipment systems. It provides audio tones and a few simple video test signals needed to adjust equipment and stripe video tapes. Analog black signals are the timing reference signals of choice and the SPG 422 provides six analog black signals each with separate timing controls. Because the SPG 422 has good frequency stability, it can perform as a stand-alone generator or genlock to an external PAL or NTSC signal.

Some installations use 525/59.94 and 625/50 component signals simultaneously or switch between standards regularly. Dual-standard operation is possible with the SPG 422 architecture. Also important for dual-standard operation, is the ability of the SPG 422 to output audio tones locked to the video standard(s) in use.

The SPG 422 has a front-panel interface that controls all instrument functions. Also, the user can control the SPG 422 via either a parallel ground-closure remote or RS-232. The ground-closure remote provides simple control of a few major instrument functions, while the RS-232 implementation is a SCPI (Standard Commands for Programmable Instruments) command language interface, with most of the front-panel interface capabilities. (Not all commands are implemented to avoid operator traps.)

Characteristics Tables

Table 1–1: Encoding parameters for serial digital video outputs

Characteristics	Supplemental information	
Standards Conformance	ITU-R BT.601 and ITU-R BT.656, SMPTE 125M, EBU Tech. 3267-E	
Coded Signals	Luminance (Y), and color difference (C_r and C_b)	
Number of Samples per Video Line	*525/59.94*	*625/50*
Luminance (Y)	858	864
Color Difference (C_r and C_b)	429	432
Sampling Structure	Orthogonal: line, field, and frame repetitive. C_r and C_b samples are co-sited with odd Y samples in each line.	
Sampling Frequency		
Luminance (Y)	13.5 MHz nominal	
Color Difference (C_r and C_b)	6.75 MHz nominal	
Signal Coding	Uniformly quantized PCM, 10 bits per sample, for each luminance and color-difference signal.	
Number of Samples per Digital Active Line	*525/59.94*	*625/50*
Luminance (Y)	720	720
Color Difference (C_r and C_b)	360	360
Correspondence Between Video Signal Levels and Quantization Levels		
Luminance (Y)	877 quantization levels, with black level corresponding to level 64 and the peak white level corresponding to level 940.	
Color Difference (C_r and C_b)	897 quantization levels symmetrically distributed around level 512, which corresponds to zero signal.	

Table 1–2: Timing relationships for serial digital video outputs

Characteristics	Supplemental information
Standards Conformance	ITU-R BT.601 and ITU-R BT.656, SMPTE 125M, EBU Tech. 3267-E
Line Timing	
525/59.94	See Figure 1–1.
625/50	See Figure 1–2.
Field Timing	
625/50	See Figure 1–3.
525/59.94	See Figure 1–4.

Timing Reference Signal — End of Active Video/Start of Active Video (EAV/SAV)

Bit	*1st Word*	*2nd Word*	*3rd Word*	*4th Word*
9	1	0	0	1
8	1	0	0	F
7	1	0	0	V
6	1	0	0	H
5	1	0	0	P3
4	1	0	0	P2
3	1	0	0	P1
2	1	0	0	P0
1	1	0	0	0
0	1	0	0	0

where:

F = 1 during field 2,
V = 1 during vertical blanking,
H = 1 during horizontal blanking,

The protection bits are:

F	V	H	P3	P2	P1	P0
0	0	0	0	0	0	0
0	0	1	1	1	0	1
0	1	0	1	0	1	1
0	1	1	0	1	1	0
1	0	0	0	1	1	1

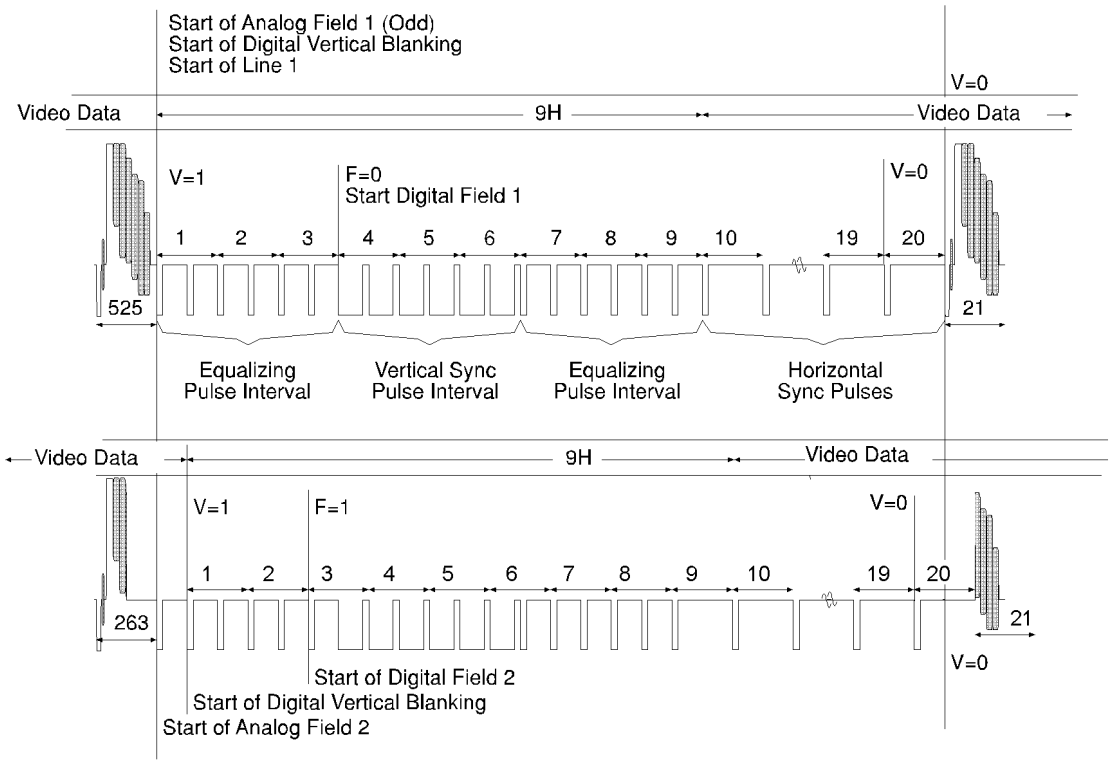

Figure 1–4: Relationship of video data/vertical sync, in 525 system

Table 1–3: Output characteristics for serial digital video signals

Characteristics	Performance requirements	Supplemental information
Standards Conformance		SMPTE 259M, EBU Tech 3267-E ITU-R BT.601 and ITU-R BT.656
Connector		BNC
Digital Format		Scrambled NRZI
Serial Bit Rate		270 Mbits/sec
Source Impedance		75 Ω
Return Loss		≥15 dB from 5 MHz to 270 MHz
Signal Amplitude	800 mV ± 10%	75 Ω load impedance, with no transmission line
DC Offset	0 V ± 0.5 V	
Rise and Fall Times	0.40 to 1.50 nsec	Measured between 20% and 80% amplitude points
Difference Between Rise and Fall Time	0.5 nsec	Measured between 20% and 80% amplitude points
Jitter		Less than ± 0.25 nsec over a period of one video line
Required Receiver Termination		75 Ω, with return loss ≥15 dB from 5 MHz to 270 MHz

Table 1–4: Signal characteristics for analog black outputs (base instrument only)

Characteristics	Performance requirements	Supplemental information
Standards Conformance		SMPTE 170M (NTSC), EBU N14–1988
Blanking Level	0 V ± 100 mV	
Blanking Width (NTSC only)		10.7 µsec ± 0.2 µsec
Black Level		
NTSC		0 or 7.5 IRE (user selectable)
PAL		Blanking Level
Sync Rise Time		
NTSC		140 nsec
PAL		250 nsec
Sync Amplitude		
NTSC	–40 IRE ± 2 IRE	
PAL	–300 mV ± 15 mV	
White Flag Level (PAL only)		0 or 700 mV (user selectable)

Table 1–4: Signal characteristics for analog black outputs (base instrument only) (cont.)

Characteristics	Performance requirements	Supplemental information
Sync Timing		
NTSC		See Figures 1–5 and 1–6.
PAL		See Figure 1–7._
Burst Rise Time		
NTSC		400 nsec
PAL		350 nsec
Burst Amplitude		
NTSC	40 IRE_{p-p} ± 2 IRE	
PAL	300 mV_{p-p} ± 15 mV	
Burst Delay from Sync		
NTSC		19 cycles of subcarrier
PAL		25 cycles of subcarrier
Burst Duration		
NTSC		9 cycles of subcarrier
PAL		10 cycles of subcarrier
Burst Frequency		
NTSC		3.579545 MHz ± 1 Hz
PAL		4.43361875 MHz ± 1 Hz
SC/H Phase Accuracy	0° ± 5°	
Field Timing Offset Range	± 2 fields	Relative to the genlock input
Field Timing Offset Resolution		Video field increments
Vertical Timing Offset Range	± 8 lines	Relative to the genlock input
Vertical Timing Offset Resolution		Video line increments
Horizontal Timing Offset Range	± 1/2 video line	Relative to the genlock input
Horizontal Timing Offset Resolution		< 0.1° of subcarrier
Horizontal Timing Offset Range	± 1/2 video line	Relative to the genlock input
Return Loss	≥30 dB	0 – 5 MHz

Characteristics	Performance requirements	Supplemental information
Standards Conformance		SMPTE RP 165, SMPTE 259M
Serial Bars Output Signal	75% Bars	525 and 625 formats available. See Figures 1–8, 1–9, and 1–10. (50 Hz)
	SMPTE Bars	525/59.94 format only See Figures 1–17 through 1–25.
	75% Bars over Red Field Timing Color Bars Red	625/50 format only See Figures 1–8, 1–9, 1–10, 1–14, 1–15 and 1–16. Lines 23 – 166 Lines 167 – 310
	100% Bars over Red Field Timing Color Bars Red	625/50 format only See Figures 1–11, 1–12, 1–13, 1–14, 1–15 and 1–16. Lines 23 – 166 Lines 167 – 310
	100% Full-Field Bars	525 and 625 formats available. See Figures 1–11, 1–12, and 1–13.
	Serial Black	525 and 625 formats available.
Error Detection and Handling Insertion		Can be enabled or disabled by user
Field Timing Offset Range	± 1 field	Relative to the genlock input
Field Timing Offset Resolution		Video field increments
Vertical Timing Offset Range	± 8 lines	Relative to the genlock input
Vertical Timing Offset Resolution		Video line increments
Horizontal Timing Offset Range	± 1/2 video line	Relative to the Genlock input
Horizontal Timing Offset Resolution		Single 27 MHz clock-cycles

Table 1–7: Signal characteristics for serial test signal (Option 2 only)

Characteristics	Performance requirements	Supplemental information
Standards Conformance		SMPTE RP 165, SMPTE 259M
Serial Test Signals	75% Bars	See Figures 1–8, 1–9, and 1–10.
	100% Bars	See Figures 1–11, 1–12, and 1–13.
	Full-field Pluge	See Figures 1–47 (50 Hz) and 1–48 (60 Hz)
	Convergence	See Figures 1–32 & 1–33 (H), and 1–34 & 1–35 (V)
	Bowtie	See Figures 1–41, 1–42, and 1–43.
	Active Picture Markers	See Figures 1–36 and 1–37.
	Multiburst	See Figures 1–26 and 1–27.
	Pulse And Bar	See Figures 1–29 and 1–31.
	Ramp	See Figures 1–44, 1–45, and 1–46.
	Serial Digital Interface (SDI matrix)	Matrix consists of Bit Slip and Clock Recovery Test signal and the Equalizer signal per SMPTE RP 178. Bit Slip stresses the recovery ability of the receiver clock regenerator by sending a string of twenty 0s followed by a single 1. The Equalizer Test signal contains a maximum low frequency content. It repeats a string of nineteen 0s followed by two 1s.
EDH Insertion		Can be enabled or disabled by user.
Field Timing Offset Range	± 1 field	Relative to the genlock input
Field Timing Offset Resolution		Video field increments
Vertical Timing Offset Range	± 8 lines	Relative to the genlock input
Vertical Timing Offset Resolution		Video line increments

Table 1–8: Signal characteristics for AES/EBU serial digital audio outputs (XLR connectors)

Characteristics	Performance requirements	Supplemental information
Standards Conformance		ANSI S4.40, SMPTE RP 155-1990
Audio Connectors	2	3-pin XLRs, male contacts
Digital Format		Serial, balanced signal pair and a signal ground
Digital Code		Bi-phase mark
Output Level	2-7 V_{p-p}	Measured differentially across 110 Ω.
Required Receiver Termination	110 Ω ± 10%	
Encoding Format		Linear PCM, two's complement binary representation.
Audio Sampling Frequency		48.000 kHz, locked to video
Number of Audio Channels	4	2 AES/EBU audio pairs on each audio connector
Quantized Resolution		20 or 24 bits (user selectable)
Audio Tone Frequency	800 Hz or 1 kHz or Silence (audio black)	User selectable, channel-by-channel
Audio Tone Amplitude	–10 to –20 dB in 2 dB steps plus Silence (audio black)	User selectable, channel-by-channel
Rise and Fall Times	Between 5 and 30 nsec	Measure from the 10% to 90% points across 110 Ω.
Pre-emphasis		None
Jitter on Data transitions	Within ± 20 nsec from an ideal clock.	
Channel Status Bits		Uses default settings, except explicit data resolution status. Emphasis bits may be set to test receivers (but do not enable emphasis in the data). (See Table 4–15.)

Table 1–9: Signal characteristics for AES/EBU serial digital audio outputs (BNC outputs)

Characteristics	Performance requirements	Supplemental information
Standards Conformance		SMPTE RP 155-1990
Audio Connectors	2	BNC connectors
Audio Timing		
Digital Format		Serial, (unbalanced) signal and a signal ground
Digital Code		Bi-phase mark
Output Level	1 V ± 0.2 V	Measured across 75 Ω.
Required Receiver Termination	75 Ω ± 10%	

Table 1–9: Signal characteristics for AES/EBU serial digital audio outputs (BNC outputs) (cont.)

Characteristics	Performance requirements	Supplemental information
Encoding Format		Linear PCM, two's complement binary representation.
Audio Sampling Frequency		48.000 kHz, locked to video
Number of Audio Channels	4	2 AES/EBU audio pairs on each audio connector
Quantized Resolution		20 or 24 bits (user selectable)
Audio Tone Frequency	800 Hz or 1 kHz or Silence (audio black)	User selectable, channel-by-channel
Audio Tone Amplitude	–10 to –20 dBFS, in 2 dB steps plus Silence (audio black)	User selectable, channel-by-channel
Jitter on Data Transitions	Within ± 20 nsec from an ideal clock	
Pre-emphasis		None
Rise and Fall Times	Between 30 and 44 nsec	Measured from the 10% to 90% points across 75 Ω.
Channel Status Bits		Uses default settings, except explicit data resolution status. Emphasis bits may be set to test receivers (but do not enable emphasis in the data). (See Table 4-15.)

Table 1–10: Signal characteristics for embedded serial audio

Characteristics	Performance requirements	Supplemental information

Table 1–14: Genlock function

Characteristics	Performance requirements	Supplemental information
Input Configuration	One 75 Ω loopthrough or two 75 Ω terminating inputs	User selectable
Genlock Input Return Loss	≥40 dB	0 – 5 MHz
Isolation between two 75Ω terminating inputs	≥60 dB	0 – 5 MHz
Internal Reference Free-Run Frequency	13.5 MHz ± 13 Hz	1 ppm/year max drift combined with 1 year calibration cycle.
Pull-in Range	Subcarrier frequency ± 20 Hz	
Genlock Input Signals		Burst locks to NTSC and PAL composite signals. Sync locks to monochrome NTSC and PAL signals. Carrier locks to 1, 3.58, 4.43, 5, and 10 MHz.
Carrier Lock Amplitude		2 V_{p-p} (8 dBm) nominal input level
Burst Lock Jitter	≤0.5°	SNR[2] >50 dB.
Genlock Noise Performance		Will remain locked with SNR > 30 dB or 60 Hz hum < 1 $V_{p-p.}$
Burst Lock Phase Change with Input Burst Amplitude	≤1°	Over burst amplitude range of nominal value ± 3 dB.
Burst Lock Phase Change with Input Signal APL	≤1°	Over input signal APL range of 10% to 90%.
Sync Lock Jitter	≤0.6 nsec	(≈0.75° at 3.58 MHz, ≈1° at 4.43 MHz), SNR >50 dB
Sync Lock Timing Change with Input Sync Amplitude	≤2 nsec	Over sync amplitude range of nominal value +3 to –3 dB.
Input SC/H Phase Range for Correct Color Framing	0° ± 45°	Will maintain initial color framing until the SC/H error exceeds 120° nominally.
Genlock Timing Range	± 2 fields ± 8 lines ± 1/2 line sub-clock-cycles	
Genlock Timing Resolution		< 0.1° of subcarrier.

[2] SNR is defined as the ratio of 1 V_{p-p} video to the rms value of white gaussian noise over a 5 MHz bandwidth.

Functional Overview

There is one input and several different kinds of outputs available from the SPG 422. This section explains what these signals are and how to use them.

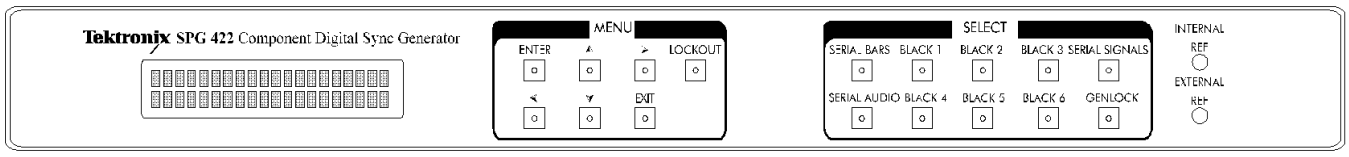

Figure 2–1: SPG 422 front panel

Genlock

The genlock input accepts either NTSC, PAL, or CW inputs. The SPG 422 expects the input to be an Analog Black reference signal either with or without burst. If burst is not present, then the SPG 422 can lock to the sync (instead of burst lock). Configure the genlock as either a loopthrough or two terminated inputs.

The user can change the timing to compensate for any delays inherent in their system.

Please note that the SPG 422 cannot auto-detect the genlock input standard. Configure the genlock through the front panel or the RS-232 remote control. Setting up the genlock Input signal has three parts: selecting video standard, selecting input configuration, and setting timing offset.

Genlock Video Standard

There are two different video standards to choose from (NTSC or PAL). Also you can choose between burst lock and sync lock.

You can also select from a list of continuous wave frequencies: 3.58, 4.43, 1.0, 5.0, or 10.0 MHz.

If the genlock is set to burst lock but the Input signal has no burst or it suddenly looses burst, the menu display of the SPG 422 will say: “Reference Unknown”. All output signals will remain locked to the internal oscillator.

Genlock Input Configuration

Connect the genlock signal in three different ways. Figure 2–2 illustrates the various options.

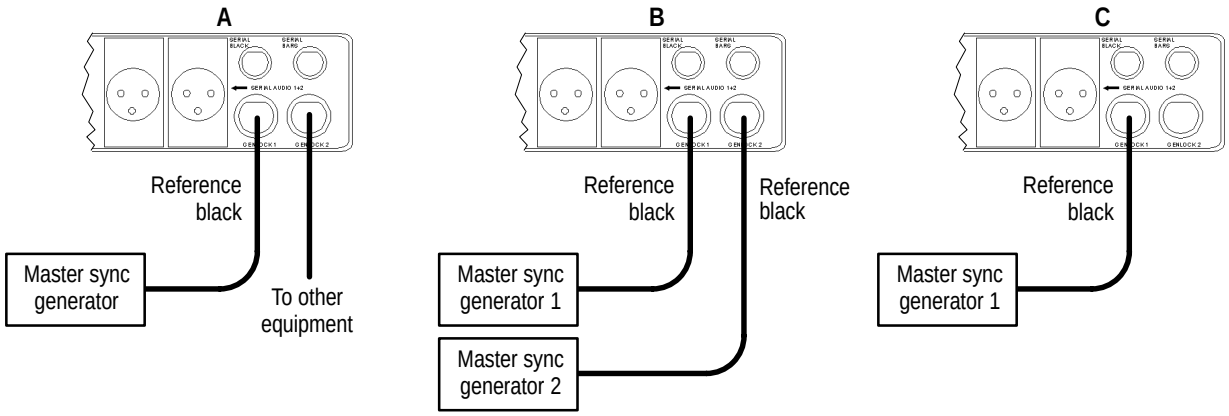

Figure 2–2: Various ways genlock input can be configured

Figure 2–2A shows the genlock as a loopthrough signal from genlock A to genlock B. This application is common when the SPG 422 is close to the master sync generator and the master sync still has other equipment to feed.

Figure 2–2B shows two possible genlock inputs: Genlock 1 and Genlock 2. These are two different references. You can select which one you want from the front panel (remember that the unselected genlock input is still terminated). An application for this setup is a dual standard suite. One genlock input would be the 525/59.94 standard and the other 625/50 standard. Set some blacks for each standard, and the user can quickly shift between the standards with a menu change.

Figure 2–2C shows a single genlock input. This is appropriate for the last signal in a reference chain.

Genlock Timing

The commands under this menu set the amount of advance or delay for all the output signals relative to the genlock input. The individual signals can then have their timing adjusted in their own menus.

You do not need to press **ENTER** for these commands. All changes will occur as you make them.

The submenus for genlock timing are: field timing, vertical offset, horizontal offset, and fine horizontal offset.

Genlock Field Timing Sets the amount of field offset using the left or right arrows. The maximum amount of offset is two fields of advance or delay.

Genlock Vertical Offset The genlock vertical offset sets the amount of vertical offset using the left and right arrows. The changes are immediate (you do not need to press **ENTER** to see the results). The amount of offset can range from eight lines advance to eight lines delay.

Genlock Horizontal Offset Genlock horizontal offset sets the amount of horizontal offset using the right or left arrow keys. It will move in units of clock cycles so the exact amount will vary depending upon the video standard selected. The total range of the horizontal offset is ±½ line.

Genlock Fine Horizontal Offset Genlock fine horizontal sets the fine horizontal timing. These increments are in sub-clock-cycle units. The total range of the fine horizontal offset is ±½ line.

Black Signals

There are at least two analog black outputs available from the rear panel. (If the SPG 422 is Option 1, then there are six analog black outputs.) Configure each separately for standard, timing, and signal type. If the selected standard is different from the genlock input, then it locks to the internal oscillator that is "clock-locked" to the genlock input. The timing offset range is ± 2 fields and ±8½ lines.

Bars Signals

The bars BNC connector outputs serial digital component color bars in either the 525 or 625 standard. A timing shift of ± 1 field and ±8½ lines is available. It is not necessary that the bars output and the genlock input be the same standard. If they are not the same standard, then the signal locks to the internal oscillator that is "clock-locked" to the genlock. Select all variables from the Bars signals menu.

Serial Black

The serial black signal is identical to the serial bars signal except the bars signal information has been stripped off and replaced with black. It takes its timing offset information directly from the serial bars signal.

Audio Signals

There are three different formats of serial audio signals available from the rear panel: AES/EBU from BNC connectors and from XLR connectors plus embedded audio in the serial digital video signal. If any audio parameters change, then all of the audio outputs are affected. Different audio tones and levels are available for each channel. Up to four channels are available. Turn them on or off and change the tone and levels independently.

Although the output frequency and amplitudes are the same, the AES and embedded audio are essentially generated by separate generators. Therefore, there is no consistent phase relationship between the two with respect to audio tones. The digital audio sample frames are synchronized with the video frame.

Serial Signals (Option 2 only)

If Option 2 is not installed then these outputs are plugged. Both outputs have identical signals. There are a wide variety of signals from which to choose. The timing offset relative to the genlock is selectable. The standard is selectable and can be independent of the genlock standard. If the standard is different from the genlock, then it takes its timing from the internal oscillator that is “clock-locked” to the genlock signal. Therefore, the signal will be clock-locked but not frame-locked to the genlock reference signal.

