WARRANTY

All TEKTRONIX instruments are warranted against defective materials and workmanship for one year. Any questions with respect to the warranty should be taken up with your TEKTRONIX Field Engineer or representative.

All requests for repairs and replacement parts should be directed to the TEKTRONIX Field Office or representative in your area. This will assure you the fastest possible service. Please include the instrument Type Number or Part Number and Serial Number with all requests for parts or service.

Specifications and price change privileges reserved.

SECTION 1

Introduction

The Sample and Hold Card in the P7001 obtains samples of waveforms generated by the Acquisition Unit of the 7704A. The A-D Converter converts the horizontal sample to a binary word of 9 bits (512 points), and the vertical sample to a binary word of 10 bits (1024 points). The horizontal sample determines the address in Memory at which the vertical sample is stored.

Working directly with the A-D Converter Card, which determines sampling rate, the Sample and Hold takes a horizontal and a vertical sample every 6.5 microseconds, regardless of sweep speeds. For sweeps slower than 0.5 milliseconds/division, all 512 horizontal locations are filled in one sweep. Sampling of repetitive waveforms at sweep speeds faster than 0.5 milliseconds/division is thus done on an equivalent basis. That is, when repetitive waveforms are sampled, subsequent sweeps provide new and/or updated samples until the A-D Converter is commanded into the HOLD mode. The combination of new and old samples in Memory provides a complete waveform.

The Sample and Hold circuit card consists of a display switching circuit, sampler circuits, and multiplexing circuits. The display switching circuits determine which waveform (real time or stored) is sent to the Display Unit for presentation. The sampler circuits generate replicas of the input vertical and horizontal signals from the Acquisition plug-in units. The multiplexing circuits switch the sampled signals at the sampling repetition rate for conversion to digital data by the A-D Converter. Fig. 1-1 illustrates the relationship

of the Sample and Hold circuits to the other P7001 circuit cards and the Digital Processing Oscilloscope (DPO). Fig. 1-2 is an overall block diagram of the Sample and Hold circuits.

