FEATURES

TUNER SECTION

- Thanks to the sensitive FM front end with dual-gate MOS FETs and frequency linear five-gang tuning capacitor the tuner section features outstanding performance characteristics: $1.7\mu V$ usable sensitivity (IHF), freedom from intermodulation distortion and beat interference.
- The seven-stage direct-coupled FM IF amplifier features a high-gain IC differential amp with constant current bias circuit and six-element phase-linear biresonator ceramic filters. They result in excellent bandpass characteristics and outstanding phase linearity for performance characteristics like 80dB selectivity and capture ratio better than 1.0dB.
- The CR-1000 multiplex circuit features exclusive Yamaha transistor-switching type demodulation employing negative feedback. The result is an MPX circuit with under 0.05% low distortion at 400Hz thanks to greatly improved intermodulation distortion, beat interference and SCA band disturbance protection characteristics. Since a conventional SCA filter is no longer needed, FM stereo separation is an outstanding 45dB at 400Hz, over 35dB at 50 to 10,000Hz, while stereo distortion is reduced to 0.15% during mono performance, 0.3% during stereo.
- The stereo separation maintains its outstanding high level regardless of fluctuations in signal strength, thanks to its outstanding FM front end and IF stage design which pays careful attention to input strength and phase characteristics.
- The specially developed Yamaha LC type active filters possess outstanding attenuation characteristics: over 70dB at 38kHz and over 50dB at 19kHz. They work together with the de-emphasis circuit to assure these excellent frequency characteristics: 0.5dB at 50 to 10,000Hz, 1.5dB at 20 to 15,000Hz.
- The exclusive Yamaha Auto-Touch AFC circuit provides steady, drift-free FM listening regardless of temperature or humidity. The circuit assures plenty of stability in weakest signal strength areas or in areas with signal strengths as high as 100dB. Noise and hiss between stations during tuning is cancelled by doubled input and output muting circuits. The CR-1000's outstanding performance comes from a design that resembles an independent tuner much more than it does a tuner section of an integrated receiver.

OTHER

IF Output for 4-channel capability and Multipath output for improved antenna setting.

EQUALIZER AMPLIFIER

- Direct-couples a unique SRPP (shunt-regulated push-pull) input stage employing carefully selected junction FET's, and a SEPP (single-ended push-pull) output stage of quality silicon transistors. 280mV input capacity: this is 100 times greater than necessary to drive it to full output (since input sensitivity is 3mV). The RIAA deviation is kept to within ± 0.2 dB. This EQ amp has an excellent signal-to-noise ratio of 80dB or better.

TONE CONTROL & FILTER AMPLIFIER

- The tone control amplifier has Yamaha's unique collector-to-emitter negative feedback to achieve optimum tone control curves; the turnover frequency is selectable — between 250Hz and 500Hz for the Bass, and between 2.5kHz, and 5kHz for the Treble.
- The filter amplifier — also the advanced three-stage direct-coupled design — boasts a sharp 12dB/octave cut-off characteristic. The cut-off frequency is 20Hz and 70Hz for the low filter, 6kHz and 12kHz for the high filter.

CONTINUOUS LOUDNESS CONTROL

An ideal loudness effect, based on actual listening conditions, can be set. Using the main circuit a continuous loudness control and overall tone balance is possible at any volume level.

MAIN AMPLIFIER

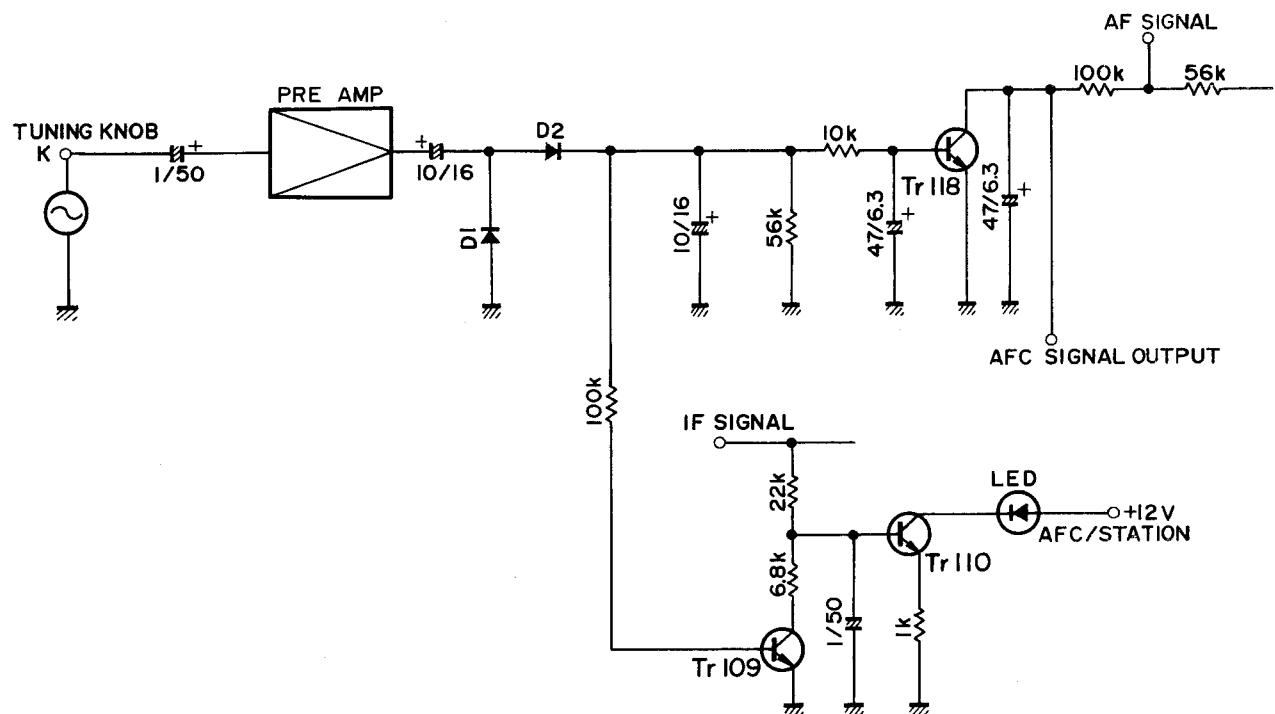

- The CR-1000's main amplifier direct-couples a differential amplifier and an output-capacitor-less (OCL) complementary amplifier, reduces distortion and expands the power bandwidth to 5 to 50,000Hz with total harmonic distortion of 0.5%. The main amplifier delivers, in the critical 20 to 20,000Hz range, 70 watts per channel into 8Ω , both channels driven, at 0.1% T.H.D.

POWER AMPLIFIER

- The CR-1000 is provided with double protection circuits for the important power transistors and speakers. One is a circuit that detects the power dissipation of the power transistors and regulates the input signal the moment the power exceeds the ASO (area of safe operation). A second means of protection is a new relay-equipped speaker protection circuit that prevents direct current from reaching speakers and harming them. The circuit returns to normal operation automatically when the abnormal condition disappears. It also cancels the popping noise that is generated when the power switch is turned on or off.

CIRCUIT DESCRIPTION

- AUTO-TOUCH AFC OFF CIRCUIT

The human body's electric current (G) is detected by the tuning knob and amplified by the pre-amplifier, which then feeds it to D1 and D2.

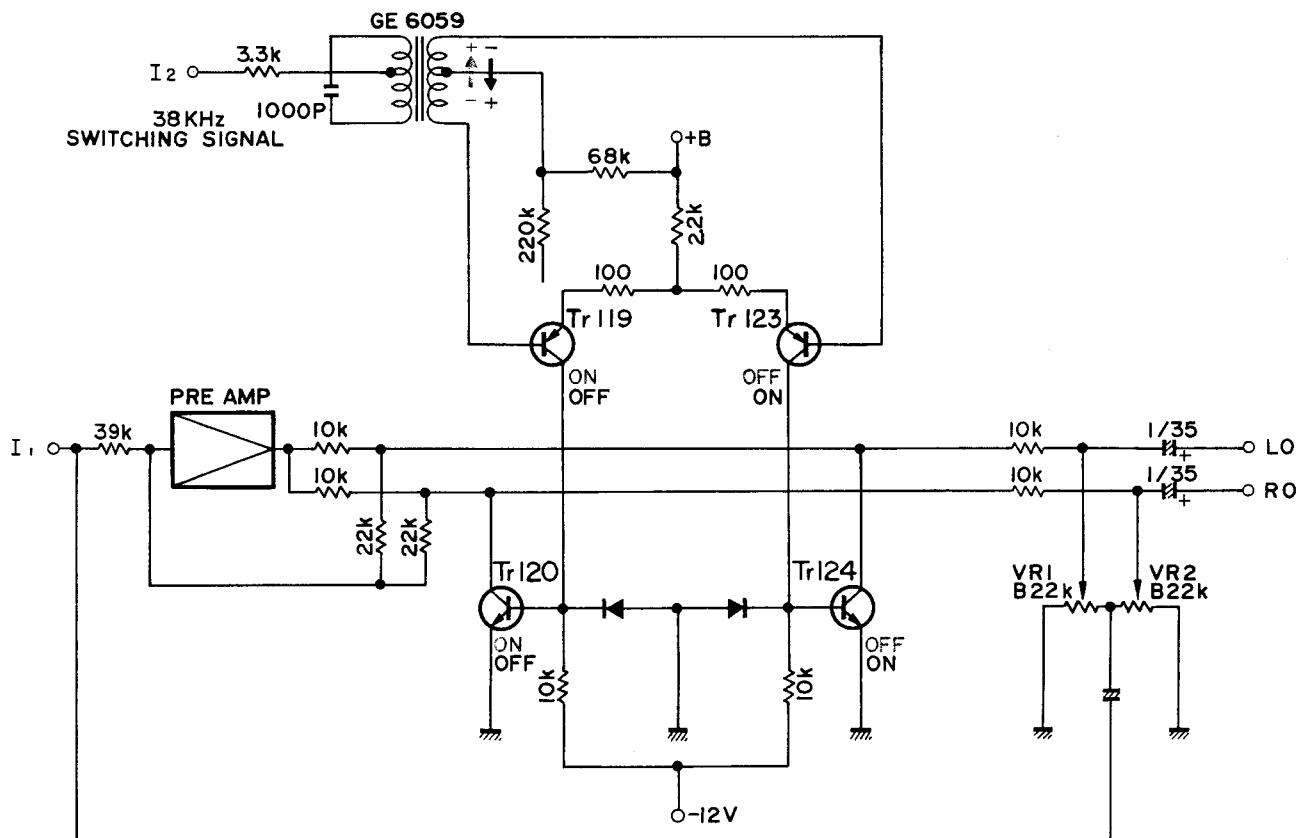

This current is then supplied to the base of the Tr118, switching it and the AFC signal on, while the AFC circuit goes off.

When the station is tuned in and the tuning knob released, the current going to the base of the Tr118 goes

off and the AFC circuit switches on for steady FM listening.

At the same time, the LED illuminated by the IF signal goes off to signal that the AFC circuit is off. This happens because D1 and D2 (mentioned above) feed current to the base of Tr109, lowering the Tr109 C-E impedance and thus reducing the Tr110 base collector current.

- MULTIPLEX DEMODULATOR WITH TRANSISTOR SWITCHING CIRCUIT EMPLOYING NEGATIVE FEEDBACK

The composite signal entering through terminal I₁ is divided into L and R stereo signals through the on/off operation of TR119 and TR123, which are switched by the 38kHz switching signal.