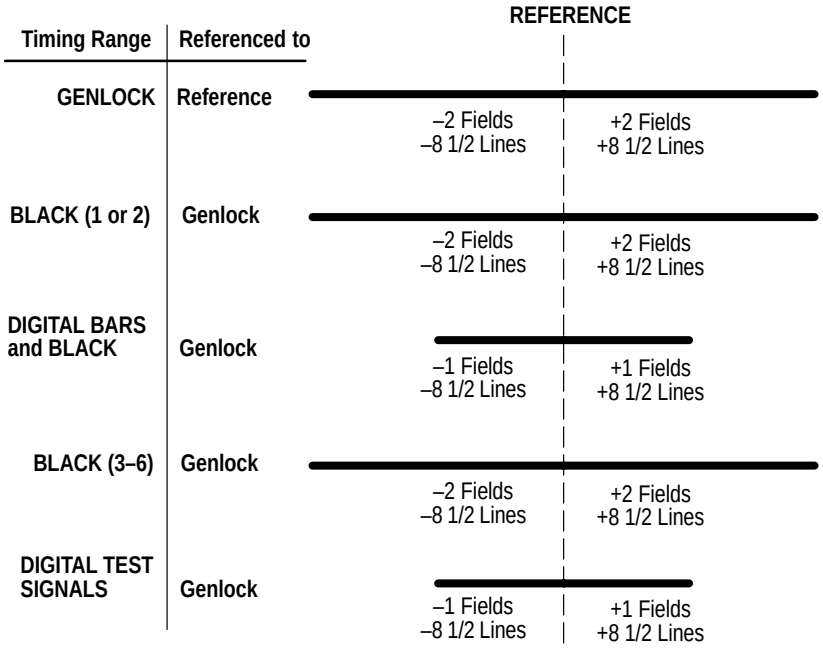

Figure 2–3: Illustration of SPG 422 timing

Theory of Operation

This section provides block-level information on how the SPG 422 circuitry works, for board-level troubleshooting. See Figure 3–1 for an SPG 422 block diagram. Component-level troubleshooting information is provided later, in a section titled Detailed Circuit Description.

Genlock

The Genlock input signal enters the circuit on the Output board through the rear-panel BNC connectors. The signal from the BNC is selected by the 2:1 Multiplexer. The signal then goes to the Sync Stripper that produces a clamped video signal and a luminance signal for use in the Chroma Filter. The Sync Stripper uses the output of the Chroma Filter to produce the luma and clamped video signal. The 2:1 Multiplexer selects the chroma and CW Bypass signals used as the Color Lock input.

On the Digital board, the outputs of the Sync Lock, Color Lock, Test, and Internal are put in a 4:1 multiplexer for use as the tune signal for the 13.5 MHz VCXO. The 13.5 MHz signal is then stepped up in frequency in the 108 MHz PLL that produces the 108 MHz and 27 MHz clocks. The Genlock Controller produces the Frame Resets. The Fine Phase circuitry generates delayed versions of the 27 MHz clock from the 108 MHz clock. The Frame Resets are then re-synchronized to these delayed clocks. The Fractional Divider uses the 27 MHz clock to produce the 6.144 MHz clock for the audio signals.

Front Panel Board

The Front Panel board consists of LEDs and switches. The LEDs light on commands from the CPU. The switches provide control commands to the CPU that determine the state of the output signals.

The Front Panel Interface converts the X-Y data format of the front-panel switches into data for the external data bus to control the microprocessor. If the front panel is disabled, then the commands from the front panel are not processed.

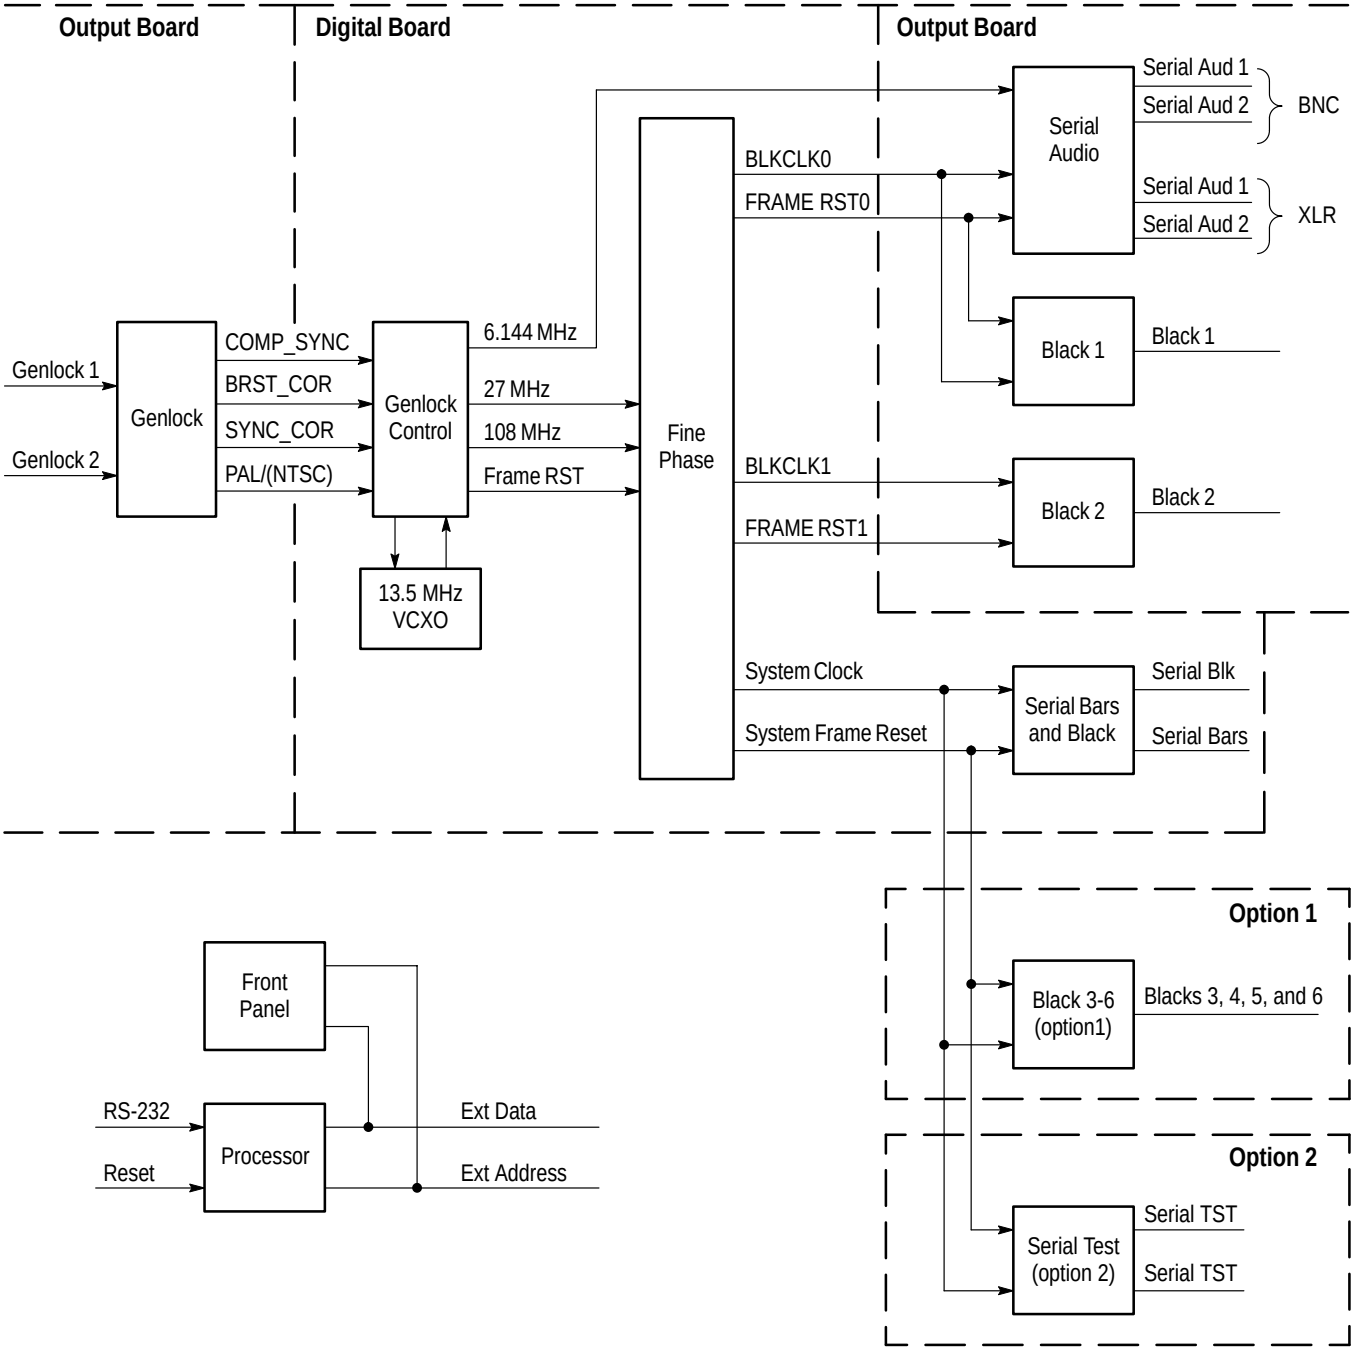

Figure 3–1: SPG 422 block diagram

Digital Board

The Digital Board CPU consists of the microprocessor and its associated memory and buffers.

The Ground Closure Parallel Remote consists of a latch that samples the remote data and places it on the external data bus whenever it is polled by the microprocessor.

The microprocessor sends data over the external data bus for conversion into driver signals for the front-panel LEDs.

The Display Data Latch consists of two parts. The first gets data from the external data bus and converts it into an analog voltage that controls the contrast of the front-panel display. The second part controls the actual characters displayed on screen.

The Test Signal Generator is a complete generator, requiring only a master clock, a synchronous frame reset, and setup information from the microprocessor. On startup, the processor writes the signal configuration information to the generator and downloads the necessary audio and video test signals into RAM.

Audio RAM data is the audio tone formatted in a specific format for AES audio. This data is read from the Audio RAMs at a particular point in the video data stream to be embedded. The audio data is placed into RAM by the microprocessor.

Controlled by signals from the CPU, the Genlock Type Selector selects which type of genlock signal to expect. The selected signal is then converted and used as the correction signal for the VCXO.

The heart of the VCXO is the Oven Oscillator Assembly, which takes the VCXO correction signal and a reference voltage to produce a 13.5 MHz instrument clock signal that is phase locked to the genlock input signal. All other timing signals are derived from this main reference clock signal.

Any errors with the oscillator are flagged with LEDs.

The main purpose of the Direct Digital Synthesizer is to produce the clock for the Burst Lock circuit and the edge strobe for the Sync Lock circuit.

The 108 MHz oscillator steps up the 13.5 MHz instrument clock to produce a 27 MHz clock and a 108 MHz clock.

The 27 MHz clock is used by the Genlock Controller and DDS. The Fine Phase and SCH measurement circuits use the 108 MHz.

The Fine Phase circuit consists of four identical circuits. The resulting signal is used to drive the test signal and option 1 timing.

The 6.144 MHz circuit produces the timing signals for the serial audio generation on the Output board.

Output Board

The Genlock input signals enter through the two rear-panel BNCs and is either terminated in 75 Ω or allowed to pass to the other input depending on the state of a signal from the Digital board. Another signal from the Digital board also further selects the input until only one of the two inputs is available.

The Sync Stripper takes the selected genlock input and produces two signals.

The Chroma filter has two purposes. First it strips chrominance information so that the Sync Stripper can use the luminance information to generate its reference signals. Second, it produces a reference signal that is the main genlock signal when the genlock is in the color lock mode.

The Burst Lock part of the Color Lock circuit takes signals from the Chroma Filter and Sync Stripper and converts them to signals for the rest of the instrument.

The Sync Lock circuit takes signals from the Sync Stripper and the Digital board and generates a signal that is sent to the Digital board.

The Black Clock Buffer converts the four black ECL clock signals to TTL levels for use on the Output board.

The Audio Generator consists of the controller PLD, Channel 1 and 2 RAM, and Channel 3 and 4 RAM.

The controller has five primary functions. First, it generates the RAM address needed by the microprocessor to write and read from the audio RAMs. Second, it generates the RAM addresses needed to read data out of the RAMs in real time. Third, it generates the control signals to control the RAMs. Fourth, it bidirectionally buffers the data between the external microprocessor data bus and the RAM data buses. The final function of the audio control PLD is to provide the user with the capability of offsetting the audio to the video timing. (This timing offset only relates to sample timing relative to video, not the timing offset of the audio blocks.) The microprocessor loads the 8-bit audio timing offset into a register in the PLD.

Audio parallel-to-serial converters take parallel audio data and convert it into a serial data stream.

The Audio Output circuit takes the signals from the parallel-to-serial converters and buffers, balances, and raises the amplitude to drive either the 100 Ω outputs or 75 Ω BNCs.

The two Black Burst Generators are nearly identical. The black burst generation circuit is a complete generator, requiring only a master clock, synchronous frame PAL and NTSC resets, and setup information from the microprocessor.

The black burst generator incorporates as much of the circuitry as possible into a large programmable logic device (PLD). The large, random look-up tables are done in EPROM.

The Black Burst Generator begins with a Frame Reset Generator that takes a PAL and an NTSC frame reset signal and selects between them, based on the signal standard chosen. This reset pulse is then delayed by an integer number of clock cycles specified by the microprocessor. This delayed reset pulse is used to synchronously reset the horizontal, vertical, and field counters. This programmable delay provides the instrument with a way to delay (or advance) the timing of the generator relative to the master timing source (the genlock). In the case of the two standard Black Burst Generators, the 27 MHz clock is also delayed in sub-nanosecond increments, under processor control, before it arrives at the generator. This allows fine control of output timing.

The clock and reset drive the counter chain. The first counter in the chain is the horizontal counter, an 11-bit up-counter that counts at 27 MHz and resets itself at the end of the video line. It is also reset by the frame-reset input. The line length is specified by the video standard selected. On the last count of the line, the counter outputs a horizontal carry pulse.

The horizontal segment data is used to divide the horizontal line into a small number of unique regions. This allows the storage of the actual signal data to be dramatically compressed.

The second counter in the chain is the vertical counter, a 10-bit up-counter that runs at 27 MHz. It is enabled to count once per video line by the horizontal carry pulse. It counts to the end of the frame in the selected video standard and resets itself. (It is also reset by the frame reset input.) On the last count of the frame, the counter outputs a vertical carry pulse.

The third counter in the chain is the frame counter, a 2-bit up-counter that runs at 27 MHz. It is enabled to count once per video frame by the horizontal and vertical carry pulses. It counts to the end of the color frame in the selected video standard and resets itself. (It is also reset by the frame reset input.)

The counters, horizontal segment decoder, and signal selection bits from the processor drive the segment decoder PROMs. These PROMs decode the counter and decoder inputs into pointers to unique blocks of eight samples of black-burst data.

Signal-segment data PROMs take the segment pointers from the decoder PROMs and output the 8-bit black-burst data.

The DAC and output circuitry converts the digital representation of black burst to analog, reconstructs the signal, filters it, and buffers it to drive 75 Ω.

Power Supply

The switching power supply generates 5 V for TTL and ECL devices. A stable linear supply of 12 V is provided for powering the analog circuitry.

This type of power supply is called a current-mode-controlled, discontinuous, flyback, switching power supply. The current output is distributed between the four supplies as follows:

+ 12 V	0.8 Amps max
+5 V	7 Amps max
–5 V	6 Amps max
–12 V	0.8 Amps max

The maximum power is limited by the maximum current in the primary of the power inductor. This is also the only current limit for the ± 5 V supplies, as they have no secondary current limit. The ±12 V supplies are current limited on the secondaries by the ±12 V linear regulators and the secondary ± 14.5 pulse width modulator.

There is also circuitry to provide for operation from both 110 and 220 VAC supplies, over-voltage protection (crowbar) on the +5 V supply, and shutdown circuitry that forces a restart of the supply if it remains in current limit for more than a short period of time (≤ 200 ms).

WARNING. *All primary voltages are referenced to a floating ground, not chassis ground. Potentials to chassis ground can be much higher and the possibility exists that you could electrocute yourself.*

Option 1 Board

The SPG 422 Option 1 board contains four identical, separate dual-standard black generators. Each generator runs on a 27 MHz master clock, with PAL and NTSC frame resets to synchronize them and some microprocessor setup information to program them.

The four black generators are controlled by the microprocessor and the Controller PLD, which takes the video standard selection for each channel and selects and processes the appropriate frame reset pulse for each generator. The Controller PLD also generates the necessary microprocessor interface signals for each Encoder.

Option 2 Board

The Option 2 board produces the additional serial digital test signals that are available when Option 2 is installed in the SPG 422. The circuitry is identical to the Bars generation in the standard instrument.

The Test Signal Generator is a complete generator, requiring only a master clock, a synchronous frame reset, and some setup information from the microprocessor. On startup, the processor writes the signal configuration information to the generator and downloads the necessary audio and video test signals into RAM.

Detailed Circuit Descriptions

This section provides detailed circuit descriptions.

Logic Conventions

Signal names are all capital letters, for example, SIGNAL.

An active low signal (normally denoted by an overscore) is a signal name enclosed in parentheses, (SIGNAL).

The aside of a signal name is always in square brackets, for example, [SIGNAL].

The aside of an active-low signal is also the signal name in square brackets, for example, [(SIGNAL)].

Front Panel Board

The Front Panel board consists of LEDs and switches. The LEDs light on commands from the CPU, [L0-L17]. The switches provide control commands to the CPU that determine the state of the output signals.

Digital Board CPU <1>

The CPU consists of the microprocessor, U3, and its associated memory and buffers. U11 contains the serial bars data. U10 contains the audio data and CPU codes. U6 is the external data-bus buffer, while U7 and U8 are the external address buffers.

Digital Board CPU I/O <2>

The Ground-Closure Parallel Remote. This consists of a latch that samples the remote data and places it on the external data bus whenever it is polled by the microprocessor.

Front-Panel Switch Interface. The Front Panel Interface converts the X-Y data format of the front-panel switches into data for the external data bus to control the microprocessor. If the front panel is disabled, then the commands from the front panel are not processed.

Front-Panel LED Drivers. The microprocessor sends data over the external data bus, and U14, U15, and U16 convert the commands into driver signals for the front-panel LEDs, L[0..19].

Display Data Latch. The Display Data Latch consists of two parts. The first part gets data from the external data bus and converts it into an analog voltage, U22, that controls the contrast of the front-panel display. The second part controls the actual characters displayed on the screen, U17.

Serial Video Generation <3>

The Test Signal Generator is a complete generator, requiring only a master clock, (SCBCLK); a synchronous frame reset, (SCBFRP) or (SCBFRN); and some setup information from the microprocessor. On startup, the processor writes the signal configuration information to the generator and downloads the necessary audio and video test signals into RAM.

Horizontal, Vertical, and Field Counters and Decoding PLDs. U25 and U34 are the Horizontal, Vertical, and Field Counters and Decoding PLDs.

The clocks and reset drive the counter chain. The counter drive state machine selects the proper test signal RAM address at the correct time in the field.

Timing Reference Signal Generator. U36 is the Timing Reference Signal (TRS) Generator. It gets the appropriate TRS data addresses and loads them into the Serial Bars RAMs so that the data is multiplexed into the video signal.

Serial Bars RAM. U26 and U27 are the Serial Bars RAM. Each line of the video signal is stored in sample order, with each video line bottom-justified in memory on 1 kB boundaries. The required video signals are downloaded into the RAM at power-up and are not changed during operation unless the video standard is changed.

The Serial Bars RAMs output, SCBD[0..9], is the parallel video signal with the TRS data loaded.

Serial Coprocessors <4>

Audio Data RAM. The data in the Audio RAMs is the audio tone in a specific format for AES audio. This data is read out of the Audio RAMs at a particular point in the video data stream to be embedded. The audio data is placed into RAM by the microprocessor by using the address, EA[0..14], and data ED[0..7] buses and the various control signals.

Serial Digital Coprocessor and Serial Blanker Coprocessor. The parallel digital video data with TRS inserted, SCBD[0..9], enters U45. The audio data is then multiplexed into the data on the data stream from the Audio Data RAMs, U42

and U43. The video data with embedded audio exists from U45 on the SER DIG[0..9] bus and enters into U44 as the serial data test signal, SDT[0..9]. There the video stream splits in two. EDH data is embedded into one of the data streams, scrambled, and exits U44 as the serial digital test signal, SDT[0..9]. The other data stream is converted into a black signal, EDH data is embedded, scrambled, and exits U44 as the serial digital black signal, SDB[0..9].

The Coprocessors are programmed by the microprocessor from the data stored in U11 <1>. The audio data is a part of the data in EPROM, U10 <1>.

Serial Video Outputs <5>

The serial black, SDB[0..9], and serial bars, SDT[0..9], signals are serializer by U48 and U49, respectively. U47 and U46 are the Serial Output drivers for the signals.

13.5 MHz Genlock Control <6>

Genlock Type Selector 4:1 MUX. Controlled by signals from the CPU, U50 selects which type of genlock signal to expect. The selected signal is then converted to VCO_TUNE and used as the correction signal for the VCXO.

13.5 MHz VCXO. The heart of the VCXO is the Oven Oscillator Assembly. It takes the VCXO correction signal and a reference voltage to produce the 13.5 MHz instrument clock signal that is phase locked to the genlock input signal. The 13.5_OSC signal is this main reference clock signal. All other timing signals are derived from this signal.

Any errors with the oscillator are flagged with LEDs. DS4 will light if the VCO_TUNE signal is greater than its threshold level. This indicates that the oscillator is not in its acceptable level. DS1 will light if the oscillator is under temperature. The oscillator is not consider stable until this light goes out (after an approximate 20-minute warm-up time).

Direct Digital Synthesizer. The main purpose of the Direct Digital Synthesizer, U82, is to produce the F_{SC} clock for the Burst Lock circuit and the Edge Strobe for the Sync Lock circuit.

108 MHz Oscillator <7>

The purpose of the 108 MHz oscillator is to step up the 13.5 MHz instrument clock to produce the 27 MHz clock and the 108 MHz clock.

The 27 MHz clock is used by the Genlock Controller and DDS. The Fine Phase and SCH measurement circuits use the 108 MHz.

DS2 lights if the 108 MHz loop is unlocked.

Fine Phase Control Signals. U91 uses the change angle signals from the Genlock Controller to generate clocks that are slightly off phase from the main 27 MHz

clock. These signals are clocked by the 108 MHz clock through the D-Q flip-flops. F_PHASE signals then go to the Fine Phase circuits <8>.

DDS Clock Generator. The 27 and 108 MHz signals are combined in D-Q flip-flop U108A to produce the DDSCLK and 27CLK0 signals for the DSS 6.144 MHz circuit <9>.

108 MHz Oscillator. The 108 MHz oscillator uses the 13.5 MHz clock from U87 and multiplies the frequency by a factor of 8 to produce the 108 MHz clock. The 108 MHz signal is used to clock the Fine Phase Control and SCH Measurement circuits.

Fine Phase <8> The Fine Phase circuit consists of three identical circuits, therefore only the Genlock Fine Phase Adjustment circuitry is described.

F_PHASE0 and (F_PHASE0) come from the Fine Phase Control circuit <7> and generate clock signals that can be set to any phase with respect to the base 27 MHz clock signal. The resulting signal is used to drive the test signal and option 1 timing.

DDS 6.144 MHz <9> This circuit produces the timing signals for the serial audio generation on the Output board.

Output Board

Genlock Input <1> See Figure 3–2.

Genlock Selector 2:1 MUX. The Genlock input signals enter through the two rear-panel BNCs. The first relay, K1, either terminates the input side in 75 Ω or allows it to pass to the other input depending on the state of the REFDUAL signal from the Digital board. On instrument serial number B020518 and above, K1 is a latching relay that prevents a state change when power is lost. The REF1/2, also from the Digital board, then further selects which input until only one of the two inputs is available as the MUX_VIDEO signal.

Sync Stripper. The Sync Stripper, U10, takes the selected genlock input, MUX_VIDEO, and produces the REF_VIDEO, (COMPSYNC), and (HDRIVE) signals.

Chroma Filter. The Chroma filter has two purposes. First it strips the MUX_VIDEO signal of any chrominance information so that the Sync Stripper can use the luminance information to generate its reference signals. Second, it produces the REF_CHROMA signal which is the main genlock signal when the genlock is in the color lock mode.

