

## RS-111-1B-12B RECEIVING SYSTEM

### FEATURES

The RS-111-1B-12B is the latest version of the well-known RS-111-1B Series. The receiving system provides AM, FM and CW reception over the 30-1000 MHz frequency range in four bands. A built-in signal monitor provides a visual display of signal activity over a frequency range of up to 1.5 MHz on both sides of the tuned frequency. The sweep width of the display is continuously variable by means of a front-panel control up to 3-MHz maximum dispersion. A 21.4-MHz crystal controlled marker oscillator built into the display may be used to indicate the exact center of the receiver's IF passband. By providing the marker oscillator, the need for a tuning meter is eliminated.

Digital automatic frequency control (DAFC) circuits provide the capability of operating the RS-111-1B-12B with an external frequency counter which provides a six-digit

readout in addition to locking the local oscillator to within 1 kHz of the tuned frequency. Automatic range and preset switching circuits are also provided. The DRO-309A and DRO-333 Frequency Counters are compatible with the RS-111-1B-12B.

Switch-selectable IF bandwidths of 20, 75 and 300 kHz provide narrowband predetection IF, AM and FM video, and audio outputs. An additional IF bandwidth of 2 MHz provides wide-band predetection IF, and simultaneous AM and FM video outputs regardless of the bandwidth switch position. An AGC monitor output is also provided. All outputs are available on the rear panel of the receiving system.

The receiving system is packaged in a compact 5.25-inch high unit designed for rack mounting. The unit operates from a 115/230 Vac, 50-400 Hz prime power source.