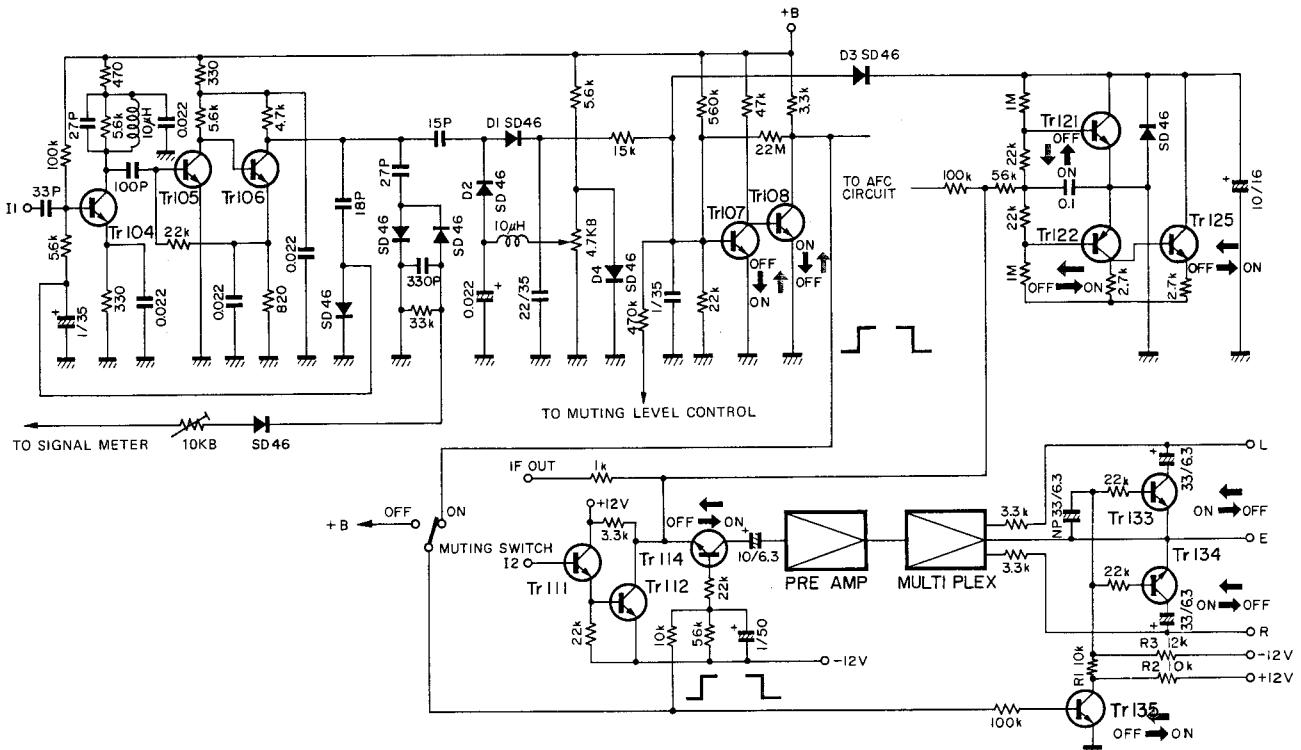

These in turn switch TR120 and TR124 on and off to the divided signal.

The stereo signal entering via terminal I₁ is separated into L and R.

At this time, crosstalk elements are removed from the L and R signals by VR1 and VR2 and negative feedback is fed to terminal I₁.

Thus the circuit assures excellent separation and ultra-low distortions.

• MUTING CIRCUIT

1. When Signal is Received

The IF signal received via I1 is amplified by Tr 104 – Tr 106. This signal is rectified by D1 and D2, becoming positive DC potential before being fed to the base of Tr 107. This switches Tr 107 on and Tr 108 off, so that the Tr 108 collector switches to positive potential. This raises the Tr 114 base potential, switching Tr 114 on, and the FM detection signal entering via I2 is passed to the pre-amp. At the same time, Tr 135 base potential is raised, switching Tr 135 on. In order to create E potential in Tr 135 collector –12V is fed to the bases of Tr 133 and Tr 134, switching them off. In this way output signal is created at the L and R terminals.

2. When No Signal is Received

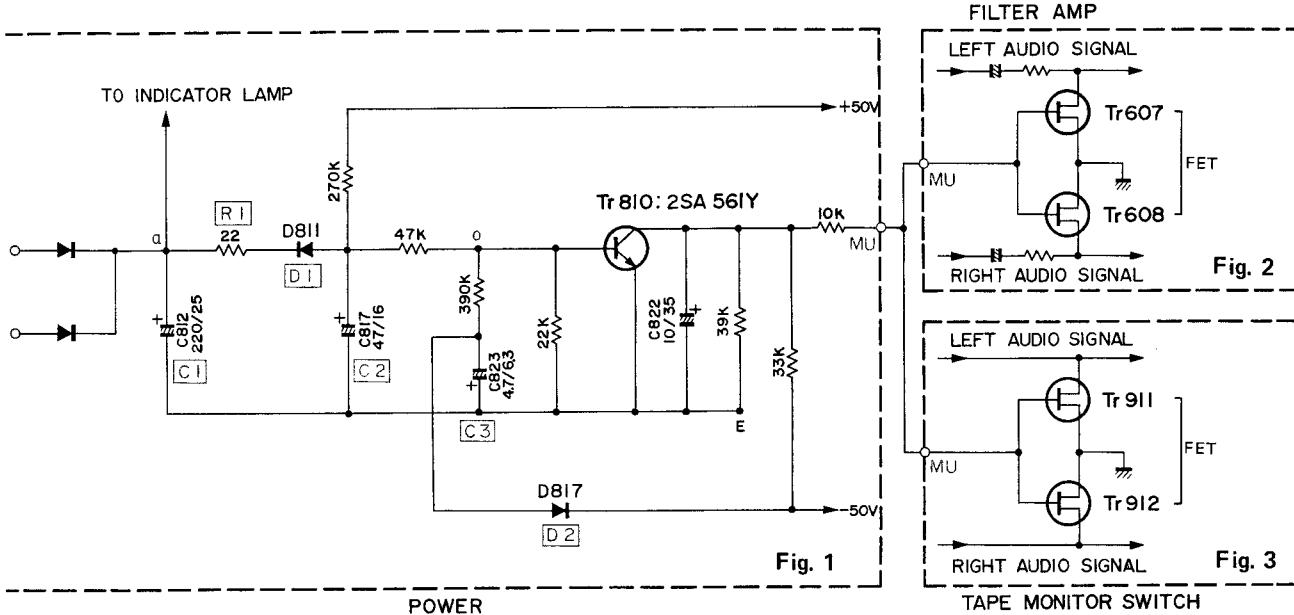

In this condition, since no IF signal is entering via I1, Tr 107 is off and Tr 108 is on. This causes the Tr 108 potential to equal E potential more or less. Tr 114 is off. At the same time Tr 135 is off, and because of the connection with R1, R2 and R3 positive potential is fed to the bases of Tr 133 and Tr 134. Tr-

133 and Tr 134 are switched on, and a complete muting action is achieved thanks to Tr 114, Tr 133 and Tr 134.

3. Signal Received, But Tuning Not Centered

In the best signal detection conditions (center of S curve) the detected output signal does not include DC components. However, if the tuning is off this point even slightly, the signal will include such DC components (+ or –). Using these DC components it is possible to determine whether the receiving conditions are good or bad. The CR-800 muting circuit utilizes this phenomenon. The AC component is achieved using a 0.1 μ F condenser taking the output of Tr 111 and Tr 112 and amplifying the detection signal, feeding only the DC component to point (a). If the +DC component generates Tr 121 goes on; if the –DC component generates, TR 122 goes on and thus switches on Tr 125. That is to say, if the signal fed to point (a) is different than the E potential, point (b) is grounded; thus it receives no signal. In this way all noise which occurs during tuning is canceled.

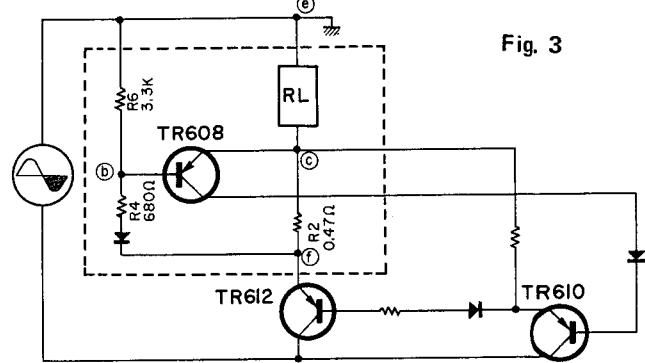

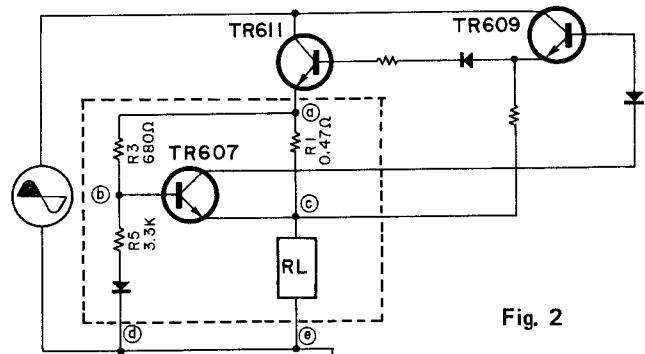

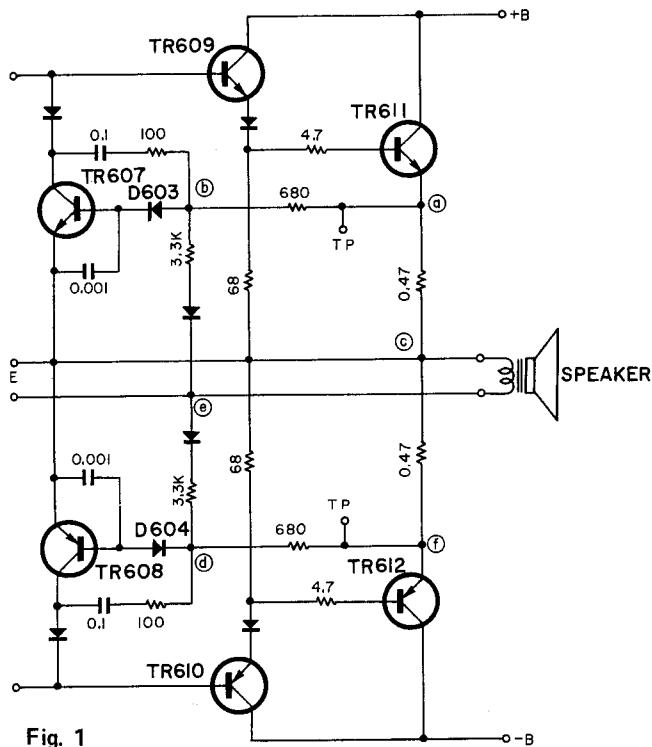

TRANSIENT NOISE CANCELLATION CIRCUIT

- When the Power switch is off FETs are on, so the signal is grounded.
- When the Power switch is on $-50V$ current immediately flows to C3, but it takes some time for the O point potential to reach C2. Thus for a short time after the Power switch is turned on Tr810 is on, but FETs is also on, thus cutting initial switching noise.

- During listening Tr810 has zero potential and is thus off due to the bias. For this reason potential is fed to MU (i.e., the gate of FETs), FETs goes off and the signal is passed.
- When the Power switch is turned off the potential for the indicator lamp passes to point O, creating E potential there. In this case the load at C2 discharges through R1 and D1, the base of Tr810 receives current from C3 and is switched on by the load. FETs also goes on and the signal is grounded, thus eliminating noise when the set is switched off.

PROTECTION CIRCUITS

The circuits indicated by the dotted lines in Figs. 2 and 3 are equivalent to the a, b, c, e and d, f, c, e bridge circuits in Fig. 1.

These bridge circuits detect both the voltage indicated by a drop in collector voltage, and that which shows power transistor current.

With these voltages damage to the set, caused by power transistor operation exceeding the area of safe operation, is avoided; Tr607~610 are suppressed and the signal driving the power transistors is controlled.

In reality, when the amp is operating the bridge, R1-R3-R5-RL and R2-R4-R6-RL bridge circuits maintain the balance.

If load resistance is shorted or too low, the bridge circuits go out of balance.

First, as shown in Fig. 2, if we examine the bridge circuit for the plus half cycle we see that when it is unbalanced the potential at point D rises above that of point C. Tr607 goes on and the voltage at the base of Tr609 drops.

To avoid damage, power transistor (Tr611) current decreases in a few seconds.

In the same way, as Fig. 3 shows, if there is a short or drop in the minus half cycle bridge circuit load resistance Tr608 goes on and Tr610 impedance rises, causing the power transistor (Tr612) current to drop in a few seconds to avoid damage.

Because of D3 and D4, however, even if the load resistance of these circuits is shorted, power transistor current does not disappear. Approximately 1.3A remains, so the output signal is not completely cancelled.

SPECIFICATION

PARTIAL DISASSEMBLY

BEFORE DISASSEMBLY

- The screwdriver for each screw should match the screw size. If you use a smaller or larger size it will damage the groove.
- If you use excessive force on the printed circuit board it will crack or cut the print wiring, so be careful.
- When using a soldering iron finish all work as quickly as possible.