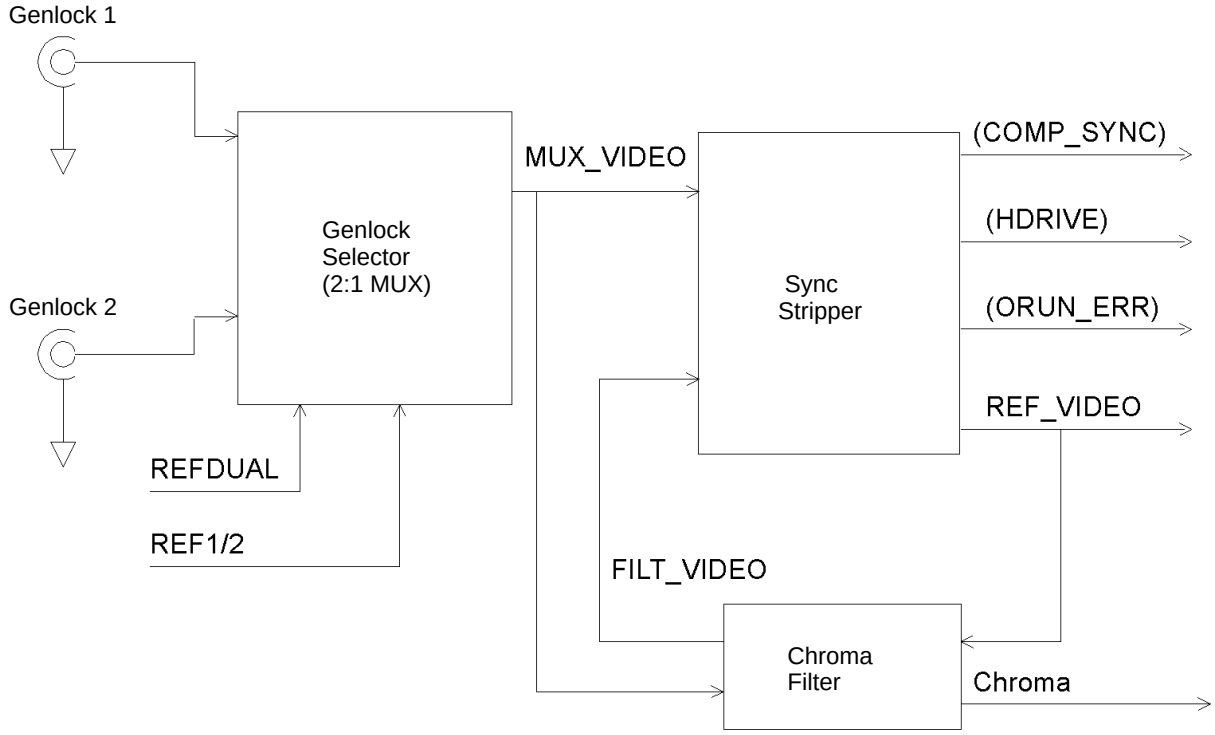

Figure 3–2: Block diagram of genlock Input <1>

Burst and Sync Locks <2> See Figure 3–3

Burst Lock The heart of the Color Lock circuit is U11. It takes the REF_CHROMA from the Chroma Filter and the COMP_SYNC signal from the Sync Stripper and converts them to signals for the rest of the instrument: BRST_COR, (BRST_LK), and H/2_ERR.

Sync Lock The Sync Lock circuit takes the REF_VIDEO signal from the Sync Stripper and the EDGEST signal from the Digital board and generates the SYNC_COR signal. The SYNC_COR signal is then sent to the Digital board.

Black Clock Buffer U1 (and U60 for board version -01 and up), the Black Clock Buffer, converts the four black ECL clock signals to TTL levels for use on the Output board.

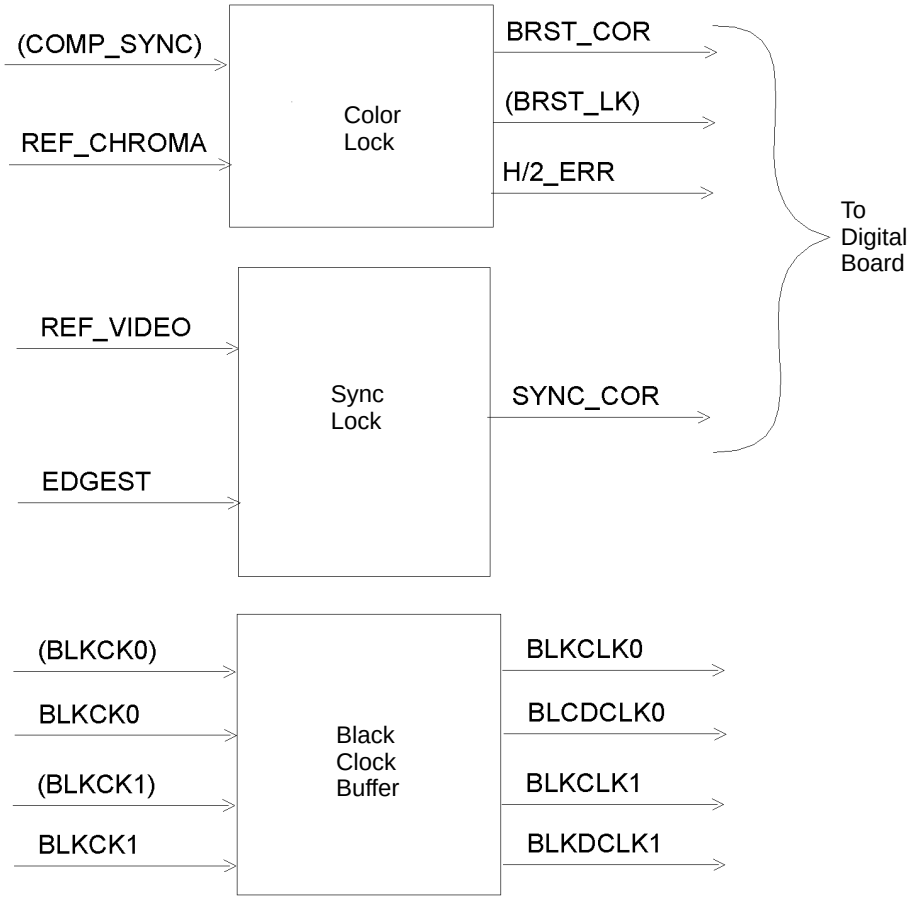

Figure 3–3: Block diagram of burst and sync locks <2>

Serial Audio Outputs <3>

Audio Generator. The Audio Generator consists of U24 (the controller PLD), U22 (Channel 1 and 2 RAM), and U23 (Channel 3 and 4 RAM).

The controller contains an address counter that free-runs on a clock locked to the serial test signal output clock, at the audio data output bit-rate (6.144 MHz). It continuously reads out the audio data. It also has another counter that can be single-stepped by the microprocessor for downloading audio data. The microprocessor gets audio frequency and amplitude and status bits from the user or the NVRAM, generates the audio data stream, inserts the CRC, and downloads it into RAM.

The controller has five primary functions.

1. Generate the RAM address needed by the microprocessor to write and read from the audio RAMs (U22 and U23).

2. Generate the RAM addresses needed to read data out of the RAMs in real time.
3. Generate the control signals to control the RAMs.
4. Buffer bi-directionally the data between the external microprocessor data bus and the RAM data buses.
5. Provide the user with the capability of offsetting the audio to the video timing.

The timing offset relates only to sample timing relative to video, not the timing offset of the audio blocks. The microprocessor loads the 8-bit audio timing offset into a register in the PLD.

Audio Parallel-to-Serial Converters. U18 and U19 take the audio data, in parallel form, and convert it into a serial data stream.

Audio Outputs. The Audio Output circuit takes the signals from the Parallel to Serial Converters and buffers, balances, and raises the amplitude to drive either the 100 Ω outputs or 75 Ω BNCs.

Black Burst Generator #1 <4> and Black Burst Generator #2 <5>

Black Burst Generator #1 and #2 are nearly identical, therefore only #1 is described.

The black burst generation circuit is a complete generator, requiring only a master clock [BLKCLK0], synchronous frame PAL and NTSC resets [(BLKFNP0) and (BLKFRN0)], and some setup information from the microprocessor [ED[0..7]].

The black burst generator incorporates as much of the circuitry as possible into a large programmable logic device, PLD. The large, random look-up tables are done in EPROM.

Black PLD (U31). The Black Burst Generator begins with a Frame Reset Generator that takes a PAL and an NTSC frame reset signal and selects between them, based on the signal standard chosen. This reset pulse is then delayed by an integer number of clock cycles specified by the microprocessor. This delayed reset pulse is used to synchronously reset the horizontal, vertical, and field counters. This programmable delay provides the instrument with a way to delay (or advance) the timing of the generator relative to the master timing source (the genlock). In the case of the two standard Black Burst Generators, the 27 MHz clock is also delayed in sub-nanosecond increments, under processor control, before it arrives at the generator. This allows fine control of output timing. (See Fine Phase <8> on the Digital board.)

The clock and reset drive the counter chain. The first counter in the chain is the horizontal counter. This 11-bit up-counter counts at 27 MHz and resets itself at the end of the video line. It is also reset by the frame reset input, either (BLKFRN0) or (BLKFRP0). The line length is specified by the video standard selected. On the last count of the line, the counter issues a horizontal carry pulse.

The horizontal segment decoder is implemented in a state machine. This state machine uses the outputs of the horizontal counter and some special timing control signals from the horizontal counter. The horizontal segment data is used to divide the horizontal line into a small number of unique regions. This allows the storage of the actual signal data to be dramatically compressed.

The second counter in the chain is the vertical counter. This is a 10-bit up-counter that runs at 27 MHz. However, it is only enabled to count once per video line by the horizontal carry pulse. It counts to the end of the frame in the selected video standard and then resets itself. (It is also reset by the frame reset input.) On the last count of the frame, the counter issues a vertical carry pulse.

The third counter in the chain is the frame counter. It is a 2-bit up-counter that runs at 27 MHz. However, it is only enabled to count once per video frame by the horizontal and vertical carry pulses. It counts to the end of the color frame in the selected video standard and then resets itself. (It is also reset by the frame reset input.)

Segment Decoder PROMs. The counters, the horizontal segment decoder, and the signal selection bits from the processor drive the segment decoder PROMs. There is one PROM for NTSC, U38, and two (to get the required output bus width) for PAL, U36 and U37. These PROMs decode the counter and decoder inputs into pointers to unique blocks of eight samples of black burst data.

Signal Segment Data PROMs. The signal segment data PROMs, U39 and U40 (which are time-multiplexed to double the speed), take the segment pointers from the decoder PROMs and output the 8-bit black burst data.

DAC and Output Filter. The DAC, U32, and output circuitry convert the digital representation of black burst to analog, reconstruct the signal, filter it, and buffer it to drive 75 Ω.

Power Supply

The switching power supply generates 5 V for TTL and ECL devices. A stable linear supply of 12 V is provided for powering the analog circuitry.

This type of power supply is called a current-mode-controlled, discontinuous, flyback, switching power supply. The current output is distributed between the four supplies as follows:

+ 12 V	0.8 Amps max
+5 V	7 Amps max
-5 V	6 Amps max
-12 V	0.8 Amps max

The maximum power is limited by the maximum current in the primary of T1. This is also the only current limit for the ± 5 V supplies, as they have no secondary current limit. The ±12 V supplies are current limited on the secondaries by the ±12 V linear regulators, U150 and U152, and the secondary ± 14.5 pulse width modulator, U200.

The power inductor, T1, is driven by switching the voltage to its primary winding on and off at a rate of approximately 60 kHz. T1 is not used as a transformer, but as an energy storage device; the energy is stored in the primary during the first half of the switching cycle, while voltage is being applied. On the second half of the switching cycle, voltage to the primary is switched off and the energy stored in T1 is transferred to the secondaries. Regulation is accomplished by feedback from the +5 V supply to the Pulse Width Modulator controlling voltage to the primary. This varies the length of time that voltage is applied to the primary, causing it to store either more or less energy.

There is also circuitry to provide for operation from both 110 and 220 VAC supplies, over voltage protection (crowbar) on the +5 V supply, and shutdown circuitry that forces a restart of the supply if it remains in current limit for more than a short period of time ≤ 200 ms).

WARNING. *All primary voltages are referenced to a floating ground, not chassis ground. An isolation transformer or a differential amplifier is therefore required for troubleshooting the circuitry in the primary and the Pulse Width Modulator, and in the supporting circuits. Potentials to chassis ground can be much higher and the possibility exists that you could electrocute yourself.*

Input, AC to DC Converter, and Voltage Doubler

This circuitry filters and rectifies the input AC voltage, charging capacitors C845 and C865 to approximately 320 VDC.

The line current passes through line filter LF950, fuse F940, and power switch S930, and is applied to rectifier CR820. At the input of CR820, P810 is used to

select between 110 V and 220 V operation. If J810 is placed on P820, for 220 V operation, CR820 works as a full-wave rectifier and C845 and C865 act in series, charging to the peak voltage (approximately 320 VDC) during the first part of each one-half cycle. They then maintain that voltage through the rest of the cycle, as the input voltage and current fall to zero.

If, on the other hand, P810 is placed on J810 (for 110 V operation), CR820, C845, and C865 act as a half-wave rectifier and voltage doubler. During the positive half-cycle of the AC input only one of the diodes within CR820 conducts, charging C865 to the peak positive voltage. A different diode within CR820 conducts during the negative half-cycle, and charges C845 to the negative peak. The total voltage across C845 and C865 is then approximately 320 VDC.

E920 and E820 limit voltage surges on the input that might pass the line filter, while R865 and R845 discharge C865 and C845 when the power is off. DS720 and associated parts form a relaxation oscillator, so DS720 blinks when the instrument is powered up. L700, C5, C6, and C700 form a filter to keep noise developed by the Power Supply from getting onto C865 and C845 and out the line cord.

Kick Starter, Housekeeping Supply

These circuits supply the power to start and maintain oscillation of the Pulse Width Modulator, so long as the input AC voltage is sufficient to maintain regulation. When the power supply is first turned on, C656 charges through R921. When the charge across C656 reaches approximately 16 V, U722 begins to switch Q638 on and off through the base drive circuitry (Q648, and associated circuits).

The power to maintain the +16 V charge on C656 is now provided by the housekeeping winding of T1, pins 5 and 6, through CR600. If there is insufficient power to maintain the charge on C656 for any reason, such as the removal of P660, then the charge on C656 is quickly depleted. U722 will turn off when the voltage on C656 drops to approximately 10 V. Then, C656 will slowly charge again through R921, and the kick start sequence will be repeated. P660 may be used as a troubleshooting jumper, to trigger and verify the kick start sequence before applying power to T1 through P500.

Power Inductor Operation

The heart of this power supply is T1, the multi-winding power inductor. The operation of T1 is as follows (see Figure 3–4). Inductor T1 is initially uncharged (has zero magnetic flux). Q638, acting as a switch, is turned on by the base drive from U722. This places the charge developed on C545 and C865 (approximately 320 V) across the primary winding. The polarity of this charge is such that the voltages induced in the secondaries all reverse bias their respective diodes (note the polarity dots). In this way, there is no current flowing in the secondaries while current is flowing in the primary.

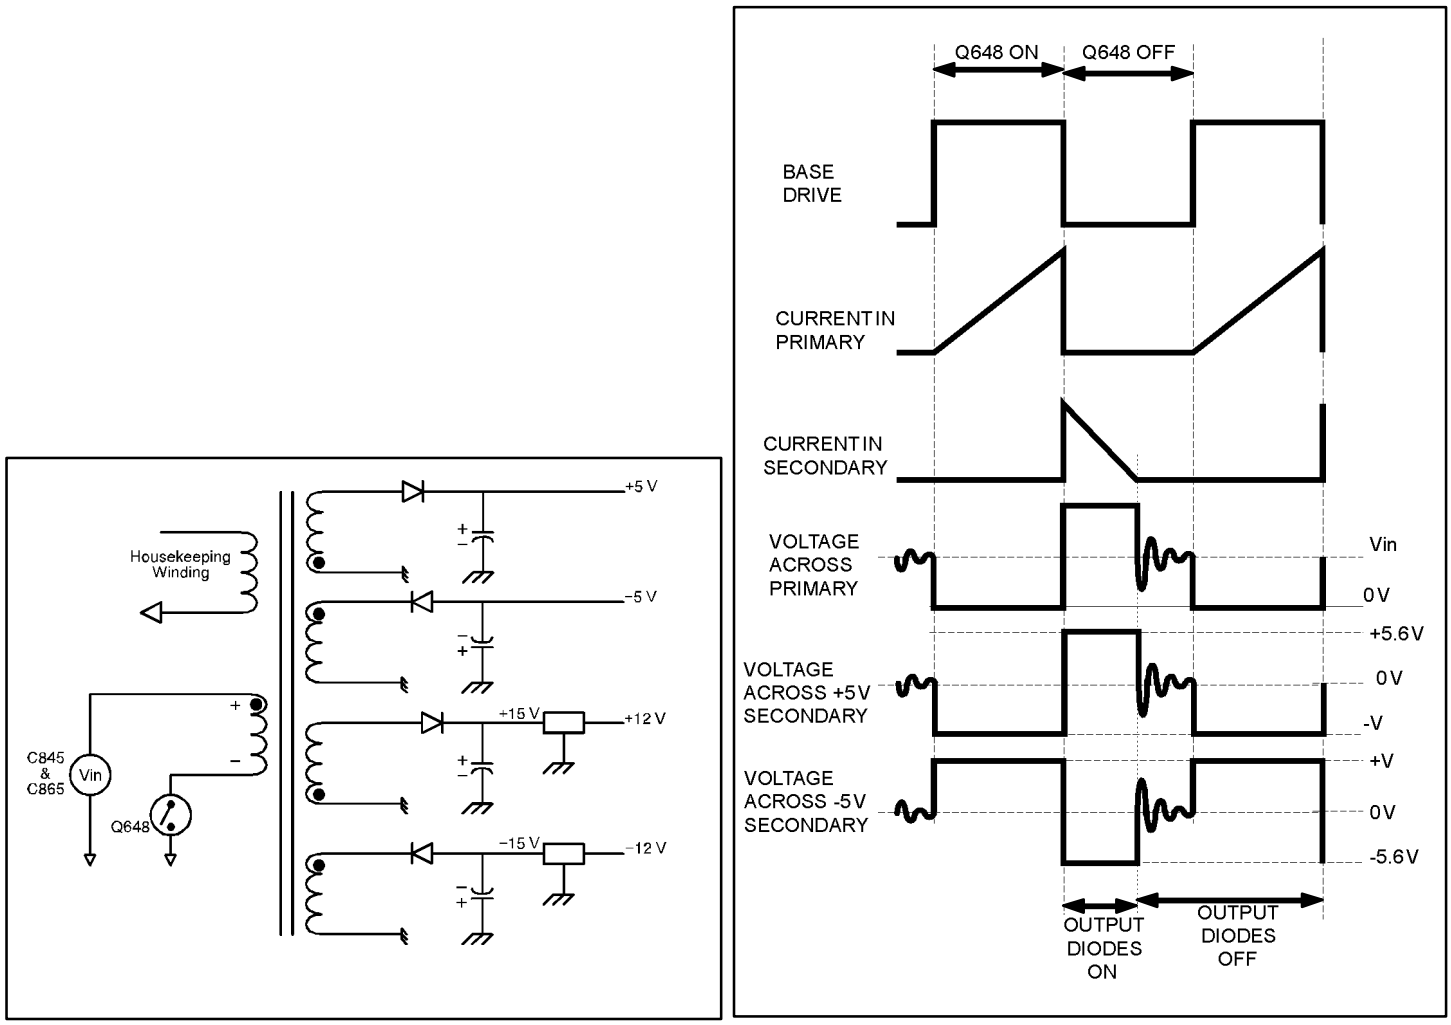

Figure 3–4: Power inductor circuit

The primary current builds as a linear ramp, storing the energy in T1 according to the relationship $E = 1/2\ Li^2$, where L is the primary inductance and i is the current flowing through it.

The current path is broken when Q638 is switched off, so current stops flowing in the primary. The flyback action of T1 then causes the voltages in the secondaries to reverse polarities, and CR575 and CR320 to turn on.

The current in the secondaries linearly ramps down as the energy that was stored in T1 primary is delivered to the load, charging the output capacitors.

When all of the energy that was stored in T1 during the first half of this cycle is delivered to the load, the current in the secondaries is at zero, and the diodes turn off. There is no current flowing in either the primary or the secondaries until

Q638 is turned back on to start the next cycle. As there is not a continuous flow of energy in T1, this is called discontinuous flyback operation. At low line voltages or high loads all the power in inductor T1 may not be transferred to the load during the second half of the cycle, in which case the diodes will not be off when Q638 turns back on. In that case there will also be some energy still stored in T1 at the end of the cycle (at low line or high load).

Load regulation is provided by sensing the +5 V supply with a divider comprised by R314, R315, and R415, and using U410 to convert this to an error signal. This error signal is optically coupled through U520 back to the Pulse Width Modulator, U722. U722 uses the error signal to vary the width of the pulse that drives Q638.

When the +5 V goes too high, U722 narrows the pulse width. This reduces the amount of energy stored in T1, and therefore the amount transferred to the load, so the +5 V goes down. Contrariwise, when the +5 V is too low, the pulse width is increased, increasing the amount of energy stored in T1 and then transferred to the load, so the voltage goes up.

Pulse Width Modulator and Error Amplifier

See Figure 3–5.

The Pulse Width Modulator, U722, is a current-mode controller. It uses inputs from the primary circuit and from the +5 V output to vary the width of the pulse that controls Q638, as mentioned above. This regulates the secondary voltages throughout variations such as input voltage, output load, and temperature.

Current mode control works by allowing the current flowing in the primary to reach a peak level that is set by the output of the error amp (internal to U722), which is controlled by the +5 V output. The current in the primary winding is sensed by R630, and applied to U722-3 as a voltage. At the start of the cycle the oscillator sets the flip-flop within U722, which turns Q638 on. The primary current, and therefore the voltage to U722-3, ramps up until the I - SENSE level is sufficient to trip the comparator. This resets the flip-flop, ending the drive pulse to Q638, and the energy stored in the transformer is transferred to the secondaries.

Line regulation is accomplished automatically without voltage feedback. As the input voltage increases, the slope of the ramp increases, and the trip point is reached sooner. This results in a shorter pulse width. A decrease in line voltage causes a decrease in the slope of the ramp, and it takes longer to reach the trip point. The same peak current is reached in both cases, however, so the same amount of energy is transferred to the load. Line regulation, then, is achieved before variations in output voltage can occur.