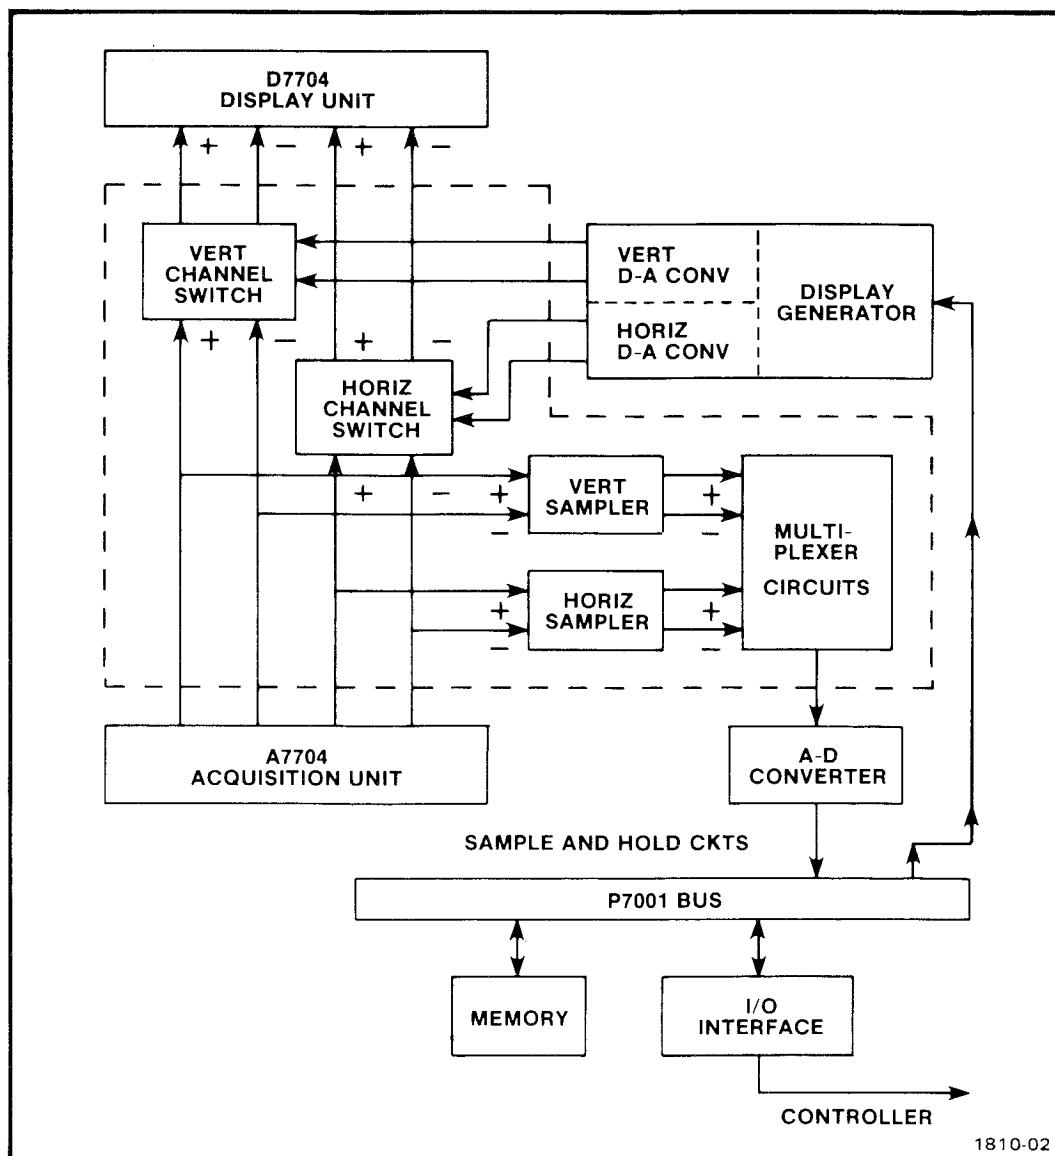

Fig. 1-1. Sample and Hold Circuits in the DPO.