Be careful not to install levers and knobs in the wrong place or upside-down. See Fig. 1.

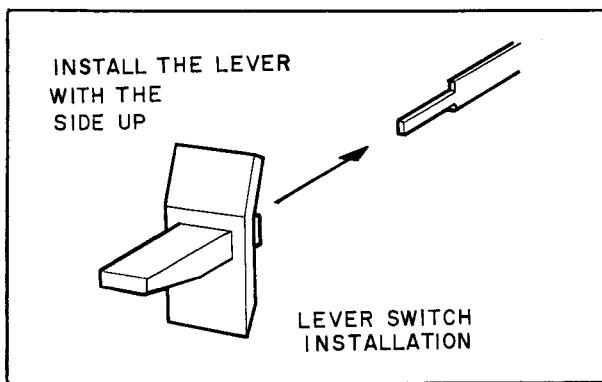

Fig. 1

CABINET REMOVAL

- Stand the set as shown in Photo 1 and remove the seven M5x25S small pan-head screws (1) to (7).
- Pull the cabinet forward to remove it as shown in Photo 2.

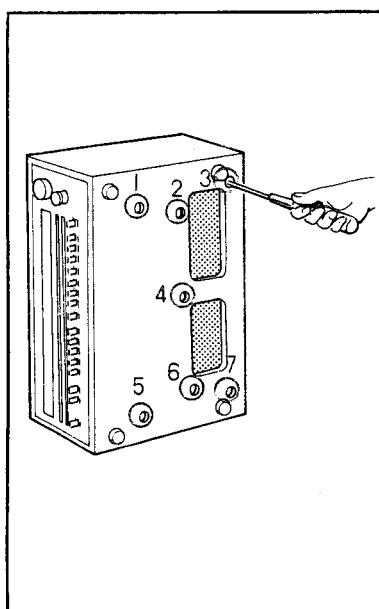

Fig. 2

MAIN AMP CIRCUIT BOARD REMOVAL

- Remove the two M5x95S small pan-head screws (1) and (2) shown in Photo 1. Then lift up to remove the heat sink and main amp circuit board.

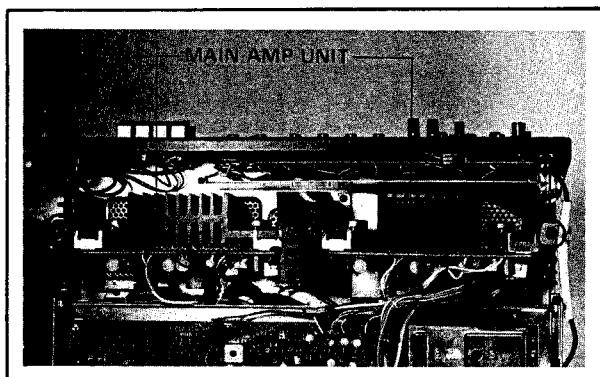

Photo 1

- Remove the four M3x16 small pan-head screws (1) to (4) shown in Photo 2, and then pull up to remove the power transistors.

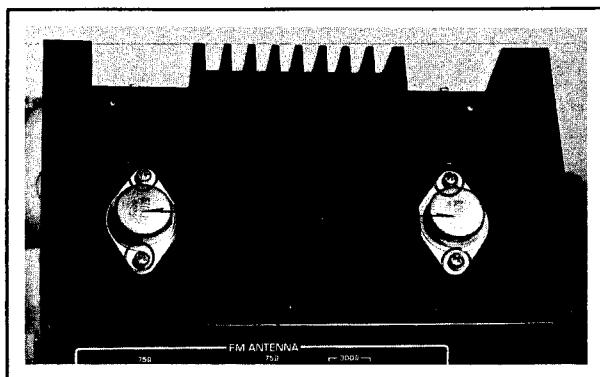

Photo 2

- Remove the two M3x8S small bind head screws (1) and (2) shown in Photo 3, then separate the main amp circuit board from the heat sink.

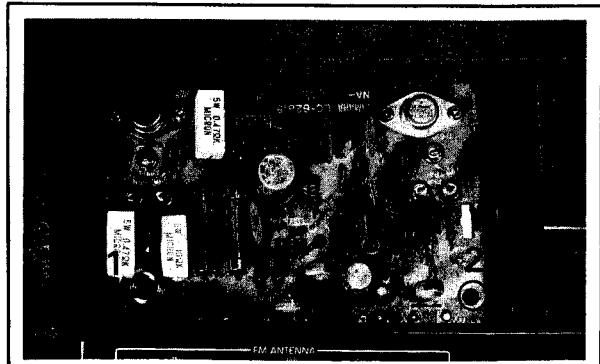

Photo 3

Note: When reinstalling the power transistor to the heat sink, be sure to fully lubricate with silicon grease. Do not tighten the fixing screws with excessive force. Attach as shown in Fig. 3.

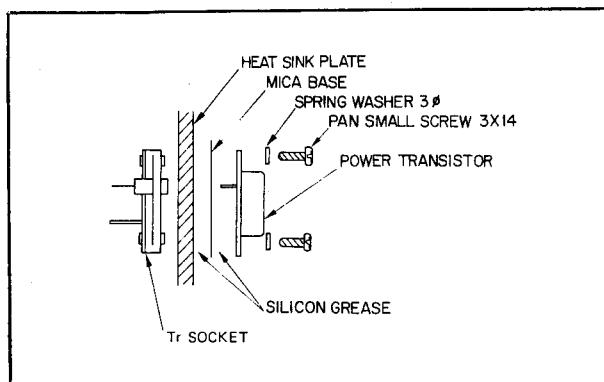

Fig. 3

SIGNAL, TUNING METER REMOVAL

- Pull off the meter lamps with their bushings.
- Remove the meter fixing springs (Photo 4) shown in Photo 5. Then remove the meters.

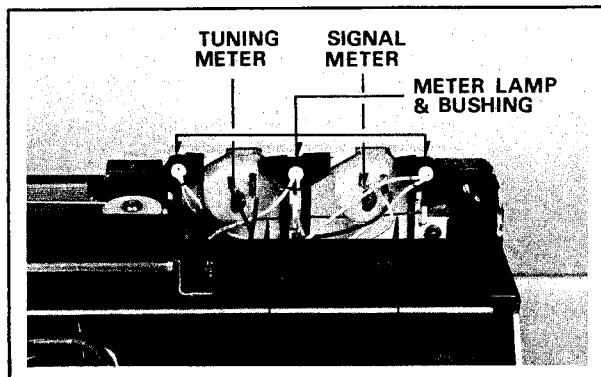

Photo 4

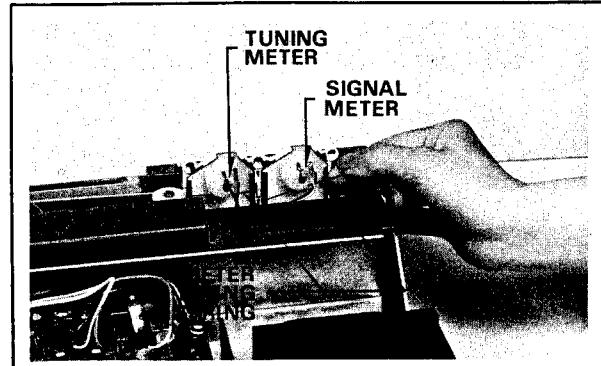

Photo 5

TUNER CIRCUIT BOARD REMOVAL

Remove the six 3x8S bind tapping screws (1) to (6) shown in Photo 6. Then lift the tuner circuit board up to remove it.

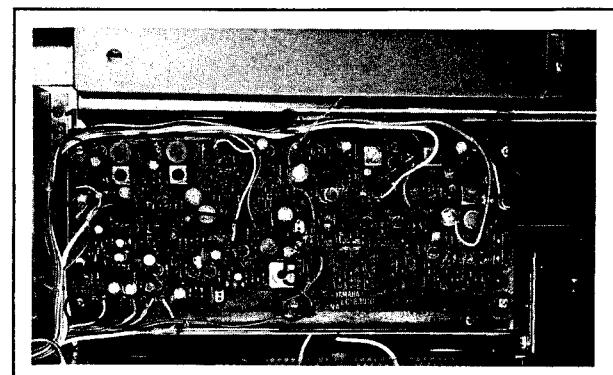

Photo 6

TUNER UNIT REMOVAL

Remove the four red-topped 3x8S bind tapping screws (1) to (4) shown in Photo 7, large-head slot screws (1) and (2) shown in Photo 8 and the red-topped screws (together with the M4x6S small bind screws) shown in Photo 9. Then remove the tuner unit as shown in Photo 10.

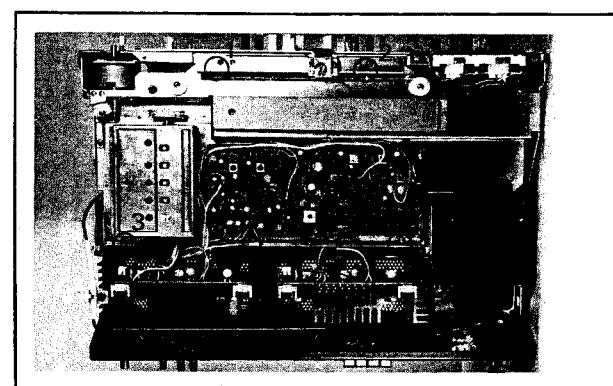

Photo 7

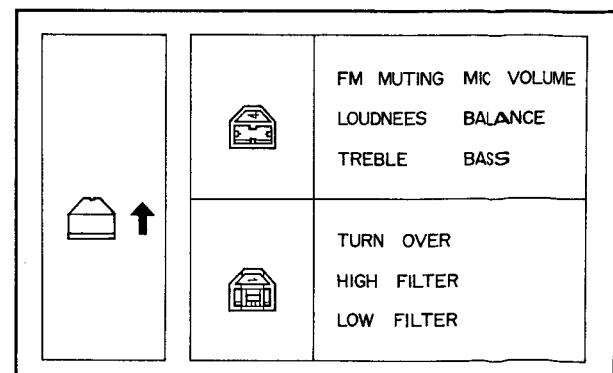

Fig. 4

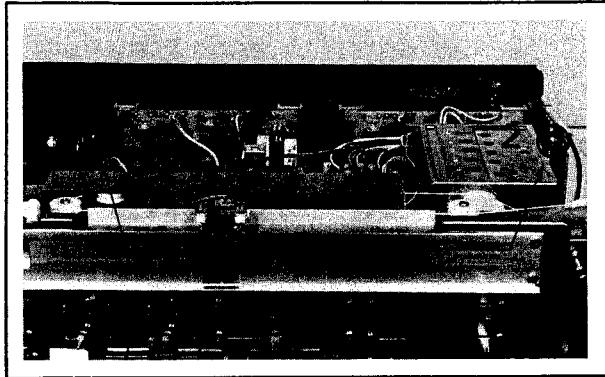

Photo 8

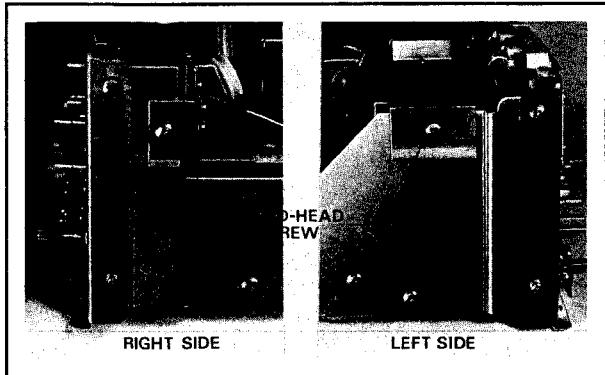

Photo 9

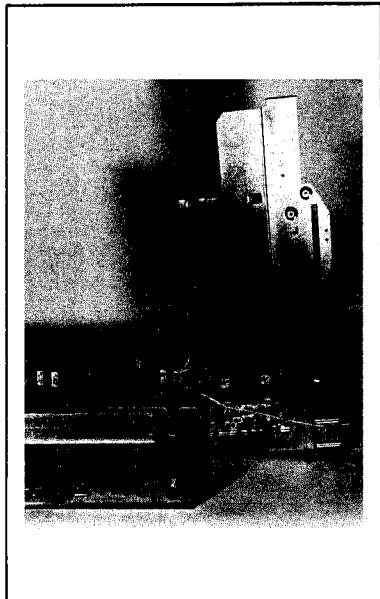

Photo 10

Note: Be careful not to pull too hard on the leads when removing the tuner unit as shown in Photo 14. Take great care not to break any leads.