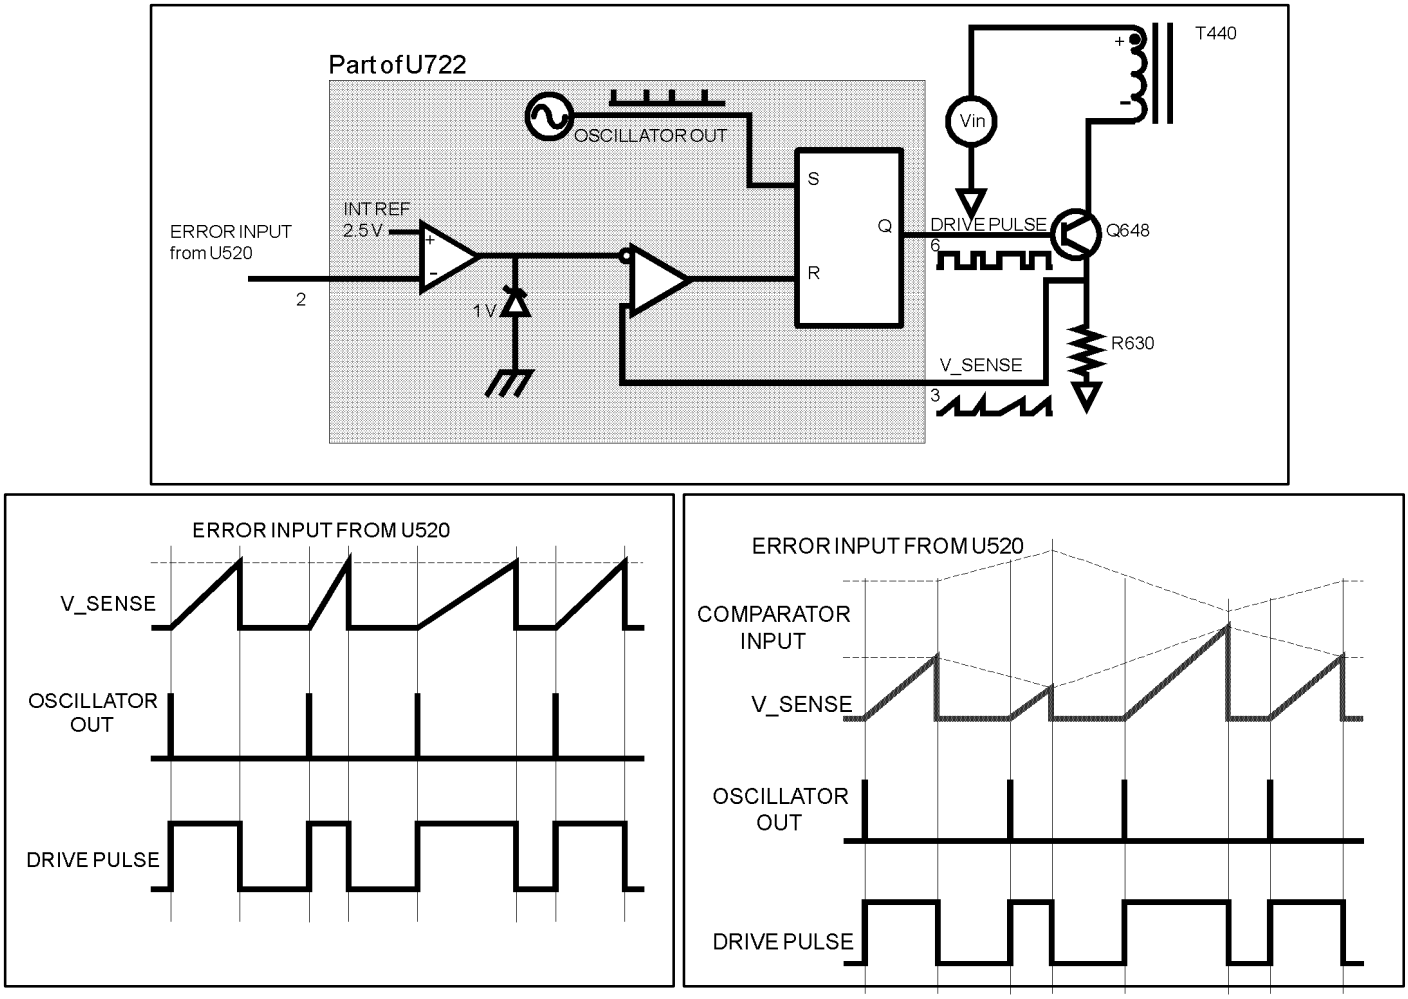

Figure 3–5: Pulse width modulator and error amplifier circuit

Load regulation is accomplished by sensing the output voltage of the + 5 V supply and comparing it to a 2.5 V reference (internal to U410). U410 is a band-gap reference set to function as an error amp. Pin 3 of U410 is the error signal; this signal is coupled to U722 through opto-isolator U520. If the load increases, the signal at U722-2 drops in voltage. This causes U722 to increase the pulse width, and thus the current and power through T1.

On the other hand, if the load decreases, the +5 V increases momentarily. The output pulse width then decreases along with the current in T1, and less power is transferred to the secondaries. In this way, the +5 V is kept constant through changes in the load.

Current Limit

Current limit is provided for the primary circuit by the internal circuitry of U722. If the ramp voltage at U722 ever reaches 1V, the output drive pulse ends. This shuts Q638 off, so no further voltage is supplied. Thus, the maximum primary current in T1 is limited to approximately 2.5 Amps, which corresponds to a maximum power level of approximately 140 Watts.

As the supply goes into current limit, U615A and Q717 come into play. U722-1 provides an indication of the peak current in T1. This voltage is fed to the inverting input of comparator U615A and compared to a fixed voltage set by divider R616, R615, and R510. R510 is an output power adjustment set so trip point will be approximately 115 Watts. If U722-1 goes high enough to trip U615A-1 low, then C717 will start to charge. If the current limit condition persists long enough for the charge on C717 to reach 700 or 800 mV, U615B trips and Q717 is turned on. This applies the reference voltage from U722-8 directly to U722-3, shutting down the supply and forcing a kick start. The supply will then cycle through kick start, current limit, and shutdown until the problem is corrected. Jumper P720 is included for troubleshooting; its removal will disable the current limit shutdown circuits.

Base Driver and Snubber

Q638 is a high (1000V) blocking voltage power transistor. To prevent transistor failure and ensure proper operation, Q638-base must have a large forward current during the on-time and a reverse base-emitter current during turn-off. The pulse from U722-6 turns FET Q648 on and current flows through R746, CR649, and into the base of Q638. The current level is set by R746. Thus Q638 turns on and 320 volts appear across T1, pins 1 and 2. When the pulse from U722-6

ends, Q648 turns off and the collector current of Q638 flows out the base of Q638 through CR648, and quickly turns Q638 off. CR640 forms a Baker Clamp to keep Q638 out of hard saturation and a slow-turn-off. When Q638 is turned off, a voltage spike appears at its collector. A combination of reflected secondary voltages, input voltage, and transformer leakage inductance can combine to produce a spike of over a thousand volts. As this can exceed the voltage rating of Q638, a snubber circuit limits the spike to approximately twice the rectified line voltage. CR500, C500, and the winding on T1, pins 3 and 4, make up the snubber circuit.

Secondary Circuits

The secondary circuits all work in the same manner. As mentioned earlier, during the first half of the cycle, CR575 and CR320 are reverse-biased, so there is no current flow.

On the second half of the cycle, when Q638 is shut off, the flyback action reverses the polarities of the secondaries, and the diodes are forward biased. This allows the energy stored within T1 to charge up the capacitors in the secondaries.

The +5 V and the -5 V supplies use LC filters from this point, to further smooth the voltage and eliminate most of the ripple.

Generating 12 Volts

The ±12 V supplies are generated with a secondary PWM and regulator composed of U200, Q250, T2, and the associated circuits. This secondary PWM is free-running with respect to the primary PWM at a frequency of approximately 60 kHz. The frequency is set by R105 and C105. Q250 is controlled by U200 to switch +5 V and -5 V (10 Volts total) across T2 during the first half of the switching cycle. During the second half of the cycle, the voltage across T2 reverses and CR150 and CR160 turn on, causing a charge to build up on C150 and C152. The voltage on C150 is regulated by U200 to be approximately +14.5 V, and the voltage on C152 will follow at approximately -14.5 V. The 14.5 V is then filtered by L150 and L162, respectively, and applied to the three terminal linear regulators (U150 and U152) to derive the + 12 V and -12 V outputs.

R260 senses the current in T2 and feeds it back as a voltage to U200-3. Q200 applies part of the ramp voltage on U200-4 through R125 to U200-3 for better noise immunity.

Q100 is in the voltage feedback path for the +14.5 volts and acts as a level shifter to get the voltage feedback signal to a level referenced at + 2.5 V with respect to U200-5. U200-5 is at -5 V with respect to ground. P800 disables the operation of U200 and turns Q250 off. With U200 disabled, the ±14.5 V outputs will go to ±5 volts. Jumper P800 is provided for troubleshooting. Its removal will disable the ±12 V PWM, which may be necessary for diagnosis or repair of the primary portion of the power supply.

Over Voltage Protection

Over voltage protection is provided on the +5 V output by a crowbar circuit composed of Q127, VR120, and R120. If the +5 V output exceeds approximately +5.5 V, VR120 will start to conduct. When VR120 is drawing enough current through R120 to raise SCR Q127 gate voltage above its cathode by approximately 0.7 V, Q127 will turn on. This shorts the +5 V output to ground, forcing the primary circuit into current limit.

Option 1 Board

The SPG 422 Option 1 board contains four separate dual-standard black generators. Each is a separate generator running on a 27 MHz master clock, with PAL and NTSC frame resets to synchronize them and some microprocessor setup information to program them.

Black burst generator <1>, <2>, <3>, and <4>

All black burst generators are identical. The following paragraphs describe black burst generator 3.

Controller PLD. The four black generators are controlled by the microprocessor and the Controller PLD, U2. The Controller PLD takes the video standard selection for each channel and selects and processes the appropriate frame reset

pulse for each generator. The Controller PLD also generates the necessary microprocessor interface signals for each of the Encoder ASICs (U4, U10, U22, and U16).

The standard selection for each channel is loaded into a flip-flop by writing the desired standard selection to the LSB of the 32nd register of the Encoder ASIC data space. This bit selects between the PAL and NTSC frame reset pulses. The Controller PLD then generates a positive output pulse that is one clock cycle wide.

The Encoder ASICs use a slightly different memory timing scheme than the microprocessor, so the Controller PLD generates the modified (READ), (WRITE), ALE, and (CS) pulses.

The Controller PLD also provides a read back register (mapped to register 32 of Black Generator 2). This register is written to and read from by the processor during RAM diagnostics to verify the external data bus connection to the Option 1 board.

Encoder ASIC, Segment Data PROM, and Line and Frame Data PROM. The black generators in the SPG 422 Option 1 store the black signals in component format and generate the composite data with the Encoder ASIC, U4.

Internal counters are reset by an external reset pulse that is derived from the PAL or NTSC frame reset (externally selected by the video standard selected). The reset pulse is 1 clock cycle wide at 27 MHz and will be latched into the counters synchronously by the 27 MHz clock. To accomplish coarse horizontal, vertical, and field timing offsets, the pulse is delayed by an integer number of clock cycles specified by the user.

The SPG 422 actually uses a pair of external memories to store the signals in run-length encoded form: the Segment Data PROM, U6, and the Line and Frame Data PROM, U5.

During the first part of a memory cycle, the H2 line is high. The vertical count, field count, and signal select lines address the frame memory and the line select data is read. When the H2 line goes low, the line select data passes through the multiplexer and is latched. (The two MSBs are also latched separately, forming the bank select address.) This line select data, along with the upper bits of the horizontal count, then addresses the line data memory, and the segment select data is read and latched, along with the line select MSBs. This segment select address, along with the Y/C line and the LSBs of the horizontal count, are latched by the system clock and address the segment data memory. This data is then latched into the Encoder ASIC.

The actual implementation uses a fast RAM to hold the segment data. At power on, the microprocessor reads the segment data (stored in an unused portion of the EPROM) using the ASIC and writes it back to the segment data RAM (using the Encoder ASIC).

The microprocessor interface to the Encoder ASIC is essentially done by a bank of 32 8-bit registers. The Encoder ASIC is mapped into the microprocessor memory space. Five bits of the external address bus, the external READ/(WRITE) line, and an address strobe (BLK2) are used to control the registers. The address strobe, which contains the basic timing information, is generated whenever the microprocessor accesses those memory locations. The strobe is used to generate the Encoder ASIC ALE and (CS) signals. The signals are also decoded and timed by the controller PLD to generate the READ and WRITE strobes.

Configuration data is written to several of the Encoder ASIC internal registers to specify the timing offset, standard, etc. The registers also serve as the porthole through which the segment memories are diagnosed and initialized. At power on, the configuration data is written to the registers and the segment data is read from the EPROM and written to the RAM. Subsequent changes to the signals are just made by changing the configuration data written to the registers.

DAC and Output Filter and Driver. Finally, the over sampled black signal data is fed to the output circuitry. The DAC and output section convert the digital representation of black burst to analog, reconstruct and filter the signal, and buffer it to drive 75 Ω.

Option 2 Board

The Option 2 board produces the additional serial digital test signals that are available when Option 2 is installed in the SPG 422. the circuitry is identical to the Bars generation in the standard instrument.

Serial Test Signal Generation <1>

The Test Signal Generator is a complete generator, requiring only a master clock, (STSGCLK); a synchronous frame reset, (STSS) or (STSR); and some setup information from the microprocessor. On startup, the processor writes the signal configuration information to the generator and downloads the necessary audio and video test signals into RAM.

Horizontal, Vertical, and Field Counters and Decoding PLDs. U9 and U10 are the Horizontal, Vertical, and Field Counters and Decoding PLDs.

The clock and reset drive the counter chain. The counter drives state machines that select the proper test signal RAM address at the correct time in the field.

Timing Reference Signal Generator. U12 is the Timing Reference Signal (TRS) Generator. It gets the appropriate TRS data addresses and loads them into the Serial Bars RAMs so that the data is multiplexed into the video signal.

Serial Test Signal RAM. U13 and U11 are the Serial Bars RAM. Each line of the video signal is stored in sample order, with each video line bottom-justified in memory on 1 kB boundaries. The required video signals are downloaded into the RAM at power on and are not changed during operation unless the video standard is changed.

The the Serial Bars RAMs output, STDD[0..9], is the parallel video signal with the TRS data loaded.

Serial Coprocessor and Outputs <2>

Audio Data RAM. The data in the Audio RAMs is the audio tone formatted in a specific format for AES audio. This data is read out of the Audio RAMs at a particular point in the video data stream to be embedded. The audio data is placed into RAM by the microprocessor through the address, EA[0..14], and data ED[0..7] buses and the various control signals.

Serial Digital Coprocessor. The parallel digital video data with TRS inserted, STSD[0..9], enters U21. The audio data is then multiplexed the data into the data stream from the Audio Data RAMs, U19 and U20. The video data with embedded audio has EDH data is embedded, is scrambled, and exits U21 as the serial digital test signal, SDT[0..9].

SDT[0..9] is serialized by U23 and is then amplified to drive the Serial Test Signal outputs by U22.

Performance Verification

The section consists of checklists and detailed procedures to use in verifying performance parameters and adjusting them to within tolerances.

The order of these procedures has been chosen to minimize changes in equipment setups. Performance parameters may be checked in any order. However, many adjustment setups are interactive. Take care when adjusting individual parameters to ensure that all others remain within specification.

Equipment Required

The following is a list of equipment required for the Performance Verification procedure and Adjustment procedure. While alternate equipment may be used for the Performance Verification, it is not recommended for the Adjustment Procedure. Use of inadequate equipment may result in faulty measurements or adjustments.

NOTE. *Using the equipment in the* List of Required Equipment, *you can obtain an accuracy ratio of 4:1 or better for warranted measurement specifications, with the following exceptions:*

Serial digital video (bar, black, and test signal) Amplitude is 1.8:1.

SCH phase is 1:1.

Genlock input return loss is 1.25:1.

Table 4–1: List of required equipment

Equipment	Description
Serial digital component waveform monitor	Must display the eye pattern of serial digital component signals. It must also be able to indicate the status of FF and AP CRCs and the presence of at least four channels of embedded audio. Example Tektronix WFM 601E
NTSC waveform monitor/vector-scope	Must be able to genlock to an external source. Equipped with an internal amplitude calibration signal (an internal VAC). Example: Tektronix 1780.
PAL waveform monitor/vector-scope	Must be able to genlock to an external source. Equipped with an internal amplitude calibration signal (an internal VAC). Example: Tektronix 1781.
Oscilloscope	500 MHz bandwidth. Example TDS 654C
75 Ω BNC cables	Example: Tektronix part number 012-0074-00.
75 Ω terminators	Example: Tektronix part number 011-0102-01.
Step attenuator	Must be able to attenuate a signal at least 6 dB and step in 0.5 dB steps. It must also have a 1 GHz bandwidth. Example: 847 Attenuator from KAY Elemetrics Corp.
NTSC/PAL generator	Must be able to turn on/off the burst, vary amplitude, and change its frequency. The SCH phase and the subcarrier frequency should also be variable. Example: Tektronix TG2000 with BG1, AGL1, AVG1 modules
Serial digital demultiplexer	Must be able to check for the presence of embedded audio and have a separate digital audio output. Example: Sony D1-AVD (BXPF-160C).
Digital audio tape recorder	Must be able to accept ASE/EBU digital audio signals and have an output for the VM700T option 40.
VM700T with options 1, 11, and 40 installed	Used to measure serial-audio signals.
Digital frequency counter/timer	Capable of measuring frequencies from 10 to 20 MHz, with accuracy within 100 Hz at 17 MHz. Example: Tegam DC5010 Universal Counter/Timer with WWV external reference
WWV clock reference signal	
75 Ω feed-through terminators (2)	Example: Tektronix part number 011-0103-02.
75/50 Ω attenuator	Example: Tektronix AMT75 75/50 Ω Adapter (sets recommended Tektronix oscilloscope TDS 654C for correct vertical amplitude)
Sine wave generator	Capable of providing a 1 to 60 Hz sine wave with high output impedance compared to 75 Ω. Example: Tektronix AFG310 Arbitrary Function Generator

Table 4–1: List of required equipment (cont.)

Equipment	Description
White noise generator	Capable of inserting white noise on a composite video signal with a variable signal to noise ratio of 60 to 10 dB. Example: Noise/Com model no. NC 6107.
271x Spectrum Analyzer	Option 4 (tracking generator) installed
Return Loss Bridge, two 75 Ω precision cables, and two 75 Ω precision terminators	Tektronix part number 015-0149-00 includes all of the required parts.
DMM	Example: Tektronix TX1 True RMS Digital Multimeter
XLR to BNC Impedance Transformer	To 6 MHz. Example: Canare BCJ-XJ-TR 110 to 75 Ω.
Oscilloscope probe (2)	500 MHz.,Tektronix part number P6139A

Calibration Data Report

The Calibration Data Report that follows can be used to document instrument performance. In addition, it can be used as a short form Performance Check for those familiar with the Performance Verification Procedure. Only steps that have numeric Performance Requirements are included in this report form. (Some steps have been omitted.)

Tektronix

Calibration Data Report

Instrument: SPG 422 **Cal. Date:** _____

Serial Number: _____

Certificate Number[1]: _____ **Technician:** _____

Procedure: 071-0596- **Revision Date:** _____

Step	Operation	Minimum tolerance	Maximum tolerance	Incoming	Outgoing

19[12]	Blanking Level	–100 mV	+100 mV		
20[12]	Sync Amplitude	–285 mV	–315 mV		
21[12]	Burst Amplitude	286 $mV_{p–p}$	315 $mV_{p–p}$		
22[12]	SC/H Phase Accuracy	–5°	+5°		
	Genlock Functions				
26	Internal Reference Free-Run Frequency	13.499987 MHz	13.500013 MHz		
27	Burst Lock Jitter (SNR >50 dB)		≤0.5°		
28	Pull-in Range	Subcarrier frequency –20 Hz	Subcarrier frequency +20 Hz		
29	Sync Lock Jitter (SNR >50 dB)		≤0.6 nsec (0.75° at 3.58 MHz, 1° at 4.43 MHz.)		
30	Sync Lock Timing Change with Input Sync Amplitude (Over sync amplitude range of nominal value +3 to –3 dB.)		≤2 nsec		
31	Input SC/H Phase Range for Correct Color Framing	–45°	+45°		
32	Burst Lock Phase Change with Input Signal APL (Over input signal APL range of 10% to 90%.)		≤1°		
33	Burst Lock Phase Change with Input Burst Amplitude		≤1°		
34	Burst Lock Phase Change with Input Burst Amplitude (60 Hz hum < 1 $V_{p–p.}$)		≤1°		
35	Isolation between two 75 Ω terminating inputs		≥60 dB (0 – 5 MHz)		

[11] **Option 1 only. Connect Black 5 to the 1780 CH B2 and include it in the procedures.**

[12] **Option 1 only. Connect Black 6 to the 1780 CH B3 and include it in the procedures.**

Step	Operation	Minimum tolerance	Maximum tolerance	Incoming	Outgoing
	Return Loss				
37	Genlock Input Return Loss		≥40 dB (0 – 5 MHz)		
38	Black 1 Return Loss		≤ 30 dB (0 to 5 MHz)		
38	Black 2 Return Loss		≤ 30 dB (0 to 5 MHz)		

Performance Verification Procedure

Serial Digital — Serial Bars Output

1. Check the EDH

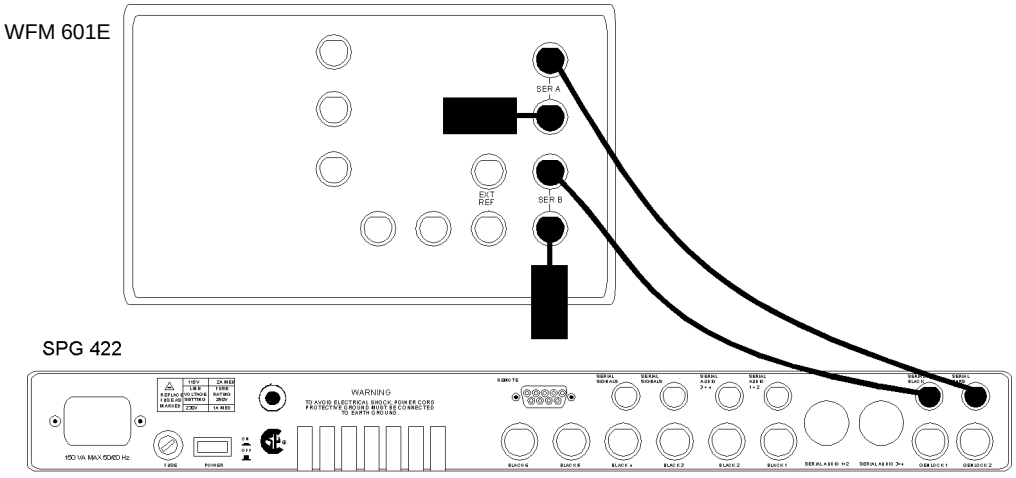

Figure 4–1: Setup to check serial digital video signals

a. Connect the equipment as shown in Figure 4–1.

b. Set the SPG 422 to output any Bars signal with the EDH enabled. (Enable EDH from the Utilities menu.)

c. Display CH A on the WFM 601E.

d. Press the WFM 601E EDH DET button to bring up the basic status screen.

e. Check that the Full Field (FF) and Active Picture (AP) CRC are valid.

f. Disable the SPG 422 EDH.

g. Check that the Full Field (FF) and Active Picture (AP) CRC are missing.

h. Re-enable the SPG 422 EDH.

2. Amplitude (800 mV ±10%)

a. Connect the equipment as shown in Figure 4–1.

b. Set the WFM 601E to display CH A eye pattern.

c. Use the WFM 601E voltage cursors to measure the amplitude of the eye pattern. The 5x vertical magnification can be used to aid in accuracy.

d. Check that the amplitude is 800 mV ±80 mV (each major horizontal division of the graticule is 100 mV).

3. Rise and Fall Times (between 0.40 ns and 1.50 ns)

a. Connect the equipment shown in Figure 4–1.

b. Set the WFM 601E to display CH A eye pattern.

c. Use the WFM 601E variable gain control to make the eye pattern amplitude exactly 10 major divisions (1 V).

d. Place the bottom of the eye pattern on the –0.3 graticule and the top on the 0.7 graticule.

e. Activate the timing cursors and align the first cursor with the position where the rising edge of the eye pattern intersects the –0.1 graticule (20% point). Align the second cursor with the intersection of the rising edge of the eye pattern and the 0.5 graticule.

f. Read the Δt from the waveform monitor.

g. Convert the value from the waveform monitor to the actual rise time using the table below.

Measured Rise Time (ns)	Actual Rise Time (ns)
0.640	0.400
0.710	0.500
0.780	0.600
0.860	0.700
0.900	0.750
0.940	0.800
1.000	0.900
1.100	1.000
1.200	1.100
1.300	1.200
1.400	1.300
1.500	1.400
1.600	1.500

h. Check that the actual rise time is between 0.400 and 1.500 ns.

i. Align the first cursor with the position where the falling edge of the eye pattern intersects the 0.5 graticule. Align the second cursor with the intersection of the falling edge of the eye pattern and the –0.1 graticule.

j. Read the Δt from the waveform monitor.

k. Convert the value from the waveform monitor to the actual rise time using the table.

l. Check that the actual fall time is between 0.400 and 1.500 ns.

4. Difference between Rise and Fall Times (≤0.50 ns)

a. Subtract the actual rise time from the actual fall time found in the previous procedure.

b. Check that the absolute value is ≤0.50 ns.

5. Jitter (≤0.25 ns)

a. Connect the equipment as shown in Figure 4–1.

b. Display CH A using the WFM 601E eye pattern display.

c. Use the WFM 601E OVERLAY display mode (found in the EYE PATTERN CONFIGure menu).

d. Set the WFM 601E to use the 10 Hz jitter filter.

e. Set the WFM 601E to x5 vertical gain.

f. Use the timing cursors to measure the width of the eye crossings (see Figure 4–2).

