

Crystal Structure of *trans* 2-Carboxy-5-methyl-dihydro-thiazolo[3,2-a]pyridinium-3-carboxylate

P. GROTH

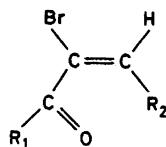

Department of Chemistry, University of Oslo, Oslo 3, Norway

The crystals are monoclinic with space group $P2_1/c$ and cell dimensions $a = 10.70$, Å, $b = 7.37$, Å, $c = 16.68$, Å, $\beta = 130.5^\circ$. There are four molecules in the unit cell. The structure was solved by the heavy atom method, and the weighted R -value arrived at was $R_w = 3.5\%$ for 1089 reflections, which were measured on a four circle diffractometer. The two S-C bond distances are 1.83, Å and 1.73, Å. The intermolecular hydrogen bond is relatively short (2.47, Å) and forms infinite chains of zwitterions in the [010] direction. The hydrogen atom is at a distance of 1.05 Å from one of the oxygens, and the O-H...O angle is 177°.

The synthesis of the dihydrothiazolo[3,2-a]pyridinium ring system has been described by Bradsher and Lohr¹ and by Balsiger *et al.*² The properties of

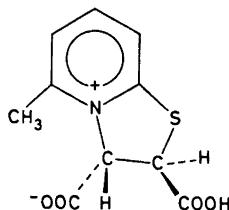

dihydrothiazolo[3,2-a]pyridinium derivatives are being studied extensively by Undheim *et al.*, who in a recent report³ have shown that such compounds may be obtained by addition of pyrid-2-thiones to α -bromo- α , β -unsaturated carbonyl compounds.

If the β -carbon in the unsaturated carbonyl compound carries a substituent, NMR evidence is in favour of a *trans* configuration in the bicyclic product. This appears to be true⁴ irrespective of the stereochemistry about the double bond in the carbonyl compound.

In order to obtain more detailed information, the crystal structure determination of *trans* 2-carboxy-5-methyl-dihydrothiazolo[3,2-a]pyridinium-3-carboxylate has been carried out.

The crystals are monoclinic with space group $P2_1/c$. The cell dimensions, determined by a manual four circle diffractometer, with estimated standard deviations^{5 *} are:

$$a = 10.707(4) \text{ \AA}; b = 7.376(4) \text{ \AA}; c = 16.688(4) \text{ \AA}; \beta = 130.52(2)^\circ.$$

The unit cell contains four molecules ($\rho_{\text{calc}} = 1.58 \text{ g/cm}^3$, $\rho_{\text{obs}} = 1.58 \text{ g/cm}^3$).

About 1650 reflections were measured by an automatic four circle diffractometer ($2\theta_{\text{max}} = 50^\circ$), using $\text{MoK}\alpha$ -radiation and a highly orientated graphite crystal monochromator. With an observed-unobserved cutoff at $2.0 \cdot \sigma(I)$, 1089 reflections were recorded as observed. No corrections for absorption or secondary extinction effects have been carried out.

The structure was solved by the heavy atom method and refined by full-matrix least squares techniques. Methyl and hydroxyl hydrogen atoms were localized in a difference Fourier map, while the positions of the other hydrogen atoms were calculated assuming C–H bond lengths of 1.03 Å. Anisotropic temperature factors were introduced for sulphur, oxygen, nitrogen, and carbon atoms. The weights in least squares were calculated from the standard deviations in intensities, $\sigma(I)$, taken as

$$\sigma(I) = [C_T + (0.02 \times C_N)^2]^{\frac{1}{2}}$$

where C_T is the total number of counts, and C_N the net count (peak minus background). The weighted R -value arrived at was 3.5 % (conventional value $R = 4.9 \%$) for 1089 observed reflections. The atomic form factors were those of Hanson *et al.*⁶ except for hydrogen.⁷ A final difference Fourier map, calculated with the phases determined by the parameters corresponding to $R_w = 3.5 \%$, contained no density fluctuations larger than $\pm 0.3 \text{ e. \AA}^{-3}$.

Final fractional coordinates and thermal parameters with estimated standard deviations are given in Tables 1 and 2. The expression for anisotropic vibration is:

$$\exp(-(B_{11}h^2 + B_{22}k^2 + B_{33}l^2 + B_{12}hk + B_{13}hl + B_{23}kl))$$

* All programs are included in this reference.

Table 1. Fractional atomic coordinates and anisotropic thermal vibration parameters with estimated standard deviations (multiplied by 10^5).

A comparison between observed and calculated structure factors is presented in Table 3.

The principal axes of the thermal vibration ellipsoids were calculated from the thermal parameters of Table 1. Root mean square amplitudes and the corresponding *B*-values for the atomic anisotropic thermal vibration along the principal axes together with the components of these axes along the crystal ones are given in Table 4.

Rigid-body analysis of translational, librational, and screw motion⁸ gave relatively large r.m.s. discrepancy between atomic vibration tensor component calculated from the thermal parameters of Table 1, and those calculated from the rigid-body parameters. By including all 16 atoms, the value obtained was 0.0048 \AA^2 . When the methyl and carboxyl groups were excluded, the r.m.s.-value dropped to 0.0034 \AA^2 . These numbers do not strongly support the assumption of regarding neither the whole molecule, nor the bicyclic ring

Table 2. Fractional atomic coordinates for hydrogen atoms with estimated standard deviations (H_m and $H_{m,n}$ are bonded to C_m , while H_B is in the hydrogen bond).

skeleton, as an oscillating rigid body, and the coordinates were therefore not corrected for librational motion.