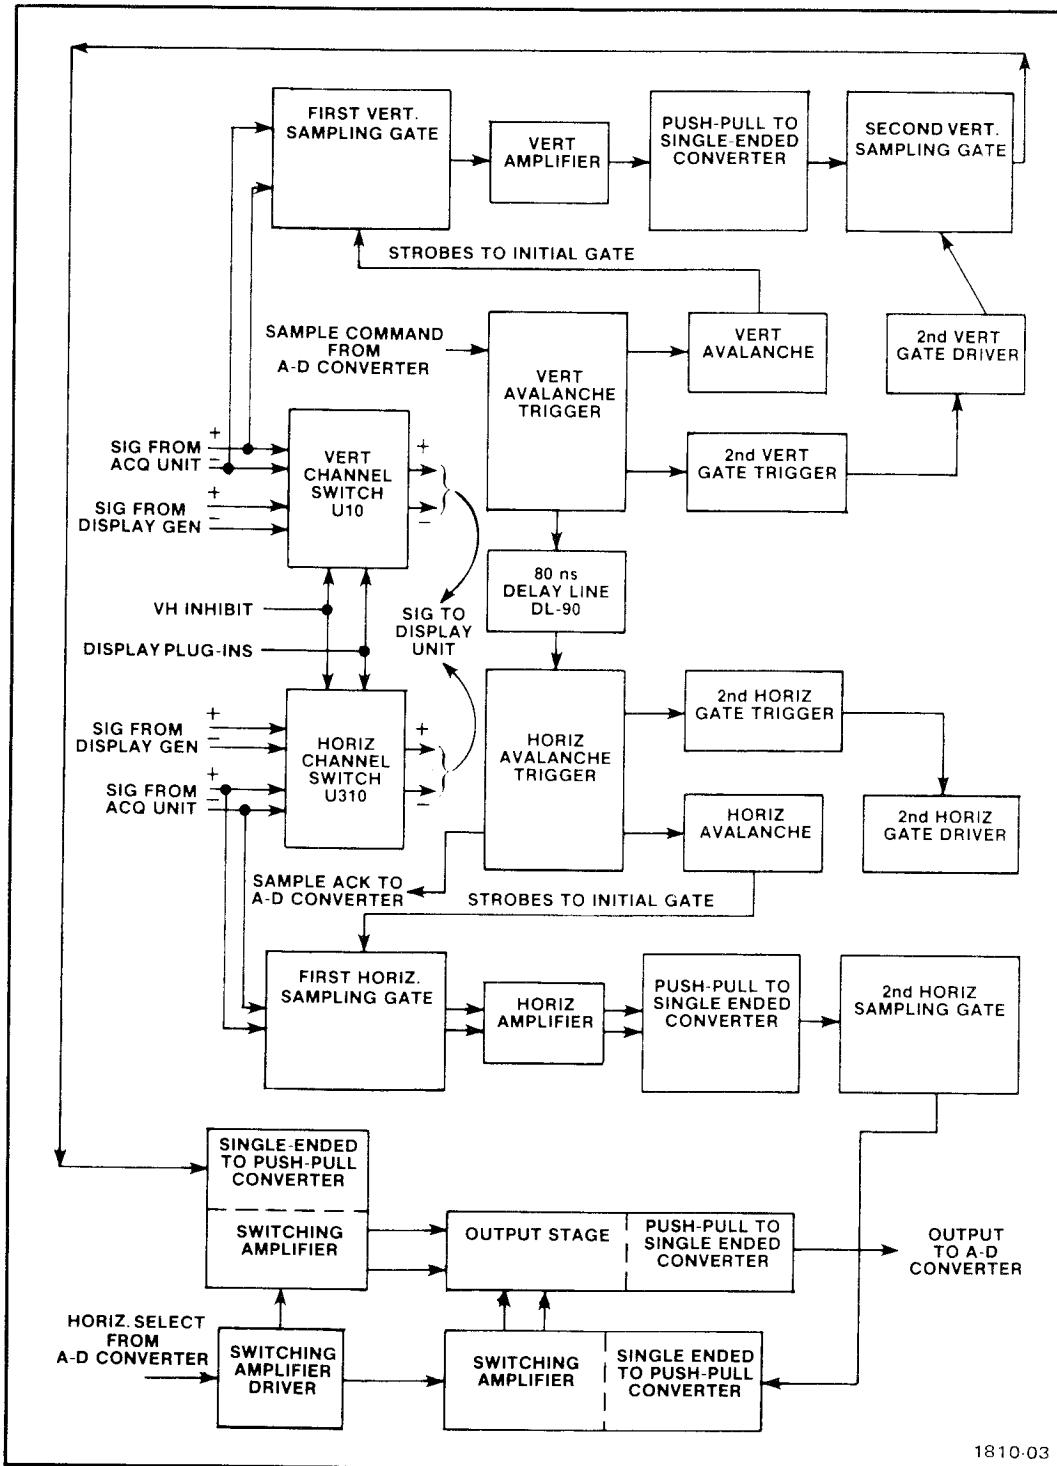

Fig. 1-2. Block Diagram of Sample and Hold Circuitry.

SECTION 2
Circuit Description

This section describes the Sample and Hold card in three basic parts: 1) Signal Interface, 2) Samplers, and 3) Multiplexing circuits.

Signal Interface

The signal interface circuits consist of the Vertical and Horizontal Channel Switches. Deflection signals for the CRT in the Display Unit are controlled by these switches. Each switch can be looked at as if it were a double-pole-triple-throw switch. That is, the input to the Display Unit can be switched to the output of the Plug-ins in the Acquisition Unit or the output of the Display Generator in the P7001 Processor, or turned off for display of Readout Characters.

The operation of each switch (vertical or horizontal) is identical; therefore, only the Vertical Switching portions will be described here.

Vertical Channel Switch. U10 (Diag. 6A) determines whether the Display Unit will receive vertical signals from the Acquisition Unit, the Display Generator Card, or both, alternately (chopped). Switching is controlled by a command signal from the Z-Axis/Front Panel Card. See Fig. 2-1 for input/output logic of U10. A VH INHIBIT signal from the Acquisition Unit turns U10 off during the time that readout information is being displayed.

The push-pull output of U10 drives the Vertical Interface Amplifier, Q35, Q45, Q61, and Q67. Signal current balance for U10 is achieved by setting the current into pins 1 and 16, 8 and 9. This is accomplished by adjusting the P7001 front panel Fine Position Display controls (Diag. 4B Front Panel/Z-Axis). The Vertical Interface Amplifier provides a push-pull 50 millivolt/div output signal to the vertical amplifier in the Display Unit.

CHOP COMMAND Pin 4	READOUT X-Y OFF Pin 6	OUTPUT SIGNAL Pins 12-13
LOW	LOW	DISPLAY GENERATOR
HIGH	LOW	SIGNAL FROM ASQUISITION
Pin 6 OVER-RIDES Pin 4	HIGH	NO OUTPUT

1810-04

Fig. 2-1. Input/Output Logic for U10.