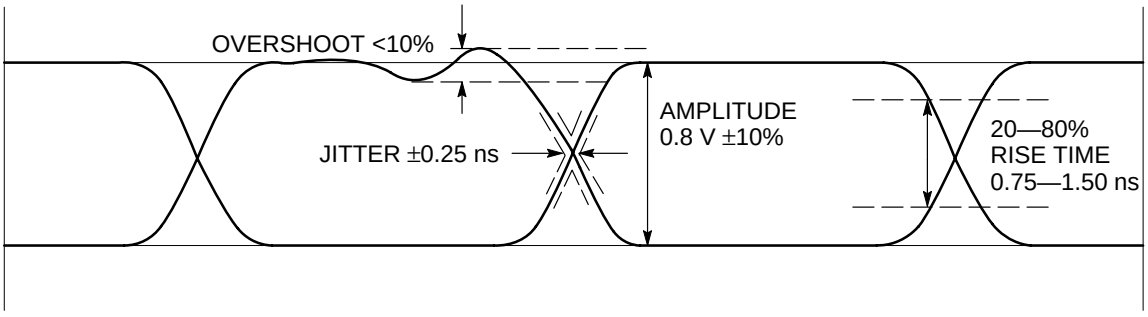

Figure 4–2: Various parts of the serial data stream

g. CHECK— that the Δt of the timing cursors is ≤0.25 ns.

6. Check for Presence of Embedded Audio

a. Connect the equipment as shown in Figure 4–1.

b. Set the SPG 422 to output any Bars signal with embedded audio enabled. (Enable embedded audio from the Serial Audio menu.)

c. Press the EDH DET button on the WFM 601E to bring up the basic status screen.

d. Check that AUDIO 1 2 3 4 is displayed in the upper right hand corner of the display. (Even if all of the audio channels are set to silence, the WFM 601E will recognize the presence of the embedded audio channels.)

7. Embedded Audio Four Channels

a. Connect the equipment as shown in Figure 4–3.

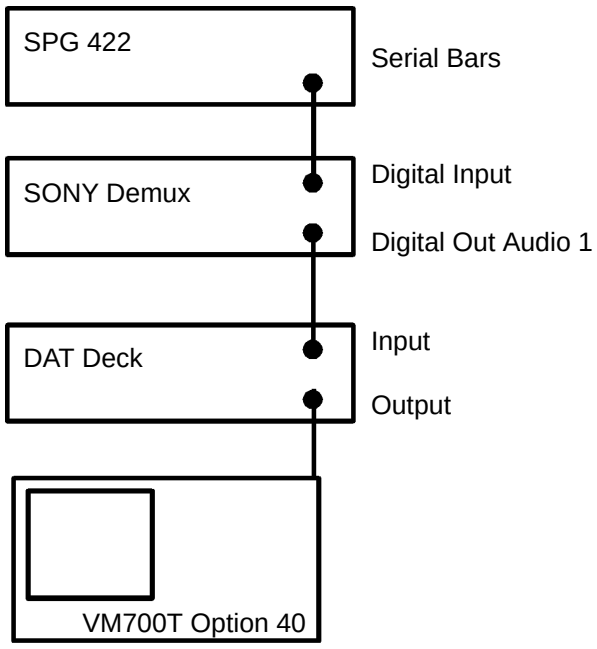

Figure 4–3: Setup required to check for an embedded audio signal

b. Set all of the SPG 422 audio channels to transmit a 1 kHz audio tone embedded in the serial digital video signal.

c. Check that the WFM 601E indicates the presence of embedded audio.

d. Ensure that DIGITAL AUDIO is selected on the Digital Audio Tape (DAT) Recorder.

e. Check that the LEDs on the DEMUX board light as given in the following list:

PLL Unlock	OFF (not red)
Video Exist	green
Audio Exist (A1 – A4)	all green
Audio Error (A1 – A4)	all off (not red)

f. Select REC on the DAT. Ensure that the DAT is in PAUSE and the "INPUT" Digital LED is solid red.

g. Check for a 1 kHz audio tone, using the VM700T.

h. Set the SPG 422 to transmit 800 Hz on all four channels.

i. Check that the tone changes to 800 Hz and that the LEDs remain in the correct state.

j. Set the SPG 422 to transmit silence on channel 1; leave the other channels at 800 Hz.

k. Check that the AUDIO EXIT LED A1 turns off, while the other three remain on.

l. Set the SPG 422 to transmit silence on channels 1 and 2. Keep 800 Hz on the other channels.

m. Check that the AUDIO EXIT LEDs A1 and A2 are off and the other two remain on.

n. Set the SPG 422 to transmit silence on all channels except 4. Keep 800 Hz on channel 4.

o. Check that the AUDIO EXIT LEDs A1, A2, and A3 are off and A4 is on.

p. Set the SPG 422 to transmit silence on all channels.

q. Check that none of the AUDIO EXIST LEDs light.

r. Set the SPG 422 to output 1 kHz on all channels.

s. Check that all of the AUDIO EXIST LEDs light again.

Serial Digital — Serial Black Output

To verify the performance of the Serial Black output, repeat procedures 1, 2, 3, 4, 5, 6, and 7, except replace the Serial Bars output (CH A on the WFM 601E) with the Serial Black output (CH B on the WFM 601E).

Serial Digital — Serial Test Signals Output (Option 2 only)

To verify the performance of the Serial Black output, repeat procedures 1, 2, 3, 4, and 5, except replace the Serial Bars output with the Serial Test Signal output. Repeat these procedures twice, once for each of the two Test Signal outputs (left and right).

Serial Audio

8. Check the Accuracy of the Serial Signals

a. Connect the equipment as shown in Figure 4–4.

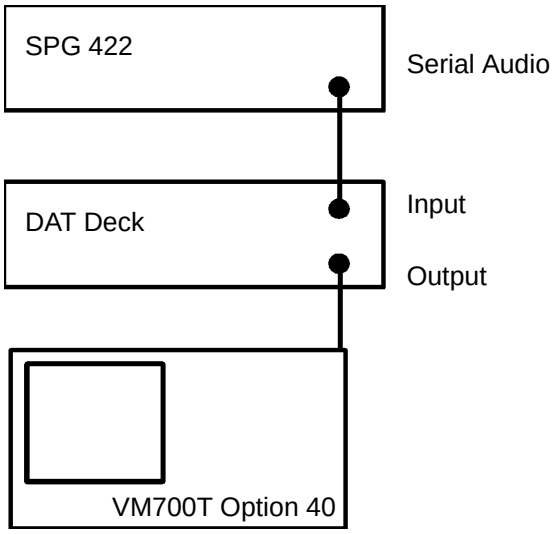

Figure 4–4: Setup to check accuracy of serial audio signals

b. Set the SPG 422 to output an 800 Hz, –20 dBFS on all four channels.

c. Turn on the VM700T.

d. Set the DAT (Digital Audio Tape recorder) to Record and Pause.

e. Display the audio signal on the VM700T.

f. Check that frequency is 800 Hz and that the levels for both channels is approximately 2.7 dBu (within 0.1 dBu).

g. Set the SPG 422 to output 1000 Hz on all channels.

h. Check that frequency is 1000 Hz and that the levels for both channels is approximately 2.7 dBu (within 0.1 dBu).

i. Move the cable to SPG 422 audio channels 3+4.

j. Check that frequency is 1000 Hz and that the levels for both channels is approximately 2.7 dBu (within 0.1 dBu).

k. Set the SPG 422 to output 800 Hz on all channels.

l. Check that frequency is 800 Hz and that the levels for both channels is approximately 2.7 dBu (within 0.1 dBu).

m. Move the cable to SPG 422 BNC audio channels 1+2 using the XLR to BNC adapter.

n. Check that frequency is 800 Hz and that the levels for both channels is approximately 2.7 dBu (within 0.1 dBu).

o. Set the SPG 422 to output 1000 Hz on all channels.

p. Check that frequency is 1000 Hz and that the levels for both channels is approximately 2.7 dBu (within 0.1 dBu).

q. Move the cable to SPG 422 BNC audio channels 3+4.

r. Check that frequency is 1000 Hz and that the levels for both channels is approximately 2.7 dBu (within 0.1 dBu).

s. Set the SPG 422 to output 800 Hz on all channels.

t. Check that frequency is 800 Hz and that the levels for both channels is approximately 2.7 dBu (within 0.1 dBu).

9. Preparation to use the oscilloscope

a. Connect the equipment as shown in Figure 4–5.

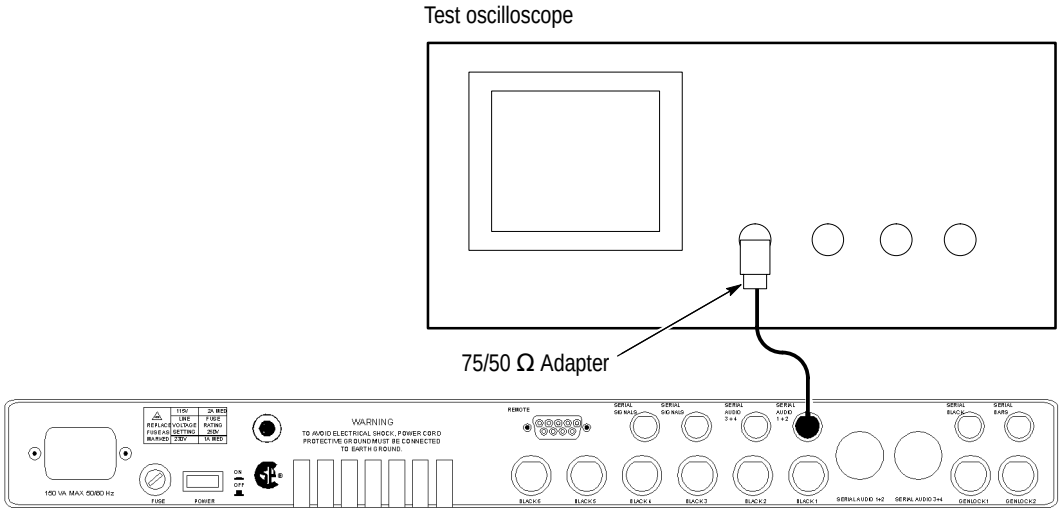

Figure 4–5: Setup to check serial audio signal

b. Configure the Oscilloscope as follows:

Acquisition	Continuous
Display	Variable Persistent
Vertical	200 mV
Vertical Offset	0 V
Horizontal	1 ns
Horiz Pos	–4 ns
Impedance	50 Ohms
Coupling	DC
BW Limit	Full

Trigger

Trigger	Main
Source	CH1
Level	0 V
Time Holdoff	510 ns
Mode	Auto
Coupling	DC
Slope	+

Measurement

Rise (S) 10% to 90%
Fall (S) 10% to 90%
Amplitude (S)
Overshoot (S)
Undershoot (S)
MID (DC LEVEL)

10. Serial Audio Amplitude
1 V ±10% into 75 Ω

a. Connect the equipment as shown in Figure 4–5. If you use a different 50/75 adapter and TDS oscilloscope from the ones specified in the Equipment List, you must multiply the signal amplitude by 2.23. The specified adapter automatically configures most TDS Oscilloscopes to compensate for the loss through the adapter.

b. Press the AUTOSET button on the oscilloscope to give a starting point for triggering and adjusting the signal.

c. Set the display type to variable persistence. This setting should result in the outline of the eye pattern displayed on the screen. The eye pattern should be similar to Figure 4–2.

d. Check using the oscilloscope cursors (horizontal bars) that the signal amplitude is between 900 and 1100 mV_{p-p}.

11. Rise and Fall Times
30 to 44 ns (10% to 90% amplitude)

a. Connect the equipment as shown in Figure 6-5.

b. Set the display type to NORMAL.

c. From the oscilloscope Measurements menu, select RISE and FALL.

d. From the oscilloscope Trigger menu, set the slope to +.

e. Check that the rise time is between 30 and 44 ns.

f. Change the slope to –, from the Trigger menu.

g. Check that the fall time is between 30 and 44 ns.

12. Jitter
≤20 ns over the period of a line

a. Use the horizontal magnification to display the eye pattern crossing.

b. Use the timing cursors to mark the edges of the eye pattern crossing.

c. Check that the jitter is less than 20 ns.

Analog Black Burst (NTSC)

13. Blanking Level
0 V ±100 mV

a. Connect the equipment as shown in Figure 4–6.

b. Set the TG 2000 BG1 to output NTSC Black Burst signal on the Black 1 and Black 2 outputs.

c. Display CH A on the waveform monitor.

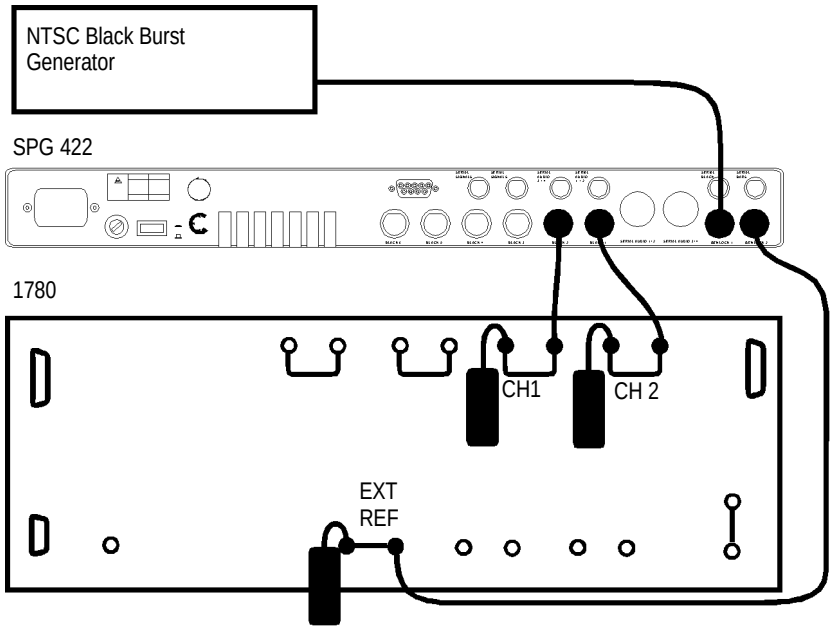

Figure 4–6: Setup to check NTSC analog black outputs

d. Confirm that any DC restorer feature of the waveform monitor is off.

e. Toggle the waveform monitor display between DC coupled and ground reference.

f. Check that the DC level is 0 mV ± 100 mV.

g. Display CH B1 on the waveform monitor.

h. Confirm that any DC restorer feature of the waveform monitor is off.

i. Toggle the waveform monitor display between DC coupled and ground reference.

j. Check that the DC level is 0 mV ± 100 mV.

14. Sync Amplitude
NTSC: –40 IRE ± 2 IRE

a. Connect the equipment as shown in Figure 4–6.

b. Set the SPG 422 to output NTSC black burst on both Black 1 and Black 2.

c. Display CH A on the waveform monitor.

d. Check using the WFM+CAL on the waveform monitor, that the sync amplitude is –40 IRE ± 2 IRE.

e. Display CH B1 on the waveform monitor.

f. Check using the WFM+CAL on the waveform monitor, that the sync amplitude is –40 IRE ± 2 IRE.

15. Burst Amplitude
NTSC: 40 IRE_{p-p} ± 2 IRE

a. Connect the equipment as shown in Figure 4–6.

b. Set the SPG 422 to output NTSC black burst on both Black 1 and Black 2.

c. Display CH A on the waveform monitor.

d. Check using the WFM+CAL on the waveform monitor, that the burst amplitude is –40 IRE_{p-p} ± 2 IRE.

e. Display CH B1 on the waveform monitor.

f. Check using the WFM+CAL on the waveform monitor, that the burst amplitude is –40 IRE_{p-p} ± 2 IRE.

16. SC/H Phase Accuracy (0° ± 5°)

a. Connect the equipment as shown in Figure 4–6.

b. Set the SPG 422 to output NTSC black burst on both Black 1 and Black 2.

c. Display CH A on the waveform monitor.

d. Put the vectorscope in SCH mode.

e. Measure the SCH of the black burst using the 1780 special SCH mode.

f. Check that the SCH is 0° ± 5°.

g. Display CH B1 on the waveform monitor.

h. Put the vectorscope in SCH mode.

i. Measure the SCH of the black burst using the 1780 special SCH mode.

j. Check that the SCH is 0° ± 5°.

17. Field Timing Offset Range
± 2 Fields Relative to Genlock

a. Set up the equipment as shown in Figure 4–6.

b. Set the SPG 422 to output NTSC black burst with no field timing offset on both Black 1 and Black 2.

c. Display CH A (Black 1) on the waveform monitor using three field horizontal timing display and external reference. Note the position of one of the fields. This is the reference field.

d. Set the SPG 422 Black 1 field offset to 1 field advance.

e. Check that the reference field advances one field from its reference position.

f. Set the SPG 422 Black 1 field offset to 2 fields advance.

g. Check that the reference field advances two fields from the reference position.

h. Set the SPG 422 Black 1 field offset to 1 field delay.

i. Check that the reference field delays one field from its reference position.

j. Set the SPG 422 Black 1 field offset to 2 fields delay.

k. Check that the reference field delays two fields from its reference position.

l. Return the SPG 422 Black 1 field delay to 0 fields advance.

m. Display CH B1 (Black 2) on the waveform monitor using three field horizontal timing display and external reference. Note the position of one of the fields. This is the reference field.

n. Set the SPG 422 Black 2 field offset to 1 field advance.

o. Check that the reference field advances one field from its reference position.

p. Set the SPG 422 Black 2 field offset to 2 fields advance.

q. Check that the reference field advances two fields from the reference position.

r. Set the SPG 422 Black 2 field offset to 1 field delay.

s. Check that the reference field delays one field from its reference position.

t. Set the SPG 422 Black 2 field offset to 2 fields delay.

u. Check that the reference field delays two fields from its reference position.

v. Return the SPG 422 Black 2 field delay to 0 fields advance.

18. Vertical Timing Offset Range
± 8 lines

NOTE*. You may want to shorten this procedure to only include the 8-line advance and delay but the full procedure is more thorough.*

a. Set up the equipment as shown in Figure 6-6.

b. Set the SPG 422 to output NTSC black burst with no vertical timing offset on both Black 1 and Black 2.

c. Display CH A on the waveform monitor using one field horizontal display, external reference, and enough horizontal magnification to show eight to ten lines of video.

d. Use the timing cursor to mark any line. This is the reference line. Note its horizontal position.

e. Set the SPG 422 Black 1 to one line advance.

f. Check that the reference line advances one line from its original position.

g. Set the SPG 422 Black 1 to two lines advance.

h. Check that the reference line advances two lines from its original position.

i. Set the SPG 422 Black 1 to three line advance.

j. Check that the reference line advances three lines from its original position.

k. Set the SPG 422 Black 1 to four lines advance.

l. Check that the reference line advances four lines from its original position.

m. Set the SPG 422 Black 1 to five lines advance.

n. Check that the reference line advances five lines from its original position.

o. Set the SPG 422 Black 1 to six lines advance.

p. Check that the reference line advances six lines from its original position.

q. Set the SPG 422 Black 1 to 7 lines advance.

r. Check that the reference line advances seven lines from its original position.

s. Set the SPG 422 Black 1 to 8 lines advance.

t. Check that the reference line advances eight lines from its original position.

u. Set the SPG 422 Black 1 to 1 line delay.

v. Check that the reference line delays one line from its original position.

w. Set the SPG 422 Black 1 to 2 lines delay.

x. Check that the reference line delays two lines from its original position.

y. Set the SPG 422 Black 1 to 3 line delay.

z. Check that the reference line delays three lines from its original position.

aa. Set the SPG 422 Black 1 to 4 lines delay.

ab. Check that the reference line delays four lines from its original position.

ac. Set the SPG 422 Black 1 to 5 lines delay.

ad. Check that the reference line delays five lines from its original position.

ae. Set the SPG 422 Black 1 to 6 lines delay.

af. Check that the reference line delays six lines from its original position.

ag. Set the SPG 422 Black 1 to 7 lines delay.

ah. Check that the reference line delays seven lines from its original position.

ai. Set the SPG 422 Black 1 to 8 lines delay.

aj. Check that the reference line delays eight lines from its original position.

ak. Return the SPG 422 Black 1 to 0 lines advance.

al. Display CH B1 (Black 2) using the same waveform monitor setup.

am. Use the waveform monitor line select to mark a reference line.

an. Repeat the above procedures for the Black 2 output.

19. Horizontal Timing Offset Range
± 1/2 video line

a. Set up the equipment as shown in Figure 4–6.

b. Set the SPG 422 to output NTSC black burst with no horizontal offset on both Black 1 and Black 2.

c. Display CH A (Black 1) and CH B1 (Black 2) on the waveform monitor in 1-line overlay mode using external reference.

d. Set the SPG 422 Black 1 to its maximum horizontal advance.

e. Check that the signal on CH A advances at least ½ line relative to CH B1. (It may be necessary to use the fine horizontal timing control to get the full ½ line advance.)

f. Set the SPG 422 Black 1 to its maximum horizontal delay.

g. Check that the signal on CH A delays by at least ½ line relative to CH B1. (It may be necessary to use the fine horizontal control to get the full ½ line delay.)

h. Return SPG 422 Black 1 to 0 horizontal advance.

i. Set the SPG 422 Black 2 to its maximum horizontal advance.

j. Repeat the above procedure for Black 2 (CH B1).

k. Return SPG 422 Black 2 to 0 horizontal advance.

Analog Black Burst (NTSC Option 1)

l. Repeat the procedures 12, 14, 15, 16, 17, 18 and 19, except with the following signal changes:

Replace Black 1 and 2 with Black 3 and 4.
Connect Black 5 to CH B2.
Connect Black 6 to CH B3.
Extend all procedures to include Black 5 (CH B2) and Black 6 (CH B3).

Analog Black Burst (PAL)

20. Blanking Level
0 V ± 100 mV

a. Connect the equipment as shown in Figure 4–7.

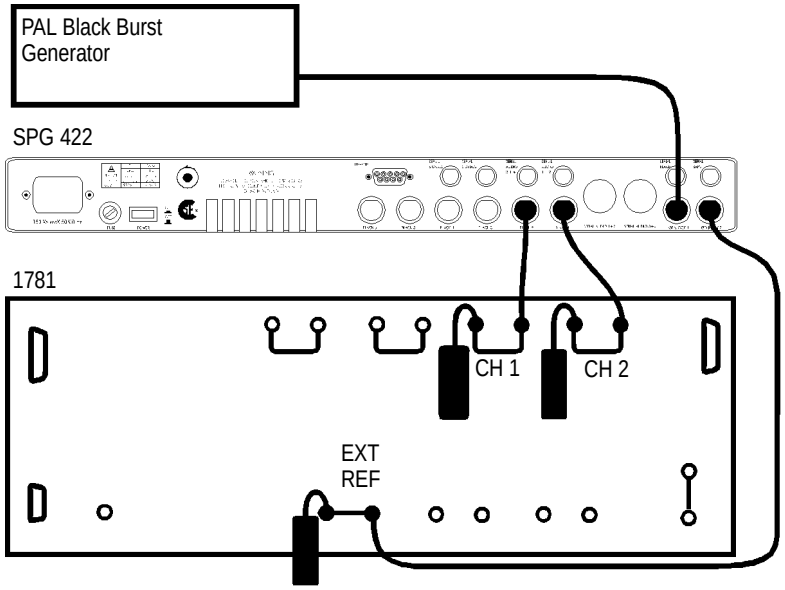

Figure 4–7: Setup to check PAL analog black outputs

b. Set the TG 2000 BG1 to output a PAL Black signal on the Black 1 and Black 2 outputs.

c. Display CH A on the 1781 waveform monitor.

d. Confirm that any DC restorer feature of the waveform monitor is off.

e. Toggle the display between DC coupled and ground reference.

f. Check that the DC level is 0 mV ± 100 mV.

g. Display CH B1 on the waveform monitor.

h. Confirm that any DC restorer feature of the monitor is off.

i. Toggle the waveform monitor display between DC coupled and ground reference.

j. Check that the DC level is 0 mV ± 100 mV.

21. Sync Amplitude
PAL: –300 mV ± 15 mV

a. Connect the equipment as shown in Figure 4–7.

b. Set the SPG 422 to output PAL Black Burst on Black 1 and Black 2.

c. Display CH A on the waveform monitor.

d. Check using the waveform monitor WFM+CAL, that the sync amplitude is –300 mV ±15 mV.

e. Display CH B1 on the waveform monitor.

f. Check using the waveform monitor WFM+CAL that the sync amplitude is –300 mV ± 15 mV.

