**Abstract**

In the paper by Dorset [*Acta Cryst.* (1997), **A53**, 445–455], identical strictures were placed on the plane groups  $p3$  and  $p31m$  for origin definition, *i.e.* it was stated that all  $hk0$  reflections were structure seminvariants. While this general restriction is true for  $p31m$ , it applies in  $p3$  only for reflections where  $h - k = 3n$ . Hence, additional origin information (one

non-seminvariant phase term) might have been used for this plane group, an option that will be considered in future work with these data sets. Owing to a typographical error, the Sayre–Hughes equation was incorrectly reproduced and should be written

$$E_h = N^{1/2} \langle E_k E_{h-k} \rangle_k.$$