Samplers

The sampling circuits consist of a First Sampling Gate, Amplifier and Push-Pull to Single-Ended converter, and a Second Sampling Gate. The process of sampling is initiated by SAMPLE COMMAND generated by the A-D Converter. This signal is sent when the A-D Converter is ready to accept another sample to be digitized.

Again, we will discuss the Vertical portion of the Sample circuits, since the Horizontal portion is identical in operation except where noted.

Vertical Avalanche Trigger and Avalanche. Comparator Q81 and Q83 (Diag. 6A) receive the SAMPLE COMMAND signal from the A-D Converter and cause Q85 and Q87 to switch. Switching Q85 on brings the avalanche transistor (Q101) into conduction. The generated short-interval strobe pulse is coupled through T110 to the First Sampling Gate bridges.

Horizontal Avalanche Trigger. Q205, Q209, Q211, and Q215 (Diag. 6B) generate the switching signal to drive the Horizontal Avalanche and the Sample Acknowledge stage (Q201). Operation is the same as the Vertical Avalanche Trigger except it is triggered by VERT SAMPLE ENABLE instead of SAMPLE COMMAND.

First Vertical Sampling Gate. The First Vertical Sampling Gate includes eight low-leakage, hot-carrier diodes, CR111, CR112, CR113, CR114, CR116, CR117, CR118, and CR119 (Diag. 6A). The diodes are connected as two four-diode bridges to maintain the push-pull nature of the input signal from the Acquisition Unit.

In the static state, the diodes are reverse biased. Strobe pulses generated by the Vertical Avalanche circuit periodically forward bias the diodes for a very brief interval (900 picoseconds). At that time, the signal level at the input to the bridge is coupled through the bridge and impressed as a voltage on the memory capacitor, which again forward-biases the bridge and allows the capacitor to

charge to the level of the input signal. The sampled signal is coupled through Q121A and Q121B to the Vertical Amplifier stage.

Vertical Amplifier and Push-Pull to Singl-Ended Converter.

The Vertical Amplifier (Q130A and Q130B) converts the push-pull signal voltage to a push-pull current. R137 sets the gain of the stage. The differential signal current is coupled through Q141, Q143, Q145A, and Q145B, which serve to convert the push-pull signal to a single-ended current driving the Second Vertical Sampling Gate. R130 is a Vertical frequency compensation adjustment.

Second Vertical Sampling Gate Driver. Upon SAMPLE COMMAND, Q97 and Q99 switch and bring Q155 into conduction. The strobe pulse thus generated is coupled through T155 to the second sampling gate.

Second Vertical Sampling Gate. The Second Vertical Sampling Gate includes four matched low-leakage, hot-carrier diodes, CR156, CR157, CR158, and CR159, connected in a bridge configuration. Operation of the bridge is the same as described for the First Sampling Gate, except that the strobe pulse width for the second gate is approximately 140 nanoseconds. The gate output signal is stored on the memory capacitor, C159. The sampled signal is coupled through Q161A and Q161B to the Single-Ended to Push-Pull Converter and Switching Amplifier.

Multiplexing Circuits

The two separately sampled vertical and horizontal signals are

time-multiplexed to provide one high impedance output to the A-D Converter. This multiplexing is controlled by the A-D Converter by the state of HORIZ SELECT which comes into Diag. 6B in the lower right corner. HORIZ SELECT is high during output of the Horizontal sample and low during output of the Vertical sample. The generation of HORIZ SELECT and SAMPLE COMMAND are timed by the A-D Converter to insure that the correct signal is sampled and sent to the A-D Converter at the correct time.

Single-Ended to Push-Pull Converter and Switching Amplifier.

The Second Sampling Gate output signal is coupled to Q167A and Q167B (Diag. 6A). Here the signal is reconverted to push-pull current in order to permit high-isolation current switching through CR175 and CR177.

Output Stage. Q175 and Q177 couple the push-pull signal current to Q191A and Q191B (Diag. 6B), which reconverts to a single-ended signal for driving about a 10-ohm virtual ground point on the A-D Converter Card.

SECTION 3

Maintenance and Calibration

Maintenance

The maintenance and service procedures for the Sample and Hold card are the same as given in the P7001 Processor Service manual, 070-1882-00.