Some of the bond distances and angles with standard deviations, estimated from the correlation matrix of the last least squares refinement cycle, listed in Table 5, may also be found in Figs. 1 and 2, where the molecule is viewed along the directions [010] and [100], respectively. Dihedral angles of the five-membered ring are given in Table 6.

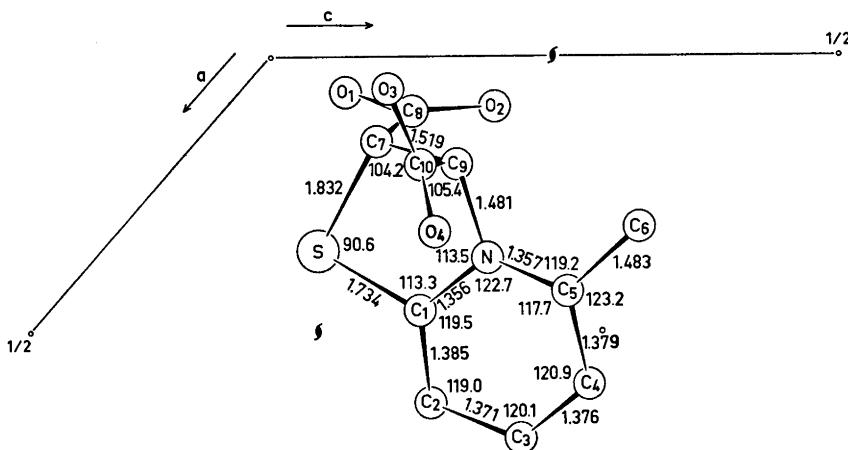

Fig. 1. Schematic drawing of the molecule viewed along [010].

Table 3. Observed and calculated structure factors on 10 times absolute scale.

Bond distances in the six-membered ring agree within error limits with the micro wave results for pyridine⁹ (C—N: 1.340±0.001 Å, and C—C: 1.394±0.001 Å), while the C—N—C angle of 122.7° is significantly larger than in pyridine (116.8°). The six-membered ring is planar, the largest deviation from the least squares plane being only 0.009 Å.

In the five-membered ring, four of the atoms lie nearly in a plane (to within 0.05 Å), while the fifth, C₇, is out of the plane by 0.57 Å.

The ring geometry may be compared with those of thiazole and tetrahydrothiophene, which are known from microwave¹⁰ and electron diffraction¹¹ investigations (Table 7).

Taking into account the extent to which these distances and angles are comparable, the agreement is satisfactory. The dihedral angle S—C₇—C₉—N

C ₇ -S-C ₁ -N	12.4 (3)

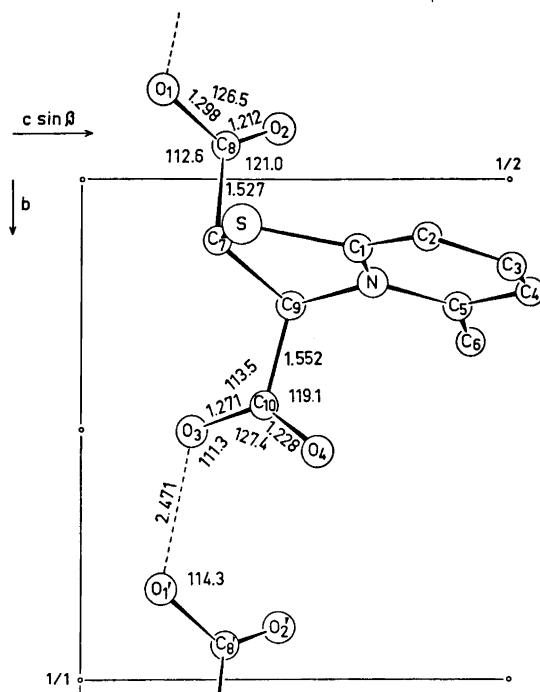

Fig. 2. Schematic drawing of the molecule viewed along [100].

(36.8°) agrees also fairly well with the tetrahydrothiophene S—C—C—C value of 40.4° (1.2°).

Although the intermolecular hydrogen bond between O₃ and O₁' is as short as 2.471 Å, it is far from symmetric (O₃···H_B = 1.42 Å, and H_B—O₁' = 1.05 Å), and no evidence for disorder has been observed. The hydrogen atom was localized in the difference Fourier map about 1.0 Å from O₁', and no

Table 7. Ring geometry of the title compound compared to those of tetrahydrothiophene and thiazole.

Distance	Tetrahydrothiophene	Thiazole	Present compound
S—C	1.839 (2)		1.832 (3) (S—C ₇)
S—C		1.726 (1)	1.734 (3) (S—C ₁)
C—C	1.536 (2)		1.519 (4) (C ₇ —C ₉)
<hr/>			
Angle			
C—S—C	93.4 (5)	98.33 (3)	90.6 (2) (C ₁ —S—C ₇)
S—C—C	106.1 (4)		104.1 (2) (S—C ₇ —C ₉)

C—N—C		110.12 (2)	113.5 (3) (C ₁ —N—C ₉)

abnormal shifts occurred when refining the coordinates and isotropic temperature factors. Distances and angles of the carboxyl groups are normal.

Fig. 2 clearly shows that the configuration of the molecule is *trans*, in agreement with NMR evidence.⁴ The dihedral angle C₈—C₇—C₉—C₁₀ is 160.1°, and the angle between the planes C₈, O₁, O₂ and C₁₀, O₃, O₄ is 114.3°.

There are some relatively short intermolecular contacts between oxygens and H₃, H₄, H₇ (2.35 Å, 2.42 Å, 2.47 Å).

Acknowledgement. The author would like to thank cand. real. R. Lie for preparing the crystals.