POWER CIRCUIT BOARD REMOVAL

- First remove the tuner unit as explained above.
- Remove the six 3x8S bind tapping screws (1) to (6) shown in Photo 11, then lift up the power circuit board to remove it.

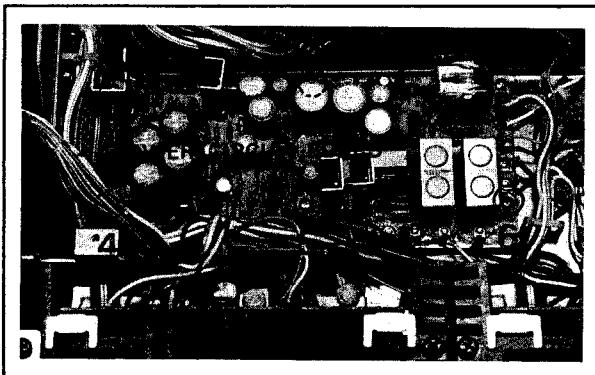

Photo 11

FRONT PANEL REMOVAL

- Remove the Tuning knob by using the hexagonal wrench provided.
- Pull off the Volume, FM Muting, Mic Volume, High Filter, Low Filter, Turnover, Treble, Bass, Loudness and Balance knobs.
- Remove the three 3x8S bind tapping screws (1) to (3) as shown in Photo 12, and the three M3x6S small bind screws (1) to (3) shown in Photo 13. Then pull the front panel forward to remove it.

Note: Refer to Fig. 4 when reattaching the knobs.

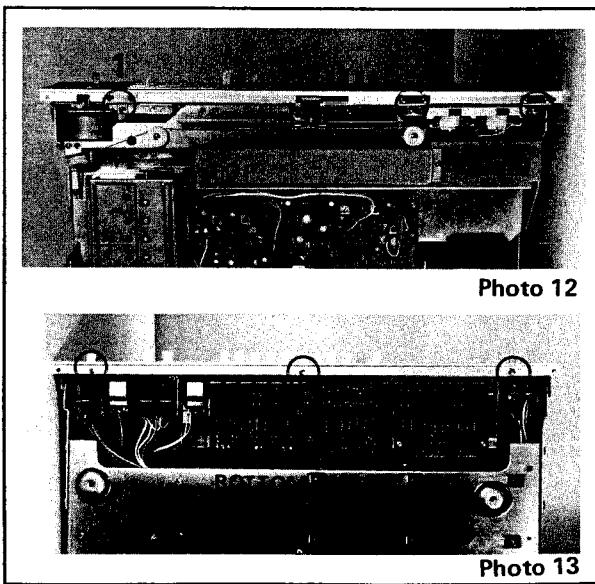

Photo 12

Photo 13

SUB CHASSIS UNIT REMOVAL

- a. Remove the dial indicator unit from the rail as shown in Photo 14.

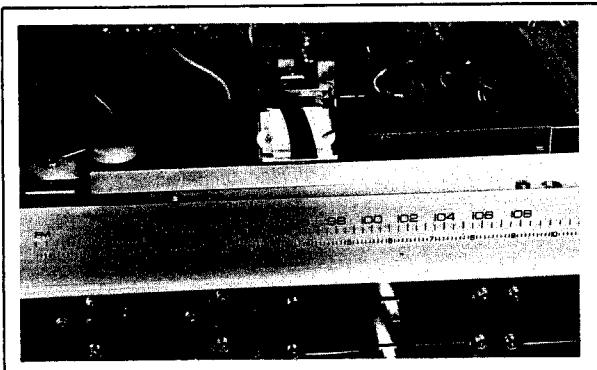

Photo 14

- b. Remove the red-topped M4x6S small bind screws (1) and (2), and the M4x5S small pan-head screws (3) and (4) shown in Photos 15 and 16. Then remove the two red-topped 3x8S bind tapping screws (1) and (2) shown in Photo 17 and pull forward to remove the sub chassis as shown in Photo 18. Note that these last two screws (Photo 17) link the sub chassis to the tuner, so that if the tuner is already removed they do not have to be taken off for sub chassis removal.

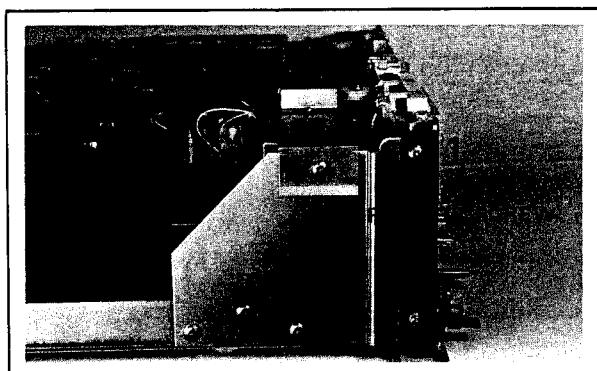

Photo 15

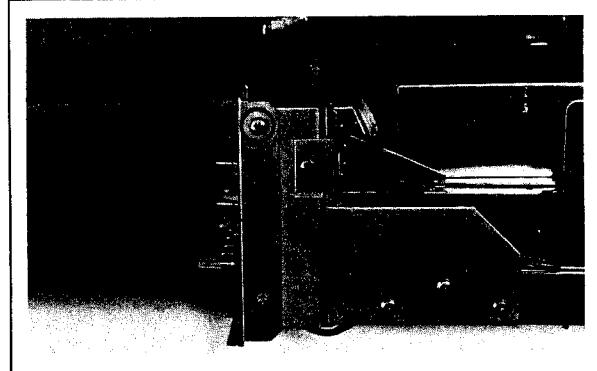

Photo 16

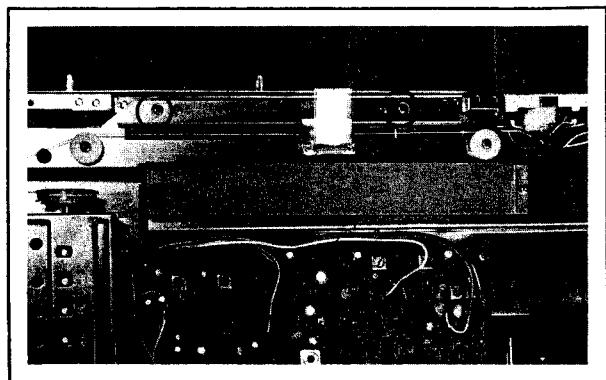

Photo 17

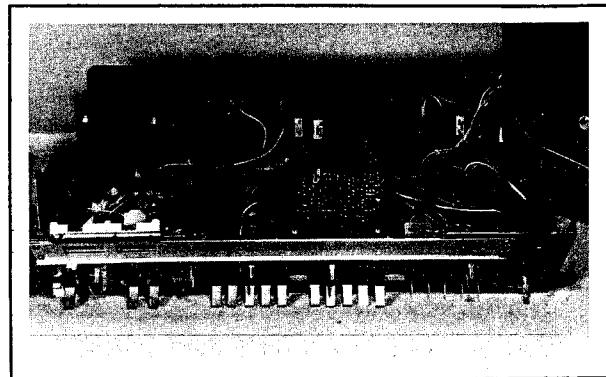

Photo 18

FUNCTION SWITCH AND EQUALIZER AMP CIRCUIT BOARD REMOVAL

- a. Remove the front panel and tuner unit as explained above.
 b. Remove all Function levers and knobs.
 c. Remove the five M3x6S small bind screws (1) to (5) shown in Photo 19.

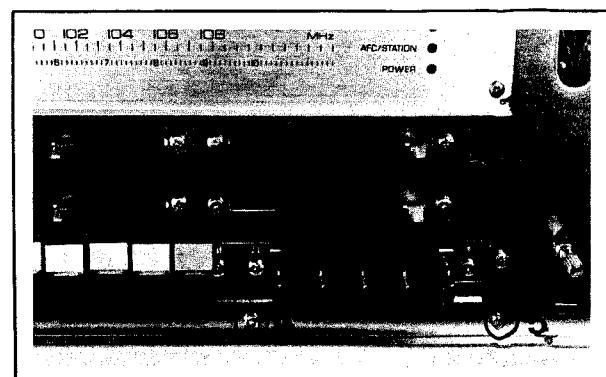

Photo 19

- d. Remove the three CIS connector shown in Photo 20 by pulling them in the direction of the arrow, then remove the function switch and equalizer amp circuit board.

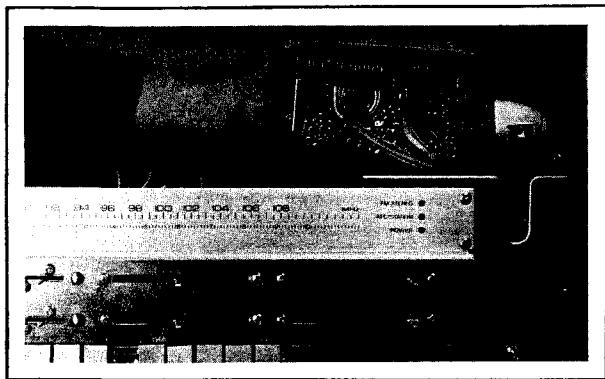

Photo 20

- e. To remove the equalizer amp circuit board, pull off the board in the direction shown by the arrow in Photo 21.

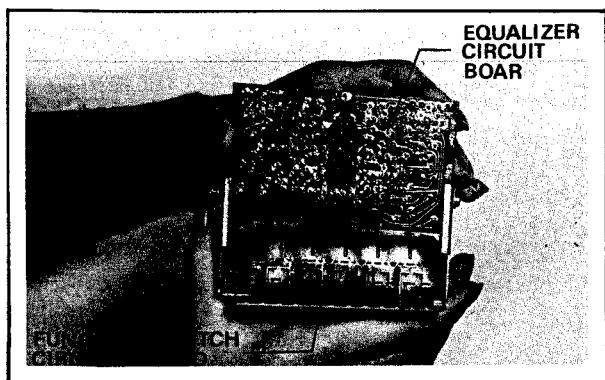

Photo 21

- f. Remove the two 3x8s small bind screws 1 ~ 2 as shown in Photo 22, then remove the function switch circuit board from its cover.

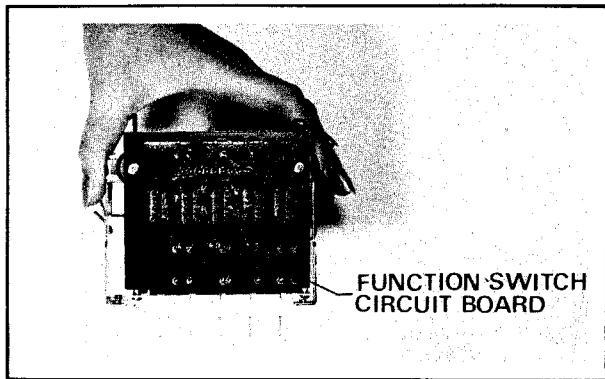

Photo 22

LOUDNESS CIRCUIT BOARD REMOVAL

- a. Remove the front panel and tuner unit as explained above.
- b. Remove the four M3x6S small bind screws (1) to (4) shown in Photo 23, then pull off the loudness circuit board.

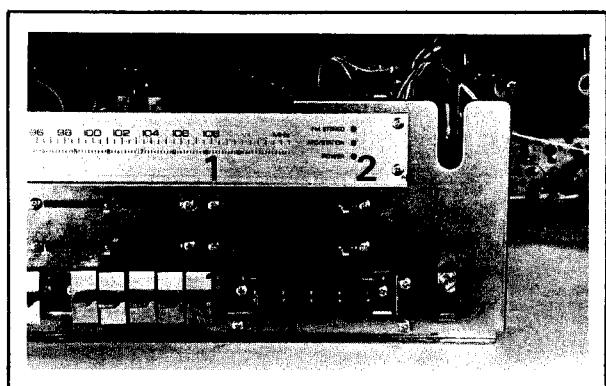

Photo 23

LED CIRCUIT BOARD REMOVAL

Remove the 3x8S bind tapping screw shown in Photo 24 and then pull off the LED circuit board.