Troubleshooting

Troubleshooting of the Sample and Hold card is best accomplished by going through the calibration procedure. When a calibration procedure step cannot be accomplished, that stage should be investigated.

Calibration

Calibration of the Sample and Hold card should only be attempted if the Vertical and Horizontal deflection adjustments in the 7704A are correct. Balance, Gain, and Compensation controls on the Sample and Hold card interact with the Balance, Gain, and Compensation controls of the 7704A. For this reason, no procedures for calibration are listed here. Instead, refer to the DPO Specifications and Calibration manual (070-1600-00) for correct procedures.

Cable Color Codes

Fig. 3-1 shows the cables (with color codes) coming to the Sample and Hold card from the Display Generator and the APD Interconnect card.

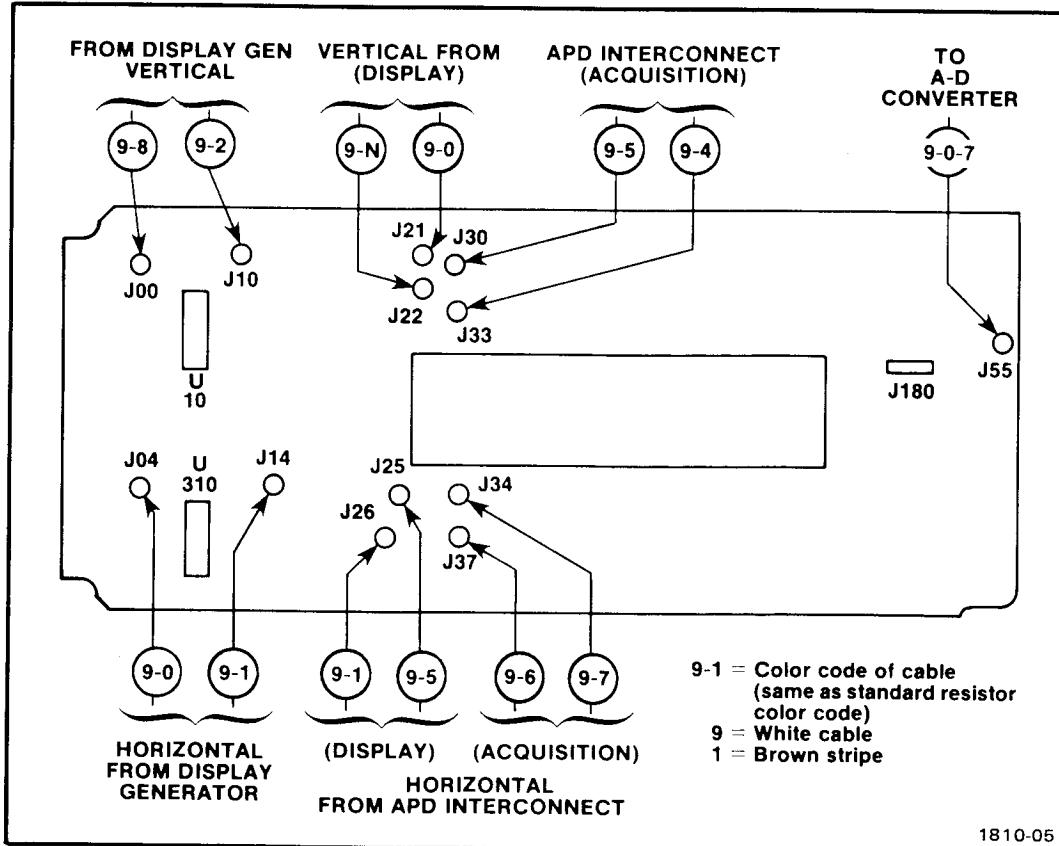

Fig. 3-1. Sample and Hold Coaxial-cable Connection.

REPLACEABLE PARTS LIST

PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

SPECIAL NOTES AND SYMBOLS

X000 Part first added at this serial number

00X Part removed after this serial number

FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

INDENTATION SYSTEM

This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

1 2 3 4 5	<i>Name & Description</i>
Assembly and/or Component	
Attaching parts for Assembly and/or Component	-----*
Detail Part of Assembly and/or Component	
Attaching parts for Detail Part	-----*
Parts of Detail Part	
Attaching parts for Parts of Detail Part	-----*

Attaching Parts always appear in the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation. The separation symbol -----*---- indicates the end of attaching parts.

Attaching parts must be purchased separately, unless otherwise specified.

ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.
