

MISTRAL

Secure VPN IP system for networks carrying sensitive information

- **How to protect sensitive data from attacks from the network?**
- **How to handle the new constraints on your constantly evolving network?**

Whatever the size of your company, these security issues cannot be ignored. This is why Thales offers the **Mistral secure VPN IPSec system**, the essential solution for all application deployments on an IP network. **Mistral** provides security for the critical data in your information system.

With its high security capacity, Mistral adapts to your new constraints resulting from:

- the mobility of your staff,
- total or partial outsourcing of your security policy,
- new network architectures (Any to any, Hub & Spoke),
- the increase in multi-media exchanges.

A complete and modular range

The Mistral range offers high flexibility: whatever your network's performance, the Mistral encryption system adapts to your needs (from 1 to 100 Mbps Full Duplex).

The Mistral equipment enables:

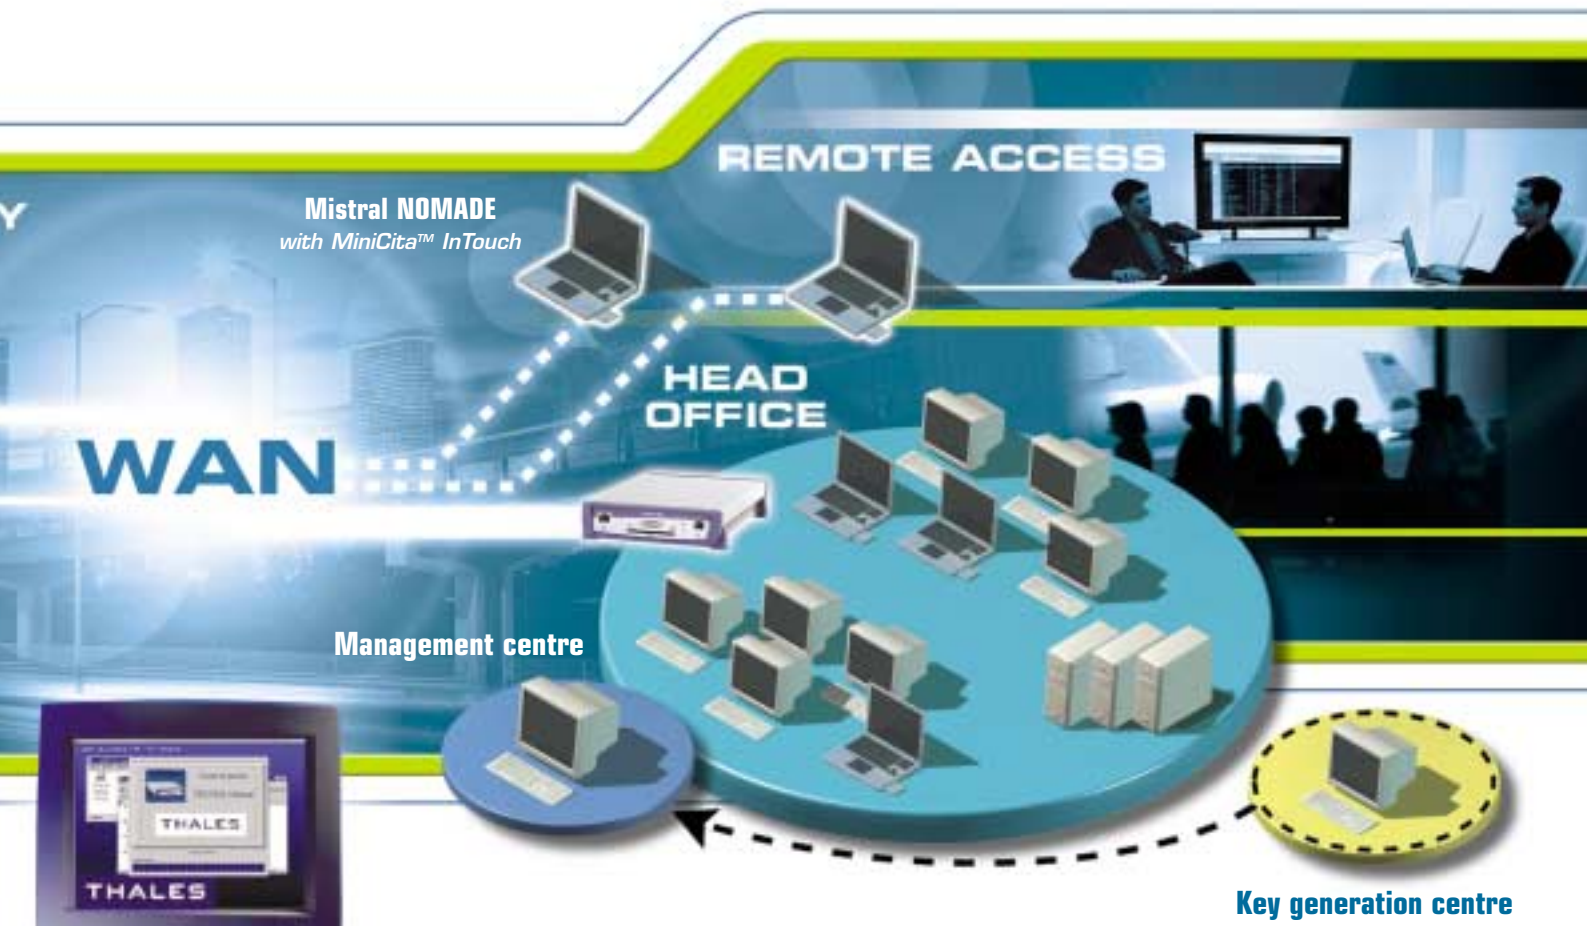

- high-level security communication using encryption and authentication (IPSec tunnels),
- transparent integration into the networks,
- easy deployment and use whatever your architecture,
- compatibility with a firewall or MPLS partitioning.

An end-to-end solution for your remote users

Mistral Nomade, included in the MiniCita™ InTouch solution, provides secure communications for your mobile staff and enables:

- terminal security (access control and high-level user authentication),
- compatibility with all types of networks (Public Telephone Network, xDSL, Wi-Fi...),
- multi-tunnelling and address filtering,
- use of a smart card or client token (standard PKCS#11).

A secure centralised administration

Relying on the flexibility of its management system, the Mistral system evolves in line with new constraints on the network and provides:

- ease of use and configuration through secure remote management,
- management of security policies and crypto-periods,
- secure downloading of software updates,
- on-line monitoring (SNMP, alarm feedback),
- intrusion and security monitoring,
- security administration independent of the network.

A complete and flexible range of services

THALES offers a broad range of services to provide users with support in deploying and implementing solutions.

Main services:

- Loan of application and assistance with pre-sale trials
- Hot-line
- On-site support
- Training
- Installation and commissioning
- Hardware and software maintenance

Customized services:

- Network security impact analysis
- Reproduction of the operational context on platform
- International installation and support services
- Assistance with upgrading the information system