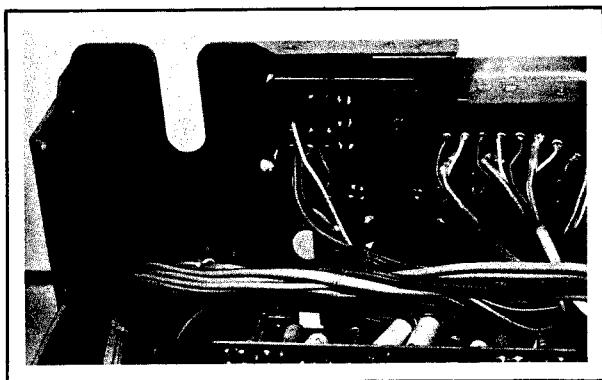

Photo 24

TAPE MONITOR SWITCH CIRCUIT BOARD REMOVAL

- Remove the front panel and tuner unit as explained above.
- Pull off all Tape levers.
- Pull off the three CIS connectors shown in Photo 25.

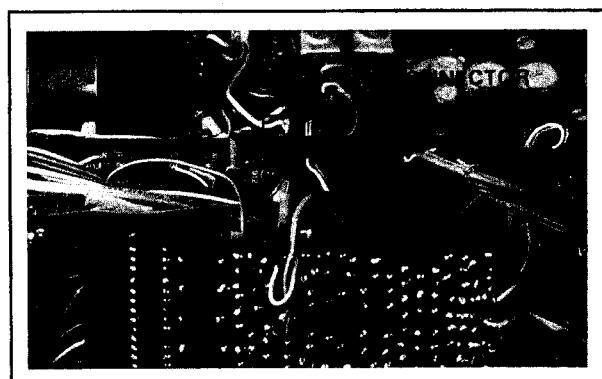

Photo 25

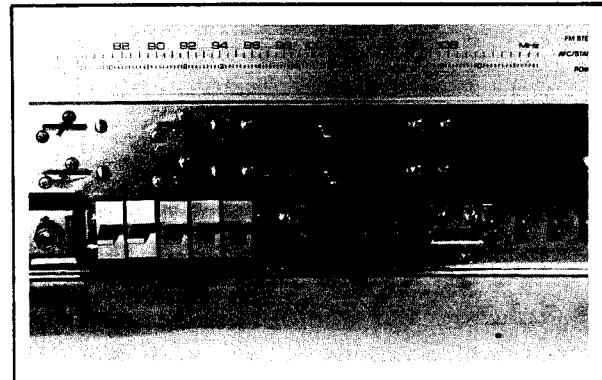

Photo 26

- Remove the two M3x6S small bind screws (1) and (2) shown in Photo 26. Then remove the Tape Monitor switch circuit board.

TONE CONTROL AMP CIRCUIT BOARD & TONE CONTROL VOLUME CIRCUIT BOARD REMOVAL

- Remove the front panel and tuner unit as explained above.
- Remove the two M3x6S small bind screws (1) and (2) and the two CIS connectors, as shown in Photo 27.
- Pull up on the tone amp circuit board to remove it.
- Remove the four M3x6S small bind screws (1) to (4) shown in Photo 28, then remove the tone control volume circuit board.

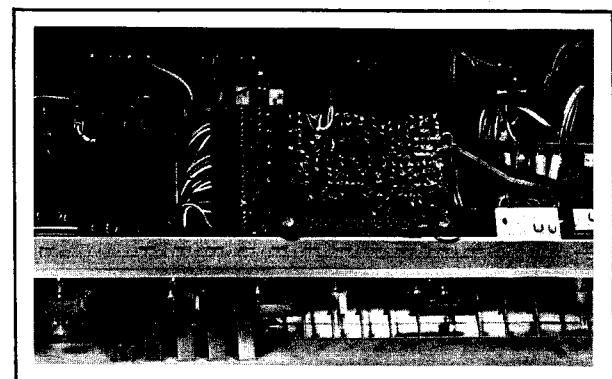

Photo 27

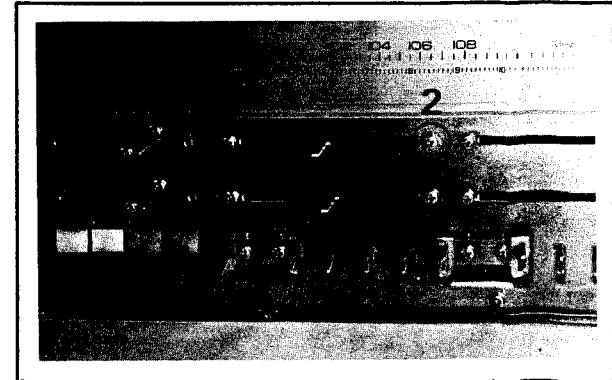

Photo 28

MODE SWITCH CIRCUIT BOARD REMOVAL

- a. Remove the front panel and tuner unit as explained above.
- b. Pull off all Mode levers.
- c. Remove the two M3x6S small bind screws (1) and (2) shown in Photo 29, and then remove the Mode switch circuit board.

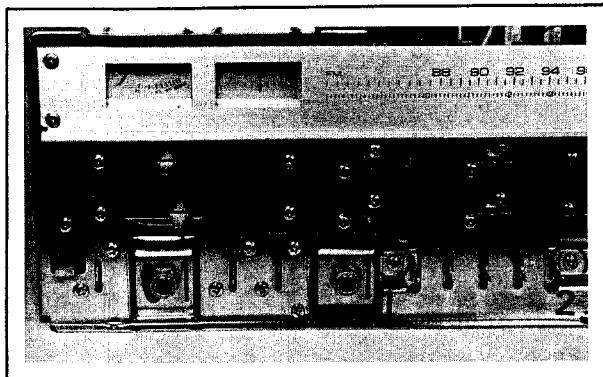

Photo 29

TONE CONTROL SWITCH CIRCUIT BOARD REMOVAL

- a. Remove the front panel and tuner unit as explained above.
- b. Remove the two CIS connectors shown in Photo 30.

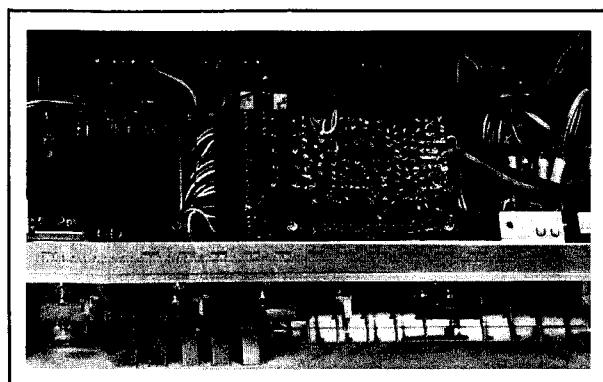

Photo 30

- c. Remove the four M3x6S small bind screws (1) to (4) shown in Photo 31, then remove the tone control switch circuit board.

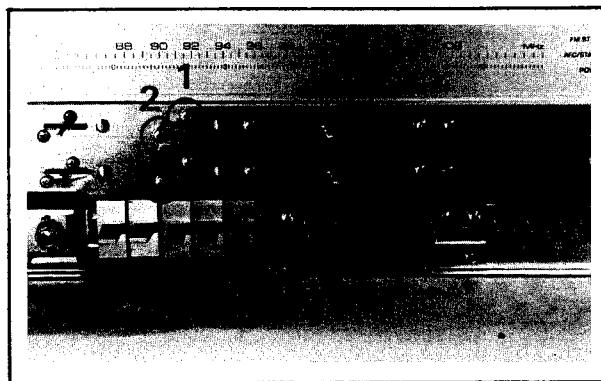

Photo 31

FILTER AMP CIRCUIT BOARD REMOVAL

Remove the two M3x6S small bind screws (1) and (2) shown in Photo 32, then pull off the filter amp circuit board.

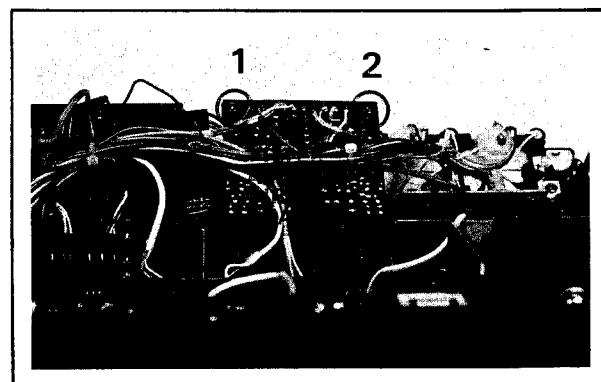

Photo 32

FILTER SWITCH CIRCUIT BOARD REMOVAL

- Remove the front panel, sub chassis and filter amp circuit board as explained above.
- Remove the four M3x6S small bind screws (1) to (4) shown in Photo 33, then pull off the filter switch circuit board.

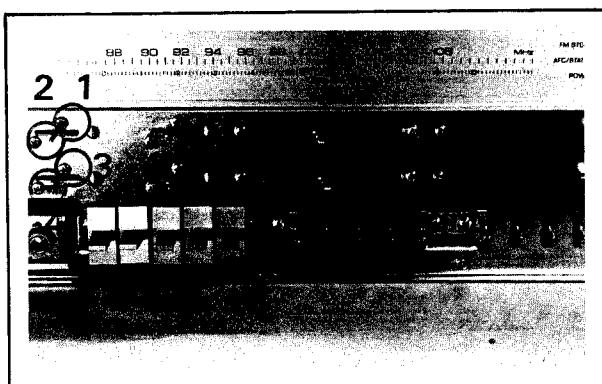

Photo 33

MIC VOLUME CIRCUIT BOARD REMOVAL

- Remove the front panel, sub chassis and mic amp circuit board as explained above.
- Remove the four M3x6S small bind screws (1) to (4) shown in Photo 35.

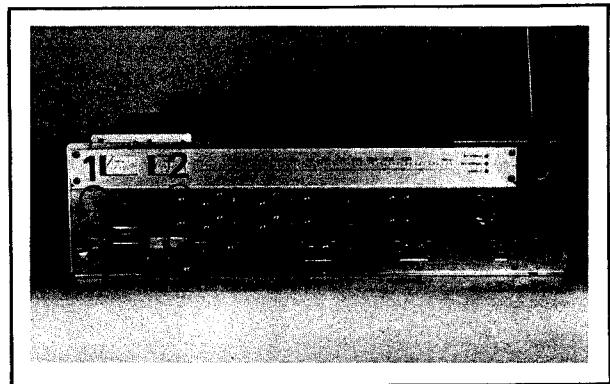

Photo 35

MIC AMP CIRCUIT BOARD REMOVAL

- Pull off the sheet holder shown in Photo 34.
- Pull the mic amp circuit board in the direction shown by the arrow to remove it.

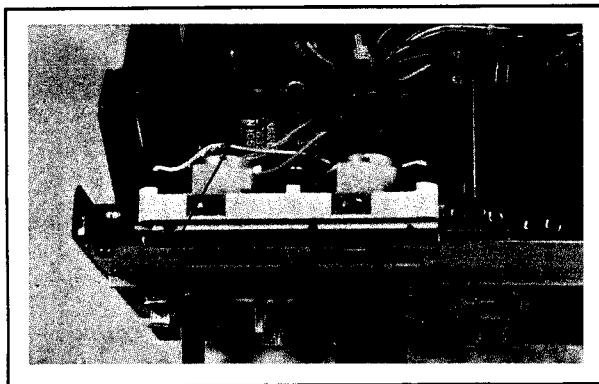

Photo 34

POWER AND SPEAKER SWITCH REMOVAL

Loosen the fixing screws on all the switches and knobs as shown in Photo 36 (all are M3x6S small bind screws), and then pull off each knob and switch.

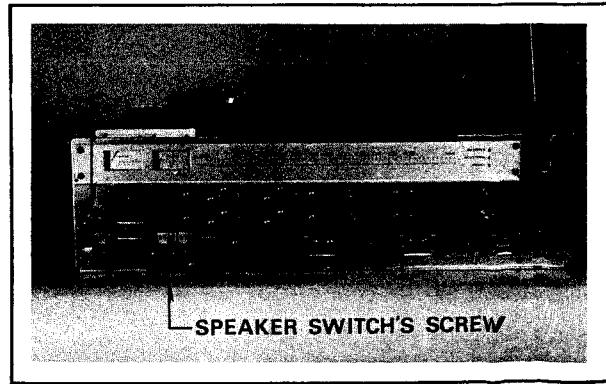

Photo 36

DROPPING THE REAR PANEL

- a. As shown in Photos 37 and 38, remove the 4x8S red-topped bind tapping screws (1) and (2), and loosen the other two (3) and (4).
- b. Remove the three 3x8S bind tapping screws (1) to (3) shown in Photo 39, then drop the rear panel as shown in Photo 40.