22. Burst Amplitude
PAL: 300 mV_{p-p} ± 15 mV

a. Connect the equipment as shown in Figure 4–7.

b. Set the SPG 422 to output PAL Black Burst on Black 1 and Black 2.

c. Display CH A on the waveform monitor.

d. Check using the waveform monitor WFM+CAL that the burst amplitude is 300 mV_{p-p} ± 15 mV.

e. Display CH B1 on the waveform monitor.

f. Check using the waveform monitor WFM+CAL that the burst amplitude is 300 mV_{p-p} ± 15 mV.

23. SC/H Phase Accuracy
0° ± 5°

a. Connect the equipment as shown in Figure 4–7.

b. Display CH A on the waveform monitor.

c. Put the vectorscope in SCH mode.

d. Measure the SCH of the black burst using the 1781 special SCH mode.

e. Check that the SCH is 0° ± 5°.

f. Display CH B1 on the waveform monitor.

g. Put the vectorscope in SCH mode.

h. Measure the SCH of the black burst using the 1781 special SCH mode.

i. Check that the SCH is 0° ± 5°.

24. Field Timing Offset Range
± 2 Fields Relative to the Genlock Input

a. Connect the equipment as shown in Figure 4–7.

b. Set the SPG 422 to output PAL black burst with F1L7 and 0 fields advance on both Black 1 and Black 2.

c. Display CH A on the waveform monitor using external reference. Use three fields for the horizontal display.

d. Note which field contains the F1L7 pulse. This is the reference position.

e. Set the SPG 422 Black 1 to 1 field advance.

f. Check that the field containing the F1L7 pulse advances one field from the reference position.

g. Set the SPG 422 Black 1 to 2 fields advance.

h. Check that the field containing the F1L7 pulse advances two fields from the reference position.

i. Return the SPG 422 Black 1 to 0 fields advance and take note of the reference position.

j. Set the SPG 422 Black 1 to 1 field delay.

k. Check that the field containing the F1L7 pulse delays one field from the reference position.

l. Set the SPG 422 Black 1 to 2 fields delay.

m. Check that the field containing the F1L7 pulse delays two fields from the reference position.

n. Return the SPG 422 Black 1 to 0 fields advance.

o. Display CH B1 (Black 2) on the waveform monitor using the same waveform monitor setup.

p. Repeat the above procedures for the SPG 422 Black 2 output.

25. Vertical Timing Offset Range
± 8 lines

NOTE*. You may want to shorten this procedure to only include the 8-line advance and delay but the full procedure is more thorough.*

a. Connect the equipment as shown in Figure 4–7.

b. Set the SPG 422 to output a PAL black burst with F1L7 pulse and no vertical offset on both Black 1 and Black 2.

c. Display CH A on the waveform monitor using external reference.

d. Set the waveform monitor to display a field, then use the horizontal magnifier to display eight to ten lines.

e. Use the waveform monitor horizontal position control to place the F1L7 pulse on the display.

f. Use the SPG 422 vertical offset for Black 1 to change the offset to 1 line advance.

g. Check that the F1L7 advances one line.

h. Use the SPG 422 vertical offset for Black 1 to change the offset to 2 lines advance.

i. Check that the F1L7 advances two lines from the original starting point.

j. Use the SPG 422 vertical offset for Black 1 to change the offset to 3 lines advance.

k. Check that the F1L7 advances three lines from the original starting point.

l. Use the SPG 422 vertical offset for Black 1 to change the offset to 4 lines advance.

m. Check that the F1L7 advances four lines from the original starting point.

n. Use the SPG 422 vertical offset for Black 1 to change the offset to 5 lines advance.

o. Check that the F1L7 advances five lines from the original starting point.

p. Use the SPG 422 vertical offset for Black 1 to change the offset to 6 line advance.

q. Check that the F1L7 advances six lines from the original starting point.

r. Use the SPG 422 vertical offset for Black 1 to change the offset to 7 line advance.

s. Check that the F1L7 advances seven lines from the original starting point.

t. Use the SPG 422 vertical offset for Black 1 to change the offset to 8 line advance.

u. Check that the F1L7 advances eight lines from the original starting point.

v. Use the SPG 422 vertical offset for Black 1 to change the offset to 0 line advance. (Back to the original starting point.)

w. Use the SPG 422 vertical offset for Black 1 to change the offset to 1 line delay.

x. Check that the F1L7 delays one line.

y. Use the SPG 422 vertical offset for Black 1 to change the offset to 2 lines delay.

z. Check that the F1L7 delays two lines from the original starting point.

aa. Use the SPG 422 vertical offset for Black 1 to change the offset to 3 lines delay.

ab. Check that the F1L7 delays three lines from the original starting point.

ac. Use the SPG 422 vertical offset for Black 1 to change the offset to 4 lines delay.

ad. Check that the F1L7 delays four lines from the original starting point.

ae. Use the SPG 422 vertical offset for Black 1 to change the offset to 5 lines delay.

af. Check that the F1L7 delays five lines from the original starting point.

ag. Use the SPG 422 vertical offset for Black 1 to change the offset to 6 lines delay.

ah. Check that the F1L7 delays six lines from the original starting point.

ai. Use the SPG 422 vertical offset for Black 1 to change the offset to 7 lines delay.

aj. Check that the F1L7 delays seven lines from the original starting point.

ak. Use the SPG 422 vertical offset for Black 1 to change the offset to 8 line delay.

al. Check that the F1L7 delays eight lines from the original starting point.

am. Return the delay on Black 1 to 0 lines.

an. Display CH B1 on the waveform monitor using the same settings as CH A.

ao. Repeat the above procedures for Black 2 (CH B1).

26. Horizontal Timing Offset Range ± 1/2 video line

a. Set up the equipment as shown in Figure 4–7.

b. Set the SPG 422 to output PAL black burst with no horizontal offset on both Black 1 and Black 2.

c. Display CH A and CH B1 on the waveform monitor in 1 line overlay mode using external reference.

d. Set the SPG 422 Black 1 to its maximum horizontal advance.

e. Check that the CH A signal advances at least ½ line relative to the CH B1 signal. (You may need to use the fine horizontal timing to get to the full ½ line offset.)

f. Set the SPG 422 Black 1 to its maximum horizontal delay.

g. Check that the CH A signal delays at least ½ line relative to the CH B1 signal. (You may need to use the fine horizontal timing to get to the full ½ line offset.)

h. Return the SPG 422 Black 1 horizontal offset to 0.

i. Repeat the above procedure for Black 2 (CH B1).

Analog Black Burst (PAL Option 1)

j. Repeat the procedures 20, 21, 22, 23, 24, 25, and 26, except with the following signal changes:

Replace Black 1 and 2 with Black 3 and 4.
Connect Black 5 to CH B2.
Connect Black 6 to CH B3.
Extend all procedures to include Black 5 (CH B2) and Black 6 (CH B3).

Genlock Functions

27. Internal Reference Free-Run Frequency 13.5 MHz ± 13 Hz

a. Set up the equipment as shown in Figure 4–8.

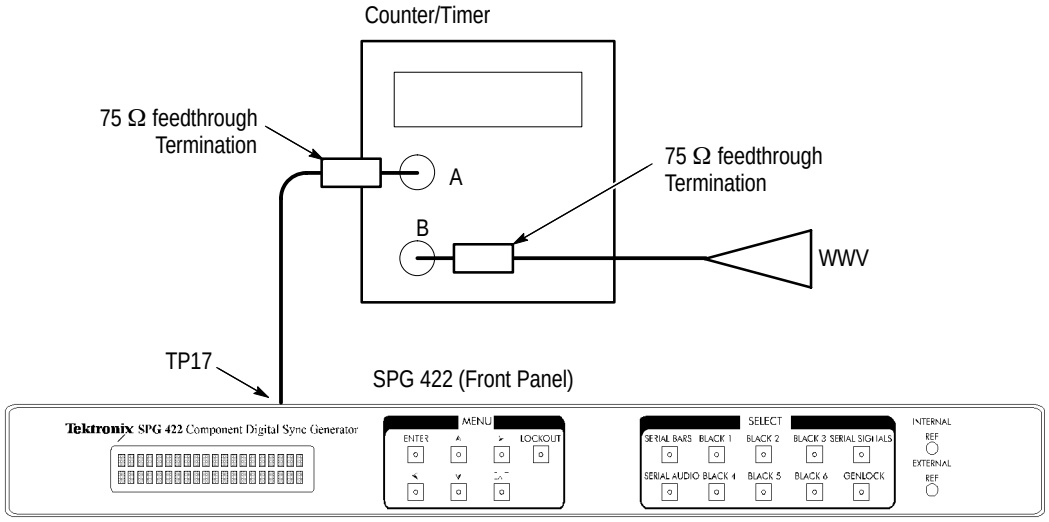

Figure 4–8: Setup to check the oscillator frequency

b. Connect the probe to TP17.

c. Check that the counter/timer reads 13.500000 MHz ± 13 Hz.

28. Burst Lock Jitter
≤0.5° (SNR >50 dB)

a. Connect the equipment as shown in Figure 4–9.

b. Set the SPG 422 to burst lock, genlock loopthrough but do not terminate the Genlock.

c. Set the step attenuator to 6 dB (0 dB).

d. Set the TG 2000 BG1 and AVG1 modules to NTSC. You must set each generator.

e. Set the TG 2000 AVG1 module to output a 0% flat field.

f. Display CH A on the waveform monitor.

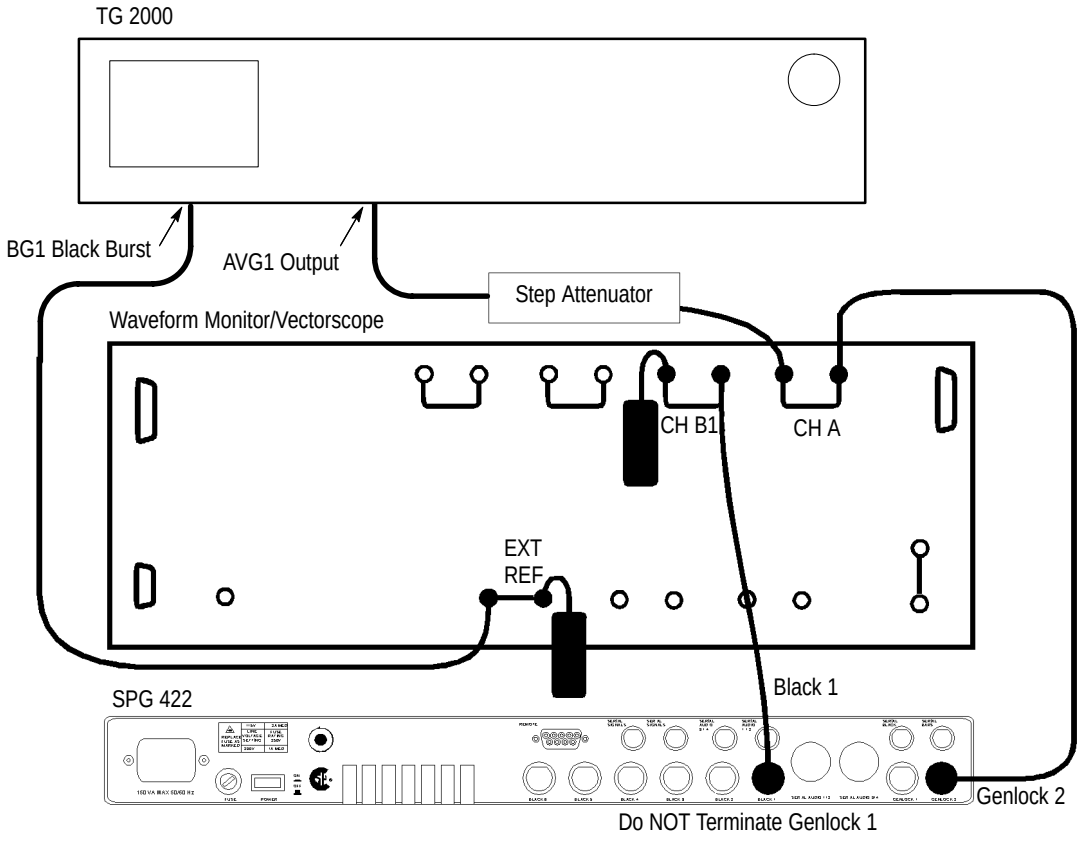

Figure 4–9: Setup to check some genlock functions

g. Check, using the 1780 waveform monitor, that the genlock input signal has a signal to noise ratio better than 50 dB. (If this signal is not good enough, you will need to find another signal source.)

h. Display CH B1 on the 1780 vectorscope.

i. Check for less than 0.5° of jitter.

29. Pull-in Range
Subcarrier Frequency ± 20 Hz

a. Connect the equipment as shown in Figure 4–9.

b. Set the SPG 422 to burst lock, genlock loopthrough but do not terminate the loopthrough.

c. Set the Step Attenuator to 6 dB (actually 0 dB of attenuation).

d. Set the TG 2000 BG1 and AVG1 modules to NTSC. You must set each generator.

e. Set the TG 2000 AVG1 module to output a 0% flat field.

f. Set the TG 2000 AVG1 to provide 20 Hz of subcarrier variation. Select the Active Signal Parameters and select the Subcarrier to adjust it. See the TG 2000/AVG1 manual for detailed instructions to make these settings.

g. Set the 1780 to display CH A and CH B1 in parade format using external reference.

h. Set the SPG 422 Genlock to loopthrough.

i. Set the SPG 422 Black 1 to output a NTSC black burst signal with no delay.

j. Check that the SPG 422 is genlocked (front-panel External Ref LED is lit).

k. Set the TG 2000 AVG1 to output the 0% flat field signal with –20 Hz subcarrier variation.

l. Check that the SPG 422 remains genlocked.

m. Set the TG 2000 AVG1 to output the 0% flat field signal with +20 Hz subcarrier variation.

n. Check that the SPG 422 remains genlocked.

o. Return the TG 2000 AVG1 to a normal subcarrier signal.

30. Sync Lock Jitter
≤ 0.6 nsec (0.75° at 3.58 MHz, 1° at 4.43 MHz, SNR >50 dB)

a. Connect the equipment as shown in Figure 4–9.

b. Set the SPG 422 to burst lock, genlock loopthrough but do not terminate the loopthrough.

c. Set the step attenuator to read 6 (0 dB).

d. Set the TG 2000 AVG1 burst amplitude for the 0% flat field signal to a minimum. Select Signal Parameters for the AVG1 to set the Burst amplitude.

e. Set the 1780 for External Reference.

f. Set the SPG 422 for NTSC sync lock, genlock loopthrough.

g. Display CH B1 on the waveform monitor.

h. Check using the waveform monitor, that the genlock input signal has a signal to noise (SNR) of better than 50 dB. (If this signal is not good enough, you will need to find another signal source.)

i. Display CH A on the vectorscope.

j. Check for less than 2.5° of jitter.

31. Sync Lock Timing Change with Input Sync Amplitude ≤2 nsec (Over sync amplitude range of nominal value +3 to –3 dB)

a. Connect the equipment as shown in Figure 4–9.

b. Set the SPG 422 for loopthrough, NTSC, sync-lock operation.

NOTE. *In order for the step attenuator to provide the range needed for the following test, remove the termination from the waveform monitor input, causing the signal to be increased by 6 dB above nominal levels. Setting the step attenuator to 6, therefore, results in a normal signal level. To attenuate the signal 6 dB, set the step attenuator to read 12. To increase the signal level by 6 dB, set the step attenuator to 0.*

c. Set the step attenuator to read 6 (0 dB).

d. Check the front-panel menu to see that the SPG 422 sync locks.

e. Look at the CH B1 vectorscope display to determine the reference phase.

f. Set the step attenuator to read 3 (+3 dB).

g. Check the front panel menu to see that the SPG 422 remains sync locked.

h. the vectorscope for a < 2° color shift on CH B1.

i. Set the step attenuator to read 9 (–3 dB).

j. Check the SPG 422 front panel menu to see that the instrument remains sync locked.

k. Check the vectorscope for a < 2° color shift.

l. Set the step attenuator to read 6 (0 dB).

32. Input SC/H Phase Range for Correct Color Framing 0° ± 45° (Will maintain initial color framing until the SC/H error exceeds 120°)

a. Connect the equipment as shown in Figure 4–9.

b. Set the step attenuator to read 6 (0 dB).

c. Set the TG 2000 AVG1 subcarrier phase to 0°. Select Signal Parameters to adjust the subcarrier phase.

d. Set the 1780 to display CH A and CH B1 on the vectorscope in overlay mode using external reference.

e. Rotate the vectorscope display so that CH B1 (the SPG 422 genlock input) is on the 0 line.

f. Use the SPG 422 Black 1 signal delay to place the CH A vector on the 0 line.

g. Use the TG 2000 AVG1 subcarrier phase control to vary the phase until the CH A vector jumps color frame. Note the position of the CH B1 vector.

h. Check that the CH B1 vector changes more than 120 before the genlock changes color frame.

i. Return the TG 2000 AVG1 subcarrier phase to 0°.

33. Burst Lock Phase Change with Input Signal APL ≤1° (Over input signal APL range of 10% to 90%)

a. Connect the equipment as shown in Figure 4–9.

b. Set the step attenuator to 0 dB.

c. Set the SPG 422 to terminate Genlock 2.

d. Set the TG 2000 AVG1 to output a field square wave.

e. Display CH A on the vectorscope using external reference.

f. Set the vector on the 0 graticule.

g. Check that the vector jitter is not more than 1°.

34. Burst Lock Phase Change with Input Burst Amplitude ≤1° (Will remain locked with SNR > 30 dB)

a. Connect the equipment as shown in Figure 4–10.

b. Set the TG 2000 AVG1 to output a 0% flat field.

c. Set the white noise generator to a minimum amount of inserted noise.

d. Display CH B1 on the waveform monitor.

e. Use the waveform monitor to measure the signal to noise ratio of the CH B1 (SPG 422 genlock input) signal.

f. Set the waveform monitor noise cursor to 30 dB.

g. Add noise to the signal using the white noise generator until the waveform monitor displays 30 dB of noise. Note the amount of inserted noise from the noise generator. This value will be used later.

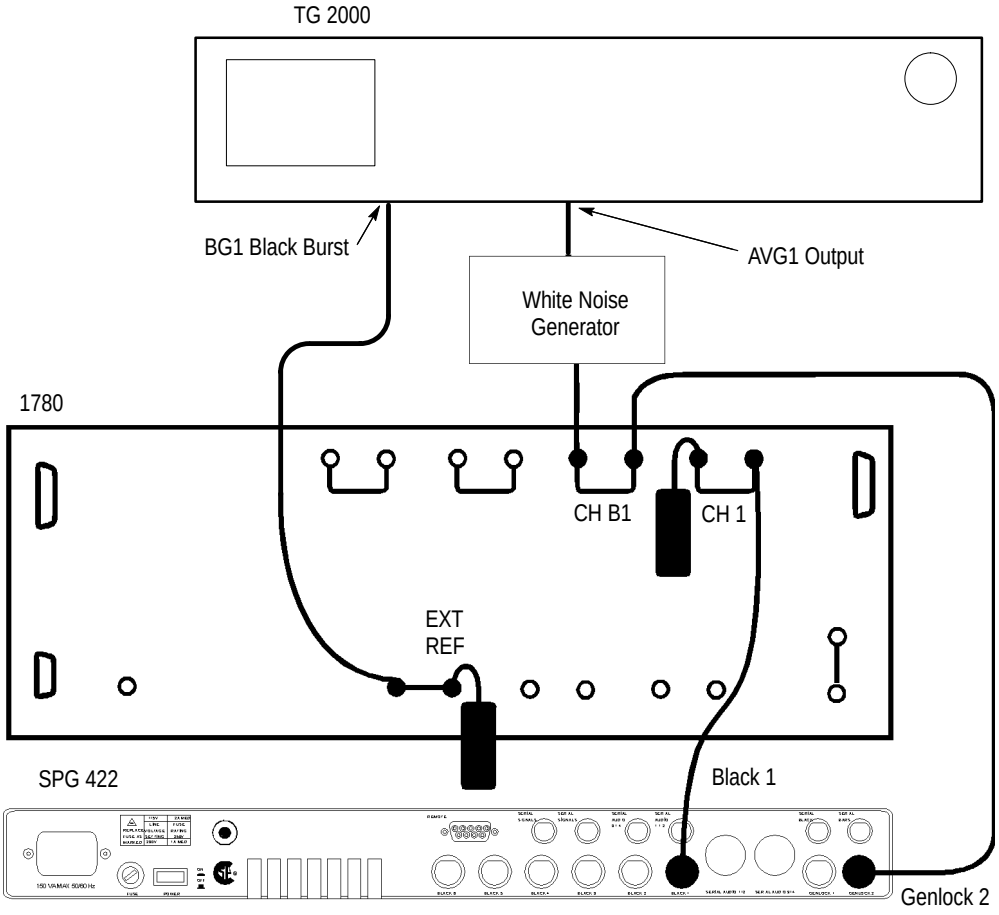

Figure 4–10: Setup to check burst lock phase change

h. Return the white noise generator to the minimum amount of noise.

i. Set the SPG 422 to burst lock on Genlock 2.

j. Check that the SPG 422 is burst locked.

k. Display CH A using external reference on the vectorscope. Rotate the subcarrier vector so that it is on the 0° graticule.

l. Slowly add noise until 30 dB of noise has been added to the signal.

m. Check that the SPG 422 is still burst locked.

n. Check that the CH A vector display has not moved more than 1°.

35. Burst Lock Phase Change with Input Burst Amplitude ≤1° (Will remain locked with 60 Hz hum < 1 V_{p-p})

a. Connect the equipment as shown in Figure 4–11.

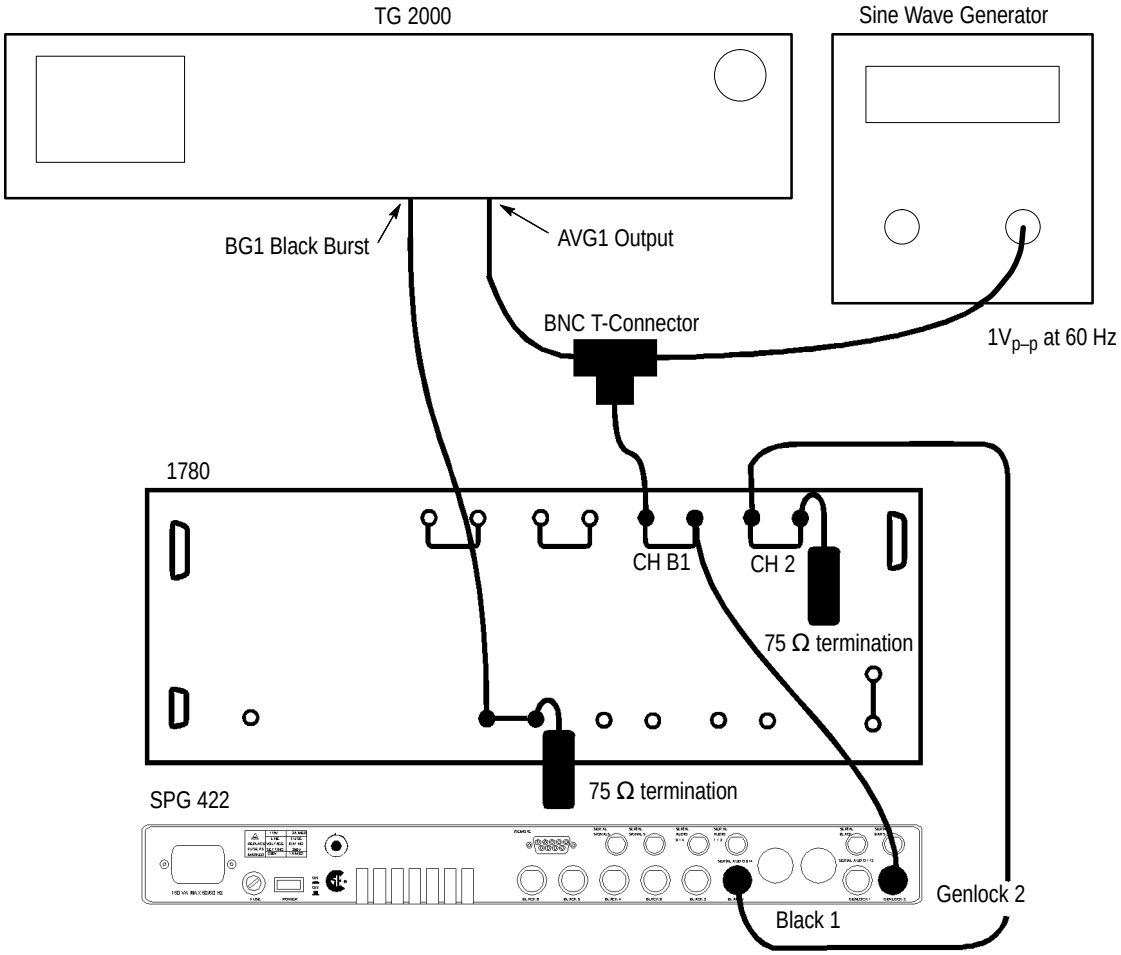

Figure 4–11: Setup to check genlock with hum

b. Set the TG 2000 AVG1 to output 0% field signal.

c. Set sine wave generator to output a 1 V_{p-p} 60 Hz signal as shown on CH B1 on the waveform monitor.

d. Set the SPG 422 to burst lock to genlock input 1.

e. Check that the SPG 422 is burst locked.

f. Display CH A on the vectorscope using external reference.

g. Vary the display to place the vector on the 0° graticule.

h. Check that the CH A display does not move more than 1° from the 0° reference graticule.

