

## 2.2. SPECIFICATIONS

This section defines the performance of the Power Analyzer. The user must be aware that exposure of the Power Analyzer inputs to their maximum value for a prolonged time will result in additional measurement errors. These errors add to those given in the specification table.

5A input:	$(I^2 \times 0.004\% / A^2)$	for $t > 1$ minute per 10 minutes
30A input:	$(I^2 \times 0.0002\% / A^2)$	for $t > 1$ minute per 10 minutes
voltage input:	$(U^2 \times 0.0000003\% / V^2)$	for $t > 1$ minute per 10 minutes.

Operating the 5A input at elevated currents ( $>4A$ ) will also affect the 30A input, and visa versa.  
Operating temperature range:             $15^\circ C - 30^\circ C$