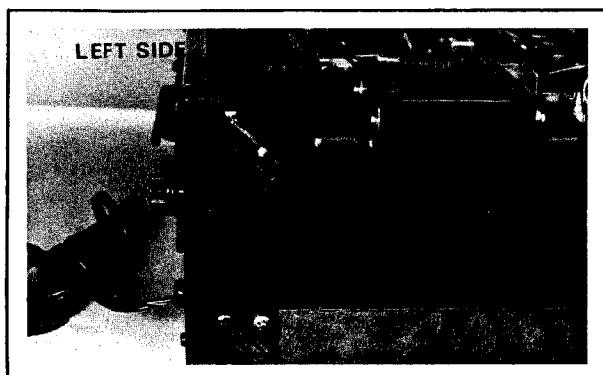

Photo 37

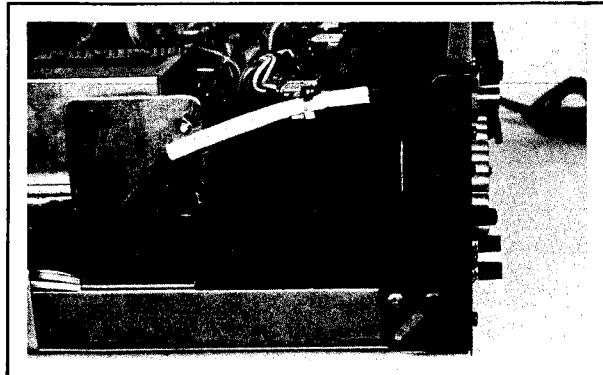

Photo 38

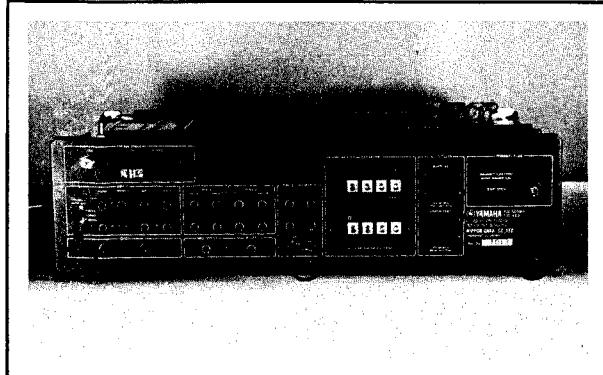

Photo 39

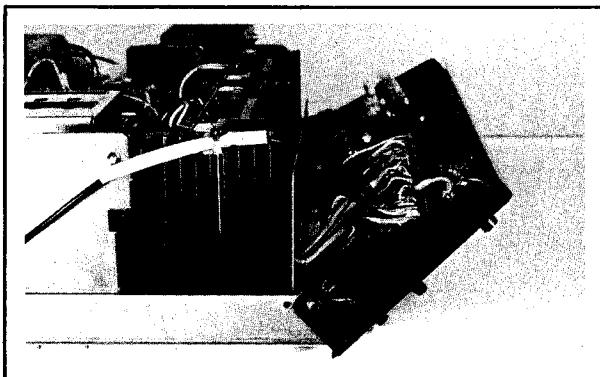

Photo 40

REAR PANEL CIRCUIT BOARD REMOVAL

- a. Remove the nine screws shown in Photo 41: M2.6x5S small torus head screws (1), (2), (8) and (9) and 3x8S bind tapping screws (3) to (7).
- b. Drop the rear panel as explained above and lift off the rear panel circuit board.

DIAL MECHANISM

MEASUREMENT AND ADJUSTMENT

TUNER SECTION

FM IF ADJUSTMENT

STEP	ADJUSTMENT ITEM	TERMINALS TO BE CONNECTED & INSTRUMENTS REQUIRED	ADJUSTMENT	HOW TO ADJUST	RATING OR STANDARD	REMARKS
1	S-Curve	Input Jack (Refer to Fig. 1.) Sweep Generator Output: 40dB/400Ω ±100Ω IO-E Oscilloscope (Refer to Fig. 1.)	T101 discrim coil (top & bottom) core, Top:Secondary T101 discrim Bottom: Primary Side	Adjust for symmetrical S-curve with the secondary-side core. Adjust for max. height with the primary-side core.	Output Voltage: 400mVp-p Intermediate Frequency: 10.7MHz ±200kHz Bandwidth: 300kHz (Refer to Fig. 2.)	

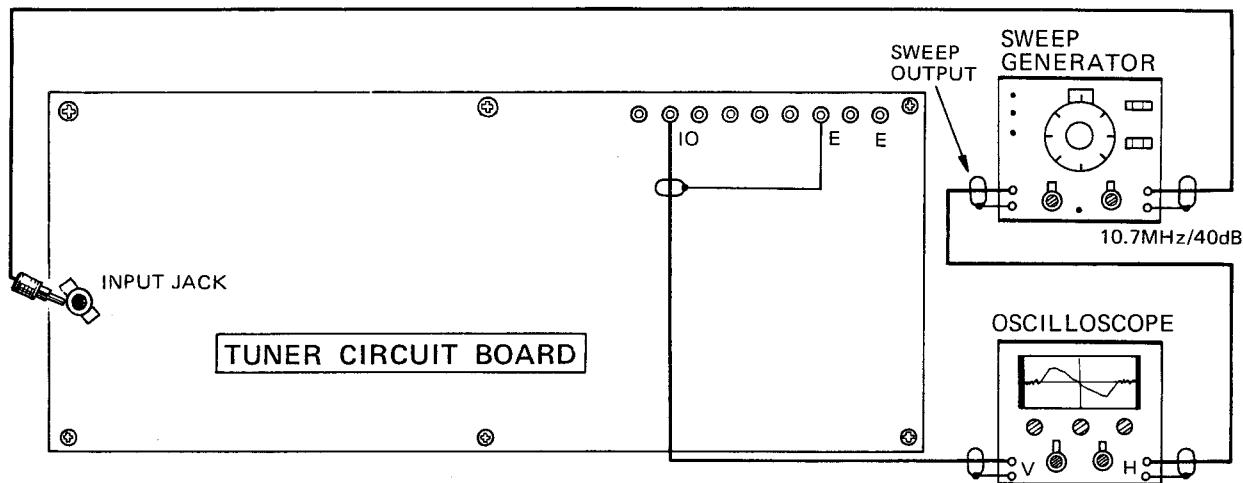

Fig. 1

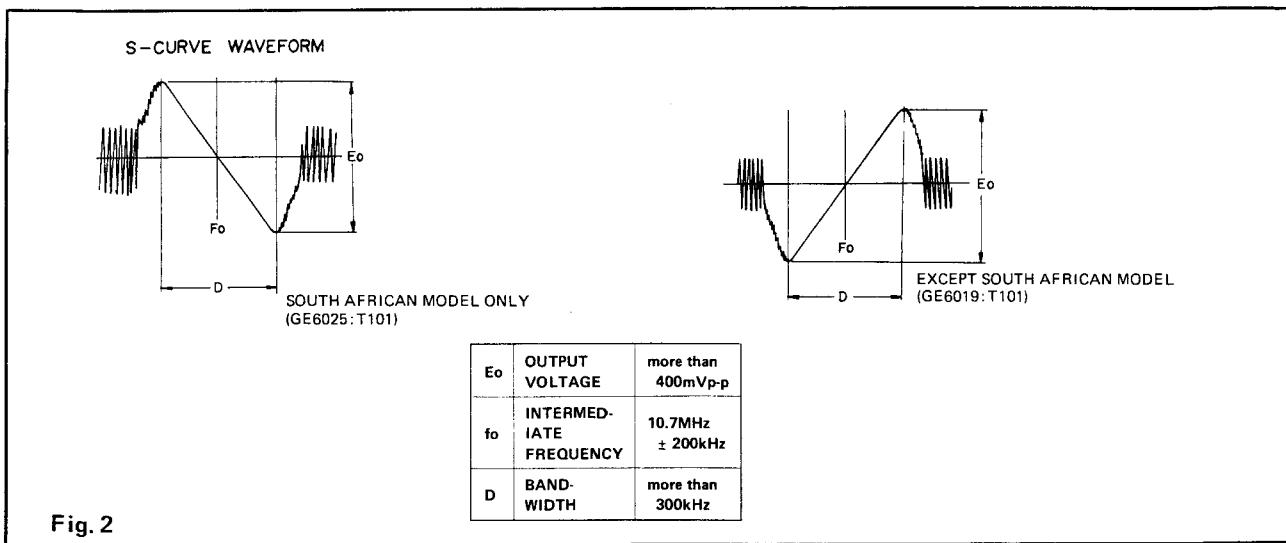

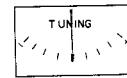

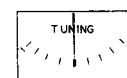

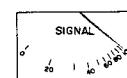

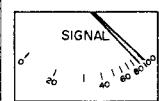

Fig. 2

FM MPX ADJUSTMENT

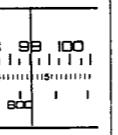

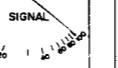

STEP	ADJUSTMENT ITEM	TERMINALS TO BE CONNECTED & INSTRUMENT REQUIRED	ADJUSTMENT	HOW TO ADJUST	RATING OR STANDARD	REMARKS
1	19kHz Filter adjustment	FM antenna terminal FM signal Generator 98MHz/60dB μ ● Modulate the stereo pilot signal only. Rec Out terminal Oscilloscope, Distortion ratio meter, Electronic voltmeter.	T105 (L) T106 (R) GE6057 (Refer to Fig. 3.)	Adjust for minimum 10kHz leak element.	Leak level: less than -60dB	Should be set at tuning point at TUNER COMPLETE ADJUSTMENT -"2".
2	Separation adjustment	FM antenna terminal FM signal Generator 98MHz/60dB μ Modulation Frequency: 400Hz/100% stereo (L, R & L-R) Rec Out terminal Oscilloscope, Distortion ratio meter, Electronic voltmeter.	VR103 (L) VR104 (R) B22k Ω (Refer to Fig. 3.)	Adjust for maximum separation (obtain this maximum by repeated left and right adjustments).	Separation: more than -42dB Standard Value: -50dB	Should be set at tuning point at TUNER COMPLETE ADJUSTMENT -"2".

TUNER COMPLETE ADJUSTMENT

STEP	ADJUSTMENT ITEM	TERMINALS TO BE CONNECTED & INSTRUMENTS REQUIRED	ADJUSTMENT	HOW TO ADJUST	RATING OR STANDARD	REMARKS
1	Discrim Balance		T101 discrim coil:Secondary Side (top) Refer to Fig. 3.	Adjust for tuning meter position at 0 with out of tune noise.		Do not connect anything to the FM antenna terminal.
2	Tuning Point Set	FM antenna terminal (300 Ω) FM signal Generator 98MHz/60dB μ Modulation Frequency: 400Hz/100% mono	Tuning knob	Center tuning meter at 0 by tuning.		AFC-E (AFC OFF)
3	Front-end IF tuning	FM antenna terminal (300 Ω) FM signal Generator 98MHz/30dB μ or so Modulation Frequency: 400Hz/100% mono	Front-end IF core primary and secondary side. Refer to Fig. 4.	Set for max. signal meter deflection.		Should be set at tuning point 2.
4	Distortion adjustment (mono)	FM antenna terminal (300 Ω) FM signal Generator 98MHz/60dB μ Modulation Frequency: 400Hz/100% mono Rec Out terminal Oscilloscope, Distortion ratio meter, Electronic volt meter.	T101 discrim coil:primary side (bottom) Refer to Fig. 4.	Adjust right and left little by little until achieving lowest distortion.	Distortion: less than -50dB (0.25%) Standard Value: less than -58dB (0.12%)	Should be set at tuning point 2.