36. Isolation Between Two 75 Ω Terminating Inputs ≥60 dB (0 – 5 MHz)

a. Connect the equipment as shown in Figure 4–12.

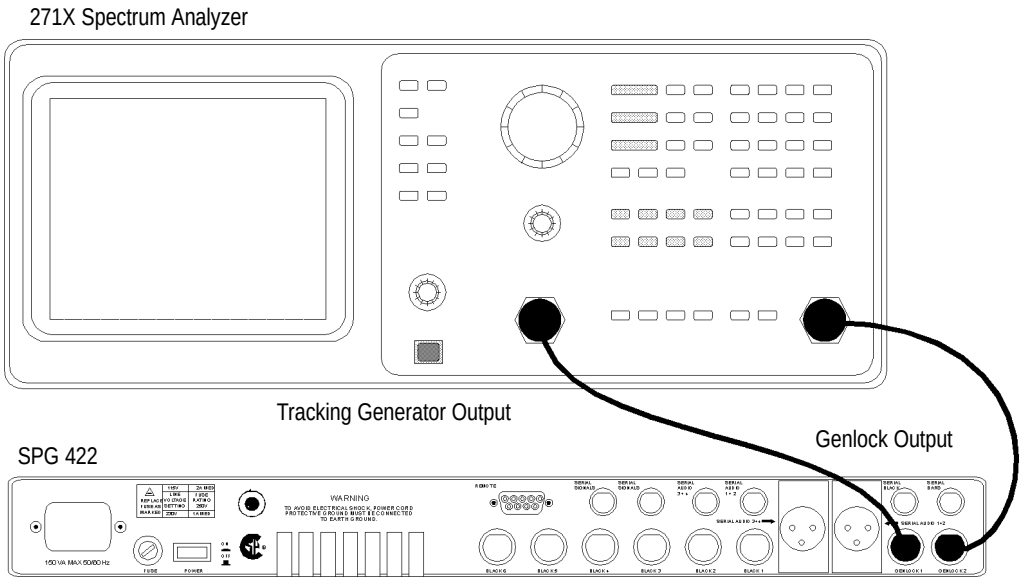

Figure 4–12: Setup to check isolation

b. Set the SPG 422 for loopthrough genlock.

c. Set the spectrum analyzer tracking generator to output a 40 dBm (≈1 V into 75 Ohms) 5 MHz signal.

d. Adjust the reference level until the tracking generator signal level is near the top of the spectrum analyzer graticule line.

e. Set the spectrum analyzer as follows:

Center frequency	5 MHz
Frequency Span/DIV	1 MHz
Resolution BW	AUTO
Trigger	FREE RUN
Display Mode	PEAK

f. Save the results in the spectrum analyzer register A.

g. Without altering any spectrum analyzer controls, set the SPG 422 to terminate the Genlock 1 input.

h. View the spectrum analyzer B register.

i. Activate the B, C MINUS A feature.

j. Turn off the A register, and turn on the marker. The B register now contains the difference in dB between the two genlock inputs, and the marker is reading that difference.

k. Check that the difference is greater than 60 dB from 0 to 5 MHz.

l. Swap the two genlock input cables.

m. Without altering any spectrum analyzer controls, set the SPG 422 to terminate the Genlock 2 input.

n. View the spectrum analyzer B register.

o. Activate the B, C MINUS A feature.

p. Turn off the A register, and turn on the marker. The B register now contains the difference in dB between the two genlock inputs, and the marker is reading that difference.

q. Check that the difference is greater than 60 dB from 0 to 5 MHz.

Return Loss

37. Return Loss Basic Setup

a. Set the spectrum analyzer as follows:

Center Freq.	5 MHz
Freq Span/DIV	1 MHz
Resolution BW	AUTO
Trigger	FREE RUN
Display Mode	PEAK

b. Set up the equipment as shown in Figure 4–13.

c. With the UNKNOWN arm of the return loss bridge open, set the tracking generator output amplitude to 1 V_{p-p} (≈40 dBm) and the frequency to 5 MHz.

d. You should see a relatively flat trace.

e. Adjust the reference signal level until the tracking generator signal level is near the top graticule line. This line represents the return loss reference for the measurement system, including any non-flatness due to the bridge, spectrum analyzer, or tracking generator.

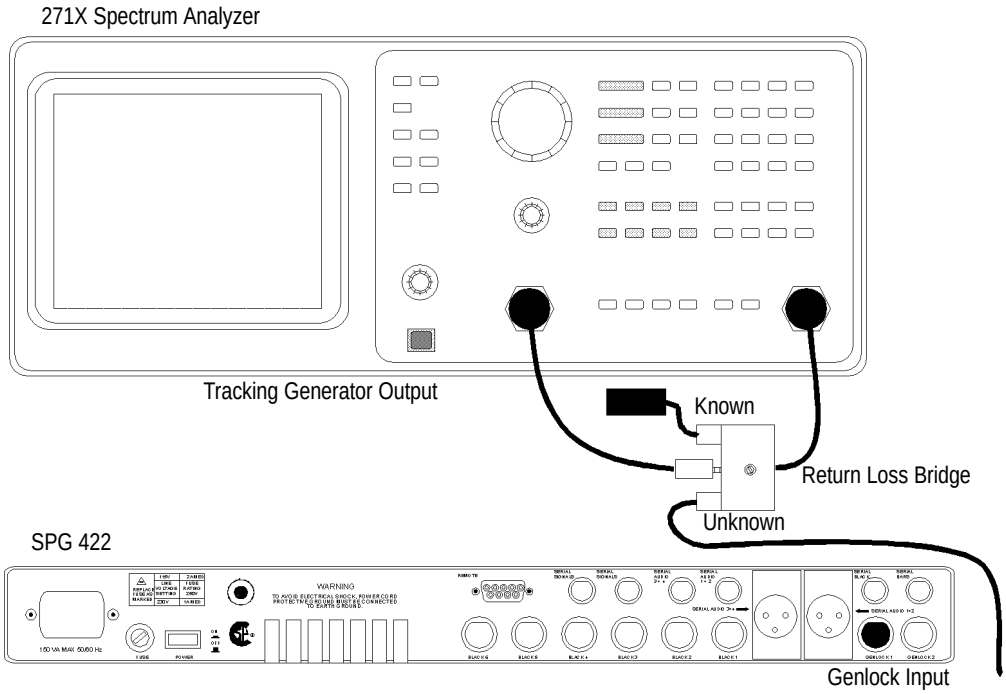

Figure 4–13: Basic setup for return loss checks

f. Save the results in register A of the spectrum analyzer.

NOTE*. All return-loss measurements will be measured in dB from this reference level.*

g. View the B register and connect a precision 75 Ohm termination to the UNKNOWN arm of the return loss bridge. An approximately flat sweep should appear more than 60 dB below the previous trace. This line is the bridge output when it is balanced, and should approach the system noise level. If the difference is not at least 60 dB, troubleshoot your setup.

38. Genlock Input Return Loss ≥40 dB (0 to 5 MHz)

a. Set the SPG 422 to terminate Genlock 1.

b. Without altering any controls, remove the resistive load, and connect the SPG 422 Genlock 1 to the UNKNOWN arm of the return loss bridge.

c. The difference between the A and B traces is the return loss.

d. Check that the return loss for Genlock 1 is greater than 40 dB.

e. Set the SPG 422 to terminate Genlock 2.

f. Without altering any controls, connect the SPG 422 Genlock 2 to the UNKNOWN arm of the return loss bridge.

g. The difference between the A and B traces is the return loss.

h. Check that the return loss for Genlock 2 is greater than 40 dB.

i. Connect the precision terminator to the SPG 422 Genlock 1 input and set the SPG 422 to genlock loopthrough.

j. The difference between the A and B traces is the return loss.

k. Check that the return loss for genlock in loopthrough mode is greater than 40 dB.

39. Black 1 and 2 Return Loss ≤ 30 dB (0 to 5 MHz)

a. Connect the UNKNOWN cable to the Black 1 output.

b. The difference between the A and B traces is the return loss.

c. Check that the return loss is greater than 30 dB.

d. Repeat for Black 2 and Black 3 through Black 6 if option 1 is installed.

Adjustment Procedure

The following section provides the procedures required to bring an SPG 422 back into specification.

Summary Adjustments

Table 5–1: +5 V Power supply adjustment

Signal	Test point	Adjustment
+5 V	T140	R143

Table 5–2: Fine phase filter adjustment

Signal	Test point	Null capacitor	Centering capacitor
Black 1	TP10	C229	C230
Black 2	TP11	C236	C237
System Black	TP9	C243	C244

Table 5–3: Fine phase filter check and sync tip adjustment

Signal	Adjustment	Comments
Black 1	R143	
Black 2	R161	CH B1 on the 1780/1781
Black 3	R14	Option 1 only (connect to CH A)
Black 4	R28	Option 1 only (connect to CH B1)
Black 5	R56	Option 1 only (connect to CH B2)
Black 6	R42	Option 1 only (connect to CH B3)

Table 5–4: Black burst sync adjustment

Signal	Adjustment
Black 1	C143
Black 2	C136

Table 5–5: Subcarrier and SCH phase adjustment for Option 1

Channel	Subcarrier level	SCH phase
Black 3	C25	L2
Black 4	C44	L8
Black 5	C82	L20
Black 6	C63	L14

Adjustment Procedure

1. **+5 V Power Supply Adjustment (R415)**

   a. Connect the line voltage to the SPG 422.

   b. Turn the instrument on.

   c. Connect a probe at TP140 and use a DMM to check for +5 V ± 100 mV.

   d. If the +5 V is out of specification, adjust R415 until it is within specification.

2. **Fine Phase Filter Adjustment**

   a. Set the Diagnostic Switches (S1) to 31 hex (001100001 closed = 1).

   b. Connect a spectrum analyzer to TP10 (Black 1 on the Digital board) using a 500 Ohm probe.

   c. Center the spectrum analyzer display around the 27 MHz carrier and set the display for 10 dB/division. The carrier should have sidebands spaced at 105 kHz intervals.

   d. Adjust C229 to null the 105 kHz sidebands.

   e. Change the display to 2 dB/division.

   f. Adjust the reference level of the spectrum analyzer to view the carrier.

   g. Adjust C230 for maximum carrier amplitude. (Center the LC resonator around 27 MHz clock.)

h. Repeat for Black 2 and System Black (Genlock) using the table below as a reference.

Signal	Test point	Null capacitor	Centering capacitor
Black 1	TP10	C229	C230
Black 2	TP11	C236	C237
System Black	TP9	C243	C244

3. Fine Phase Filter Check

a. Keep the Diagnostic switch (S1) in 31 hex.

b. Connect TP19 (27 MHz) to channel 1 of the oscilloscope and channel 2 to TP10 (Black 1) using 500 Ω scope probes.

c. Invert channel 2.

d. Trigger on the signal from TP19 (channel 1).

e. Check that the signal from TP10 lags that of TP19 by a nominal 2.2 ns.

f. If the value of the delay is less than 3 ns or more than 10 ns, repeat the Fine Phase Filter Adjustment (above).

g. Adjust the centering capacitor for a nominal 6.5 ns delay.

h. Check Black 2 (TP11) and System Black (TP9) for the same timing.

i. Return the Diagnostic switches to their default position.

4. Sync Tip Adjustment

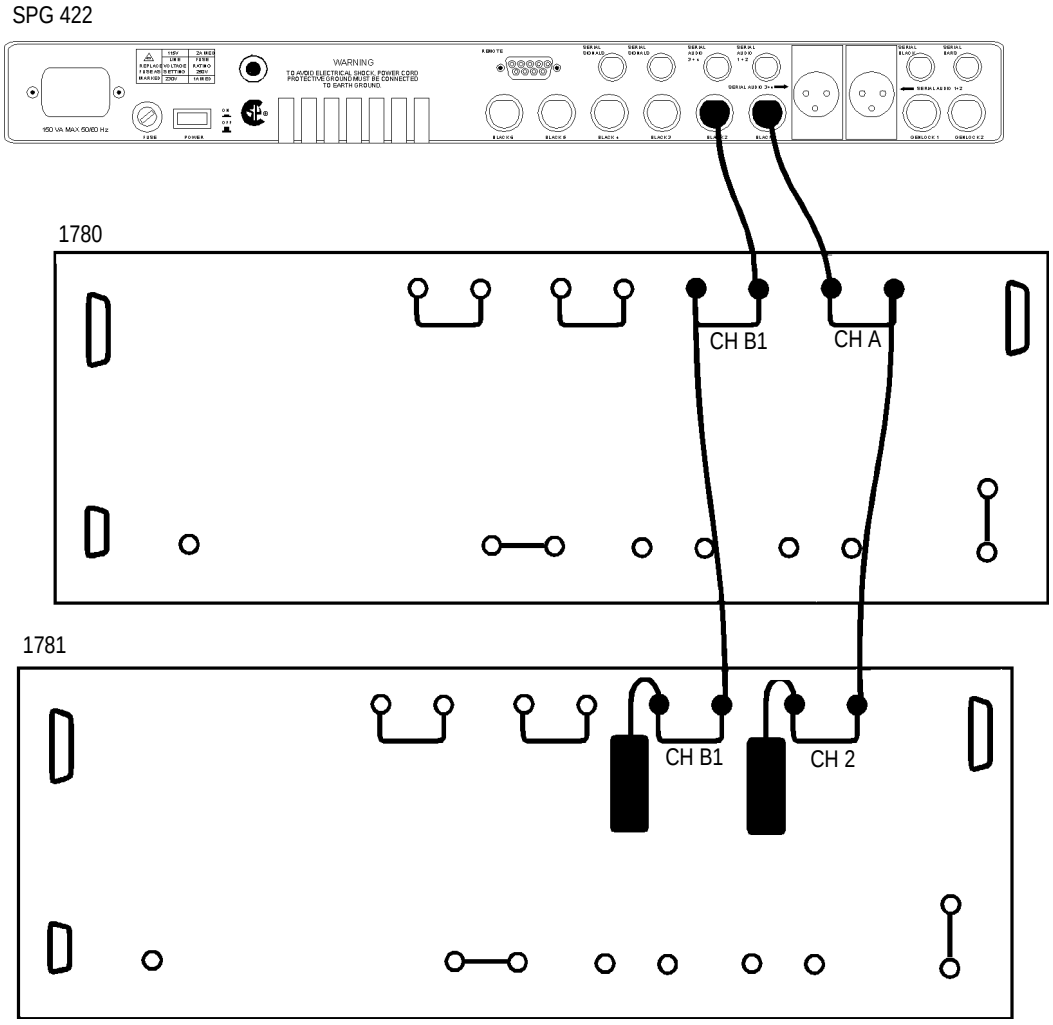

Figure 5–1: Setup for sync tip adjustment

a. Connect the equipment as shown in Figure 5–1 above.

b. View Black 1 (CH 1) on the 1781 PAL vectorscope/waveform monitor.

c. Use the SPG 422 front-panel menu to change the Black 1 output to PAL.

d. Adjust R143 (gain on the Output board) for proper sync amplitude.

e. View Black 1 (CH1) on the 1780 NTSC vectorscope/waveform monitor.

f. Use the SPG 422 front-panel menu to change Black 1 to NTSC.

g. Check the sync amplitude and readjust R143 as necessary. If R130 requires readjusting, check the PAL version to be sure that it remains within specifications.

h. Repeat this procedure with the other Black outputs. Use the list below to select which potentiometer to adjust and channel to view.

Black 1	R143	
Black 2	R161	CH B1 on the 1780/1781
Black 3	R14	Option 1 only (connect to CH A)
Black 4	R28	Option 1 only (connect to CH B1)
Black 5	R56	Option 1 only (connect to CH B2)
Black 6	R42	Option 1 only (connect to CH B3)

5. Black Burst Sin(x)/x Adjustment

a. Connect the equipment as shown in Figure 5–1.

b. Use the SPG 422 front panel to output a PAL signal for Black 1.

c. View the Black 1 output (CH A) on the 1781 PAL vectorscope/waveform monitor.

d. Adjust C130 Sin(x)/x on the Output board for proper subcarrier amplitude (300 mV_{p-p} ± 15 mV).

e. Check for proper SCH phase (0° ± 5°), and adjust C130 if necessary.

f. View the Black 1 output (CH A) on the 1780 NTSC vectorscope/waveform monitor.

g. Change the Black 1 to output an NTSC signal, using the SPG 422 front panel.

h. Check that the subcarrier is at its proper level (40 IRE_{p-p} ± 2 IRE) and adjust as necessary.

i. Check that the SCH phase is within specification (0° ± 5°), and adjust if necessary.

j. Repeat swapping from NTSC to PAL until both subcarrier levels and SCH phases are within specification.

k. Repeat procedure with the Black 2 output CH B1), adjusting C136.

6. Subcarrier and SCH Phase Adjustment (Option 1 only)

a. Set up the equipment as shown in Figure 5–1, except connect Black 3 to CH A, Black 4 to CH B1, Black 5 to CH B2, and Black 6 to CH B3.

b. Use the SPG 422 front-panel menu change the Black 3 output to PAL.

c. View the Black 3 signal CH A on the 1781 PAL vectorscope/waveform monitor.

d. Adjust C25 for proper subcarrier amplitude (300 mV_{p-p} ± 15 mV) and L2 for zero SCH Phase (0° ± 5°). (Repeat as necessary, because these adjustments interact.)

e. View the Black 3 signal on the 1780 NTSC vectorscope/waveform monitor.

f. Use the SPG 422 front-panel menu to change Black 3 to output an NTSC signal.

g. Check that the subcarrier level is 40 IRE_{p-p} ± 2 IRE and the SCH Phase is 0° ± 5°.

h. Adjust C25 and L2 until both NTSC and PAL subcarrier specifications are met.

NOTE*. C25 has a gain effect on both NTSC and PAL subcarrier levels, while L2 can be used to trade off gain between NTSC and PAL for their SCH performance.*

i. Repeat procedure with Black 4 through Black 6 output, using the list below:

Channel	Subcarrier level	SCH phase
Black 3	C25	L2
Black 4	C44	L8
Black 5	C82	L20
Black 6	C63	L14

Maintenance

This section discusses the options available for servicing the Tektronix SPG 422. It also contains instructions for preventive maintenance, general troubleshooting, and corrective maintenance. If the instrument does not function properly, troubleshooting and corrective measures should be taken immediately to circumvent additional problems.

Service Options

Servicing options include returning the instrument to Tektronix for repair and/or recalibration or major assembly exchange by the customer. Each of these options should be investigated as to which will be the most time efficient and cost effective.

Tektronix maintains service centers around the world to provide quick turn-around repair and recalibration services. When this service is used, even during the warranty period, the instrument should be tagged and repackaged according to the instructions at the end of this section.

Preparation

- Qualified Service Personnel Only
- Read the Safety Summary and the Service Strategy
- Read Operating Basics
- Follow Static Guidelines

Preventive Maintenance

Preventive maintenance consists of cleaning, visual inspection, performance checking, and, if needed, readjustment. The preventive maintenance schedule established for the instrument should be based on the environment in which it is operated and the amount of use. Under average conditions, scheduled preventive maintenance should be performed every 2000 hours of operation.

Service Setups

There is one setup procedure that should only be performed by qualified service personnel, because it requires removal of the instrument top cover. This sets the operation of the rear-panel Remote connector.

Configuring the Remote

RS-232 Operation

The instrument is factory-set for RS-232 operation. The remote cable should be connected to J6, labeled RS-232, on the Digital board. See the Reference section of this manual for the RS-232 commands.

Ground-Closure Operation

To set the SPG 422 Remote for ground-closure operation, place the remote cable on J9, labeled Parallel on the Digital board. See the Reference section of this manual for how to use the ground-closure commands.

Inspection and Cleaning

Preventive Maintenance consists of cleaning, lubricating, visual inspection, checking performance, and readjusting the SPG 422 on a regular schedule. The inspection and cleaning schedule should be established based on the amount of use and the surrounding environment of the SPG 422. Under average conditions, a preventive maintenance check should be performed at least once a year (severe environment conditions such as high heat, high humidity, or dust may dictate a shorter time interval).

Cleaning

The instrument should be cleaned often enough to prevent dust or dirt from accumulating. Dust accumulating in the instrument acts as an insulating blanket, preventing proper cooling, and possibly causing overheating and component breakdown. Under high humidity conditions, accumulated dust can also provide an electrical conduction path.

CAUTION. *Avoid the use of chemical cleaning agents that might damage the plastics used in the instrument. Avoid using organic cleaning solutions such as benzene, toluene, xylene, acetone, Freon, or other halogenated hydrocarbon solvents. Use a non-residue type of cleaner, preferably isopropyl alcohol.*

Exterior. Remove accumulated dust with a soft cloth or small paint brush. The brush is particularly useful around the connectors and front-panel buttons. Remove hardened dirt with a soft cloth, dampened in a mild detergent and water solution. Do not use abrasive cleaners.

Interior. The best way to remove accumulated dust inside the instrument is to blow it off with dry, low-velocity air. Remove remaining dust with a small paint brush, followed by a soft cloth dampened in a mild detergent and water solution.

CAUTION. *Do not allow water to get inside any enclosed assembly or component.*

Visual Inspection

Visually inspect the instrument during the preventive maintenance routine for signs of damage, scorched components, and loose or disconnected pin connectors. If you discover heat damaged parts, try to determine the cause of the overheating; otherwise, the damage may repeat.

Periodic checks of the transistors and integrated circuits are not recommended. The best measure of performance is the actual operation of the component in the circuit.

Static-Sensitive Components

This instrument contains electrical components that are susceptible to damage or degradation from static discharge. See Table 6–1 for relative susceptibility of various classes of semiconductors. Higher static discharge voltages than the levels listed in Table 6–1 can degrade the performance and reliability of the semiconductor components. Static voltages of 1 kV to 30 kV are common in unprotected environments.

CAUTION. *Static discharge can damage or degrade many semiconductor components.*

Table 6–1: Relative susceptibility levels

Semiconductor classes	Relative susceptibility levels
MOS or CMOS microcircuits or discrete or linear microcircuits with MOS inputs (most sensitive)	100 to 500 V
EL, 74F, 74ALS, and 155- P/N parts	200 to 500 V
Schottky signal diodes	250 V
Schottky TTL	500 V
High-frequency bipolar transistors & ICs	400 to 600 V
JFETs	600 to 800 V
Low-frequency linear microcircuits	400 to 1000 V
Low-power Schottky TTL	900 V
TTL (least sensitive)	1200 V

NOTE. *Static discharges of less than 2 kV are seldom felt.*

Observe the following precautions to avoid damage:

1. Minimize handling of static-sensitive components.
2. Transport and store static-sensitive components or assemblies in their original containers or on non-conductive surfaces.
3. Discharge the static voltage from your body by wearing a grounded wrist strap while handling these components. Service static-sensitive components or assemblies only at a static-free workstation by qualified personnel. If soldering is involved, use a soldering iron connected to earth ground and special anti-static desoldering tools.
4. Avoid handling components in areas that have a floor or work surface covering capable of generating a static charge. Carpeted floors should be sprayed to reduce static problems. Also nothing capable of generating or holding a static charge should be allowed on the work-station surface.
5. Keep the component leads shorted together whenever possible.
6. Pick up the components by the body, never by the leads.
7. Do not slide the components over any surface.
8. Use a soldering iron that is connected to earth ground.
9. Use only special anti-static, suction, or wick-type desoldering tools.

Performance Verification and Readjustments

Instrument performance should be checked after each 2000 hours of operation, or every 12 months. This will help to ensure maximum performance and assist in locating defects that may not be apparent during regular operation. The Performance Verification and Adjustment Procedures are included in this manual.