STEP	ADJUSTMENT ITEM	TERMINALS TO BE CONNECTED & INSTRUMENT REQUIRED	ADJUSTMENT	HOW TO ADJUST	RATING OR STANDARD	REMARKS
5	Distortion adjustment (Stereo)	FM antenna terminal (300Ω) FM signal Generator 98MHz/60dB μ Modulation Frequency: 400Hz 100% stereo (L,R & L-R)	T104 (GE-6059), Front-end IF core (top & bottom). Refer to Fig. 3 ~ 4.	Adjust T104 for minimum distortion at maximum L-R signal. Adjust from end IF (top & bottom) core via L or R for minimum distortion.	Distortion: less than -40dB (0.4%) Standard Value: less than -54dB (0.2%)	Should be set at tuning point 2.
		Rec Out terminal Oscilloscope, Distortion ration meter, Electronic volt meter.				
6	Meter adjustment	FM antenna terminal (300Ω) FM signal Generator 98MHz/100dB μ Modulation Frequency: 400Hz/100% mono	Set VR101 (semi-fixed variable resistor for meter adjustment, $B10k\Omega$) (Refer to Fig. 3.)	Set for Maximum ("100") signal meter deflection.	Allowable Error: +0mm, -1mm. 	Should be set at tuning point 2.
7	Muting level adjustment	FM antenna terminal (300Ω) FM signal Generator 98MHz/20dB μ Modulation Frequency: 400Hz/100% mono	Set VR102 (semi-fixed variable resistor for muting level adjustment; $B4.7k\Omega$) (Refer to Fig. 3.)	Turn to the right little by little until output power appears.	Level where output appears: 20-dB μ +5dB μ -3dB μ	Should be set at tuning point 2.
		Rec Out terminal Oscilloscope, Electronic voltmeter				

TRACKING ADJUSTMENT

STEP	ADJUSTMENT ITEM	TERMINALS TO BE CONNECTED & INSTRUMENT REQUIRED	ADJUSTMENT	HOW TO ADJUST	RATING OR STANDARD	REMARKS
1	Dial pointer adjustment I Dial pointer adjustment II	FM antenna terminal FM signal Generator 98MHz/60dB μ	Tuning knob Dial pointer	Turn the knob and set the tuning point at TUNER COMPLETE ADJUSTMENT —“2”. Set to the middle of the “98” on the gauge board.		AFC-E (AFC OFF)
2	Low-band tracking conformation	FM antenna terminal FM signal Generator 90MHz/60dB μ	Tuning knob	Turn the knob and set the tuning point at 1.	Deviation should be within ± 1.0 -mm of the center of the standards (2 and 2').	AFC-E, CM-E If the check shows that only one of the standards (2 and 2') are not met, adjust the needle for that measurement to within the standard.
2'	High-band tracking conformation	FM antenna terminal FM signal Generator 106MHz/60dB μ	Dial pointer	Inspect for deviation from the center of the numbers on the dial scale.		
3	Tracking adjustment I	FM antenna terminal FM signal Generator 90, 98, 106MHz/60dB μ	Tuning knob Dial pointer	Reset the dial pointer so that the greatest deviation is within the standard range.		When both 2 and 2' are out of the standard range.
4	Tracking adjustment II	FM antenna terminal FM signal Generator 90, 98, 106MHz/60dB μ FM antenna terminal FM signal Generator 88MHz/60dB μ 88MHz/30dB μ FM antenna terminal FM signal Generator 106MHz/60dB μ 106MHz/30dB μ	Tuning knob Front end L OSC core Front end RF, ANT core. (Refer to Fig. 4.) Front end L OSC trimmer Front end RF, ANT trimmer (Refer to Fig. 4.)	Match the needle to the numbers. Set the tuning point at 1. Set for maximum meter deflection. Set the tuning point at 1. Set for maximum meter deflection.		When the standard is not met even after adjustments 2, 2' and 3.

AUDIO SECTION

EQ AMPLIFIER ADJUSTMENT

STEP	ADJUSTMENT ITEM	TERMINALS TO BE CONNECTED & INSTRUMENT REQUIRED	ADJUSTMENT	HOW TO ADJUST	RATING OR STANDARD	REMARKS
1	SEPP Output mid-point voltage adjustment	TP1 — E (L) TP2 — E (R) Refer to Fig.5 Electronic voltmeter	VR401 (L) VR402 (R) Refer to Fig.5	Set the voltage between TP1 and E, TP2 and E to rating value (28.0V ±0.5V) with VR401, VR402.	28.0V ±0.5V	
2	Bias adjustment	PHONO 1 or 2 jack Oscillator 1kHz/240mV REC OUT JACK Distortion ratio meter Electronic voltmeter Oscilloscope	VR401 (L) VR402 (R) Refer to Fig.6	Set VR401 and VR402 for lowest possible distortion within the limits set by the Step 1 adjustment of the SEPP output voltage (28.0V ±0.5V).		

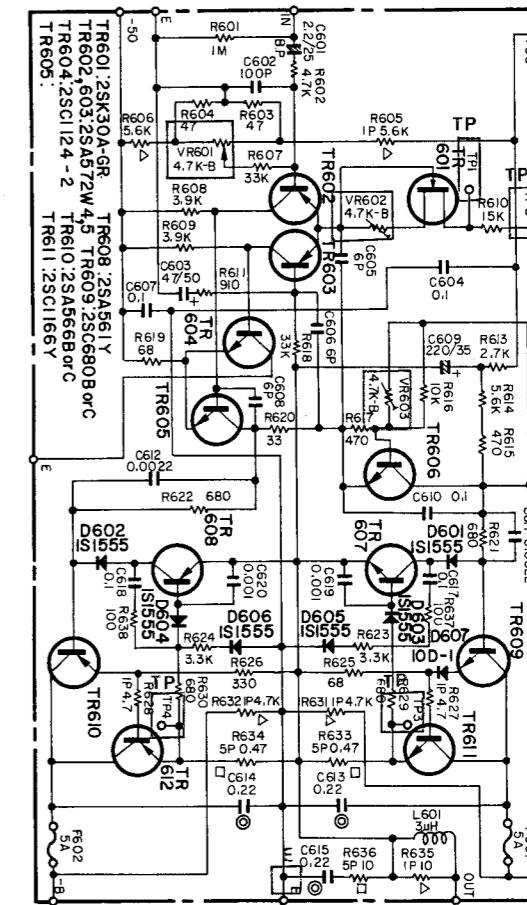

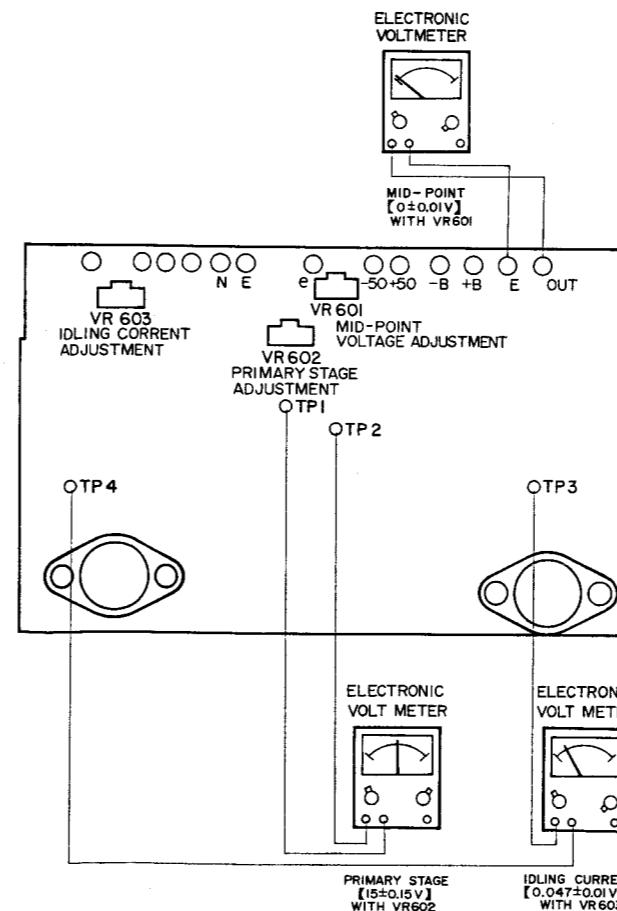

MAIN AMPLIFIER ADJUSTMENT

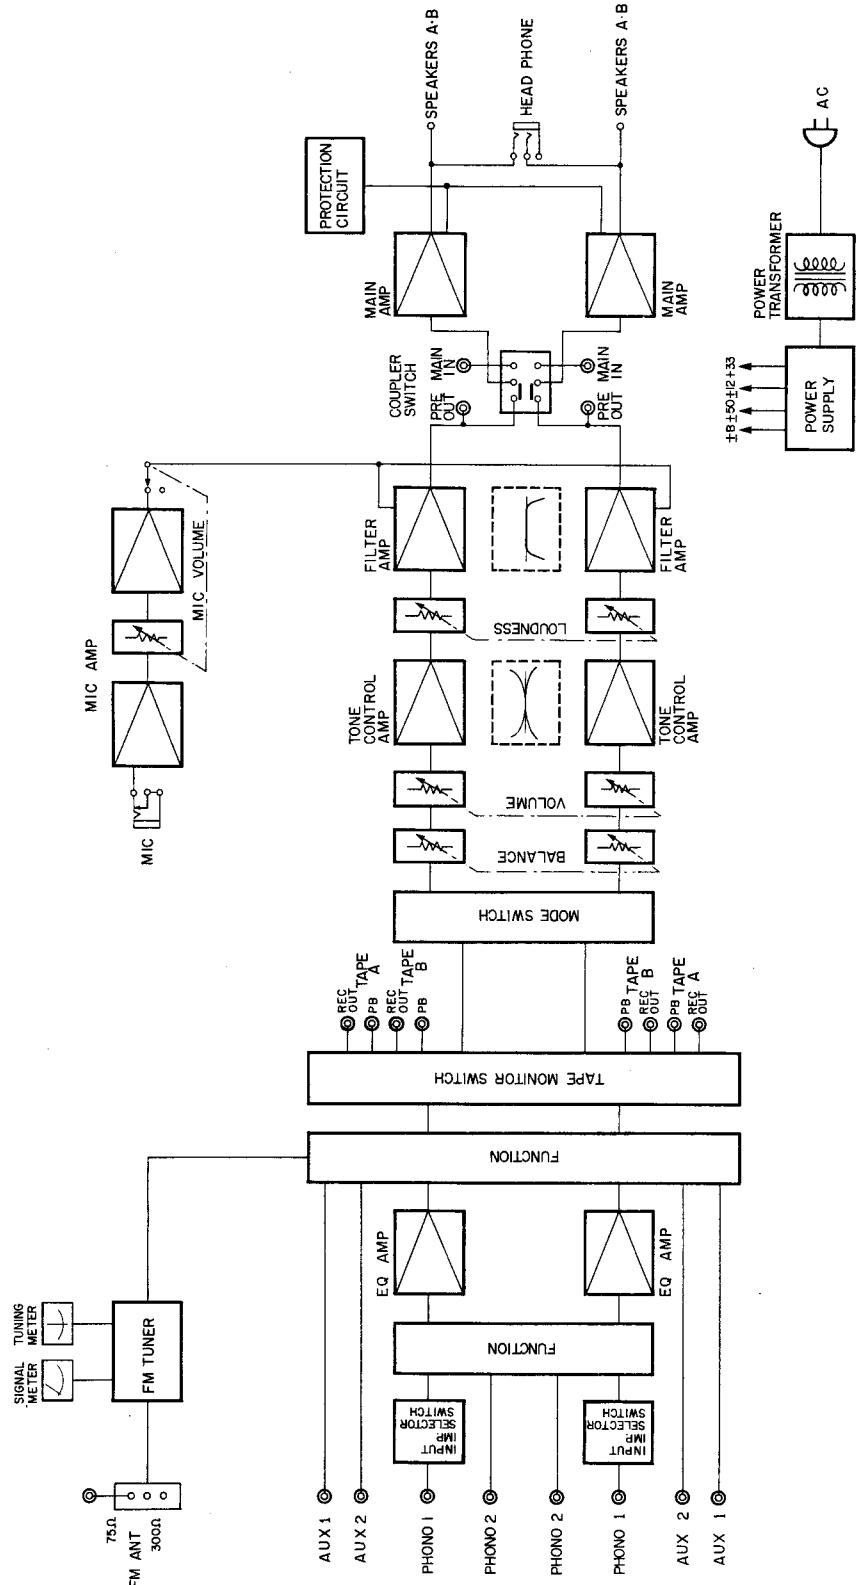

BEFORE ADJUSTMENT

- Turn the Pre/Main coupler switch Off.
- After the power switch is turned in, wait 1 minute before adjustment, to be sure of the most stable operation.
- Do not connect speakers or dummy load resistor to the speaker terminals.

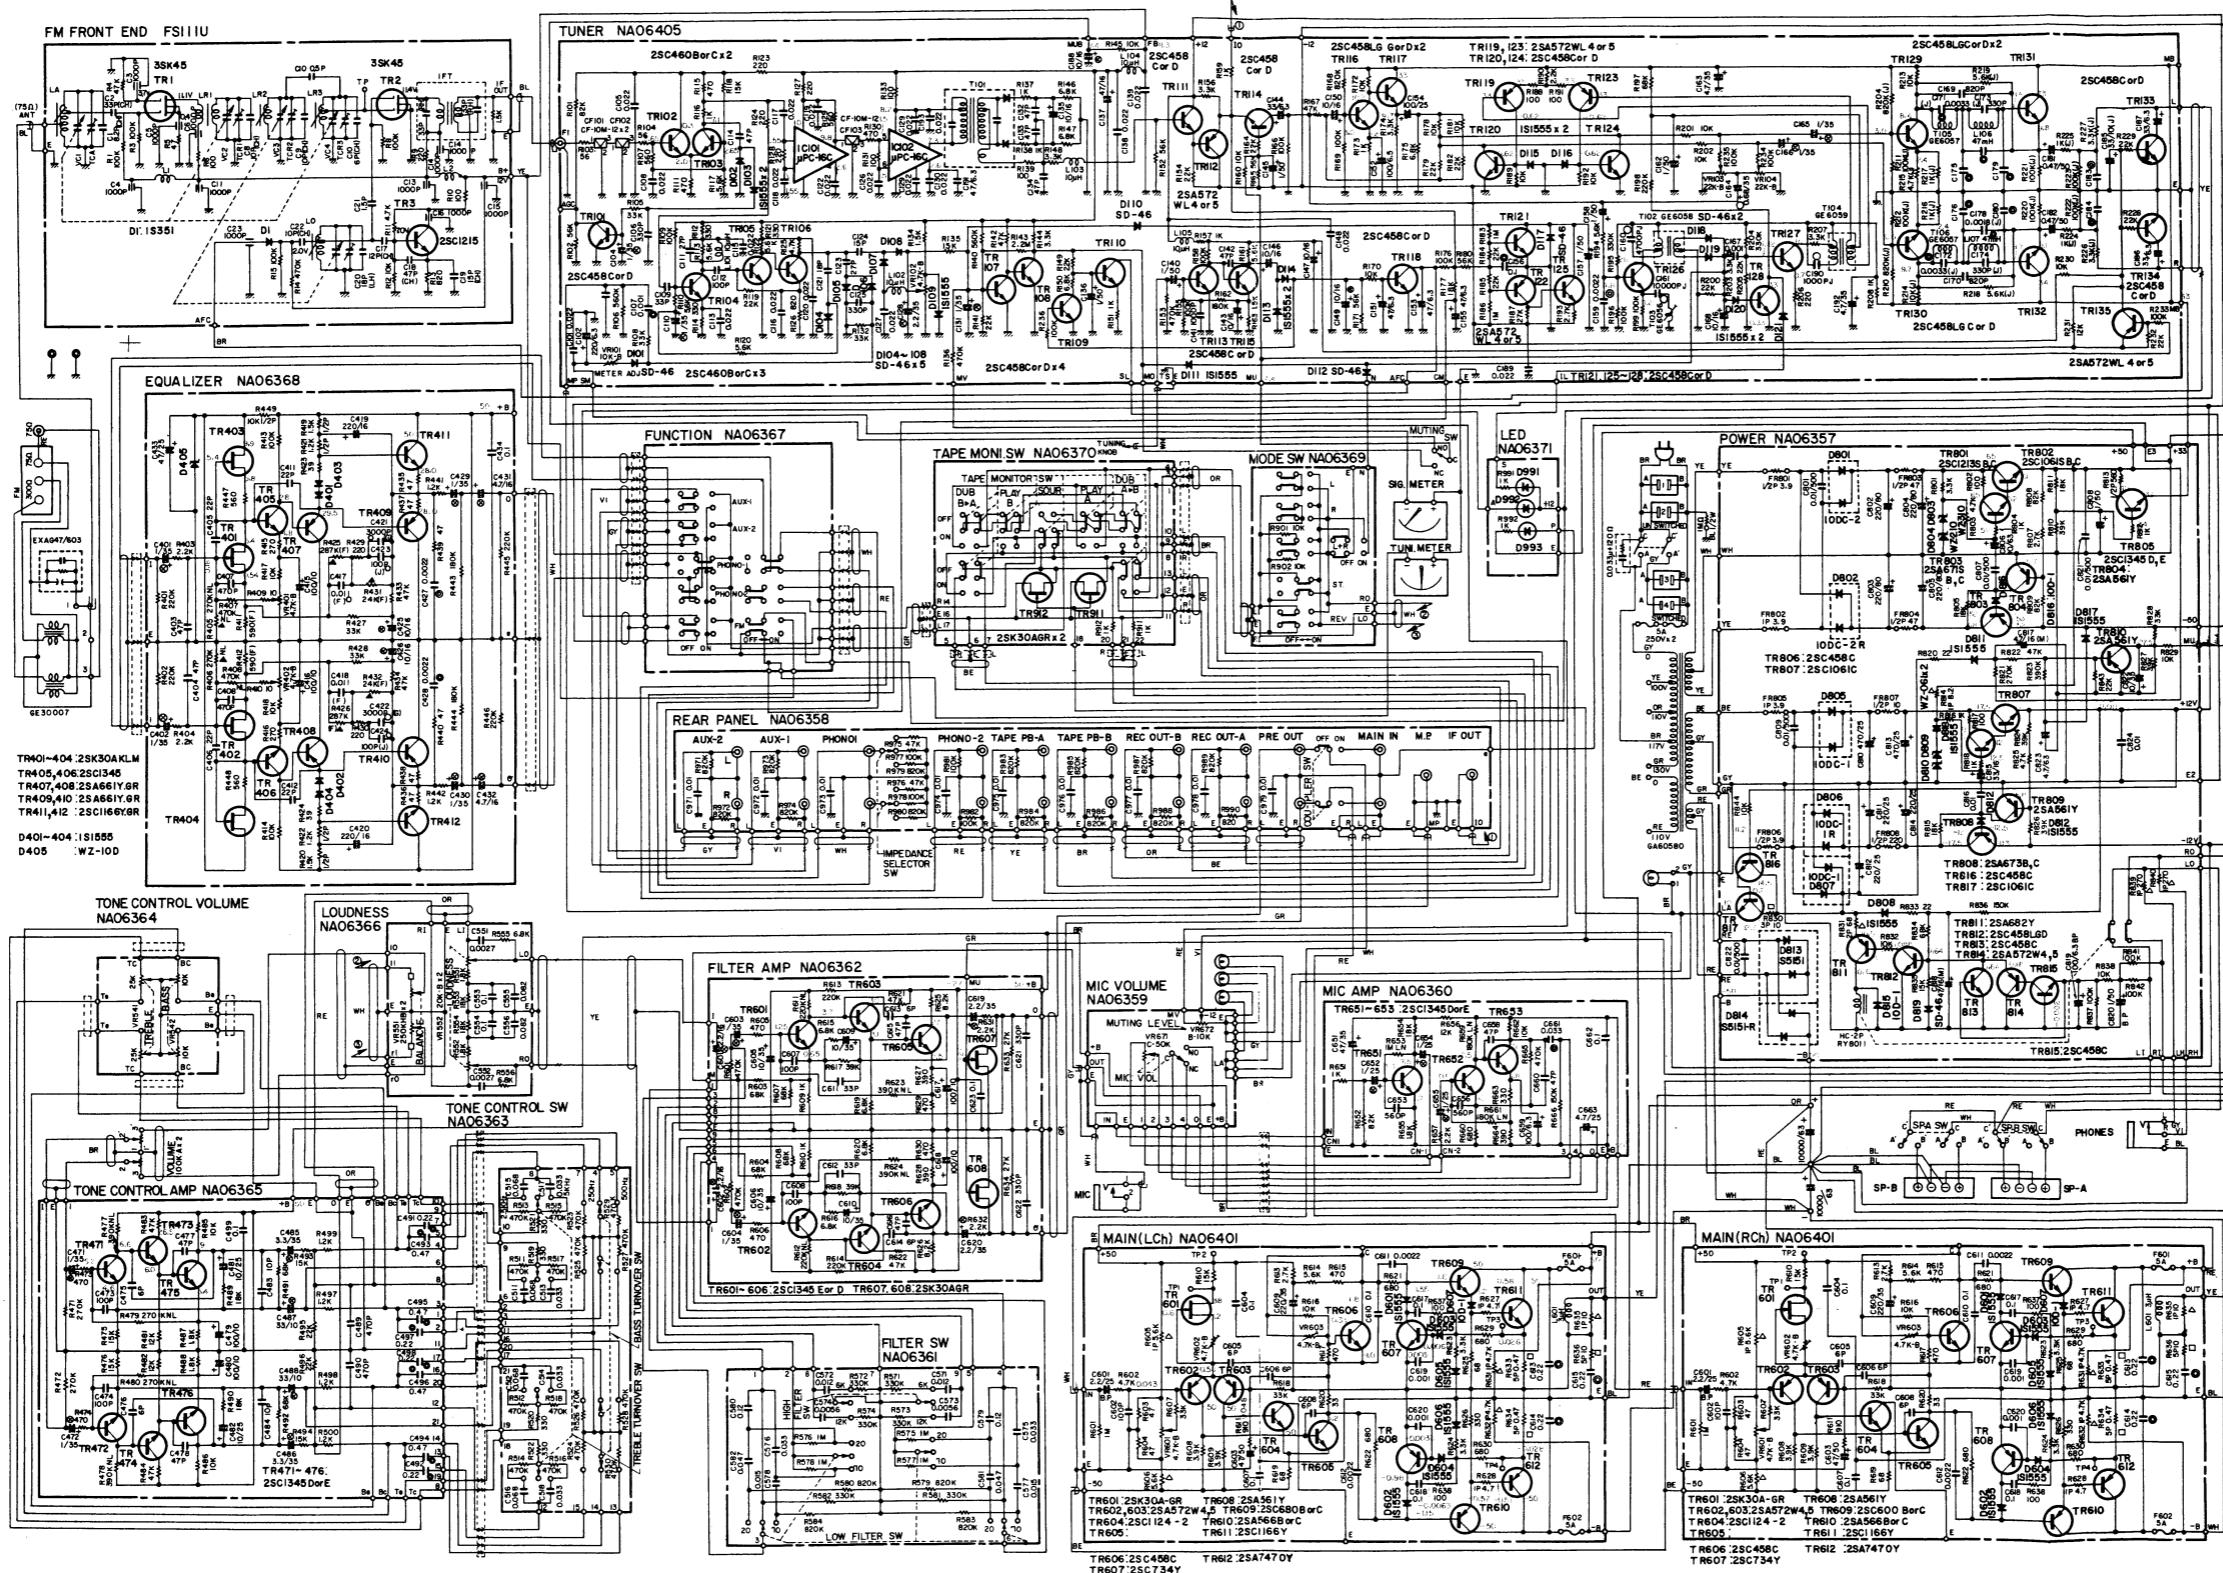

STEP	ADJUSTMENT ITEM	TERMINALS TO BE CONNECTED & INSTRUMENT REQUIRED	ADJUSTMENT	HOW TO ADJUST	RATING OR STANDARD	REMARKS
1	Primary stage differential amplification circuit current adjustment	TP1 (-) — TP2 (+) Refer to Fig.8. Electronic voltmeter	VR602 Refer to Fig.8.	Set the voltage between TP1 and TP2 to rating value (15V ±0.15V) with VR602.	15V ±0.15V	
2	Mid-point voltage adjustment	OUT — E Refer to Fig.8. Electronic voltmeter.	VR601 Refer to Fig.8.	Set the voltage between OUT and E to rating value (0V ±0.01V) with VR601.	0V ±0.01V	
3	Idling current adjustment	TP3 (+) — TP4 (-) Refer to Fig.8. Electronic voltmeter.	VR603 Refer to Fig.8.	Set the voltage between TP3 and TP4 to rating value (0.047V ±0.01V)	0.047V ±0.01V	
4				Repeat steps 1 ~ 3 several times.