Corrective Maintenance

The following procedure is designed to assist in isolating problems, which in turn expedites repairs and minimizes down time. There are no specific troubleshooting procedures for this instrument because it is a very simple instrument.

General Troubleshooting Procedures

Ensure that the malfunction exists in the instrument. This is done by making sure that the instrument is operating as intended by Tektronix (see Operating Instructions), and by checking that a malfunction has not occurred before the signal entered the SPG 422.

Determine and evaluate all trouble symptoms. This is accomplished by isolating the problem to a general area, such as an assembly. The block diagram and the Theory of Operation are valuable aids in signal tracing.

CAUTION. *Use extreme care when probing with meter leads or probes. The components are very dense and there is only limited access within the instrument. The inadvertent movement of leads or a probe could cause a short circuit or transient voltages capable of destroying components.*

Determine the nature of the problem. Attempt to make the determination of whether the instrument is out of calibration or if there has been a component failure. Once the type of failure has been determined, proceed on to identify the functional area most likely at fault.

Visually inspect the suspect assembly for obvious defects. Most commonly these will be broken or loose components, improperly seated components, overheated or burned components, chafed insulation, etc. Repair or replace all obvious defects. In the case of overheated components, determine the cause of overheating and correct the cause before re-applying power.

Use successive electrical checks to locate the source of the problem. The primary tool for the problem isolation is the oscilloscope. Use the Performance Verification procedure to determine if a circuit is operating within specifications. At times, it may be necessary to change a calibrations adjustment to determine if a circuit if operational, but since this can destroy instrument calibration, care should be exercised. Before changing an adjustment, note its position so that it can be returned to its original setting.

Determine the extent of the repair. If the necessary repair is complex, it may be advisable to contact your local Tektronix field office or representative before continuing. Removal and replacement procedures for the assemblies can be found in this section.

Tektronix Service Offerings

Tektronix maintains a service organization that can provide a number of services to assist in maintaining instrument operation at its specified levels. They range from complete repair and adjustment, at a convenient location, to supplying replacement parts. In addition, there are training programs that are available for service technicians.

NOTE. *When considering which service offerings best suit the current need, remember that Tektronix provides a limited parts and service warranty for all its products. No customer repairs should be attempted during the instrument warranty period.*

Service Training

Tektronix provides service training in a number of programs. In addition to classes held at our Beaverton campus, special classes at convenient locations can be arranged. To find out more about service training programs, contact your local Tektronix field office or representative. US customers can call our service organization directly using 1–800–TEK–WIDE (835–9433) and ask for "Service Training". The 800 number is a 24-hour service, but service training specialists are only available between 8 am and 4 pm pacific coast time.

Field Service Centers

Tektronix maintains service centers worldwide. These centers provide repair and calibration services for Tektronix instruments. They can be contacted through your Tektronix field office or representative. In addition, US and Canadian customers can call 1–800–TEK–WIDE (835–9433) for assistance in contacting their nearest service center. Not all service centers are equipped to repair or calibrate all instruments; be ready to give the operator the instrument type and operating options when calling for assistance.

Module Exchange

The module exchange program provides an easily accessible means of returning an instrument to operational status. The defective module is exchanged for a calibrated module at a cost less than the new module price. The process begins by contacting one of the module exchange centers. They can be contacted through your Tektronix field office or representative. In addition, US customers can call 1–800–TEK–WIDE (835–9433) for assistance in contacting the Television Board Exchange Center. The center will provide information on the cost of the module and returning the failed module.

NOTE. *Circuit boards that are damaged due to mishandling or containing modifications not originated by Tektronix are not acceptable for the exchange program.*

When calling to arrange for a circuit board exchange it is essential that you have some information ready to relay to our technician. The instrument type and serial number, along with installed options are absolutely essential. In addition, the Assembly number (A??) and the 9-digit circuit board part number (67?-????-??) will help ensure that you are getting a direct replacement. Finally, if you know or are able to provide the software version number it will further ensure that the circuit board you receive will return instrument performance to what it was before the failure occurred.

The following paragraphs are intended to assist in ordering the exact circuit board replacement. Note that this information is important whether you are ordering a circuit board from the Module Exchange Center or as a new replacement part from Tektronix.

Circuit board assembly number	Assembly name
Front Panel	A1
Digital	A2
Output	A3
EMI Filter	A7
Option 1	A5
Option 2	A6
Power	A4

Circuit Board Assembly Number. This is the number used in the Replaceable Electric Parts List, Circuit Board Illustrations, and on the schematic diagrams to identify the assembly.

Assembly Name. The actual name applied to the circuit board. It will usually be related to the function of the assembly. Use this number to look up the Tektronix part number.

First Seven Digits of the Part Number. These digits make up the general part number. They are often the same for several members of the same instrument family. Always look up this number in the part list. Be sure that it is for the serial number of your instrument. See the Replaceable Electrical Parts list Serial Number/Assembly Effective/Discontinued column for the range in which your instrument serial number falls.

Part Number Suffix. This portion of the part number often varies between members of the same family to denote various types or because the circuit board contains factory-modified circuitry. Always look up this number in the parts list. Be sure that it is for your instrument serial number. See the Replaceable Electrical Parts list Serial Number/Assembly Effective/Discontinued column for the range in which your instrument serial number falls.

Having the pieces of information from the Replaceable Parts List, plus the instrument type, serial number, and software version number (if applicable) ensures that you will receive the module required to return the instrument to complete operation.

Factory Replacement Parts

Replacement parts are available through the local Tektronix field office or representative. However, many common electric parts are available through local sources. Using a local source, where possible, will eliminate shipping delays.

Changes to Tektronix instruments are sometimes made to accommodate improved components, as they become available, and to improve circuit performance. Therefore, it is important to include the following information when ordering parts:

1. Part Number
2. Instrument Type or Number
3. Serial Number
4. Modification or Option Number (if applicable)

Etched Circuit Boards

The instrument consists of etched circuit boards. All of the circuit boards are designed as assemblies. Each assembly has as alphanumeric designation. These assemblies are listed at the beginning of the Replaceable Electrical Parts list of this manual.

Troubleshooting Aids

There are several troubleshooting aids that the SPG 422 provides. These include: Diagnostic LEDs, the diagnostics from the front panel, and the S1 diagnostic switch on the Digital board.

Diagnostic LEDs

There are several Diagnostic LEDs on the circuit boards that only light in the event of a problem within a given circuit. See Table 6–2 below for the LEDs and what problems they indicate.

Table 6–2: Diagnostic LEDs

Board	LED	Indication	Solution
Digital	DS1	Oven Under Temperature	Wait at least twenty minutes after power-on to assure that the crystal is warm and stable. This LED could be on by itself or all of the other LEDs could also be on.
Digital	DS4	13.5 Loop Unlocked	If on in conjunction with DS1, Oven Under Temperature LED, just wait until the crystal warms up then both LEDs should turn off. Otherwise, the crystal could be out of the range of the 13.5 PLL. If you are using internal genlock, this LED should never be on.
Digital	DS2	108 Loop Unlocked	The 108 PLL is outside of its 50 kHz pull-in range. If DS1 and DS4 are also on, wait for the crystal to warm up before continuing troubleshooting. Otherwise, there is a problem in the 108 MHz oscillator circuit.
Digital	DS3	6.144 Loop Unlocked	The 6.144 MHz audio clock is unlocked. There is a problem in the 6.144 MHz oscillator circuit or data is not properly loaded in the Ado Altera part.

Front-Panel Diagnostics

These are explained completely in the user manual. Please see the discussion of the front-panel diagnostics in that manual.

S1 Diagnostic Switch

These diagnostics are in addition to the front-panel diagnostics and can help narrow down a problem.

There are three types of diagnostics, including:

- C. Diagnostic runs continuously until switch is moved to new position
- U. User feedback only (using LEDs, LCD display, scope display, etc.)
- P. Processor feedback (using LCD display or RS-232)

Table 6–3: Diagnostic switch

Code (S1) 12345678	Diagnostic name	Function	Type
oooooooo		Default position, no diagnostics	
Xooooooo	EPROM diagnostic	Calculate and check EPROM checksums This diagnostic tests the state of U10 and U11 by performing a checksum. Since the complement of the checksum is stored at the end of each device, the overall checksum for each device should be 0. The Checksum calculation for U10 is in the range 0xC0000–0xFDFFF. This excludes 8K bytes at the upper part of U10 for two reasons. The first is that 0xFFFF00–0xFFFFF is reserved for internal CPU registers, and second that the TdRem (Turbo Debugger Remote) requires address space 0xFFE00–0xFFFFF. The complement of the checksum value is calculated and stored at location 0xFDFFF. The Checksum calculation for U11 is in the range 0x00000–0x3FFFF. The complement of the checksum is stored at 0x3FFFF.	C,U,P
XooooooX	RAM diagnostic	Read/write test of all RAMs This routine tests: 1) Serial Color Bar RAM (U26, U27) 2) Serial Color Bar Coprocessor RAM (U42, U43) 3) Read back registers on the Option 1 board 4) Option 1 Black Signal video RAM (U6, U12, U18, U24) 5) Option 2 Serial Test Signal video RAM (U13, U11) 6) Serial Test Signal Coprocessor RAM (U19, U20)	C,U,P
XoooooXo	NVRAM diagnostic and initialize	Test and initialize NVRAM This routine tests reading and writing of the NVRAM. It then uses the return code to notify the user of the test results. If the tests are successful, the NVRAM is then initialized to factory defaults. If this routine is called from the front-panel diagnostics menu or by the diagnostic switches, the user must press the front-panel ENTER key to execute the NVRAM test and initialization to prevent accidental destruction of the stored settings.	C,U,P
XoooooXX	Port diagnostic	This routine walks through the decoded addresses to allow the user to troubleshoot address decoder problems. This routine confuses the processor system, so it reboots when exiting the routine.	C,U

Table 6–3: Diagnostic switch (cont.)

Code (S1) 12345678	Diagnostic name	Function	Type
XooooXoo	RS–232 loopback	Loopback Test — Sends, receives, and verifies characters using the RS-232 port. The Loopback Test writes a test string to the RS-232 transmitter and expects to receive the same string back in the receiver within approximately one second. If the string is not received or if it is not correct, an error is reported.	C,U,P
XooooXoX	Switch/LED test	Reads switches and lights their LEDs This routine allows the user to test front-panel LEDs and switches by manually pressing the switches and verifying that the corresponding LED comes on.	C,U
XooooXXo	LCD test	LCD and LCD memory test This routine writes data patterns to the LCD display and its memories and then verifies each result. If a readback compare is in error the routine prematurely returns with an error number. At the end of the routine the backlight blinks indicating that all tests have passed. The error number is NOT programmed to display anything at this time. However if no errors have occurred, then the routine will not have quit early and the Backlight will blink.	C,U
XooooXXX	DAC ramp diagnostic	Outputs ramp from LCD contrast DAC This diagnostic allows the user to test the DAC by verifying that the DAC is generating a ramp. This can be used to verify that the oscillator test voltage TEST_COR varies between 3.24 V and 7.4 V. Test_Cor is routed through an active switch to the Oscillator oven as the Tune voltage. See the VCO diagnostic for oscillator adjustment. The ramp to the contrast control is too fast to notice any contrast changes on the display. The front-panel contrast control adjustment should be used to check contrast.	C,U
XoooXooo	Parallel remote diagnostic	Reads from the parallel remote and writes to the display This routine allows the user to test the parallel ground-closure remote by verifying that the binary contents of the parallel remote switches are written to the display.	C,U,P

Table 6–3: Diagnostic switch (cont.)

Code (S1) 12345678	Diagnostic name	Function	Type
XoooXooX	Serial output clock	Serial output clock diagnostics This diagnostic forces the GVG serializer CLK/(VID) lines high to make them output a 270 MHz clock instead of serial digital video. This is to help in troubleshooting the instrument only. The problem is that if there is a problem and the output goes away, it could be that the serializer is not working or it could be that its data inputs have stopped. Either way, there is no serializer output to examine. It should also be easier to measure the jitter on the clock output.	C,U
XoooXoXo	VCO diagnostic	Sends test voltage to VCO This diagnostic uses the LCD contrast DAC to drive the VCO correction voltage to allow the user to test the oscillator pull range from the front panel. This is to verify specifications and help troubleshooting the instrument only. Wait for a button to be pressed. If LEFT_BUTTON or RIGHT_BUTTON is selected to update “value” and write the test value to the contrast DAC.	C,U
XoooXoXX	Genlock FPGA diagnostics	This routine downloads a new configuration file to the genlock controller PLD(U82) and then test the reading/writing of the internal registers.	C,P
XoooXXoo	Genlock calibration diagnostics	This diagnostic downloads a set of values to the FPGA (U82) for calibration. The Genlock IC (U82) contains 16 addresses beginning at “GNLK_ADDR” address. The values downloaded are: Reg: 0 1 2 3 8 9 Value (hex) : 80 3F 3F 0 3F 0	C, U, P
oXooooo	Lockout	Enables (Open) / Disables (Closed) Lockout Timing Lockout timing disables the keyboard after 5 minutes, when enabled by setting segment 2 open. This prevents inadvertent keyboard selections from being made. Lockout timing is disabled (infinite delay) when segment 2 is closed. The Lockout button may still be used to disable the keyboard, and power–up will initially enable the lockout.	

Repackaging Instructions

Repackage the instrument according to these instructions.

Identification Tag

If the instrument is to be shipped to Tektronix Service Center for service or repair, attach a tag to the instrument showing:

1. Owner (with complete address) and the name of the person at your firm that can be contacted.
2. Instrument serial number and a description of the service required.

Repackaging for Shipment

Repackage the instrument in the original manner to provide adequate protection. If the original packaging is not available or is unfit for use, repackage the instrument as follows:

1. Obtain a corrugated cardboard carton whose inside dimensions are at least six inches greater than the dimensions of the instrument to allow room for cushioning. The shipping carton should have a test strength of at least 275 pounds.
2. Surround the instrument with polyethylene sheeting to protect the finish.
3. Cushion the instrument on all sides by tightly packing dunnage or urethane between the carton and the instrument. Allow three inches on all sides for cushioning.
4. Seal the carton with shipping tape or an industrial stapler.

Options

The A Options accommodate the various national electrical power connections. A number of other options are also available. Option 1 adds four more analog black outputs and option 2 adds two additional test signal outputs.

Power Cord Options

Any of the following power cord options can be ordered for the SPG 422. If no power cord option is ordered, instruments are shipped with a North American 125 V power cord.

Option A1. Universal Europe, 220V/16A Power Plug (power cord and one replacement fuse)

Option A2. United Kingdom, 240V/15A Power Plug (power cord and one replacement fuse)

Option A3. Australian, 240V/10A Power Plug (power cord and one replacement fuse)

Option A4 North American, 250V/10A Power Plug (power cord and one replacement fuse)

Unless otherwise specified, power cords for use in North America are UL listed and CSA certified. Cords for use in areas other than North America are approved by at least one test house acceptable in the country to which the product is shipped. Power cord part numbers are shown on the “Accessories” pull-out.

Option 1 — Additional Black Outputs

Option 1 adds four additional analog black outputs to the two outputs that are standard on the SPG 422. This is accomplished by adding a board to the SPG 422 and can be done at the factory or as a field upgrade. Any additional information required to operate the SPG 422 with option 1 installed is already incorporated into the documentation and is given wherever applicable throughout this manual.

Option 2 — Adding Serial Test Signals

Option 2 adds serial test signals and two additional outputs to the SPG 422. This allows the SPG 422 more flexibility to test a serial digital system and still act as a master sync generator. This option adds a board to the instrument. Any additional information required to operate the SPG 422 with the option 2 is included where applicable throughout this manual.

Ordering

Any of these options can be ordered with the SPG 422. In addition, these items are available from your nearest Tektronix field office or distributor. Be sure to include both the name and number of any Field Upgrades Kits ordered.

Replaceable Electrical Parts

This section contains a list of the electrical components for the SPG 422. Use this list to identify and order replacement parts.

Parts Ordering Information

Replacement parts are available through your local Tektronix field office or representative.

Changes to Tektronix products are sometimes made to accommodate improved components as they become available and to give you the benefit of the latest improvements. Therefore, when ordering parts, it is important to include the following information in your order:

- Part number
- Instrument type or model number
- Instrument serial number
- Instrument modification number, if applicable

If you order a part that has been replaced with a different or improved part, your local Tektronix field office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

Using the Replaceable Electrical Parts List

The tabular information in the Replaceable Electrical Parts List is arranged for quick retrieval. Understanding the structure and features of the list will help you find all of the information you need for ordering replacement parts. The following table describes each column of the electrical parts list.

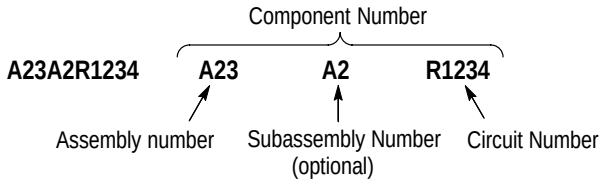
Parts list column descriptions

Column	Column name	Description
1	Component number	The component number appears on diagrams and circuit board illustrations, located in the diagrams section. Assembly numbers are clearly marked on each diagram and circuit board illustration in the *Diagrams* section, and on the mechanical exploded views in the *Replaceable Mechanical Parts* list section. The component number is obtained by adding the assembly number prefix to the circuit number (see Component Number illustration following this table). The electrical parts list is arranged by assemblies in numerical sequence (A1, with its subassemblies and parts, precedes A2, with its subassemblies and parts). Chassis-mounted parts have no assembly number prefix, and they are located at the end of the electrical parts list.
2	Tektronix part number	Use this part number when ordering replacement parts from Tektronix.
3 and 4	Serial number	Column three indicates the serial number at which the part was first effective. Column four indicates the serial number at which the part was discontinued. No entry indicates the part is good for all serial numbers.
5	Name & description	An item name is separated from the description by a colon (:). Because of space limitations, an item name may sometimes appear as incomplete. Use the U.S. Federal Catalog handbook H6-1 for further item name identification.
6	Mfr. code	This indicates the code number of the actual manufacturer of the part.
7	Mfr. part number	This indicates the actual manufacturer's or vendor's part number.

Abbreviations

Abbreviations conform to American National Standard ANSI Y1.1–1972.

Component Number



Read: Resistor 1234 (of Subassembly 2) of Assembly 23

List of Assemblies

A list of assemblies is located at the beginning of the electrical parts list. The assemblies are listed in numerical order. When a part's complete component number is known, this list will identify the assembly in which the part is located.

Chassis Parts

Chassis-mounted parts and cable assemblies are located at the end of the Replaceable Electrical Parts List.

Mfr. Code to Manufacturer Cross Index

The table titled Manufacturers Cross Index shows codes, names, and addresses of manufacturers or vendors of components listed in the parts list.

Diagrams/Circuit Board Illustrations

Symbols

Graphic symbols and class designation letters are based on ANSI Standard Y32.2–1975.

Logic symbology is based on ANSI Y32.14–1973 in terms of positive logic. Logic symbols depict the logic function performed and may differ from the manufacturer's data.

Overline, parenthesis, or leading slash indicate a low asserting state.

Example: $\overline{\text{ID CONTROL}}$, (ID CONTROL), or /ID CONTROL.

Abbreviations are based on ANSI Y1.1–1972.

Other ANSI standards that are used in the preparation of diagrams by Tektronix, Inc. are:

Y14.15, 1966 -- Drafting Practices.
Y14.2, 1973 -- Line Conventions and Lettering.
Y10.5, 1968 -- Letter Symbols for Quantities Used in Electrical Science and Electrical Engineering.

American National Standard Institute
1430 Broadway, New York, New York 10018

Component Values

Electrical components shown on the diagrams are in the following units unless noted otherwise:

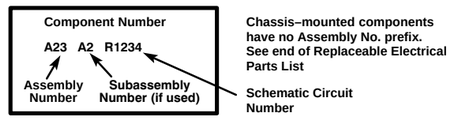
Capacitors: Values one or greater are in picofarads (pF).
Values less than one are in microfarads (μF).
Resistors = Ohms (Ω).

The following information and special symbols may appear in this manual.

Assembly Numbers

Each assembly in the instrument is assigned an assembly number (e.g., A20). The assembly number appears on the diagram (in circuit board outline), circuit board illustration title, and lookup table for the schematic diagram.

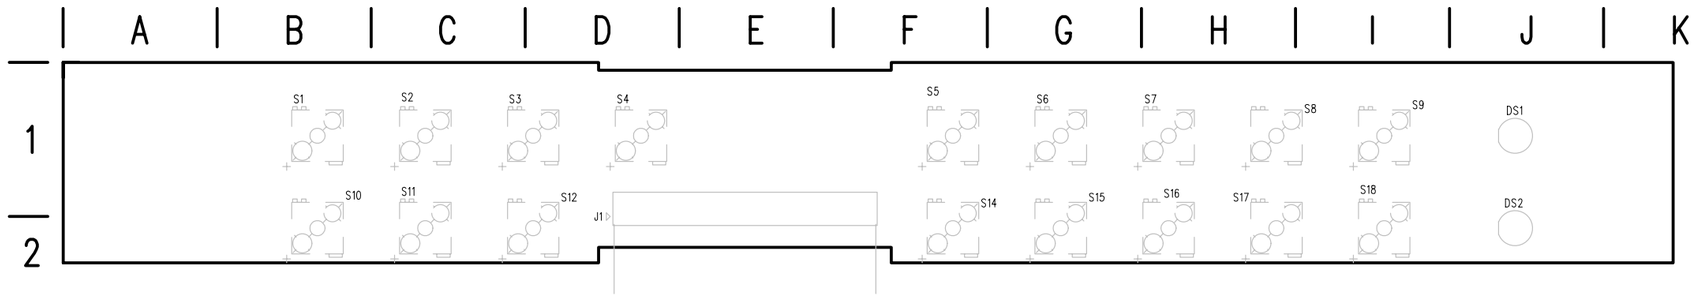
The Replaceable Electrical Parts List is arranged by assembly number in numerical sequence; the components are listed by component number. Example:



Grid Coordinates

The schematic diagram and circuit board component location illustration have grids. A lookup table with the grid coordinates is provided for ease of locating the component. Only the components illustrated on the facing diagram are listed in the lookup table.

When more than one schematic diagram is used to illustrate the circuitry on a circuit board, the circuit board illustration will only appear opposite the first diagram; the lookup table will list the diagram number of other diagrams that the other circuitry appears on.



Static Sensitive Devices

Replaceable Mechanical Parts

This section contains a list of the replaceable mechanical components for the SPG 422. Use this list to identify and order replacement parts.

Parts Ordering Information

Replacement parts are available through your local Tektronix field office or representative.

Changes to Tektronix products are sometimes made to accommodate improved components as they become available and to give you the benefit of the latest improvements. Therefore, when ordering parts, it is important to include the following information in your order:

- Part number
- Instrument type or model number
- Instrument serial number
- Instrument modification number, if applicable

If you order a part that has been replaced with a different or improved part, your local Tektronix field office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

Using the Replaceable Mechanical Parts List

The tabular information in the Replaceable Mechanical Parts List is arranged for quick retrieval. Understanding the structure and features of the list will help you find all of the information you need for ordering replacement parts. The following table describes the content of each column in the parts list.

Parts list column descriptions

Column	Column name	Description
1	Figure & index number	Items in this section are referenced by figure and index numbers to the exploded view illustrations that follow.
2	Tektronix part number	Use this part number when ordering replacement parts from Tektronix.
3 and 4	Serial number	Column three indicates the serial number at which the part was first effective. Column four indicates the serial number at which the part was discontinued. No entry indicates the part is good for all serial numbers.
5	Qty	This indicates the quantity of parts used.
6	Name & description	An item name is separated from the description by a colon (:). Because of space limitations, an item name may sometimes appear as incomplete. Use the U.S. Federal Catalog handbook H6-1 for further item name identification.
7	Mfr. code	This indicates the code of the actual manufacturer of the part.
8	Mfr. part number	This indicates the actual manufacturer's or vendor's part number.

Abbreviations

Abbreviations conform to American National Standard ANSI Y1.1–1972.

Chassis Parts

Chassis-mounted parts and cable assemblies are located at the end of the Replaceable Electrical Parts List.

Mfr. Code to Manufacturer Cross Index

The table titled Manufacturers Cross Index shows codes, names, and addresses of manufacturers or vendors of components listed in the parts list.
